</table>
Reserved schema names and reserved words

Restrictions exist on the use of certain names that are used by DB2. In some cases, names are reserved and cannot be used by application programs. In other cases, certain names are not recommended for use by application programs though not prevented by the database manager.
Reserved schema names

In general, for certain objects, schema names that begin with the prefix SYS are reserved. The schema name for these objects cannot begin with SYS except for certain exceptions.

The schema name for the objects listed in the following table must follow the restrictions listed in the table.

**Recommendation:** Do not to use SESSION name as a schema name.

*Table 158. Objects with schema name restrictions and exceptions.*

<table>

</tr>
</tbody>
</table>

**Notes:**
1. If the user who executes the CREATE statement has the SYSADM or SYSCTRL privilege.
2. For external user-defined scalar functions or external user-defined table functions if the user who executes the CREATE statement has the SYSADM or SYSCTRL privilege.
## Reserved words

Certain words cannot be used as ordinary identifiers in some contexts because those words might be interpreted as SQL keywords. For example, `ALL` cannot be a column name in a `SELECT` statement. Each word, however, can be used as a delimited identifier in contexts where it otherwise cannot be used as an ordinary identifier. For example, if the quotation mark ("') is the escape character that begins and ends delimited identifiers, “ALL” can appear as a column name in a `SELECT` statement.

New reserved words for this version of DB2 for z/OS are identified with notes in this topic. In addition, some topics in this information might indicate words that cannot be used in the specific context that is being described.

IBM SQL has additional reserved words that DB2 for z/OS does not enforce. Therefore, you should not use these additional reserved words as ordinary identifiers in names that have a continuing use. See *IBM DB2 SQL Reference for Cross-Platform Development* for a list of the words.

Characteristics of SQL statements in DB2 for z/OS

DB2 allows specific actions on each SQL statement, and only certain SQL statements are allowed in external routines and SQL procedures.
## Actions allowed on SQL statements

Specific DB2 statements can be executed, prepared interactively or dynamically, or processed by the requester, the server, or the precompiler or coprocessor.

The following table shows whether a specific DB2 statement can be executed, prepared interactively or dynamically, or processed by the requester, the server, or the precompiler or coprocessor. The letter Y means yes.

<td></td>
<td>Y</td>
</tr>
</tbody>
</table>

Note:

1. The statement can be dynamically prepared. It cannot be issued dynamically.
2. The statement can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.
3. The statement can be dynamically prepared, but only from an ODBC or CLI driver that supports dynamic CALL statements.
4. The requesting system processes the PREPARE statement when the statement being prepared is ALLOCATE CURSOR or ASSOCIATE LOCATORS.
5. The value to which special register CURRENT SQLID is set is used as the SQL authorization ID for dynamic SQL statements only when DYNAMICRULES run behavior is in effect. The CURRENT SQLID value is ignored for the other DYNAMICRULES behaviors.
6. This statement can be used only in the triggered action of a trigger.
7. Local special registers can be referenced in a VALUES INTO statement if it results in the assignment of a single host-variable, not if it results in setting more than one value.
8. Some processing also occurs at the requester.
SQL statements allowed in external functions and stored procedures

Certain SQL statements can be executed in an external stored procedure or in an external user-defined function. Whether the statements can be executed depends on the level of SQL data access with which the stored procedure or external function is defined.

The following table shows which SQL statements in an external stored procedure or in an external user-defined function can execute. The letter Y means yes.

In general, if an executable SQL statement is encountered in a stored procedure or function defined as NO SQL, SQLSTATE 38001 is returned. If the routine is defined to allow some level of SQL access, SQL statements that are not supported in any context return SQLSTATE 38003. SQL statements not allowed for routines defined as CONTAINS SQL return SQLSTATE 38004, and SQL statements not allowed for READS SQL DATA return SQLSTATE 38002.

Table 160. SQL statements in external user-defined functions and stored procedures

### Table 160. SQL statements in external user-defined functions and stored procedures (continued)

<table>
<thead>
<tr>
<th>SQL statement</th>
<th>Level of SQL access</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>NO SQL</td>
</tr>
</tbody>
</table>
| Notes:        | 1. Although the SQL option implies that no SQL statements can be specified, non-executable statements are not restricted.  
2. The stored procedure that is called must have the same or more restrictive level of SQL data access than the current level in effect. For example, a routine defined as MODIFIES SQL DATA can call a stored procedure defined as MODIFIES SQL DATA, READS SQL DATA, CONTAINS SQL, or NO SQL. A routine defined as CONTAINS SQL can call a procedure defined as CONTAINS SQL or NO SQL.  
3. The COMMIT statement cannot be executed in a user-defined function. The COMMIT statement cannot be executed in a stored procedure if the procedure is in the calling chain of a user-defined function or trigger.  
4. The statement specified for the EXECUTE statement must be a statement that is allowed for the particular level of SQL data access in effect. For example, if the level in effect is READS SQL DATA, the statement must not be an INSERT, UPDATE, MERGE, or DELETE statement.  
5. The statement is supported only if it does not contain a subquery or query-expression.  
6. RELEASE SAVEPOINT, SAVEPOINT, and ROLLBACK (with the TO SAVEPOINT clause) cannot be executed from a user-defined function.  
7. If the ROLLBACK statement (without the TO SAVEPOINT clause) is executed in a user-defined function, an error is returned to the calling program, and the application is placed in a must rollback state.  
8. The ROLLBACK statement (without the TO SAVEPOINT clause) cannot be executed in a stored procedure if the procedure is in the calling chain of a user-defined function or trigger. |  

---

### SQL control statements for external SQL procedures

SQL control statements for external SQL procedures can be used only with SQL procedures that are created with the FENCED or EXTERNAL clause. SQL control statements provide the capability to control the logic flow, declare and set variables, and handle warnings and exceptions. Some SQL control statements include other nested SQL statements.

**SQL-control-statement:**
Control statements are supported in SQL procedures. External SQL procedures are created by specifying either FENCED or EXTERNAL, LANGUAGE SQL, and an SQL routine body on the CREATE PROCEDURE (SQL - external) statement. The SQL routine body must be a single SQL statement which may be an SQL control statement.

The remainder of this chapter contains a description of the control statements that are supported for external SQL procedures, and includes syntax diagrams, semantic descriptions, usage notes, and examples of the use of the statements that constitute the SQL routine body. In addition, you can find information about referencing SQL parameters and variables in “References to SQL parameters and SQL variables.”

The two common elements that are used in describing specific SQL control statements are:
- SQL control statements as described above
- “SQL-procedure-statement” on page 1885

**References to SQL parameters and SQL variables**

SQL parameters and SQL variables can be referenced anywhere in the statement where an expression or a host variable can be specified. Host variables can be specified in SQL routines. SQL parameters and SQL variables can be referenced anywhere in the compound statement in which they are declared and can be qualified with the label name that is specified at the beginning of the compound statement.

All SQL parameters and SQL variables are considered nullable. The name of an SQL parameter or SQL variable in an SQL routine can be the same as the name of a column in a table or view that the SQL routine references. Names that are the same should be explicitly qualified. Qualifying a name clearly indicates whether the name refers to a column, SQL variable, or SQL parameter.

If the name is not qualified, the following rules describe whether the name refers to the column, the SQL variable, or the SQL parameter:
- The name is checked first as an SQL variable name and then as an SQL parameter name.
- If an SQL variable or SQL parameter by that name is not found, the name is assumed to be a column name.
The name of an SQL variable or SQL parameter in an SQL routine can be the name of an identifier that is used in certain SQL statements. If the name is not qualified, the following rules describe whether the name refers to the identifier, the SQL variable, or the SQL parameter:

- In the SET PATH and SET SCHEMA statements, the name is checked as an SQL variable name or an SQL parameter name. If an SQL variable or SQL parameter by that name is not found, the name is assumed to be an identifier.
- In the ASSOCIATE LOCATORS, CONNECT statement, the SET CONNECTION statement, and the RELEASE (connection) statement the name is used as an identifier.
SQL-procedure-statement

An SQL control statement may allow multiple SQL statements to be specified within the SQL control statement. These statements are defined as SQL procedure statements.

Syntax

```
SQL-label: SQL-control-statement SQL-statement
```

Description

**SQL-label**

Specifies a label for the statement. *SQL-label* must not be a delimited identifier that includes lowercase letters or special characters. The label must be unique within the procedure.

**SQL-control-statement**

Specifies an SQL statement that provides the capability to control logic flow, declare and set variables, and handle warnings and exceptions, as defined in this section. Control statements are supported in SQL procedures.

**SQL-statement**

Specifies an SQL statement. These statements are described in Chapter 5, "Statements," on page 757.

Notes

**Comments**: Comments can be included within the body of an SQL procedure. In addition to the double-dash form of comments (--), a comment can begin with /* and end with */. The following rules apply to this form of comment:

- The beginning characters /* must be adjacent and on the same line.
- The ending characters */ must be adjacent and on the same line.
- Comments can be started wherever a space is valid.
- Comments can be continued to the next line.

**Handling errors and warnings**: Conditions can be detected within an SQL procedure by using the following methods:

- Test the special SQL variables SQLSTATE and SQLCODE.
- Issue a GET DIAGNOSTICS statement to request the condition information. See "GET DIAGNOSTICS" on page 1553.
- Define condition handlers to detect and process conditions. See "compound-statement" on page 1893 for information about defining condition handlers.
assignment-statement (SQL control statements for external routines)

The assignment statement assigns a value to an SQL parameter or to an SQL variable.

Syntax

```
SET SQL-parameter-name = CURRENT SERVER SQL-variable-name
```

<table>
<thead>
<tr>
<th>CURRENT SERVER</th>
<th>CURRENT PACKAGESET</th>
<th>CURRENT PACKAGE PATH</th>
<th>expression</th>
<th>NULL</th>
</tr>
</thead>
</table>

Description

**SQL-parameter-name**

Identifies the parameter that is the assignment target. The parameter must be specified in `parameter-declaration` in the CREATE PROCEDURE statement and must be defined as OUT or INOUT.

**SQL-variable-name**

Identifies the SQL variable that is the assignment target. SQL variables can be declared in a compound-statement and must be declared before it is used. For information on declaring SQL variables, see "compound-statement" on page 1893.

**expression or NULL**

Specifies the expression or value that is the assignment source. The expression can be any expression of the type described in "Expressions" on page 206 except it cannot contain a reference to local special registers (CURRENT SERVER, CURRENT PACKAGESET, or CURRENT PACKAGE PATH).

Notes

**Assignment rules:** Assignment statements in SQL procedures must conform to the SQL assignment rules. For example, the data type of the target and source must be compatible. See "Assignment and comparison" on page 114 for assignment rules.

When a string is assigned to a fixed-length variable and the length of the string is less than the length attribute of the target, the string is padded on the right with the necessary number of single-byte or double-byte blanks. When a string is assigned to a variable and the string is longer than the length attribute of the variable, the value is truncated and a warning is returned.

The ENCODING bind option is not used during processing of assignments to string variables. For example, assume that the system does not use mixed or DBCS, and the system EBCDIC SBCS CCSID is 37. Character conversion will not occur on assignment even if CCSID 500 is specified for the ENCODING bind parameter for the package for the procedure.

If truncation of the whole part of a number occurs on assignment to a numeric variable, the value is truncated and a warning is returned.
Assignments involving SQL parameters:

- An IN parameter can appear on the left side of an assignment statement. When control returns to the caller, the original value of an IN parameter is passed to the caller.
- An OUT parameter can appear on the left or right side of an assignment statement. When control returns to the caller, the last value that is assigned to an OUT parameter is returned to the caller.
- An INOUT parameter can appear on the left or right side of an assignment statement. The first value of the parameter is determined by the caller, and the last value that is assigned to the parameter is returned to the caller.
- A LOB parameter cannot be used as an output value in an SQL statement in an SQL procedure when connected to a remote site. To circumvent the restriction, use a LOB SQL variable instead of a LOB parameter.

Considerations for SQLSTATE and SQLCODE SQL variables: Assignment to these variables is not prohibited. However, it is not recommended as assignment does not affect the diagnostic area or result in the activation of condition handlers. Furthermore, processing an assignment to these SQL variables causes the specified values for the assignment to be overlayed with the SQL return codes returned from executing the statement that does the assignment.

Examples

Increase the SQL variable $p\_salary$ by 10 percent.

```sql
SET p_salary = p_salary + (p_salary * .10)
```

Set SQL variable $p\_salary$ to the null value.

```sql
SET p_salary = NULL
```

Set SQL variable $midinit$ to the first character of SQL variable $midname$.

```sql
SET midinit = SUBSTR(midname,1,1)
```
CALL statement

The CALL statement invokes a stored procedure.

Syntax

```
CALL procedure-name argument-list
```

**argument-list:**

```
( SQL-variable-name, SQL-parameter-name, expression, NULL )
```

**Description**

**procedure-name**

Identifies the stored procedure to call. The procedure name must identify a stored procedure that exists at the current server.

**argument-list**

Identifies a list of values to be passed as parameters to the stored procedure. The number of parameters must be the same as the number of parameters defined for the stored procedure. See "CALL" on page 1026 for more information.

Control is passed to the stored procedure according to the calling conventions for SQL procedures. When execution of the stored procedure is complete, the value of each parameter of the stored procedure is assigned to the corresponding parameter of the CALL statement defined as OUT or INOUT.

**SQL-variable-name**

Specifies an SQL variable as an argument to the stored procedure. For an explanation of references to SQL variables, see "References to SQL parameters and SQL variables" on page 1883.

**SQL-parameter-name**

Specifies an SQL parameter as an argument to the stored procedure. For an explanation of references to SQL parameters, see "References to SQL parameters and SQL variables" on page 1883.

**expression**

The parameter is the result of the specified *expression*, which is evaluated before the stored procedure is invoked. If *expression* is a single *SQL-parameter-name* or *SQL-variable-name*, the corresponding parameter of the procedure can be defined as IN, INOUT, or OUT. Otherwise, the corresponding parameter of the procedure must be defined as IN. If the result of the *expression* can be the null value, either the description of the
procedure must allow for null parameters or the corresponding parameter of the stored procedure must be defined as OUT.

The following additional rules apply depending on how the corresponding parameter was defined in the CREATE PROCEDURE statement for the procedure:

- **IN expression** can contain references to multiple SQL parameters or variables. In addition to the rules stated in "Expressions" on page 206 for *expression*, *expression* cannot include a column name, an aggregate function, or a user-defined function that is sourced on an aggregate function.
- **INOUT or OUT expression** can only be a single SQL parameter or variable.

**NULL**
The parameter is a null value. The corresponding parameter of the procedure must be defined as IN and the description of the procedure must allow for null parameters.

**Notes**
See "CALL" on page 1026 for more information on the SQL CALL statement.

**Examples**

Call stored procedure proc1 and pass SQL variables as parameters.

```sql
CALL proc1(v_empno, v_salary)
```
**CASE statement**

The CASE statement selects an execution path based on the evaluation of one or more conditions. A CASE statement operates in the same way as a CASE expression.

**Syntax**

```sql
CASE
  simple-when-clause
  searched-when-clause
  ELSE
    SQL-procedure-statement;
END CASE
```

**Description**

**CASE**

Begins a case-expression.

**simple-when-clause**

Specifies the expression prior to the first WHEN keyword that is tested for equality with the value of each expression that follows the WHEN keyword, and the result to be executed when those expressions are equal. If the comparison is true, the THEN statement is executed. If the result is unknown or false, processing continues to the next expression or the ELSE statement.

The data type of the expression prior to the first WHEN keyword must be comparable to the data types of each expression that follows the WHEN keywords.

**searched-when-clause**

Specifies the search-condition that is applied to each row or group of table data presented for evaluation, and the result when that condition is true. search-condition cannot contain a fullselect. If the search condition is true, the
THEN statement is executed. If the condition is unknown or false, processing continues to the next search condition or the ELSE statement.

**SQL-procedure-statement**

Specifies a statement that follows the THEN and ELSE keyword. The statement specifies the result of a searched-when-clause or a simple-when-clause that is true, or the result if no case is true. The statement must be one of the statements listed under "SQL-procedure-statement" on page 1885.

**search-condition**

Specifies a condition that is true, false, or unknown about a row or group of table data.

**ELSE SQL-procedure-statement**

If none of the conditions specified in the simple-when-clause or searched-when-clause are true, the statements in the else-clause are executed.

If none of the conditions specified in the WHEN clause are true and an ELSE clause is not specified, an error is returned at run time, and the execution of the CASE statement is terminated.

**END CASE**

Ends a case-statement.

**Notes**

If none of the conditions specified in the WHEN clause are true and an ELSE clause is not specified, an error is returned at run time, and the execution of the CASE statement is terminated.

CASE statements that use a simple case statement WHEN clause can be nested up to three levels. CASE statements that use a searched statement WHEN clause have no limit to the number of nesting levels.

**Considerations for the SQLSTATE and SQLCODE SQL variables:** When the first SQL-procedure-statement in the CASE statement is executed, the SQLSTATE and SQLCODE SQL variables reflect the result of evaluating the expression or search conditions of that CASE statement. If a CASE statement does not include an ELSE clause and none of the search conditions evaluate to true, an error is returned.

**Examples**

*Example 1:* Use a simple case statement WHEN clause to update column DEPTNAME in table DEPT, depending on the value of SQL variable v_workdept.

```sql
CASE v_workdept
  WHEN 'A00'
    THEN UPDATE DEPT SET
      DEPTNAME = 'DATA ACCESS 1';
  WHEN 'B01'
    THEN UPDATE DEPT SET
      DEPTNAME = 'DATA ACCESS 2';
  ELSE UPDATE DEPT SET
    DEPTNAME = 'DATA ACCESS 3';
END CASE
```

*Example 2:* Use a searched case statement WHEN clause to update column DEPTNAME in table DEPT, depending on the value of SQL variable v_workdept.

```sql
CASE
  WHEN v_workdept < 'B01'
    THEN UPDATE DEPT SET
```

Appendix. Additional information for DB2 SQL 1891
DEPTNAME = 'DATA ACCESS 1';
WHEN v_workdept < 'C01'
  THEN UPDATE DEPT SET
    DEPTNAME = 'DATA ACCESS 2';
ELSE UPDATE DEPT SET
  DEPTNAME = 'DATA ACCESS 3';
END CASE
**compound-statement**

A compound statement contains a group of statements and declarations for SQL variables, cursors, and condition handlers.

**Syntax**

```
label: BEGIN NOT ATOMIC
  SQL-variable-declaration;
  SQL-condition-declaration;
  return-codes-declaration
  DECLARE-CURSOR-statement;
  handler-declaration;
  SQL-procedure-statement;
  END label
```

**Notes:**

1. Only one `label:` can be specified for each `SQL-procedure-statement`. If an ending label is specified for this beginning label, the labels must be the same.

**SQL-variable-declaration:**

```
DECLARE SQL-variable-name data-type DEFAULT NULL
  DEFAULT constant
  RESULT_SET_LOCATOR VARYING
```

**SQL-condition-declaration:**

```
DECLARE SQL-condition-name CONDITION FOR SQLSTATE string-constant
```

**return-codes-declaration:**
**Description**

*label*
- Defines the label for the code block. If the beginning label is specified, it can be used to qualify SQL variables declared in the compound statement and can also be specified on a LEAVE statement. If the ending label is specified, it must be the same as the beginning label.

**NOT ATOMIC**
- NOT ATOMIC indicates that an error within the compound statement does not cause the compound statement to be rolled back.

*SQL-variable-declaration*
- Declares a variable that is local to the compound statement.

*SQL-variable-name*
- A qualified or unqualified name that designates a variable in an SQL procedure body. The unqualified form of *SQL-variable-name* is an SQL identifier and must not be a delimited identifier that contains lowercase letters or special characters. The qualified form is an SQL procedure statement label followed by a period (.) and an SQL identifier.
DB2 folds all SBCS SQL variable names to uppercase. SQL variable names should not be the same as column names. If an SQL statement contains an SQL variable or parameter and a column reference with the same name, DB2 interprets the name as an SQL variable or parameter name. To refer to the column, qualify the column name with the table name. Further, to avoid ambiguous variable references and to ensure compatibility with other DB2 platforms, qualify the SQL variable or parameter name with the label of the SQL procedure statement.

**data-type**

Specifies the data type and length of the variable. SQL variables follow the same rules for default lengths and maximum lengths as SQL procedure parameters. See "CREATE PROCEDURE (SQL - external)” on page 1236 for a description of SQL data types and lengths.

**DEFAULT constant or NULL**

Defines the default for the SQL variable. The variable is initialized when the SQL procedure is called. If a default value is not specified, the variable is initialized to NULL.

**RESULT_SET_LOCATOR VARYING**

Specifies the data type for a result set locator variable.

**SQL-condition-declaration**

Declares a condition name and corresponding SQLSTATE value.

**SQL-condition-name**

Specifies the name of the condition. The condition name is an SQL identifier and must not be a delimited identifier that includes lowercase letters or special characters. SQL-condition-name must be unique within the procedure body and can be referenced only within the compound statement in which it is declared.

**FOR SQLSTATE string-constant**

Specifies the SQLSTATE that is associated with the condition. The string must be specified as five characters enclosed in single quotes, and cannot be '00000'.

**return-codes-declaration**

Declares special variables called SQLSTATE and SQLCODE that are set automatically to the value returned after processing an SQL statement. Both the SQLSTATE and SQLCODE variables can be declared only in the outermost compound statement of the SQL procedure. Assignment to these variables is not prohibited; however, assignment is ignored by exception handlers, and processing the next SQL statement replaces the assigned value.

**DECLARE CURSOR-statement**

Declares a cursor. Each cursor in the procedure body must have a unique name. An OPEN statement must be specified to open the cursor, and a FETCH statement can be specified to read rows. The cursor can be referenced only from within the compound statement. For more information on declaring a cursor, see "DECLARE CURSOR” on page 1417.

**handler-declaration**

Specifies a set of statements to execute when an exception or completion condition occurs in the compound statement. SQL-procedure-statement is the set of statements that execute when the handler receives control. See "SQL-procedure-statement” on page 1885 for information on SQL-procedure-statement.
A handler is active only within the compound statement in which it is declared.

The actions that a handler can perform are:

**CONTINUE**
Specifies that after the condition handler is activated and completes successfully, control is returned to the SQL statement that follows the statement that raised the condition. However, if the condition is an error condition and it was encountered while evaluating a search condition, as in a CASE, IF, REPEAT or WHILE statement, control returns to the statement that follows the corresponding END CASE, END IF, END REPEAT, or END WHILE.

**EXIT**
After the handler is invoked successfully, control is returned to the end of the compound statement.

The conditions that can cause the handler to gain control are:

**SQLSTATE** *string-constant*
Specifies an SQLSTATE for which the handler is invoked. The SQLSTATE cannot be '00000'.

**SQL-condition-name**
Specifies a condition name for which the handler is invoked. The condition name must be previously defined in a condition declaration.

**SQLEXCEPTION**
Specifies that the handler is invoked when an SQLEXCEPTION occurs. An SQLEXCEPTION is an SQLSTATE in which the class code is a value other than '00', '01', or '02'. For more information on SQLSTATE values, see **DB2 Codes**.

**SQLWARNING**
Specifies that the handler is invoked when an SQLWARNING occurs. An SQLWARNING is an SQLSTATE value with a class code of '01'.

**NOT FOUND**
Specifies that the handler is invoked when a NOT FOUND condition occurs. NOT FOUND corresponds to an SQLSTATE value with a class code of '02'.

**Notes**

The order of statements in a compound statement must be:
1. SQL variable, condition declarations, and return codes declarations
2. Cursor declarations
3. Handler declarations
4. SQL procedure statements

Compound statements cannot be nested.

Unlike host variables, SQL variables are not preceded by colons when they are used in SQL statements.

The following rules apply to handlers:
- A handler declaration that contains SQLEXCEPTION, SQLWARNING, or NOT FOUND cannot contain additional SQLSTATE or condition names.
- Handler declarations within the same compound statement cannot contain duplicate conditions.
- A handler declaration cannot contain the same condition code or SQLSTATE value more than once, and cannot contain an SQLSTATE value and a condition name that represent the same SQLSTATE value.
- A handler is activated when it is the most appropriate handler for an exception or completion condition.
- If there is no handler for an SQL error, the error is passed to the caller in the SQLCA.
- A handler cannot be activated by an assignment statement that assigns a value to SQLSTATE.

The following rules and recommendations apply to the SQLCODE and SQLSTATE SQL variables:
- A null value cannot be assigned to SQLSTATE or SQLCODE.
- The SQLSTATE and SQLCODE variable values should be saved immediately to temporary variables if there is any intention to use the values. If a handler exists for SQLSTATE, this assignment must be done as the first statement to be processed in the handler to avoid having the value replaced by the next SQL procedure statement. If the condition raised by the SQL statement is handled, the value is changed by the first SQL statement contained in the handler.

*Considerations for the SQLSTATE and SQLCODE SQL variables:* The compound statement itself does not affect the SQLSTATE and SQLCODE SQL variables. However, SQL statements contained within the compound statement can affect the SQLSTATE and SQLCODE SQL variables. At the end of the compound statement, the SQLSTATE and SQLCODE SQL variables reflect the result of the last SQL statement executed within the compound statement that caused a change to the SQLSTATE and SQLCODE SQL variables. If the SQLSTATE and SQLCODE SQL variables were not changed within the compound statement, they contain the same values as when the compound statement was entered.

**Examples**

Create a procedure body with a compound statement that performs the following actions:
- Declares SQL variables, a condition for SQLSTATE '02000', a handler for the condition, and a cursor
- Opens the cursor, fetches a row, and closes the cursor

```sql
CREATE PROCEDURE PROC1(OUT NOROWS INT) LANGUAGE SQL
BEGIN
  DECLARE vFirstname VARCHAR(12);
  DECLARE vMidinit CHAR(1);
  DECLARE vLastname VARCHAR(15);
  DECLARE vEdlevel SMALLINT;
  DECLARE vSalary DECIMAL(9,2);
  DECLARE at_end INT DEFAULT 0;
  DECLARE not_found CONDITION FOR '02000';
  DECLARE c1 CURSOR FOR
    SELECT FIRSTNME, MIDINIT, LASTNAME,
    EDLEVEL, SALARY
    FROM EMP;
  DECLARE CONTINUE HANDLER FOR not_found SET NOROWS=1;
```
OPEN c1;
FETCH c1 INTO v_firstnme, v_midinit,
v_lastname, v_edlevel, v_salary;
END
GET DIAGNOSTICS statement

The GET DIAGNOSTICS statement obtains information about the previous SQL statement that was executed.

See “GET DIAGNOSTICS” on page 1553.

When you need to specify a variable in a GET DIAGNOSTICS statement that is used within an SQL procedure, you would use either SQL-variable-name or SQL-parameter-name. In an embedded GET DIAGNOSTICS statement, you would use a host-variable. You can replace the instances of host-variable in the description of “GET DIAGNOSTICS” on page 1553 with SQL-variable-name or SQL-parameter-name.
GOTO statement

The GOTO statement is used to branch to a user-defined label within an SQL procedure.

Syntax

```
GOTO label
```

Description

`label`

Specifies a labeled statement at which processing is to continue.

The labeled statement and the GOTO statement must be in the same scope.

The following rules apply to the scope:

- If the GOTO statement is defined in a compound statement, `label` must be defined inside the same compound statement.
- If the GOTO statement is defined in a handler, `label` must be defined in the same handler and follow the other scope rules.
- If the GOTO statement is defined outside of a handler, `label` must not be defined within a handler.

If `label` is not defined within a scope that the GOTO statement can reach, an error is returned.

A label name cannot be the same as the name of the SQL procedure in which the label is used.

Notes

Use the GOTO statement sparingly. Because the GOTO statement interferes with the normal sequence of processing, it makes an SQL procedure more difficult to read and maintain. Before using a GOTO statement, determine whether some other statement, such as an IF statement or LEAVE statement, can be used instead.

Examples

Use a GOTO statement to transfer control to the end of a compound statement if the value of an SQL variable is less than 600.

```
BEGIN
  DECLARE new_salary DECIMAL(9,2);
  DECLARE service DECIMAL(8,2);
  SELECT SALARY, CURRENT_DATE - HIREDATE
    INTO new_salary, service
  FROM EMP
  WHERE EMPNO = v_empno;
  IF service < 600
    THEN GOTO EXIT;
  END IF;
  IF rating = 1
    THEN SET new_salary =
      new_salary + (new_salary * .10);
  ELSEIF rating = 2
    THEN SET new_salary =
      new_salary + (new_salary * .05);
```
END IF;
UPDATE EMP
SET SALARY = new_salary
WHERE EMPNO = v_empno;
EXIT: SET return_parm = service;
END
**IF statement**

The IF statement selects an execution path based on the evaluation of a condition.

**Syntax**

```
IF search-condition THEN SQL-procedure-statement;
ELSEIF search-condition THEN SQL-procedure-statement;
ELSE SQL-procedure-statement;
END IF
```

**Description**

- **search-condition**
  Specifies the condition for which an SQL statement should be invoked. If the condition is unknown or false, processing continues to the next search condition until either a condition is true or processing reaches the ELSE clause.

- **SQL-procedure-statement**
  Specifies the statement to be invoked if the preceding search-condition is true. If no search-condition evaluates to true, then the SQL-procedure-statement following the ELSE keyword is invoked. The statement must be one of the statements listed under “SQL-procedure-statement” on page 1885.

**Notes**

- **Considerations for the SQLSTATE and SQLCODE SQL variables:** When the first SQL-procedure-statement in the IF statement is executed, the SQLSTATE and SQLCODE SQL variables reflect the result of evaluating the search conditions of that IF statement. If an IF statement does not include an ELSE clause and none of the search conditions evaluate to true, then when the statement that follows that IF statement is executed, the SQLSTATE and SQLCODE SQL variables reflect the result of evaluating the search conditions of that IF statement.

**Examples**

Assign a value to the SQL variable `new_salary` based on the value of SQL variable rating.

```
IF rating = 1
  THEN SET new_salary =
    new_salary + (new_salary * .10);
ELSEIF rating = 2
```
THEN SET new_salary =
    new_salary + (new_salary * .05);
ELSE SET new_salary =
    new_salary + (new_salary * .02);
END IF
ITERATE statement

The ITERATE statement causes the flow of control to return to the beginning of a labeled loop.

Syntax

```
 ITERATE label
```

Description

`label`

Specifies the label of the LOOP, REPEAT, or WHILE statement to which the flow of control is passed.

Examples

This example uses a cursor to return information for a new department. If the not_found condition handler is invoked, the flow of control passes out of the loop. If the value of `v_dept` is 'D11', an ITERATE statement causes the flow of control to be passed back to the top of the LOOP statement. Otherwise, a new row is inserted into the table.

```
CREATE PROCEDURE ITERATOR ()
  LANGUAGE SQL
  MODIFIES SQL DATA
  BEGIN
    DECLARE v_dept CHAR(3);
    DECLARE v_deptname VARCHAR(29);
    DECLARE v_admdept CHAR(3);
    DECLARE at_end INTEGER DEFAULT 0;
    DECLARE not_found CONDITION FOR SQLSTATE '02000';
    DECLARE c1 CURSOR FOR
      SELECT deptno,deptname,admrdept
      FROM department
      ORDER BY deptno;
    DECLARE CONTINUE HANDLER FOR not_found
      SET at_end = 1;
    OPEN c1;
    ins_loop:
    LOOP
      FETCH c1 INTO v_dept, v_deptname, v_admdept;
      IF at_end = 1 THEN
        LEAVE ins_loop;
      ELSEIF v_dept = 'D11' THEN
        ITERATE ins_loop;
      END IF;
      INSERT INTO department (deptno,deptname,admrdept)
        VALUES('NEW', v_deptname, v_admdept);
    END LOOP;
    CLOSE c1;
  END
```
**LEAVE statement**

The LEAVE statement transfers program control out of a loop or a compound statement.

**Syntax**

```
LEAVE label
```

**Description**

`label`

Specifies the label of the compound statement or loop to exit.

A label name cannot be the same as the name of the SQL procedure in which the label is used.

**Notes**

When a LEAVE statement transfers control out of a compound statement, all open cursors in the compound statement, except cursors that are used to return result sets, are closed.

**Examples**

Use a LEAVE statement to transfer control out of a LOOP statement when a negative SQLCODE occurs.

```
ftch_loop: LOOP
  FETCH c1 INTO
    v_firstname, v_midinitial,
    v_lastname, v_edlevel, v_salary;
  IF SQLCODE=100 THEN LEAVE ftch_loop;
  END IF;
END LOOP
```
LOOP statement

The LOOP statement executes a statement or group of statements multiple times.

Syntax

```
 label: LOOP SQL-procedure-statement ; END LOOP
```

Notes:
1. Only one label: can be specified for each SQL-procedure-statement.

Description

`label`

Specifies the label for the LOOP statement. If the ending label is specified, the beginning label must be specified, and the two must match.

A label name cannot be the same as the name of the SQL procedure in which the label is used.

`SQL-procedure-statement`

Specifies the statements to be executed in the loop. The statement must be one of the statements listed under "SQL-procedure-statement" on page 1885.

Examples

This procedure uses a LOOP statement to fetch values from the employee table. Each time the loop iterates, the OUT parameter counter is incremented and the value of `v_midinit` is checked to ensure that the value is not a single space (' '). If `v_midinit` is a single space, the LEAVE statement passes the flow of control outside of the loop.

```sql
CREATE PROCEDURE LOOP_UNTIL_SPACE(OUT counter INTEGER)
    LANGUAGE SQL
    BEGIN
        DECLARE v_counter INTEGER DEFAULT 0;
        DECLARE v_firstmme VARCHAR(12);
        DECLARE v_midinit CHAR(1);
        DECLARE v_lastname VARCHAR(15);
        DECLARE c1 CURSOR FOR
            SELECT firstmme, midinit, lastname
            FROM employee;
        DECLARE EXIT HANDLER FOR NOT FOUND
            SET counter = -1;
        OPEN c1;
        fetch_loop:
            LOOP
                FETCH c1 INTO v_firstmme, v_midinit, v_lastname;
                IF v_midinit = ' ' THEN
                    LEAVE fetch_loop;
                END IF;
                SET v_counter = v_counter + 1;
        END LOOP;
    END;
```
END LOOP fetch_loop;
SET counter = v_counter;
CLOSE c1;
END
**REPEAT statement**

The REPEAT statement executes a statement or group of statements until a search condition is true.

**Syntax**

```sql
label:
REPEAT
  SQL-procedure-statement
UNTIL search-condition
END REPEAT
```

**Notes:**
1. Only one `label` can be specified for each `SQL-procedure-statement`.

**Description**

- **label**
  
  Specifies the label for the REPEAT statement. If the ending label is specified, the beginning label must be specified, and the two must match.

  A label name cannot be the same as the name of the SQL procedure in which the label is used.

- **SQL-procedure-statement**
  
  Specifies the statements to be executed. The statement must be one of the statements listed under "SQL-procedure-statement" on page 1885.

- **search-condition**
  
  Specifies a condition that is evaluated after each execution of the REPEAT statement. If the condition is true, the REPEAT loop will exit. If the condition is unknown or false, the REPEAT loop continues.

**Examples**

Use a REPEAT statement to fetch rows from a table.

```sql
fetch_loop:
  REPEAT
    FETCH c1 INTO
      v_firstname, v_midinit, v_lastname;
  UNTIL SQLCODE <> 0
  END REPEAT fetch_loop
```
**RESIGNAL statement**

The RESIGNAL statement is used within a condition handler to re-raise the current condition, or to raise an alternate condition so that it can be processed at a higher level. It causes an exception, warning, or not found condition to be returned along with optional message text.

Issuing the RESIGNAL statement without an operand causes the current condition to be passed upwards.

**Syntax**

```plaintext
RESIGNAL

SQLSTATE VALUE

sqlstate-string-constant

SQL-variable-name signal-information

SQL-condition-name

SET MESSAGE_TEXT = diagnostic-string-expression
```

**Description**

**SQLSTATE VALUE**

Specifies the SQLSTATE that will be returned. Any valid SQLSTATE value can be used. It must be a character string constant with exactly five characters that follow the rules for SQLSTATE values:

- Each character must be from the set of digits ('0' through '9') or non-accented upper case letter ('A' through 'Z').
- The SQLSTATE class (the first two characters) cannot be '00' because it represents successful completion.

If the SQLSTATE does not conform to these rules, an error occurs.

**sqlstate-string-constant**

A character string constant with a length of five bytes that is a valid SQLSTATE value.

**SQL-variable-name** or **SQL-parameter-name**

Specifies an SQL variable or SQL parameter that is defined for the procedure.

**SQL-variable-name**

Specifies an SQL variable that is declared within the compound-statement that contains the RESIGNAL statement. **SQL-variable-name** must be defined as CHAR or VARCHAR data type with a length of five bytes, must not be null, and must contain a valid SQLSTATE value.

**SQL_parameter-name**

Specifies an SQL parameter that is defined for the procedure that contains the SQLSTATE value. The SQL parameter must be defined as
a CHAR or VARCHAR value and have a length of five bytes and must not be null. The SQL parameter must contain a valid SQLSTATE value.

**SQL-condition-name**

Specifies the name of the condition that will be returned. `condition-name` must be declared within the `compound-statement`.

**SET MESSAGE_TEXT**

Specifies a string that describes the error or warning. The string is returned in the SQLERRMC field of the SQLCA or with the GET DIAGNOSTICS statement.

**diagnostic-string-expression**

An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see "GET DIAGNOSTICS" on page 1553.

**Notes**

While any valid SQLSTATE value can be used in the RESIGNAL statement, programmers should define new SQLSTATE values based on ranges reserved for applications. This practice prevents the unintentional use of an SQLSTATE value that might be defined by the database manager in a future release.

If the RESIGNAL statement is issued without an SQLSTATE clause or a `condition-name`, the RESIGNAL statement must be in a handler and the identical condition that activated the handler is returned. The SQLSTATE, SQLCODE, and the SQLCA associated with the condition are unchanged.

If an SQLSTATE clause or a `condition-name` was specified, the SQLCODE returned is based on the SQLSTATE value as follows:

- If the specified SQLSTATE class is either '01' or '02', a warning or not-found message is returned, and the SQLCODE is set to +438.
- Otherwise, an exception is returned and the SQLCODE is set to -438.

The other fields of the SQLCA are set as follows:

- SQLERRDx fields are set to zero.
- SQLWARNx fields are set to blank.
- SQLERRMC is set to the first 70 bytes of MESSAGE_TEXT.
- SQLERRML is set to the length of SQLERRMC.
- SQLERRP is set to ROUTINE.

When the SQLSTATE or condition indicates that an exception is returned (an SQLSTATE class other than '01' or '02'), the exception is not handled, and control is immediately returned to the end of the compound statement.

When the SQLSTATE or condition indicates that a warning (SQLSTATE class '02') is returned, the warning is not handled, and processing continues with the next statement.

When the SQLSTATE or condition indicates that a not-found condition (SQLSTATE class '02') is returned, the not-found condition is not handled, and processing continues with the next statement.
**Examples**

The following example detects a division by zero error. The IF statement uses a SIGNAL statement to invoke the overflow condition handler. The condition handler uses a RESIGNAL statement to return a different SQLSTATE to the client application.

```sql
CREATE PROCEDURE divide ( IN numerator INTEGER,
                          IN denominator INTEGER,
                          OUT divide_result INTEGER)
  LANGUAGE SQL
  CONTAINS SQL
BEGIN
  DECLARE overflow CONDITION for SQLSTATE '22003';
  DECLARE CONTINUE HANDLER FOR overflow
    RESIGNAL SQLSTATE '22375';
  IF denominator = 0 THEN
    SIGNAL overflow;
  ELSE
    SET divide_result = numerator / denominator;
  END IF;
END
END
```
RETURN statement

The RETURN statement is used to return from the routine. For SQL functions, it returns the result of the function. For an SQL procedure, it optionally returns an integer status value.

Syntax

```sql
RETURN expression
NULL
```

Description

description

expression

Specifies a value that is returned from the routine.

- If the routine is a function, expression must be specified and the value of expression must conform to the SQL assignment rules as described in "Assignment and comparison" on page 114. If the value is being assigned to a string variable, storage assignment rules apply.
- If the routine is a procedure, the data type of expression must be INTEGER. If expression evaluates to the null value, a value of 0 is returned.

The expression cannot include a column name or a host variable. See "Expressions" on page 206 for information on expressions. The expression cannot contain a scalar fullselect.

NULL

The null value is returned from the SQL function. NULL is not allowed in SQL procedures.

Notes

When a RETURN statement is not used within an SQL procedure or when no value is specified: If a RETURN statement was not used to return from a procedure or if a value is not specified on the RETURN statement, one of the following values is set:

- If the procedure returns with an SQLCODE that is greater or equal to zero, the return status is set to a value of '0'.
- If the procedure returns with an SQLCODE that is less than zero, the return status is set to a value of '-1'.

When a RETURN statement is used within an SQL procedure: If a RETURN statement with a specified return value was used to return from a procedure, the SQLCODE, SQLSTATE, and message length in the SQLCA are initialized to zeros and the message text is set to blanks. An error is not returned to the caller.

When the value is returned: When a value is returned from a procedure, the caller may access the value using one of the following methods:

- The GET DIAGNOSTICS statement to retrieve the RETURN_STATUS when the SQL procedure was called from another SQL procedure.
- The parameter bound for the return value parameter marker in the escape clause CALL syntax (?=CALL...) in a CLI application.
Directly from the SQLCA returned from processing the CALL of an SQL procedure by retrieving the value of sqlerrd[0]. When the SQLCODE is less than zero, the sqlerrd[0] value is not set. The application should assume a return status value of '-1'.

Examples

Use a RETURN statement to return from an SQL procedure with a status value of zero if successful or '-200' if not successful.

```sql
BEGIN
  ....
  GOTO FAIL;
  ....
SUCCESS: RETURN 0;
  FAIL: RETURN -200;
END
```
**SIGNAL statement**

The SIGNAL statement is used to return an error or warning condition. It causes an error or warning to be returned with the specified SQLSTATE, along with optional message text.

**Syntax**

```
SIGNAL VALUE (1)
```

`sqlstate-string-constant`

`SQL-condition-name`

`SQL-parameter-name`

Notes:
1. The SQLSTATE variation must be used within a trigger body.
2. `SQL-condition-name` must not be specified within a trigger body.
3. `signal-information` must be specified within a trigger body

**signal-information:**

```
SET MESSAGE_TEXT = (1)
```

Notes:
1. `(diagnostic-string-expression)` must only be specified within a trigger body.

**Description**

**SQLSTATE VALUE**

Specifies the SQLSTATE that will be returned. Any valid SQLSTATE value can be used. It must be a character string constant with exactly five characters that follow the rules for SQLSTATEs:

- Each character must be from the set of digits (0 through 9) or non-accented upper case letter (A through Z).
- The SQLSTATE class (the first two characters) cannot be '00' because it represents successful completion.

If the SQLSTATE does not conform to these rules, an error occurs.

**sqlstate-string-constant**

A character string constant with a length of five bytes that is a valid SQLSTATE value.
**SQL-variable-name or SQL-parameter-name**

Specifies an SQL variable or SQL parameter that contains a valid SQLSTATE value.

**SQL-variable-name**

Specifies an SQL variable that is declared within the compound-statement. SQL-variable-name must be defined as a CHAR or VARCHAR data type, have a length of five bytes, must not be null, and must contain a valid SQLSTATE value.

**SQL-parameter-name**

Specifies an SQL parameter that is defined for the procedure and contains the SQLSTATE value. The SQL parameter must be defined as a CHAR or VARCHAR value, have a length of five bytes, must not be null, and must contain a valid SQLSTATE value.

**SQL-condition-name**

Specifies the name of the condition that will be returned. condition-name must be declared within the compound-statement.

**SET MESSAGE_TEXT**

Specifies a string that describes the error or warning. The string is returned in the SQLERRMC field of the SQLCA or with the GET DIAGNOSTICS statement.

**diagnostic-string-expression**

An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see "GET DIAGNOSTICS" on page 1553.

**diagnostic-string-expression**

An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see "GET DIAGNOSTICS" on page 1553.

This syntax variation is only provided within the scope of a CREATE TRIGGER statement for compatibility with previous versions of DB2. To conform with the ANS and ISO standards, this form should not be used.

**Notes**

While any valid SQLSTATE value can be used in the SIGNAL statement, programmers should define new SQLSTATEs based on ranges reserved for applications. This practice prevents the unintentional use of an SQLSTATE value that might be defined by the database manager in a future release.

If a SIGNAL statement is issued, the SQLCODE that is returned is based on the SQLSTATE as follows:

- If the specified SQLSTATE class is either '01' or '02', a warning or not-found message is returned, and the SQLCODE is set to +438.
- Otherwise, an exception is returned and the SQLCODE is set to -438.

The other fields of the SQLCA are set as follows:

- SQLERRDx fields are set to zero.
- SQLWARNx fields are set to blank.
- SQLERRMC is set to the first 70 bytes of MESSAGE_TEXT.
• SQLERRML is set to the length of SQLERRMC.
• SQLERRP is set to ROUTINE.

When the SQLSTATE or condition indicates that an exception (an SQLSTATE class other than '01' or '02') is returned, one of the following actions occurs:
• If a handler exists for the specified SQLSTATE, condition, or SQLEXCEPTION, the exception is handled, and control is transferred to that handler.
• Otherwise, the exception is not handled, and control is immediately returned to the end of the compound statement.

When the SQLSTATE or condition indicates that a warning (SQLSTATE class '01') is returned, one of the following actions occurs:
• If an active handler exists for the specified SQLSTATE, condition, or SQLWARNING, the warning is handled, and control is transferred to that handler.
• Otherwise, the warning is not handled, and processing continues with the next statement.

When the SQLSTATE or condition indicates that a not-found condition (SQLSTATE class '02') is returned, one of the following actions occurs:
• If an active handler exists for the specified SQLSTATE, condition, or not-found condition, the not-found condition is handled, and control is transferred to that handler.
• Otherwise, the not-found condition is not handled, and processing continues with the next statement.

When the SIGNAL statement is issued in a handler, no active handler exists.

Using a SIGNAL statement in the body of a trigger: Within the triggered action of a CREATE TRIGGER statement, the message text can be specified using only these variations:

```
SIGNAL SQLSTATE sqlstate-string-constant
  SET MESSAGE_TEXT = diagnostic-string-expression
SIGNAL SQLSTATE sqlstate-string-constant
  (diagnostic-string-expression)
```

Examples

Example 1: The following example shows an SQL procedure for an order system that signals an application error when a customer number is not known to the application. The ORDERS table includes a foreign key to the CUSTOMER table, requiring that the CUSTNO exist before an order can be inserted.

```
CREATE PROCEDURE SUBMIT_ORDER
  (IN ONUM INTEGER, IN CNUM INTEGER,
   IN PNUM INTEGER, IN QNUM INTEGER)
  LANGUAGE SQL
  SPECIFIC SUBMIT_ORDER
  MODIFIES SQL DATA
BEGIN
  DECLARE EXIT HANDLER FOR SQLSTATE VALUE '23503'
    SIGNAL SQLSTATE '75002'
      SET MESSAGE_TEXT = 'Customer number is not known';
  INSERT INTO ORDERS (ORDERNO, CUSTNO, PARTNO, QUANTITY)
    VALUES (ONUM, CNUM, PNUM, QNUM);
END
```
**Example 2:** The following example shows a trigger for an order system that allows orders to be recorded in an ORDERS table (ORDERNO, CUSTNO, PARTNO, QUANTITY) only if there is sufficient stock in the PARTS tables. When there is insufficient stock for an order, SQLSTATE '75001' is returned along with an appropriate error description.

```sql
CREATE TRIGGER CK_AVAIL
  NO CASCADE BEFORE INSERT ON ORDERS
  REFERENCING NEW AS NEW_ORDER
  FOR EACH ROW MODE DB2SQL
  WHEN (NEW_ORDER.QUANTITY > (SELECT ON_HAND FROM PARTS
                             WHERE NEW_ORDER.PARTNO = PARTS.PARTNO))
  BEGIN ATOMIC
    SIGNAL SQLSTATE '75001' ('Insufficient stock for order');
  END
```
**WHILE statement**

The **WHILE** statement repeats the execution of a statement or group of statements while a specified condition is true.

**Syntax**

```
(1)

label: WHILE search-condition DO SQL-procedure-statement; END WHILE
```

**Notes:**

1. Only one `label:` can be specified for each `SQL-procedure-statement`. If an ending label is specified for this beginning label, the labels must be the same.

**Description**

- **label**
  - Specifies the label for the **WHILE** statement. If the ending label is specified, it must be the same as the beginning label.
  - A label name cannot be the same as the name of the SQL procedure in which the label is used.

- **search-condition**
  - Specifies a condition that is evaluated before each execution of the loop. If the condition is true, the SQL procedure statement in the loop is executed.

- **SQL-procedure-statement**
  - Specifies the statements to be executed in the loop. The statement must be one of the statements listed under "SQL-procedure-statement" on page 1885.

**Examples**

Use a **WHILE** statement to fetch rows from a table while SQL variable `at_end`, which indicates whether the end of the table has been reached, is 0.

```sql
WHILE at_end = 0 DO
  FETCH c1 INTO
    v_firstname, v_midinit,
    v_lastname, v_edlevel, v_salary;
  IF SQLCODE=100 THEN SET at_end=1;
  END IF;
END WHILE
```
SQL communication area (SQLCA)

An SQLCA is a structure or collection of variables that is updated after each SQL statement executes. An application program that contains executable SQL statements must provide exactly one SQLCA, with a few exceptions.

The following exceptions exist:

- A program that is precompiled with the STDSQL(YES) option must not provide an SQLCA.
- In some cases a Fortran program must provide more than one SQLCA.

In all host languages except REXX, the SQL INCLUDE statement can be used to provide the declaration of the SQLCA.

**In COBOL and assembler:**

The name of the storage area must be SQLCA.

**In PL/I, and C:**

The name of the structure must be SQLCA. Every executable SQL statement must be within the scope of its declaration.

Unless noted otherwise, C is used to represent C/370™ and C/C++ programming languages.

**In Fortran:**

The name of the COMMON area for the INTEGER variables of the SQLCA must be SQLCA1; the name of the COMMON area for the CHARACTER variables must be SQLCA2. An SQLCA definition is required for every subprogram that contains SQL statements. One is also needed for the main program if it contains SQL statements.

**In Java:**

The DB2Sqlca class, which is an encapsulation of the SQLCA, should be used.

**In REXX:**

DB2 generates the SQLCA automatically. A REXX procedure cannot use the INCLUDE statement. The REXX SQLCA has a somewhat different format from SQLCAs for the other languages.

Description of SQLCA fields

For the most part, COBOL, C, PL/I, and assembler use the same names for the SQLCA fields, and Fortran uses different names. However, there is one instance where C, PL/I, and assembler names differ from COBOL.

The names in the following table are those provided by the SQL INCLUDE statement.

<table>
<thead>
<tr>
<th>assembler, COBOL, or PL/I Name</th>
<th>C Name</th>
<th>Fortran Name</th>
<th>Data Type</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQLCAID</td>
<td>sqlcaid</td>
<td>Not used.</td>
<td>CHAR(8)</td>
<td>An “eye catcher” for storage dumps, containing the text 'SQLCA'. The sixth byte is 'L' if line number information is returned from parsing a dynamic statement or a native SQL procedure. The sixth byte is not set when processing an external SQL procedure.</td>
</tr>
<tr>
<td>SQLCABC</td>
<td>sqlcabc</td>
<td>Not used.</td>
<td>INTEGER</td>
<td>Contains the length of the SQLCA: 136.</td>
</tr>
<tr>
<td>SQLCODE (See note 1)</td>
<td>SQLCODE</td>
<td>SQLCOD</td>
<td>INTEGER</td>
<td>Contains the SQL return code. (See note 2)</td>
</tr>
<tr>
<td>SQLERRML (See note 3)</td>
<td>SQLERRML</td>
<td>SQLTXL</td>
<td>SMALLINT</td>
<td>Length indicator for SQLERRMC, in the range 0 through 70. 0 means that the value of SQLERRMC is not pertinent.</td>
</tr>
<tr>
<td>SQLERRMC (See note 3)</td>
<td>SQLERRMC</td>
<td>SQLTXT</td>
<td>VARCHAR(70)</td>
<td>Contains one or more tokens, separated by X'FF', that are substituted for variables in the descriptions of error conditions. It may contain truncated tokens. A message length of 70 bytes indicates a possible truncation.</td>
</tr>
<tr>
<td>SQLERRP</td>
<td>SQLERRP</td>
<td>SQLERP</td>
<td>CHAR(8)</td>
<td>Provides a product signature and, in the case of an error, diagnostic information such as the name of the module that detected the error. In all cases, the first three characters are 'DSN' for DB2 for z/OS.</td>
</tr>
<tr>
<td>SQLERRD(1)</td>
<td>SQLERRD[0]</td>
<td>SQLERR(1)</td>
<td>INTEGER</td>
<td>For a sensitive static cursor, contains the number of rows in a result table when the cursor position is after the last row (that is, when SQLCODE is equal to +100). On successful return from an SQL procedure, contains the return status value from the SQL procedure. SQLERRD(1) can also contain an internal error code.</td>
</tr>
<tr>
<td>assembler, COBOL, or PL/I Name</td>
<td>C Name</td>
<td>Fortran Name</td>

<td>--------------</td>
<td>-----------</td>
<td>---------</td>
</tr>
<tr>
<td>SQLERRD(3)</td>
<td>sqlerrd[2]</td>
<td>SQLERR(3)</td>
<td>INTEGER</td>
<td>Contains the number of rows that qualified to be deleted, inserted, or updated after a DELETE, INSERT, UPDATE, or MERGE statement. The number excludes rows affected by triggers, referential integrity constraints, or inserted rows that are the result of processing a FOR PORTION OF clause for a BUSINESS_TIME period. For the OPEN of a cursor for a SELECT with a data change statement or for a SELECT INTO, SQLERRD(3) contains the number of rows affected by the embedded data change statement. The value is 0 if the SQL statement fails, indicating that all changes made in executing the statement canceled. For a DELETE statement the value will be -1 if the operation is a mass delete from a table in a segmented table space and the DELETE statement did not include selection criteria. If the delete was against a view, neither the DELETE statement nor the definition of the view included selection criteria. For a TRUNCATE statement, the value will be -1. For a PREPARE statement, contains the estimated number of rows selected. If the number of rows is greater than 2 147 483 647, a value of 2 147 483 647 is returned. For a REFRESH TABLE statement, SQLERRD(3) contains the number of rows inserted into the materialized query table. For a rowset-oriented FETCH, contains the number of rows fetched. For SQLCODES -911 and -913, SQLERRD(3) contains the reason code for the timeout or deadlock. When an error is encountered in parsing a dynamic statement, or when parsing, binding, or executing a native SQL procedure, SQLERRD(3) will contain the line number where the error was encountered. The sixth byte of SQLCAID must be ‘L’ for this to be a valid line number. This value will be meaningful only if the statement source contains new line control characters. This information is not returned for an external SQL procedure.</td>

</tr>
</tbody>
</table>

Notes:
1. With the precompiler option STDSQL(YES) in effect, SQLCODE is replaced by SQLCADE in SQLCA.
2. For the specific meanings of SQL return codes, see DB2 Codes.
3. In COBOL, SQLERRM includes SQLERRML and SQLERRMC. In PL/I and C, the varying-length string SQLERRM is equivalent to SQLERRML prefixed to SQLERRMC. In assembler, the storage area SQLERRM is equivalent to SQLERRML and SQLERRMC. See the examples for the various host languages in "The included SQLCA" on page 1925.
4. The use of timers may require special handling because they are floating-point values in an INTEGER array. In PL/I, for example, you could first copy the value into a BIN FIXED(31) based variable that coincides with a BIN FLOAT(24) variable.
5. For a description of SQLSTATE values, see DB2 Codes.
The included SQLCA

The description of the SQLCA that is given by INCLUDE SQLCA is shown for each of the host languages.

The REXX SQLCA

The REXX SQLCA consists of a set of variables, rather than a structure. DB2 makes the SQLCA available to your application automatically.

The following table lists the variables in a REXX SQLCA.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQLCODE</td>
<td>Contains the SQL return code.</td>
</tr>
<tr>
<td>SQLERRMC</td>
<td>Contains one or more tokens, separated by X'FF', that are substituted for variables in the descriptions of error conditions. It might contain truncated tokens. A message length of 70 bytes indicates a possible truncation.</td>
</tr>
<tr>
<td>SQLERRP</td>
<td>Provides a product signature and, in the case of an error, diagnostic information such as the name of the module that detected the error. For DB2 for z/OS, the product signature is 'DSN'.</td>
</tr>
<tr>
<td>SQLERRD.1</td>
<td>For a sensitive static cursor, contains the number of rows in a result table when the cursor position is after the last row (that is, when SQLCODE is equal to +100). SQLERRD(1) can also contain an internal error code.</td>
</tr>
<tr>
<td>SQLERRD.2</td>
<td>For a sensitive static cursor, contains the number of rows in a result table when the cursor position is after the last row (that is, when SQLCODE is equal to +100). SQLERRD(2) can also contain an internal error code.</td>
</tr>
<tr>
<td>SQLERRD.3</td>
<td>Contains the number of rows that qualified for the operation after an SQL data change statement (but not rows deleted as a result of CASCADE delete). For the OPEN of a cursor for a SELECT with an SQL data change statement or for a SELECT INTO, SQLERRD(3) contains the number of rows affected by the embedded data change statement. Set to 0 if the SQL statement fails, indicating that all changes made in executing the statement were canceled. Set to -1 for a mass delete from a table in a segmented table space, for a truncate operation, or a delete from a view when neither the DELETE statement nor the definition of the view included selection criteria. For rowset-oriented FETCH statements, contains the number of rows returned in the rowset. For SQLCODES -911 and -913, SQLERRD(3) contains the reason code for the timeout or deadlock. After successful execution of the REFRESH TABLE statement, SQLERRD(3) contains the number of rows inserted into the materialized query table. When an error is encountered in parsing a dynamic statement, or when parsing, binding, or executing a native SQL procedure, SQLERRD(3) will contain the line number where the error was encountered. The sixth byte of SQLCAID must be 'L' for this to be a valid line number. This value will be meaningful only if the statement source contains new line control characters. This information is not returned for an external SQL procedure.</td>
</tr>
<tr>
<td>SQLERRD.4</td>
<td>Generally, contains timerons, a short floating-point value that indicates a rough relative estimate of resources required. This value does not reflect an estimate of the time required to execute the SQL statement. After you prepare an SQL statement, you can use this field as an indicator of the relative cost of the prepared SQL statement. For a particular statement, this number can vary with changes to the statistics in the catalog. This value is subject to change between releases of DB2 for z/OS.</td>

SQL descriptor area (SQLDA)

An SQLDA is a collection of variables that is required for execution of the SQL DESCRIBE statement, and can be optionally used by the PREPARE, OPEN, FETCH, EXECUTE, and CALL statements. An SQLDA can be used in a DESCRIBE or PREPARE INTO statement, modified with the addresses of host variables, and then reused in a FETCH statement.

The meaning of the information in an SQLDA depends on the context in which it is used. For DESCRIBE and PREPARE INTO, DB2 sets the fields in the SQLDA to provide information to the application program. For OPEN, EXECUTE, FETCH, and CALL, the application program sets the fields in the SQLDA to provide DB2 with information:

DESCRIBE statement-name or PREPARE INTO
With the exception of SQLN, DB2 sets fields of the SQLDA to provide information to an application program about a prepared statement. Each SQLVAR occurrence describes a column of the result table.

DESCRIBE TABLE
With the exception of SQLN, DB2 sets fields of the SQLDA to provide information to an application program about the columns of a table or view. Each SQLVAR occurrence describes a column of the specified table or view.

DESCRIBE CURSOR
With the exception of SQLN, DB2 sets fields of the SQLDA to provide information to an application program about the result set that is associated with the specified cursor. Each SQLVAR occurrence describes a column of the result set.

DESCRIBE INPUT
With the exception of SQLN, DB2 sets fields of the SQLDA to provide information to an application program about the input parameter markers of a prepared statement. Each SQLVAR occurrence describes an input parameter marker.

DESCRIBE PROCEDURE
With the exception of SQLN, DB2 sets fields of the SQLDA to provide information to an application program about the result sets returned by the specified stored procedure. Each SQLVAR occurrence describes a returned result set.

OPEN, EXECUTE, FETCH, and CALL
The application program sets fields of the SQLDA to provide information about host variables or output buffers in the application program to DB2. Each SQLVAR occurrence describes a host variable or output buffer.

- For OPEN and EXECUTE, each SQLVAR occurrence describes an input value that is substituted for a parameter marker in the associated SQL statement that was previously prepared.
- For FETCH, each SQLVAR occurrence describes a host variable or buffer in the application program that is to be used to contain an output value from a row of the result.
- For CALL, each SQLVAR occurrence describes a host variable that corresponds to a parameter in the parameter list for the stored procedure.
For information on the way to use the SQLDA, see DB2 Application Programming and SQL Guide.
Description of SQLDA fields

An SQLDA consists of four variables, a header, and an arbitrary number of occurrences of a sequence of variables collectively named SQLVAR.

In DESCRIBE and PREPARE INTO, each occurrence of the SQLVAR describes the column of a table. In FETCH, OPEN, EXECUTE, and CALL, each occurrence describes a host variable.

The SQLDA Header

The fields in the SQLDA header have different usage depending on whether the SQLDA is being used in a DESCRIBE or PREPARE INTO statement or the SQLDA is being used in a FETCH, INSERT, OPEN, EXECUTE, or CALL statement.

The following table describes the fields in the SQLDA header.

<table>
<thead>
<tr>
<th>C name assembler, COBOL or PL/I name</th>
<th>Data type</th>
<th>Usage in DESCRIBE and PREPARE INTO</th>
<th>Usage in FETCH, INSERT, OPEN, EXECUTE, and CALL</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqldaid</td>
<td>CHAR(8)</td>
<td>An “eye catcher” for storage dumps, containing the text ‘SQLDA’. The 7th byte of the field is a flag that can be used to determine if more than one SQLVAR entry is needed for each column. For details, see “Determining how many SQLVAR occurrences are needed” on page 1934. For DESCRIBE CURSOR, the field is set to ‘SQLRS’. If the cursor is declared WITH HOLD in a stored procedure, the high-order bit of the 8th byte is set to 1. For DESCRIBE PROCEDURE, it is set to ‘SQLPR’.</td>
<td>A plus sign (+) in the 6th byte indicates that SQLNAME contains an overriding CCSID. A ‘2’ in the 7th byte indicates the two SQLVAR entries were allocated for each column or parameter. A ‘3’ in the 7th byte indicates that three SQLVAR entries were allocated for each column or parameter. Although three entries are never needed on input to DB2, an SQLDA with three entries might be used when the SQLDA was initialized by a DESCRIBE or PREPARE INTO with a USING BOTH clause. Otherwise, SQLDAID is not used.</td>
</tr>
<tr>
<td>sqldabc</td>
<td>INTEGER</td>
<td>Length of the SQLDA, equal to SQLN * 44+16.</td>
<td>Length of the SQLDA, greater than or equal to SQLN * 44+16.</td>
</tr>
</tbody>
</table>
Table 163. Fields of the SQLDA header (continued)

<table>
<thead>
<tr>
<th>C name</th>
<th>Data type</th>
<th>Usage in DESCRIBE and PREPARE INTO</th>
<th>Usage in FETCH, INSERT, OPEN, EXECUTE, and CALL</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqln</td>
<td>SMALLINT</td>
<td>Unchanged by DB2. The field must be set to a value greater than or equal to zero before the statement is executed. The field indicates the total number of occurrences of SQLVAR. At the very least, the number should be: • For DESCRIBE INPUT, the number of parameter markers to be described. • For other DESCRIBE or PREPARE INTO: the number of columns of the result, or a multiple of the columns of the result when there are multiple sets of SQLVAR entries because column labels are returned in addition to column names.</td>
<td>Total number of occurrences of SQLVAR provided in the SQLDA. SQLN must be set to a value greater than or equal to zero.</td>
</tr>
<tr>
<td>SQLN</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>sqld</td>
<td>SMALLINT</td>
<td>The number of columns described by occurrences of SQLVAR. Double that number if USING BOTH appears in the DESCRIBE or PREPARE INTO statement. Contains a 0 if the statement string is not a query. For DESCRIBE PROCEDURE, the number of result sets returned by the stored procedure. Contains a 0 if no result sets are returned.</td>
<td>The number of host variables described by occurrences of SQLVAR.</td>
</tr>
<tr>
<td>SQLD</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note:
1. The third column of this table represents several forms of the DESCRIBE statement:
   • For DESCRIBE output and PREPARE INTO, the column pertains to columns of the result table.
   • For DESCRIBE CURSOR, the column pertains to a result set associated with a cursor.
   • For DESCRIBE INPUT, the column pertains to parameter markers.
   • For DESCRIBE PROCEDURE, the column pertains to the result sets returned by the stored procedure.

SQLVAR entries
For each column or host variable described by the SQLDA, there are both base SQLVAR entries and extended SQLVAR entries.

Base SQLVAR entry
The base SQLVAR entry is always present. The fields of this entry contain the base information about the column or host variable such as data type code, length attribute (except for LOBs), column name (or label), host variable address, and indicator variable address.

Extended SQLVAR entry
The extended SQLVAR entry is needed (for each column) if the result
includes any LOB or distinct type 39 columns. For distinct types, the extended SQLVAR contains the distinct type name. For LOBs, the extended SQLVAR contains the length attribute of the host variable and a pointer to the buffer that contains the actual length. If locators are used to represent LOBs, an extended SQLVAR is not necessary.

The extended SQLVAR entry is also needed for each column when the USING BOTH clause was specified, which indicates that both columns names and labels are returned. (DESCRIBE output is the only statement with the USING BOTH clause).

The fields in the extended SQLVAR that return LOB and distinct type information do not overlap, and the fields that return LOB and label information do not overlap. Depending on the combination of labels, LOBs and distinct types, more than one extended SQLVAR entry per column may be required to return the information. See “Determining how many SQLVAR occurrences are needed” on page 1934.

The following table shows how to map the base and extended SQLVAR entries. For an SQLDA that contains both base and extended SQLVAR entries, the base SQLVAR entries are in the first block, followed by a block of extended SQLVAR entries, which if necessary, are followed by a second block of extended SQLVAR entries. In each block, the number of occurrences of the SQLVAR entry is equal to the value in SQLD40 even though many of the extended SQLVAR entries might be unused.

<table>
<thead>
<tr>
<th>LOBs</th>
<th>Distinct types</th>
<th>7th byte of SQLDAID</th>
<th>Minimum for SQLD</th>
<th>First set (Base)</th>
<th>Second set (Extended)</th>
<th>Third set (Extended)</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>

<td>Not Used</td>
<td>Not Used</td>
</tr>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>2</td>
<td>(n)</td>
<td>Column names, labels</td>
<td>LOBs, distinct types, or both</td>
<td>Not used</td>
</tr>
</tbody>
</table>

### Using BOTH clause was specified:

<table>
<thead>
<tr>
<th>LOBs</th>
<th>Distinct types</th>
<th>7th byte of SQLDAID</th>
<th>Minimum for SQLD</th>
<th>First set (Base)</th>
<th>Second set (Extended)</th>
<th>Third set (Extended)</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>Space</td>
<td>(2n)</td>
<td>Column names</td>
<td>Labels</td>
<td>Not used</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>2</td>
<td>(n)</td>

<td>Labels</td>
</tr>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>3</td>
<td>(n)</td>
<td>Column names</td>
<td>LOBs and distinct types</td>
<td>Labels</td>
</tr>
</tbody>
</table>

39. DESCRIBE INPUT does not return information about distinct types.
40. When an extended SQLVAR entry is present for each column for labels (and there are no LOB or distinct type columns in the result).
Table 164. Contents of SQLVAR arrays (continued)

<table>
<thead>
<tr>
<th>LOBs</th>
<th>Distinct types¹</th>
<th>7th byte of SQLDAID</th>
<th>SQLD</th>
<th>Minimum for SQLN²</th>
<th>First set (Base)</th>
<th>Second set (Extended)</th>
<th>Third set (Extended)</th>
</tr>
</thead>
</table>

Notes:

1. DESCRIBE INPUT does not return information about distinct types.
2. The number of columns or host variables that the SQLDA describes.
3. Either LOBs, distinct types, or both are present.
4. Here, the 7th byte is set to a space and SQLD is set to two times the number of columns in the result. For all other values of the 7th byte for USING BOTH, SQLD is set to the number of columns in the result, and the 7th byte can be used to determine how many SQLVAR entries are needed for each column of the result.

Determining how many SQLVAR occurrences are needed:

The number of SQLVAR occurrences needed depends on the statement that the SQLDA was provided for and the data types of the columns or parameters being described.

If the USING BOTH clause was not specified for the statement and neither LOBs nor distinct types are present in the result, only one SQLVAR entry (a base entry) is needed for each column. The 7th byte of SQLDAID is set to a space. The SQLD is set to the number of columns in the result and represents the number of SQLVAR occurrences needed. If an insufficient number of SQLVAR occurrences were provided, DB2 returns a +236 warning in SQLCODE if the standards option was set. Otherwise, SQLCODE is zero.

If USING BOTH is specified and neither LOBs nor distinct types are present in the result, an extended SQLVAR entry per column is needed for the labels in addition to the base SQLVAR entry. The 7th byte of the SQLDAID is set to space. SQLD is set to the twice the number of columns in the result and represents the combined number of base and extended SQLVAR occurrences needed.

If LOBs, distinct types, or both are present in the results, one extended SQLVAR entry is needed per column in addition to the base SQLVAR entry with one exception. The exception is that when the USING BOTH clause is specified and distinct types are present in the results, two extended SQLVAR entries per column are needed. When a sufficient number of SQLVAR entries are provided in the SQLDA for both the base and extended SQLVARs, information for the LOBs and distinct types is returned. The 7th byte of SQLDAID is set to the number of SQLVAR entries that were used for each column:

2 Two SQLVAR entries per column (a base and an extended)
3 Three SQLVAR entries per column (a base and two extended)

SQLD is set to the number of columns in the result. Therefore, the value of the 7th byte of SQLDAID multiplied by the value of SQLD is the total number SQLVAR entries that were provided.

Otherwise, when an insufficient number of SQLVAR entries have been provided when LOBs or distinct types are present, DB2 indicates that by returning one of the following warnings in SQLCODE. DB2 also sets the 7th byte of SQLDAID to indicate how many SQLVAR entries are needed for each column of the result.

+237 There are insufficient SQLVAR entries to describe the data, and the data
includes distinct types. In this case, there were enough base SQLVAR entries to describe the data, so the base SQLVAR entries are set. However, sufficient extended SQLVAR entries were not provided so the distinct type names are not returned.

+238 There are insufficient SQLVAR entries to describe the data, and the data includes LOBs. In this case no information is returned in the SQLVAR entries.

+239 There are insufficient SQLVAR entries to describe the data, and the data includes distinct types. There weren't even enough base SQLVAR entries. In this case no information is returned in the SQLVAR entries.

Field descriptions of an occurrence of a base SQLVAR:

The fields of a base SQLVAR have different uses depending on the SQL statement.

The following table describes the contents of the fields of a base SQLVAR.

Table 165. Fields in an occurrence of a base SQLVAR

<table>
<thead>
<tr>
<th>C name</th>
<th>assembler name</th>
<th>Data type</th>
<th>Usage in DESCRIBE and PREPARE INTO</th>
<th>Usage in FETCH, OPEN, EXECUTE, and CALL</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqltype</td>
<td>SMALLINT</td>
<td>Indicates the data type of the column or parameter and whether it can contain null values. For a description of the type codes, see Table 167 on page 1939. For a distinct type, the data type on which the distinct type was based is placed in this field. The base SQLVAR provides no indication that this is part of the description of a distinct type.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>sqllen</td>
<td>SMALLINT</td>
<td>The length attribute of the column or parameter. For datetime data, the length of the string representation of the value. See “SQLTYPE and SQLLEN” on page 1939 for a description of allowable values. For LOBs, the value is 0 regardless of the length attribute of the LOB. Field SQLLONGLEN in the extended SQLVAR contains the length attribute.</td>
<td>The length attribute of the host variable. See “SQLTYPE and SQLLEN” on page 1939 for a description of allowable values. For LOBs, the value is 0 regardless of the length attribute of the LOB. Field SQLLONGLEN in the extended SQLVAR contains the length attribute. For XML AS BLOB, CLOB, or DBCLOB, sqllen is 0 as for LOB types.</td>
<td></td>
</tr>
<tr>
<td>C name</td>
<td>assembler</td>
<td>Data type</td>
<td>Usage in DESCRIBE and PREPARE INTO</td>
<td>Usage in FETCH, OPEN, EXECUTE, and CALL</td>
</tr>
<tr>
<td>--------</td>
<td>-----------</td>
<td>-----------</td>
<td>-------------------------------------</td>
<td>----------------------------------------</td>
</tr>
<tr>
<td>sqldata</td>
<td>SQLDATA</td>
<td>pointer</td>
<td>For string columns or parameters, SQLDATA contains X'0000zzzz', where zzzz is the associated CCSID. For character strings, SQLDATA can alternatively contain X'FFFF', which indicates bit data. Not used for other types of data. For datetime columns, SQLDATA can contain the CCSID of the string representation of the datetime value. For DESCRIBE PROCEDURE, the result set locator value associated with the result set.</td>
<td>Contains the address of the host variable.</td>
</tr>
<tr>
<td>sqlind</td>
<td>SQLIND</td>
<td>pointer</td>
<td>Reserved</td>
<td>Contains the address of an associated indicator variable, if SQLTYPE is odd. Otherwise, the field is not used.</td>
</tr>
<tr>
<td>sqlname</td>
<td>SQLNAME</td>
<td>VARCHAR(30)</td>
<td>Contains the unqualified name or label of the column, or a string of length zero if the name or label does not exist. If the name is longer than 30 bytes, it is truncated at a byte boundary. For more information about column names, see Names of result columns. For DESCRIBE PROCEDURE, SQLNAME contains the cursor name used by the stored procedure to return the result set. The values for SQLNAME appear in the order the cursors were opened by the stored procedure.</td>
<td>Can contain CCSID and/or host-variable-array dimension information. DB2 interprets the third and fourth byte of the data portion of SQLNAME as the CCSID of the host variable if all of the following are true and the third and fourth byte are not X'0000': • The 6th byte of SQLDAID is '+' (x'4E') • SQLTYPE indicates the host variable is a string variable • The length of SQLNAME is 8 • The first two bytes of the data portion of SQLNAME are X'0000'. If the third and fourth byte of the data portion of SQLNAME are X'0000', DB2 uses the appropriate default CCSID. For FETCH, OPEN, INSERT, and EXECUTE, if the length of SQLNAME is 8, and the first two bytes of the data portion of SQLNAME are X'0000', DB2 interprets the fifth through eighth bytes of the data portion of the SQLNAME field as follows:</td>
</tr>
</tbody>
</table>
### Table 165. Fields in an occurrence of a base SQLVAR (continued)

<table>
<thead>
<tr>
<th>C name</th>
<th>assembler</th>
<th>Data type</th>
<th>Usage in DESCRIBE and PREPARE INTO</th>
<th>Usage in FETCH, OPEN, EXECUTE, and CALL</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlname</td>
<td>SQLNAME</td>
<td></td>
<td>(cont.)</td>
<td></td>
</tr>
</tbody>
</table>

- **fifth and sixth bytes**: a flag field that indicates the type of host variable that is being described by the current SQLDA entry. The values of this field are as follows:
  - X'0000' - host variable
  - X'0100' - XML host variable (XML AS BLOB, XML AS CLOB, XML AS DBCLOB)
  - X'0001' - host variable array
  - X'0101' - XML host variable array
  - X'0002' - special host variable that represents the value for 'n' in a multiple-row INSERT statement.

- **seventh and eighth bytes**: if the sixth byte is X'01', a binary small integer (halfword) that represents the dimension of the host-variable-array, and the corresponding indicator-array if one is specified.

#### Notes:

1. The third column of this table represents several forms of the DESCRIBE statement.
   - For DESCRIBE output and PREPARE INTO, the column pertains to columns of the result table.
   - For DESCRIBE CURSOR, the column pertains to a result set associated with a cursor.
   - For DESCRIBE INPUT, the column pertains to parameter markers.
   - For DESCRIBE PROCEDURE, the column pertains to the result sets returned by the stored procedure.

---

**Field descriptions of an occurrence of an extended SQLVAR:**

The fields of an extended SQLVAR have different uses depending on the SQL statement.

The following table describes the contents of the fields of an extended SQLVAR entry.
<table>
<thead>
<tr>
<th>C name</th>
<th>Data type</th>
<th>Usage in DESCRIBE(^1) and PREPARE INTO</th>
<th>Usage in FETCH, OPEN, EXECUTE, and CALL</th>
</tr>
</thead>
<tbody>
<tr>
<td>assembler, COBOL, or PL/I name</td>
<td>INTEGER</td>
<td>The length attribute of a LOB (BLOB, CLOB, or DBCLOB) column.</td>
<td>The length attribute of a LOB (BLOB, CLOB, or DBCLOB) host variable. DB2 ignores the SQLLEN field in the base SQLVAR for these data types. The length attribute indicates the number of bytes for a BLOB or CLOB, and the number of characters for a DBCLOB.</td>
</tr>
<tr>
<td>len.sqllonglen, SQLLONGL, SQLLONGLEN</td>
<td>SQLDATAL</td>
<td>Not used.</td>
<td>Used only for LOB (BLOB, CLOB, and DBCLOB) host variables. If the value of the field is null, the actual length of the LOB is stored in the 4 bytes immediately before the start of the data, and SQLDATA points to the first byte of the field length. The actual length indicates the number of bytes for a BLOB or CLOB, and the number of characters for a DBCLOB. If the value of the field is not null, the field contains a pointer to a 4-byte long buffer that contains the actual length in bytes (even for DBCLOBs) of the data in the buffer pointed to from the SQLDATA field in the matching base SQLVAR. Regardless of whether this field is used, field SQLLONGLEN must be set.</td>
</tr>
</tbody>
</table>

\(^1\) SQL Reference
Table 166. Fields in an occurrence of an extended SQLVAR (continued)

<table>
<thead>
<tr>
<th>C name assembler, COBOL, or PL/I name</th>
<th>Data type</th>
<th>Usage in DESCRIBE and PREPARE INTO</th>
<th>Usage in FETCH, OPEN, EXECUTE, and CALL</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqldatatype_name</td>
<td>VARCHAR(30)</td>
<td>A SQLTNAME field of the extended SQLVAR is set to one of the following:</td>
<td></td>
</tr>
<tr>
<td>SQLTNAME</td>
<td>SQLTNAME</td>
<td>• For a distinct type column, the database manager sets this field to the fully qualified distinct type name. If the qualified name is longer than 30 bytes, it is truncated.</td>
<td></td>
</tr>
<tr>
<td>SQLDATATYPE-NAME</td>
<td>SQLDATATYPE-NAME</td>
<td>• For a label, the database manager sets this field to label.</td>
<td></td>
</tr>
</tbody>
</table>

Note:
1. The third column of this table represents several forms of the DESCRIBE statement.
   • For DESCRIBE output and PREPARE INTO, the column pertains to columns of the result table.
   • For DESCRIBE CURSOR, the column pertains to a result set associated with a cursor.
   • For DESCRIBE INPUT, the column pertains to parameter markers.
   • For DESCRIBE PROCEDURE, the column pertains to the result sets returned by the stored procedure.

**SQLTYPE and SQLLEN:**

The contents of the SQLTYPE and SQLLEN fields of the SQLDA depends on the SQL statement that is returning the value.

The following table shows the values that can appear in the SQLTYPE and SQLLEN fields of the SQLDA. In DESCRIBE and PREPARE INTO, an even value of SQLTYPE means the column does not allow nulls, and an odd value means the column does allow nulls. In DESCRIBE INPUT statements, only odd values are returned for SQLTYPE. In FETCH, OPEN, EXECUTE, and CALL, an even value of SQLTYPE means no indicator variable is provided, and an odd value means that SQLIND contains the address of an indicator variable.

Table 167. SQLTYPE and SQLLEN values for DESCRIBE, PREPARE INTO, FETCH, OPEN, EXECUTE, and CALL

<table>
<thead>
<tr>

<td>Not used</td>
</tr>
</tbody>
</table>

**Note:**
1. SQLLEN might be different if a date installation exit is specified.
2. SQLLEN might be different if a time installation exit is specified.
3. Field SQLLONGLEN in the extended SQLVAR contains the length attribute of the column.
4. BIGINT is supported by other DB2 platforms.

**SQLDATA:**

Depending on the data type of the string column that the SQLVAR is describing, the SQLDATA field can contain different CCSID values.

The following table identifies the CCSID values that appear in the SQLDATA field when the SQLVAR element describes a string column.
Table 168. CCSID values for SQLDATA

<table>
<thead>
<tr>
<th>Data type</th>
<th>Subtype</th>
<th>Bytes 1 and 2</th>
<th>Bytes 3 and 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Character</td>
<td>SBCS data</td>

<td>N/A</td>
<td>X'0000'</td>
<td>CCSID</td>
</tr>
<tr>
<td>Any other data type</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
</tr>
</tbody>
</table>
Unrecognized and unsupported SQLTYPES

The values that appear in the SQLTYPE field of the SQLDA are dependent on the level of data type support available at the sender as well as at the receiver of the data. This support is particularly important as new data types are added to the product.

New data types might not be supported by the sender or receiver of the data and might not be recognized by the sender or receiver of the data. Depending on the situation, the new data type might be returned, a compatible data type that is agreed to by both the sender and the receiver of the data might be returned, or an error might occur.

When the sender and receiver agree to use a compatible data type, the following table indicates the mapping that takes place. This mapping takes place when at least one of the sender or receiver does not support the data type provided. The unsupported data type can be provided by either the application or the database manager.

Table 169. Compatible data types for unsupported data types

<table>
<thead>
<tr>
<th>Data type</th>
<th>Compatible data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROWID</td>
<td>VARCHAR(40) FOR BIT DATA</td>
</tr>
</tbody>
</table>

No indication is given in the SQLDA that the data type is substituted.
The included SQLDA

Only assembler, C, C++, COBOL, and PL/I C are supported for the SQLDA that is given by INCLUDE SQLDA.

**assembler:**

```c
SQLTRIPL EQU C'3'
SQLDOUBL EQU C'2'
SQLSINGL EQU C'1'

*     SQLSECT SAVE
*
SQLDA  DSECT
  SQLDAID DS CL8  ID
  SQLDABC DS F   BYTE COUNT
  SQLN  DS H COUNT SQLVAR/SQLVAR2 ENTRIES
  SQLD  DS H COUNT VARS (TWICE IF USING BOTH)
  *
  SQLVAR DS 0F BEGIN VARS
  SQLVARN DSECT *, NTH VARIABLE
  SQLTYPE DS H DATA TYPE CODE
  SQLLEN DS 0H LENGTH
  SQLPRCSN DS X DEC PRECISION
  SQLSCALE DS X DEC SCALE
  SQLDATA DS A ADDR OF VAR
  SQLIND DS A ADDR OF IND
  SQLNAME DS H,CL30 DESCRIBE NAME
  SQLSIZ2 EQU *-SQLDATA
  SQLSIZV EQU *-SQLVARN
  *
  SQLDA  DSECT
  SQLVAR2 DS 0F BEGIN EXTENDED FIELDS OF VARS
  SQLVARN2 DSECT *, EXTENDED FIELDS OF NTH VARIABLE
  SQLLONGL DS F LENGTH
  SQLRSVDL DS F RESERVED
  SQLDATAL DS A ADDR OF LENGTH IN BYTES
  SQLNAME DS H,CL30 DESCRIBE NAME
  *
  SQLSECT RESTORE
```

In the above declaration, SQLSECT SAVE is a macro invocation that remembers the current CSECT name. SQLSECT RESTORE is a macro invocation that continues that CSECT.

**C and C++:**

```c
#ifndef SQLDASIZE /* Permit duplicate Includes */
/**/

Identifying an SQLDA in C or C++

A descriptor-name can be specified in the CALL, DESCRIBE, EXECUTE, FETCH, and OPEN statements. When the host application is written in C or C++, descriptor-name can be a pointer variable with pointer notation.

For example, descriptor-name could be declared as

```c
sqlda *outsqlda;
```

Afterwords, it could be used in a statement like the following:

```sql
EXEC SQL DESCRIBE STMT1 INTO DESCRIPTOR :*outsqlda;
```
## The REXX SQLDA

A REXX SQLDA consists of a set of REXX variables with a common stem. The stem must be a REXX variable name that contains no periods and is the same as the value of `descriptor-name` that you specify when you use the SQLDA in an SQL statement. DB2 does not support the INCLUDE SQLDA statement in REXX.

The following table shows the variable names in a REXX SQLDA. The values in the second column of the table are values that DB2 inserts into the SQLDA when the statement executes. Except where noted otherwise, the values in the third column of the table are values that the application must put in the SQLDA before the statement executes.

### Table 170. Fields of a REXX SQLDA

<table>
<thead>
<tr>
<th>Variable name</th>
<th>Usage in DESCRIBE and PREPARE INTO</th>
<th>Usage in FETCH, OPEN, EXECUTE, and CALL</th>
</tr>
</thead>
<tbody>
<tr>
<td>stem.SQLD</td>
<td>The number of columns that are described in the SQLDA. Double that number if USING BOTH appears in the DESCRIBE or PREPARE INTO statement. Contains a 0 if the statement string is not a query. For DESCRIBE PROCEDURE, the number of result sets returned by the stored procedure. Contains a 0 if no result sets are returned.</td>
<td>The number of host variables that are used by the SQL statement.</td>
</tr>
<tr>
<td>stem.n.SQLTYPE</td>
<td>Indicates the data type of the column or parameter and whether it can contain null values. For a description of the type codes, see “SQLTYPE and SQLLEN” on page 1939. For a distinct type, the data type on which the distinct type was based is placed in this field. The base SQLVAR provides no indication that this is part of the description of a distinct type.</td>
<td>Indicates the data type of the host variable and whether an indicator variable is provided. Host variables for datetime values must be character string variables. For FETCH, a datetime type code means a fixed-length character string. For a description of the type codes, see “SQLTYPE and SQLLEN” on page 1939.</td>
</tr>
<tr>
<td>stem.n.SQLLEN</td>
<td>For a column other than a DECIMAL or NUMERIC column, the length attribute of the column or parameter. For datetime data, the length of the string representation of the value. See “SQLTYPE and SQLLEN” on page 1939 for a description of allowable values.</td>
<td>For a host variable that does not have a decimal data type, the length attribute of the host variable. See “SQLTYPE and SQLLEN” on page 1939 for a description of allowable values.</td>
</tr>
<tr>
<td>stem.n.SQLLEN.SQLPRECISION</td>
<td>For a DECIMAL or NUMERIC column, the precision of the column or parameter.</td>
<td>For a host variable with a decimal data type, the precision of the host variable.</td>
</tr>
<tr>
<td>stem.n.SQLLEN.SQLSCALE</td>
<td>For a DECIMAL or NUMERIC column, the scale of the column or parameter.</td>
<td>For a host variable with a decimal data type, the scale of the host variable.</td>
</tr>
</tbody>
</table>
Table 170. Fields of a REXX SQLDA (continued)

<table>
<thead>
<tr>
<th>Variable name</th>
<th>Usage in DESCRIBE and PREPARE INTO</th>
<th>Usage in FETCH, OPEN, EXECUTE, and CALL</th>
</tr>
</thead>
<tbody>
<tr>
<td>stem.n.SQLCCSID</td>
<td>For a string column or parameter, the CCSID of the column or parameter.</td>
<td>For a string host variable, the CCSID of the host variable.</td>
</tr>
<tr>
<td>stem.n.SQLUSECCSID</td>
<td>Not used.</td>
<td>Set to a new CCSID. If set, REXX will change the CCSID of the SQLDATA.</td>
</tr>
<tr>
<td>stem.n.SQLLOCATOR</td>
<td>For DESCRIBE PROCEDURE, the value of a result set locator.</td>
<td>Not used.</td>
</tr>
<tr>
<td>stem.n.SQLDATA</td>
<td>Not used.</td>
<td>Before EXECUTE or OPEN, contains the value of an input host variable. The application must supply this value. After FETCH, contains the values of an output host variable.</td>
</tr>
<tr>
<td>stem.n.SQLIND</td>
<td>Not used.</td>
<td>Before EXECUTE or OPEN, contains a negative number to indicate that the input host variable in stem.n.SQLDATA is null. The application must supply this value. After FETCH, contains a negative number if the value of the output host variable in stem.n.SQLDATA is null.</td>
</tr>
<tr>
<td>stem.n.SQLNAME</td>
<td>The name of the nth column in the result table. For DESCRIBE PROCEDURE, contains the cursor name that is used by the stored procedure to return the result set. The values for SQLNAME appear in the order that the cursors were opened by the stored procedure.</td>
<td>Not used.</td>
</tr>
</tbody>
</table>
DB2 catalog tables

DB2 for z/OS maintains a set of tables (in database DSNDB06) called the DB2 catalog.

About these topics

These topics describe that catalog by describing the columns of each catalog table.

The catalog tables describe such things as table spaces, tables, columns, indexes, privileges, application plans, and packages. Authorized users can query the catalog; however, it is primarily intended for use by DB2 and is therefore subject to change. All catalog tables are qualified by SYSIBM. Do not use this qualifier for user-defined tables.

The catalog tables are updated by DB2 during normal operations in response to certain SQL statements, commands, and utilities.

Additional information

Release dependency indicators: Some objects depend on functions in particular releases of DB2. If you are running on a release of DB2 and fall back to a previous release, an object that depends on the more recent release becomes frozen. The object is marked with a release dependency indicator and is unavailable until remigration. The release dependency indicator, which is listed in the IBMREQD column of the catalog tables, shows the release of DB2 upon which the objects depends. Release dependency indicators in IBMREQD are defined by the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>Version 1R3 dependency indicator, not from the machine-readable material (MRM) tape</td>
</tr>
<tr>
<td>C</td>
<td>Version 2R1 dependency indicator, not from MRM tape</td>
</tr>
<tr>
<td>D</td>
<td>Version 2R2 dependency indicator, not from MRM tape</td>
</tr>
<tr>
<td>E</td>
<td>Version 2R3 dependency indicator, not from MRM tape</td>
</tr>
<tr>
<td>F</td>
<td>Version 3R1 dependency indicator, not from MRM tape</td>
</tr>
<tr>
<td>G</td>
<td>Version 4 dependency indicator, not from MRM tape</td>
</tr>
<tr>
<td>H</td>
<td>Version 5 dependency indicator, not from MRM tape</td>
</tr>
<tr>
<td>I</td>
<td>Version 6 dependency indicator, not from MRM tape</td>
</tr>
<tr>
<td>J</td>
<td>Version 6 dependency indicator, not from MRM tape</td>
</tr>
<tr>
<td>K</td>
<td>Version 7 dependency indicator, not from MRM tape</td>
</tr>
<tr>
<td>L</td>
<td>Version 8 dependency indicator, not from MRM tape</td>
</tr>
<tr>
<td>M</td>
<td>Version 9 dependency indicator, not from MRM tape</td>
</tr>
<tr>
<td>O</td>
<td>Version 10 dependency indicator, not from MRM tape</td>
</tr>
<tr>
<td>N</td>
<td>Not from MRM tape, no dependency</td>
</tr>
</tbody>
</table>
Programming interface information

Not all catalog table columns are part of the general-use programming interface. Whether a column is part of this interface is indicated in a column labeled “Use” in the table that describes the column. The values that “Use” can assume are as follows:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>G</td>
<td>Column is part of the general-use programming interface</td>
</tr>
<tr>
<td>S</td>
<td>Column is part of the product-sensitive interface</td>
</tr>
<tr>
<td>I</td>
<td>Column is for internal use only</td>
</tr>
<tr>
<td>N</td>
<td>Column is not used</td>
</tr>
</tbody>
</table>

For columns for which “Use” is N or I, the name of the column and its description do not appear in the explanation of the column.
Table spaces and indexes

DB2 catalog tables are contained in certain table spaces and have indexes.

The following tables list the table space and indexes for each catalog table and lists the index fields for each index. The indexes are in ascending order, except where noted.

Table 171. Table spaces and indexes for the catalog tables

**SQL statements allowed on the catalog**

Certain SQL statements can be used to change the value of certain options for existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables.
Table 172. SQL statements that can be used to change existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables

<table>

<tr>
<td></td>
<td>MAXROWS</td>
<td></td>
</tr>
<tr>
<td></td>
<td>PCTFREE</td>
<td></td>
</tr>
<tr>
<td></td>
<td>TRACKMOD</td>
<td></td>
</tr>
</tbody>
</table>

You cannot alter the GBPCACHE or MAXROWS value of some catalog table spaces.
Do not specify GBPCACHE for the following table spaces:
- DSNDB06.SYSTSCOL
- DSNDB06.SYSTSDBA
- DSNDB06.SYSTSDBR
- DSNDB06.SYSTSDBU
- DSNDB06.SYSTSFAU
- DSNDB06.SYSTSFLD
- DSNDB06.SYSTSFOR
- DSNDB06.SYSTSIPT
- DSNDB06.SYSTSIXR
- DSNDB06.SYSTSIXS
- DSNDB06.SYSTSIXT
- DSNDB06.SYSTSKEY
- DSNDB06.SYSTSPKA
- DSNDB06.SYSTSPKD
- DSNDB06.SYSTSPKG
- DSNDB06.SYSTSPKL
- DSNDB06.SYSTSPKS
- DSNDB06.SYSTSPKX
- DSNDB06.SYSTSPKY
- DSNDB06.SYSTSPLA
- DSNDB06.SYSTSPLD
- DSNDB06.SYSTSPLN
- DSNDB06.SYSTSPLY
- DSNDB06.SYSTSPVR
- DSNDB06.SYSTSREL
- DSNDB06.SYSTSTM
- DSNDB06.SYSTSSYN
- DSNDB06.SYSTSTAB
- DSNDB06.SYSTSTAU
- DSNDB06.SYSTSTPT
- DSNDB06.SYSTSTSP

For DSNDB06.SYSEQ, MAXROW can be specified only with a value of 1.

You can specify the LOCKSIZE keyword on the ALTER TABLESPACE statement for any catalog table spaces that are not LOB table spaces.
Table 172. SQL statements that can be used to change existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables (continued)

<table>
<thead>
<tr>
<th>SQL statement</th>
<th>Index</th>
<th>Allowable clauses and usage notes</th>
</tr>
</thead>
</table>
| CREATE INDEX  | User-created | All clauses are allowed, except for:  
|               |       | CLOSE YES  
|               |       | CLUSTER  
|               |       | UNIQUE  
|               |       | DEFER YES (only on tables SYSINDEXES, SYSINDEXPART, and SYSKEYS)  
|               |       | COMPRESS YES  
|               |       | Any partitioning clause  
|               |       |  
|               |       | Indexes that are created with key-expressions are not allowed on the catalog.  
|               |       |  
|               |       | The only value allowed for BUFFERPOOL is BP0.  
|               |       |  
|               |       | You can create up to 500 indexes on the catalog.  
| DROP INDEX    | User-created | The statement has no clauses.  

Reorganizing the catalog

The REORG TABLESPACE utility can be run on all the table spaces in the catalog database (DSNDB06) to reclaim unused or wasted space, which can affect performance.

The utility observes the PCTFREE and FREEPAGE values specified in the ALTER INDEX statement for all the catalog indexes and the following table spaces:
- DSNDB06.SYSCOPY
- DSNDB06.SYSGPAUT
- DSNDB06.SYGRTNS
- DSNDB06.SYSHIST
- DSNDB06.SYSJAVA
- DSNDB06.SYSAUXA
- DSNDB06.SYSAUXB
- DSNDB06.SYSEQ
- DSNDB06.SYSEQ2
- DSNDB06.SYSTS
- DSNDB06.SYSTS
- DSNDB06.SYSTUSR
- DSNDB01.SCT02
- DSNDB01.SPT01

For details on running REORG TABLESPACE, see DB2 Utility Guide and Reference.
New and changed catalog tables

This release of DB2 for z/OS includes many new catalog tables as well as many catalog tables that have new or changed content.

Descriptions of the following catalog tables have been added:

- SYSIBM.SYSAUDITPOLICIES
- SYSIBM.SYSAUTOALERTS
- SYSIBM.SYSAUTOALERTS_OUT
- SYSIBM.SYSAUTORUNS_HIST
- SYSIBM.SYSAUTORUNS_HISTOU
- SYSIBM.SYSAUTOTIMEWINDOWS
- SYSIBM.SYSCONTROLS
- SYSIBM.SYSDUMMYA
- SYSIBM.SYSDUMMYE
- SYSIBM.SYSDUMMYU
- SYSIBM.SYINDEXES_RTSECT
- SYSIBM.SYINDEXES_TREE
- SYSIBM.SYSPACKCOPY
- SYSIBM.SYSPACKSTMT_STMT
- SYSIBM.SYSPACKSTMT_STMTB
- SYSIBM.SYSPENDINGDDL
- SYSIBM.SYSPENDINGOBJECTS
- SYSIBM.SYSQUERY
- SYSIBM.SYSQUERY_AUX
- SYSIBM.SYSQUERYOPTS
- SYSIBM.SYSQUERYPLAN
- SYSIBM.SYSROUTINES_TREE
- SYSIBM.SYSS_PROFILES
- SYSIBM.SYSS_PROFILE_TEXT
- SYSIBM.SYSTRIGGERS_STMT
- SYSIBM.SYSVIEWS_STMT
- SYSIBM.SYSVIEWS_TREE
- SYSIBM.SYSXMLTYPMOD
- SYSIBM.SYSXMLTYPMSHEMA

The catalog tables that are listed in the following table have new or revised columns, column values, or column descriptions to support the new function in this release of DB2 for z/OS.

<table>
<thead>
<tr>

SYSIBM.IPLIST table

The SYSIBM.IPLIST table allows multiple IP addresses to be specified for a given LOCATION.

Insert rows into this table when you want to define a remote DB2 data sharing group. The same value for the IPADDR column cannot appear in both the SYSIBM IPNAMES table and the SYSIBM.IPLIST table. Rows in this table can be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>LINKNAME</td>
<td>VARCHAR(24)</td>
<td>This column is associated with the value specified in the LINKNAME column in the SYSIBM.LOCATIONS table and the SYSIBM.IPNAMES table. The values of the other columns in the SYSIBM.IPNAMES table apply to the server identified by the LINKNAME column in this row.</td>
<td>G</td>
</tr>
</tbody>
</table>
| IPADDR      | VARCHAR(254)    | This column contains an IPv4 or IPv6 address, or domain name of a remote TCP/IP host of the server. If WLM Domain Name Server workload balancing is used, this column must contain the member specific domain name. If Dynamic VIPA workload balancing is used, this column must contain the member specific Dynamic VIPA address. The IPADDR column must be specified as follows:
• An IPv4 address must be left justified and is represented as a dotted decimal address. For example, ‘123.456.78.912’ would be interpreted as an IPv4 address.
• An IPv6 address must be left justified and is represented as a colon hexadecimal address. An example of an IPv6 address is ‘2001:DB8:0000:0000:0008:0800:200C:417A’, which can also be expressed in compressed form as ‘2001:DB8::8:0800:200C:417A’.
• A domain name is converted to an IP address by the domain name server where a resulting IPv4 or IPv6 address is determined. An example of a domain name is ‘stlmvs1.svl.ibm.com’. | G   |
| IBMREQD     | CHAR(1)         | A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators.                                                               | G   |
SYSIBM.IPNames table

The SYSIBM.IPNames table defines the remote DRDA servers DB2 can access using TCP/IP.

Rows in this table can be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>LINKNAME</td>
<td>VARCHAR(24)</td>
<td>The value specified in this column must match the value specified in the LINKNAME column of associated row.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>
<td>SECURITY_OUT</td>
<td>CHAR(1)</td>
<td>This column defines the DRDA security option that is used when local DB2 SQL applications connect to any remote server associated with this TCP/IP host.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>WITH DEFAULT</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>'A'</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

A The option is “already verified”. Outbound connection requests contain an authorization ID and no password. The authorization ID used for an outbound request is either the DB2 user’s authorization ID or a translated ID, depending upon the value of the USERNAMES column.

The authorization ID is not encrypted when it is sent to the partner. For encryption, refer to ‘D’.

D The option is “userid and security-sensitive data encryption”. Outbound connection requests contain an authorization ID and no password. The authorization ID used for an outbound request is either the DB2 user’s authorization ID or a translated ID, depending upon the value of the USERNAMES column.

This option indicates that the userid and security-sensitive data are to be encrypted. For non-encryption, refer to ‘A’.

E The option is “userid, password, and security-sensitive data encryption”. Outbound connection requests contain an authorization ID and a password. The password is obtained from the SYSIBM.USERNAMES table. The USERNAMES column must specify ‘O’.

This option indicates that the userid, password, and security-sensitive data are to be encrypted. For non-security-sensitive data encryption, refer to ‘P’.

If the applications connect to any remote server as trusted, the USERNAMES column must specify ‘O’ or ‘S’.
<table>

</tr>
</tbody>
</table>
| IPADDR     | VARCHAR(254)  | This column contains an IPv4 or IPv6 address, or domain name of a remote TCP/IP host. The IPADDR column must be specified as follows:  
  • An IPv4 address must be left justified and is represented as a dotted decimal address. For example, '123.456.78.91' would be interpreted as an IPv4 address.  
  • An IPv6 address must be left justified and is represented as a colon hexadecimal address. An example of an IPv6 address is '2001:0DB8:0000:0000:0008:0800:200C:417A', which can also be expressed in compressed form as '2001:DB8::8:800:200C:417A'.  
  • A domain name is converted to an IP address by the domain name server where a resulting IPv4 or IPv6 address is determined. An example of a domain name is 'stlmvs1.svl.ibm.com'. | G   |
SYSIBM.LOCATIONS table

The SYSIBM.LOCATIONS table contains a row for every accessible remote server. The row associates a LOCATION name with the TCP/IP or SNA network attributes for the remote server. Requesters are not defined in this table.

Rows in this table can be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCATION</td>
<td>VARCHAR(128)</td>
<td>A unique location name for the accessible server. This is the name by which the remote server is known to local DB2 SQL applications.</td>
<td>G</td>
</tr>
</tbody>
</table>
| LINKNAME    | VARCHAR(24) | Identifies the VTAM® or TCP/IP attributes associated with this location. For any LINKNAME specified, one or both of the following statements must be true:  
• A row exists in SYSIBM.LUNAMES whose LUNAME matches the value specified in the SYSIBM.LOCATIONS LINKNAME column. This row specifies the VTAM communication attributes for the remote location.  
• A row exists in SYSIBM.IPNAMES whose LINKNAME matches the value specified in the SYSIBM.LOCATIONS LINKNAME column. This row specifies the TCP/IP communication attributes for the remote location. | G   |
| IBMREQD     | CHAR(1)     | A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. | G   |
| PORT        | VARCHAR(96) | TCP/IP is used for outbound DRDA connections when the following statement is true:  
• A row exists in SYSIBM.IPNAMES, where the LINKNAME column matches the value specified in the SYSIBM.LOCATIONS LINKNAME column.  
If the above mentioned row is found, the value of the PORT column is interpreted as follows:  
• If PORT is blank, the default DRDA port (446) is used.  
• If PORT is nonblank, the value specified for PORT can take one of two forms:  
  – If the value in PORT is left justified with 1-5 numeric characters, the value is assumed to be the TCP/IP port number of the remote database server.  
  – Any other value is assumed to be a TCP/IP service name, which can be converted to a TCP/IP port number using the TCP/IP getservbyname socket call. TCP/IP service names are not case sensitive. | G   |

Appendix. Additional information for DB2 SQL
<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>TPN</td>
<td>VARCHAR(192) NOT NULL WITH DEFAULT</td>
<td>Used only when the local DB2 begins an SNA conversation with another server. When used, TPN indicates the SNA LU 6.2 transaction program name (TPN) that will allocate the conversation. A length of zero for the column indicates the default TPN. For DRDA conversations, this is the DRDA default, which is X'07F6C4C2'. For DB2 private protocol conversations, this column is not used. When the server is DB2 Server for VSE &amp; VM, TPN should contain the resource ID of that machine.</td>
<td>G</td>
</tr>
<tr>
<td>DBALIAS</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Database alias. The name associated with the server. This name is used to access a remote database server. If DBALIAS is blank, the location name is used to access the remote database server. This column does not change the name of any database objects sent to the remote site that contains the location qualifier. This column applies only to DRDA connections.</td>
<td>G</td>
</tr>
<tr>
<td>TRUSTED</td>
<td>CHAR(1) NOT NULL WITH DEFAULT 'N'</td>
<td>Indicates whether the connection to the remote server can be trusted. This is restricted to TCP/IP only. This column is ignored for connections using SNA.</td>

</tr>
</tbody>
</table>

Appendix. Additional information for DB2 SQL 1975
**SYSIBM.LUMODES table**

Each row of the SYSIBM.LUMODES table provides VTAM with conversation limits for a specific combination of LUNAME and MODENAME. The table is accessed only during the initial conversation limit negotiation between DB2 and a remote LU. This negotiation is called change-number-of-sessions (CNOS) processing.

Rows in this table can be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>LUNAME</td>
<td>VARCHAR(24)</td>
<td>LU name of the server involved in the CNOS processing.</td>

</tr>
<tr>
<td>MODENAME</td>
<td>VARCHAR(24)</td>
<td>Name of a logon mode description in the VTAM logon mode table.</td>
<td>G</td>
</tr>
<tr>
<td>CONVLIMIT</td>
<td>SMALLINT</td>
<td>Maximum number of active conversations between the local DB2 and the other system for this mode. Used to override the number in the DSESILM parameter of the VTAM APPL definition statement for this mode.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see <a href="#">Release dependency indicators</a>.</td>
<td>G</td>
</tr>
</tbody>
</table>
**SYSIBM.LUNAMES table**

The SYSIBM.LUNAMES table must contain a row for each remote SNA client or server that communicates with DB2.

Rows in this table can be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>LUNAME</td>
<td>VARCHAR(24)</td>
<td>Name of the LU for one or more accessible systems. A blank string indicates the row applies to clients whose LU name is not specifically defined in this table. All other column values for a given row in this table are for clients and servers associated with the row’s LU name.</td>
<td>G</td>
</tr>
<tr>
<td>SYSMODENAME</td>
<td>VARCHAR(24)</td>
<td>Mode used to establish inter-system conversations. A blank indicates the default mode IBMDB2LM (DB2 private protocol access and for collecting sysplex balancing information from remote data sharing groups). If private protocols are used to access a remote DB2 LU or if the remote LU is a member of a DB2 data sharing group, use a separate mode other than the default mode.</td>
<td>G</td>
</tr>
<tr>
<td>SECURITY_IN</td>
<td>CHAR(1)</td>
<td>This column defines the security options that are accepted by this DB2 when an SNA client connects to DB2: The option is “verify”. An incoming connection request must include one of the following: a userid and password, a userid and RACF PassTicket, or a Kerberos security ticket. The option is “already verified”. A request does not need a password, although a password is checked if it is sent. With this option, an incoming connection request is accepted if it includes any of the following: a userid, a userid and password, a userid and RACF PassTicket, or a Kerberos security ticket. If the USERNAMES column contains ‘T’ or ‘B’, RACF is not invoked to validate incoming connection requests that contain only a userid unless one of the following situations is true: • The RACF access control authorization exit (D5NX@XAC) is enabled • The IBM supplied RACF SECLABEL resource class is active.</td>
<td>G</td>
</tr>
</tbody>
</table>

SYSIBM.SYSAUTOALERTS.OUT table

The SYSIBM.SYSAUTOALERTS.OUT table is an auxiliary table for the OUTPUT column of the SYSIBM.SYSAUTOALERTS table.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>OUTPUT</td>
<td>CLOB(2M)</td>
<td>The output of the autonomic stored procedure.</td>
<td>G</td>
</tr>
</tbody>
</table>
The SYSIBM.SYSAUTORUNS_HIST table contains one row for each time an autonomic procedure has been run.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>HISTORY_ENTRY_ID</td>
<td>BIGINT</td>
<td>The ID of the entry in the history table.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>GENERATED ALWAYS</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>AS IDENTITY</td>
<td></td>
<td></td>
</tr>
<tr>
<td>PROC_NAME</td>
<td>VARCHAR(128)</td>
<td>The name of the autonomic stored procedure that produced this entry.</td>
<td>G</td>
</tr>
<tr>
<td>STARTTS</td>
<td>TIMESTAMP</td>
<td>The timestamp when the autonomic stored procedure started.</td>
<td>G</td>
</tr>
<tr>
<td>ENDTTS</td>
<td>TIMESTAMP</td>
<td>The timestamp when the autonomic stored procedure ended.</td>
<td>G</td>
</tr>
<tr>
<td>OUTPUT</td>
<td>CLOB(2M)</td>
<td>The output of the autonomic stored procedure.</td>
<td>G</td>
</tr>
<tr>
<td>ERROR_MESSAGE</td>
<td>VARCHAR(1331)</td>
<td>An error message that indicates why the autonomic stored procedure was not successful. No ERROR_MESSAGE text is expected in case of a successful execution.</td>
<td>G</td>
</tr>
<tr>
<td>RETURN_CODE</td>
<td>INTEGER</td>
<td>The return code written directly by the autonomic stored procedure. This column contains NULL if the autonomic stored procedure execution failed, or if the autonomic stored procedure does not write any return code. A RETURN_CODE of 0 is expected in case of a successful execution.</td>
<td>G</td>
</tr>
<tr>
<td>ROWID</td>
<td>ROWID</td>
<td>The ROWID value for the OUTPUT column of this table.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>GENERATED ALWAYS</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
SYSIBM.SYSAUTORUNS_HISTOU table

The SYSIBM.SYSAUTORUNS_HISTOU table is an auxiliary table for the OUTPUT column of the SYSIBM.SYSAUTORUNS_HIST table.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>OUTPUT</td>
<td>CLOB(2M)</td>
<td>The output of the autonomic stored procedure.</td>
<td>G</td>
</tr>
</tbody>
</table>
### SYSIBM.SYSAUTOTIMEWINDOWS table

TheSYSIBM.SYSAUTOTIMEWINDOWS table contains one row for each time period during which autonomic procedures can be run.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>WINDOW_ID</td>
<td>BIGINT</td>
<td>The ID of the time window described in this row.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>

<td>The comma-separated list of actions that are allowed during this time window.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If this column contains NULL, all actions are allowed.</td>
<td></td>
</tr>
<tr>
<td>MAX_TASKS</td>
<td>INTEGER</td>
<td>The number of concurrent actions that are allowed during this time window.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If this column contains NULL, any number of actions are allowed concurrently.</td>
<td></td>
</tr>
</tbody>
</table>
**SYSIBM.SYSAUXRELS table**

The SYSIBM.SYSAUXRELS table contains one row for each auxiliary table created for a LOB column. A base table space that is partitioned must have one auxiliary table for each partition of each LOB column.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>TBOWNER</td>
<td>VARCHAR(128)</td>
<td>The schema of the base table.</td>

</tbody>
</table>
### SYSIBM.SYSCHECKDEP table

The SYSIBM.SYSCHECKDEP table contains one row for each reference to a column in a check constraint.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>TBOWNER</td>
<td>VARCHAR(128)</td>
<td>The schema of the table on which the check constraint is defined.</td>
<td>G</td>
</tr>
<tr>
<td>TBNAME</td>
<td>VARCHAR(128)</td>
<td>Name of the table on which the check constraint is defined.</td>
<td>G</td>
</tr>
<tr>
<td>CHECKNAME</td>
<td>VARCHAR(128)</td>
<td>Name of the check constraint.</td>
<td>G</td>
</tr>
<tr>
<td>COLNAME</td>
<td>VARCHAR(128)</td>
<td>Name of the column that the check constraint refers to.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators.</td>
<td>G</td>
</tr>
</tbody>
</table>
**SYSIBM.SYSCHECKS table**

The SYSIBM.SYSCHECKS table contains one row for each check constraint.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>TBOWNER</td>

</tbody>
</table>
**SYSIBM.SYSCOLSTATS table**

The SYSIBM.SYSCOLSTATS table contains partition statistics for selected columns. For each column, a row exists for each partition in the table.

Rows are inserted when RUNSTATS collects either indexed column statistics or non-indexed column statistics for a partitioned table space. No row is inserted if the table space is nonpartitioned. Rows in this table can be inserted, updated, and deleted.

<table>

SYSIBM.SYSCOLUMNS_HIST table

The SYSIBM.SYSCOLUMNS_HIST table contains rows from SYSCOLUMNS.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

</tbody>
</table>
SYSIBM.SYSDUMMY1 table

The SYSIBM.SYSDUMMY1 table contains one row. The table is used for SQL statements in which a table reference is required, but the contents of the table are not important.

Unlike the other catalog tables, which reside in Unicode table spaces, SYSIBM.SYSDUMMY1 resides in table space SYSEBCDC, which is an EBCDIC table space.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**SYSIBM.SYSDUMMYA table**

The SYSIBM.SYSDUMMYA table contains one row. The table is used for SQL statements in which a table reference is required, but the contents of the table are not important.

SYSIBM.SYSDUMMYA resides in table space SYSTSASC, which is an ASCII table space.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see <a href="#">Release dependency indicators</a>.</td>
<td>G</td>
</tr>
</tbody>
</table>
The SYSIBM.SYSDUMMYE table contains one row. The table is used for SQL statements in which a table reference is required, but the contents of the table are not important.

SYSIBM.SYSDUMMYE resides in table space SYSEBCDC, which is an EBCDIC table space.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
<td></td>
</tr>
</tbody>
</table>
**SYSIBM.SYSDUMMYU table**

The SYSIBM.SYSDUMMYU table contains one row. The table is used for SQL statements in which a table reference is required, but the contents of the table are not important.

SYSIBM.SYSDUMMYU resides in table space SYSTSUNI, which is a UNICODE table space.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>

**SYSIBM.SYSINDEXES_HIST table**

The SYSIBM.SYSINDEXES_HIST table contains rows from SYSINDEXES.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

### SYSIBM.SYSINDEXSPACESTATS table

The SYSIBM.SYSINDEXSPACESTATS table contains real time statistics for index spaces.

Rows in this table can be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>UPDATESTATETIME</td>
<td>TIMESTAMP</td>
<td>The timestamp that the row in the SYSINDEXSPACESTATS table is inserted or last updated.</td>
<td>G</td>
</tr>
<tr>
<td>NLEVELS</td>
<td>SMALLINT</td>
<td>The number of levels in the index tree.</td>
<td>G</td>
</tr>
<tr>
<td>NPAGES</td>
<td>INTEGER</td>
<td>The number of pages in the index tree that contain only pseudo-deleted index entries. This is an updatable column.</td>
<td>G</td>
</tr>
<tr>
<td>NLEAF</td>
<td>INTEGER</td>
<td>The number of leaf pages in the index.</td>
<td>G</td>
</tr>
<tr>
<td>NACTIVE</td>
<td>INTEGER</td>
<td>The number of active pages in the index space or partition. This value is equivalent to the number of pre-formatted pages.</td>
<td>G</td>
</tr>
<tr>
<td>SPACE</td>
<td>INTEGER</td>
<td>The amount of space, in KB, that is allocated to the index space or partition. For multi-piece, linear page sets, this value is the amount of space in all data sets. A null value indicates the amount of space is unknown.</td>
<td>G</td>
</tr>
<tr>
<td>EXTENTS</td>
<td>SMALLINT</td>
<td>The number of extents in the index space or partition. For multi-piece index spaces, this value is the number of extents for the last data sets. For a data set that is stripped across multiple volumes, the value is the number of logical extents. A null value indicates the number of extents is unknown.</td>
<td>G</td>
</tr>
<tr>
<td>LOADRLASTTIME</td>
<td>TIMESTAMP</td>
<td>The timestamp that the LOAD REPLACE utility was last run on the index space or partition. A null value indicates that the LOAD REPLACE utility has never been run on the index space or partition or that the timestamp is unknown.</td>

<td>BLOB(100M)</td>
<td>The contents of the JAR file.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**SYSIBM.SYSJAROBJECTS table**

The SYSIBM.SYSJAROBJECTS table contains binary large object representing the installed JAR file.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>JARSHEMA</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The schema of the JAR file.</td>
<td>G</td>
</tr>
<tr>
<td>JAR_ID</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the JAR file.</td>
<td>G</td>
</tr>
<tr>
<td>OWNER</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Authorization ID of the owner of the JAR object.</td>
<td>G</td>
</tr>
<tr>
<td>JAR_DATA_ROWID</td>
<td>ROWID NOT NULL GENERATED ALWAYS</td>
<td>ID used to support BLOB data type.</td>
<td>G</td>
</tr>
<tr>
<td>JAR_DATA</td>
<td>BLOB(100M) NOT NULL</td>
<td>The contents of the JAR file. This is an updatable column.</td>
<td>G</td>
</tr>
<tr>
<td>PATH</td>
<td>VARCHAR(2048) NOT NULL</td>
<td>The class resolution path of the JAR file.</td>
<td>G</td>
</tr>
<tr>
<td>CREATEDTS</td>
<td>TIMESTAMP NOT NULL</td>
<td>Time when the JAR object was created.</td>
<td>G</td>
</tr>
<tr>
<td>ALTEREDTS</td>
<td>TIMESTAMP NOT NULL</td>
<td>Time when the JAR object was altered.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1) NOT NULL WITH DEFAULT 'N'</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see <a href="#">Release dependency indicators</a>.</td>
<td>G</td>
</tr>
<tr>
<td>OWNERTYPE</td>
<td>CHAR(1) NOT NULL WITH DEFAULT</td>
<td>Indicates the type of owner: blank = Authorization ID L = Role</td>
<td>G</td>
</tr>
</tbody>
</table>
**SYSIBM.SYSJAVAOPTS table**

The SYSIBM.SYSJAVAOPTS table contains build options used during INSTALL_JAR.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>JARSCHEMA</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The schema of the JAR file.</td>
<td>G</td>
</tr>
<tr>
<td>JAR_ID</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the JAR file.</td>
<td>G</td>
</tr>
<tr>
<td>BUILDSCHEMA</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Schema name for BUILDNAME.</td>
<td>G</td>
</tr>
<tr>
<td>BUILDNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Procedure used to create the routine.</td>
<td>G</td>
</tr>
<tr>
<td>BUILDOWNER</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Authorization ID used to create the routine.</td>
<td>G</td>
</tr>
<tr>
<td>DBRMLIB</td>
<td>VARCHAR(256) NOT NULL</td>
<td>PDS name where DBRM is located.</td>
<td>G</td>
</tr>
<tr>
<td>HPJCOMPILE_OPTS</td>
<td>VARCHAR(512) NOT NULL</td>
<td>HPJ compile options used to install the routine.</td>
<td>G</td>
</tr>
<tr>
<td>BIND_OPTS</td>
<td>VARCHAR(2048) NOT NULL</td>
<td>Bind options used to install the routine.</td>
<td>G</td>
</tr>
<tr>
<td>POBJECT_LIB</td>
<td>VARCHAR(256) NOT NULL</td>
<td>PDSE name where program object is located.</td>
<td>G</td>
</tr>
<tr>

<td>CHAR(1) NOT NULL WITH DEFAULT 'N'</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators.</td>
<td>G</td>
</tr>
</tbody>
</table>
SYSIBM.SYSJAVAPATHS table

The SYSIBM.SYSJAVAPATHS table contains the complete class resolution path of a JAR file, and records the dependencies that one JAR file has on the JAR files in its Java path.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>JARSHEMA</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The schema of the JAR file.</td>
<td>G</td>
</tr>
<tr>
<td>JAR_ID</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the JAR file.</td>
<td>G</td>
</tr>
<tr>
<td>OWNER</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Authorization ID of the owner of the JAR object.</td>
<td>G</td>
</tr>
<tr>
<td>ORDINAL</td>
<td>SMALLINT NOT NULL</td>
<td>The ordinal number of the path element within the JAR file's Java path.</td>
<td>G</td>
</tr>
<tr>
<td>PE_CLASS_PATTERN</td>
<td>VARCHAR(2048) NOT NULL</td>
<td>The pattern for the names of the classes that are to be searched for in this path element's JAR file.</td>
<td>G</td>
</tr>
<tr>
<td>PE_JARSHEMA</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The schema of this path element's JAR file.</td>
<td>G</td>
</tr>
<tr>
<td>PE_JAR_ID</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of this path element's JAR file.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1) NOT NULL WITH DEFAULT 'N'</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators.</td>
<td>G</td>
</tr>
</tbody>
</table>
### SYSIBM.SYSKEYCOLUSE table

The SYSIBM.SYSKEYCOLUSE table contains a row for every column in a unique constraint (primary key or unique key) from the SYSIBM.SYSTABCONST table.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONSTNAME</td>
<td>VARCHAR(128)</td>
<td>Name of the constraint.</td>
<td>G</td>
</tr>
<tr>
<td></td>

<td>VARCHAR(128)</td>
<td>Name of the column</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>
<td>COLSEQ</td>
<td>SMALLINT</td>
<td>Numeric position of the column in the key (the first position in the key is 1).</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>
<td>COLNO</td>
<td>SMALLINT</td>
<td>Numeric position of the column in the table on which the constraint is defined.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see <a href="#">Release dependency indicators</a>.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL WITH DEFAULT 'N'</td>
<td></td>
<td></td>
</tr>
<tr>
<td>PERIOD</td>
<td>CHAR(1)</td>
<td>Indicates whether the column is the start or end column for the BUSINESS_TIME period:</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL WITH DEFAULT</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>B</td>
<td>The column is the start of the period BUSINESS_TIME.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>C</td>
<td>The column is the end of the period BUSINESS_TIME.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>blank</td>
<td>Column is not used as either the start or the end of a BUSINESS_TIME period.</td>
<td></td>
</tr>
</tbody>
</table>
### SYSIBM.SYSKEYS table

The SYSIBM.SYSKEYS table contains one row for each column of an index key.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>IXNAME</td>
<td>VARCHAR(128)</td>

SYSIBM.SYSKEYTARGETSTATS table

The SYSIBM.SYSKEYTARGETSTATS table contains partition statistics for selected key-targets. For each key-target, a row exists for each partition in the table.

Rows are inserted when RUNSTATS collects indexed key statistics or non-indexed key statistics for a partitioned table space. No row is inserted if the table space is nonpartitioned. Rows in this table can be inserted, updated, and deleted.

### SYSIBM.SYSKEYTGTDISTSTATS table

The SYSIBM.SYSKEYTGTDISTSTATS table contains zero or more rows per partition for the first key-target of a data-partitioned secondary index.

Rows are inserted when RUNSTATS scans a data-partitioned secondary index. No row is inserted if the index is a secondary index. Rows in this table can be inserted, updated, and deleted.

### SYSIBM.SYSLOBSTATS table

The SYSIBM.SYSLOBSTATS table contains one row for each LOB table space.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATSTIME</td>
<td>TIMESTAMP</td>
<td>Timestamp of RUNSTATS statistics update.</td>
<td>G</td>
</tr>
<tr>
<td>AVGSIZE</td>
<td>INTEGER</td>
<td>Average size of a LOB, measured in bytes, in the LOB table space.</td>
<td>S</td>
</tr>
<tr>
<td>FREESPACE</td>
<td>INTEGER</td>
<td>Number of kilobytes of available space in the LOB table space.</td>
<td>S</td>
</tr>
<tr>
<td>ORGRATIO</td>
<td>DECIMAL(5,2)</td>
<td>The percentage of organization in the LOB table space.</td>
<td>S</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td>A value of '100' indicates perfect organization of the LOB table space.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>A value of '1' indicates that the LOB table space is disorganized.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>A value of '0' indicates that the LOB table space is totally disorganized.</td>
<td></td>
</tr>
<tr>
<td>DBNAME</td>
<td>VARCHAR(24)</td>
<td>Name of the database that contains the LOB table space named in NAME.</td>
<td>G</td>
</tr>
<tr>
<td>NAME</td>
<td>VARCHAR(24)</td>
<td>Name of the LOB table space.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see <a href="#">Release dependency indicators</a>.</td>
<td>G</td>
</tr>
</tbody>
</table>
**SYSIBM.SYSLOBSTATS_HIST table**

The SYSIBM.SYSLOBSTATS_HIST table contains rows from SYSIBM.SYSLOBSTATS.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATTIME</td>
<td>TIMESTAMP</td>

</tbody>
</table>
### SYSIBM.SYSPACKAGE table

The SYSIBM.SYSPACKAGE table contains a row for every package.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCATION</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Always contains blanks</td>
<td>S</td>
</tr>
<tr>
<td>COLLID</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Name of the package collection. For a trigger package, it is the schema name of the trigger.</td>
<td>G</td>
</tr>
<tr>
<td>NAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Name of the package.</td>
<td>G</td>
</tr>
<tr>
<td>CONTOKEN</td>
<td>CHAR(8) NOT NULL FOR BIT DATA</td>
<td>Consistency token for the package. For a package derived from a DB2 DBRM, this is either: • the “level” as specified by the LEVEL option when the package’s program was precompiled • the timestamp indicating when the package’s program was precompiled, in an internal format.</td>
<td>S</td>
</tr>
<tr>
<td>OWNER</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Authorization ID of the package owner. For a trigger package, the value is the authorization ID of the owner of the trigger, which is set to the current authorization ID (the plan or package owner for static CREATE TRIGGER statement; the CURRENT SQLID for a dynamic CREATE TRIGGER statement).</td>
<td>G</td>
</tr>
<tr>
<td>CREATOR</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Authorization ID of the owner of the creator of the package version. For a trigger package, the value is determined differently. For dynamic SQL, it is the primary authorization ID of the user who issued the CREATE TRIGGER statement. For static SQL, it is the authorization ID of the plan or package owner.</td>
<td>G</td>
</tr>
<tr>
<td>TIMESTAMP</td>
<td>TIMESTAMP NOT NULL</td>
<td>Timestamp indicating when the package was created.</td>
<td>G</td>
</tr>
<tr>
<td>BINDTIME</td>
<td>TIMESTAMP NOT NULL</td>
<td>Timestamp indicating when the package was last bound.</td>
<td>G</td>
</tr>
<tr>
<td>QUALIFIER</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Implicit qualifier for the unqualified table, view, index, and alias names in the static SQL statements of the package.</td>
<td>G</td>
</tr>
<tr>
<td>PKSIZE</td>
<td>INTEGER NOT NULL</td>
<td>Size of the base section(^{41}) of the package, in bytes.</td>
<td>G</td>
</tr>
<tr>
<td>AVGSIZE</td>
<td>INTEGER NOT NULL</td>
<td>Average size, in bytes, of those sections(^{41}) of the plan that contain SQL statements processed at bind time.</td>
<td>G</td>
</tr>
<tr>
<td>SYSENTRIES</td>
<td>SMALLINT NOT NULL</td>
<td>Number of enabled or disabled entries for this package in SYSIBM.SYSPKSYSTEM. A value of 0 if all types of connections are enabled.</td>
<td>G</td>
</tr>
</tbody>
</table>

---

\(^{41}\) Packages are divided into sections. The base section of the package must be in the EDM pool during the entire time the package is executing. Other sections of the package, corresponding roughly to sets of related SQL statements, are brought into the pool as needed.
<table>
<thead>
<tr>
<th>Column name</th>

44. Rows in which the value of SEQNO, STMTNO, and SECTNO are zero are for internal use.

45. To convert a negative STMTNO to a meaningful statement number that corresponds to your precompile output, add 65536 to it. For example, -26472 is equivalent to +39064 (-26472 + 65536).

</table>
### SYSIBM.SYSPLAN table

The SYSIBM.SYSPLAN table contains one row for each application plan.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>Name of the application plan.</td>
<td>G</td>
</tr>
<tr>
<td>CREATOR</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Authorization ID of the owner of the application plan.</td>
<td>G</td>
</tr>
<tr>
<td>VALIDATE</td>
<td>CHAR(6) NOT NULL</td>
<td>Not used</td>
<td>N</td>
</tr>
<tr>
<td>ISOLATION</td>
<td>CHAR(1) NOT NULL</td>
<td>Isolation level for the plan:</td>
<td>G</td>
</tr>
<tr>
<td>VALID</td>
<td>CHAR(1) NOT NULL</td>
<td>Whether the application plan is valid:</td>
<td>G</td>
</tr>
<tr>
<td>OPERATIVE</td>
<td>CHAR(1) NOT NULL</td>
<td>Whether the application plan can be allocated:</td>
<td>G</td>
</tr>
<tr>
<td>PLSIZE</td>
<td>INTEGER NOT NULL</td>
<td>Size of the base section (^{46}) of the plan, in bytes.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1) NOT NULL</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see <a href="#">Release dependency indicators</a></td>
<td>G</td>
</tr>
<tr>
<td>AVGSIZE</td>
<td>INTEGER NOT NULL</td>
<td>Average size, in bytes, of those sections (^{46}) of the plan that contain SQL statements processed at bind time.</td>
<td>G</td>
</tr>
</tbody>
</table>

---

46. Plans are divided into sections. The base section of the plan must be in the EDM pool during the entire time the application program is executing. Other sections of the plan, corresponding roughly to sets of related SQL statements, are brought into the pool as needed.

</tbody>
</table>
## SYSIBM.SYSPLANDEP table

The SYSIBM.SYSPLANDEP table records the dependencies of plans on tables, views, aliases, synonyms, table spaces, indexes, functions, and stored procedures.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>BNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of an object the plan depends on.</td>
<td>G</td>
</tr>
<tr>
<td>BCREATOR</td>
<td>VARCHAR(128) NOT NULL</td>
<td>If BNAME is a table space, its database. Otherwise, the schema of BNAME. If BNAME is a role, the value is blank.</td>
<td>G</td>
</tr>
<tr>
<td>BTYPE</td>
<td>CHAR(1) NOT NULL</td>
<td>Type of object identified by BNAME:</td>
<td>G</td>
</tr>
<tr>
<td>DNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>Name of the plan.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1) NOT NULL</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see <a href="#">Release dependency indicators</a></td>
<td>G</td>
</tr>
</tbody>
</table>
## SYSIBM.SYSPLSYSTEM table

The SYSIBM.SYSPLSYSTEM table contains zero or more rows for every plan. Each row for a given plan represents one or more connections to an environment in which the plan could be used.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME</td>
<td>VARCHAR(24)</td>
<td>Name of the plan.</td>
<td>G</td>
</tr>
<tr>
<td>SYSTEM</td>
<td>VARCHAR(24)</td>
<td>Environment. Values can be:</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td>• BATCH</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• TSO batch</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• DB2CALL</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• DB2 call attachment facility</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• CICS</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Customer Information Control System</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• DLIBATCH</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• DLI batch support facility</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• IMSBMP</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• IMS BMP region</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• IMSMPP</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• IMS MPP or IFP region</td>
<td></td>
</tr>
<tr>
<td>ENABLE</td>
<td>CHAR(1)</td>
<td>Indicates whether the connections represented by the row are enabled or</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td>disabled:</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• N Disable</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Y Enabled</td>
<td></td>
</tr>
<tr>
<td>CNAME</td>
<td>VARCHAR(60)</td>
<td>Identifies the connection or connections to which the row applies.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td>Interpretation depends on the environment specified by SYSTEM. Values can be:</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Blank if SYSTEM=BATCH or SYSTEM=DB2CALL</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The name of a single connection if SYSTEM has any other value</td>
<td></td>
</tr>
</tbody>
</table>

CNAME can also be blank when SYSTEM is not equal to BATCH or DB2CALL. When this is so, the row applies to all connections for the indicated environment.

| IBMREQD     | CHAR(1)       | A value of Y indicates that the row came from the basic machine-readable    | G   |
|             | NOT NULL      | material (MRM) tape. For all other values, see Release dependency indicators |     |
## SYSIBM.SYSQUERY table

The SYSIBM.SYSQUERY table contains one row for each query in a set of queries.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYID</td>
<td>BIGINT</td>
<td>Unique identifier for the query.</td>
<td>G</td>
</tr>
<tr>
<td>QUERY_HASH</td>
<td>CHAR(16)</td>
<td>The hash key generated by statement text.</td>
<td>G</td>
</tr>
<tr>
<td>SCHEMA</td>
<td>VARCHAR(128)</td>
<td>The default schema name for unqualified objects in the query or blank.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If the query contains unqualified objects and plan hints exist for the query, those plan hints will only be applied if the default schema matches the schema in the plan hint.</td>
<td></td>
</tr>
<tr>
<td>QUERY_SEC_HASH</td>
<td>CHAR(16)</td>
<td>The hash key generated by the modified statement text.</td>
<td>G</td>
</tr>
<tr>
<td>QUERY_HASH_VERSION</td>
<td>INTEGER</td>
<td>The version of the query hash.</td>
<td>G</td>
</tr>
<tr>

</table>
SYSIBM.SYSQUERYPLAN table

The SYSIBM.SYSQUERYPLAN table contains the plan hint information for the queries in the SYSIBM.SYSQUERY table. It correlates to the SYSIBM.SYSQUERY table by the QUERYID column. For a query, there can be up to 3 copies of plan hints stored in the SYSIBM.SYSQUERYPLAN table, distinguished by the value of the COPYID column.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYID</td>
<td>BIGINT</td>
<td>Unique identifier for the query. The value of QUERYID corresponds to the value of the QUERYID column in the SYSIBM.SYSQUERY column.</td>
<td>G</td>
</tr>
<tr>
<td>COPYID</td>
<td>SMALLINT</td>
<td>The version of the plan hints for the query in this row.</td>
<td>G</td>
</tr>
<tr>

<td>CHAR(1)</td>
<td>Whether the plan hints are valid:</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators.</td>
<td>G</td>
</tr>
<tr>
<td>QBLOCKNO</td>
<td>SMALLINT</td>
<td>A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.</td>
<td>G</td>
</tr>
<tr>
<td>PLANNO</td>
<td>SMALLINT</td>
<td>The number of the step in which the query that is indicated in QBLOCKNO was processed. This column indicates the order in which the steps were executed.</td>
<td>G</td>
</tr>
<tr>
<td>METHOD</td>
<td>SMALLINT</td>
<td>A number that indicates the join method that is used for the step:</td>
<td>G</td>
</tr>
</tbody>
</table>

0 The table in this step is the first table that is accessed, a continuation of a previous table that was accessed, or a table that is not used.

1 A nested loop join is used. For each row of the current composite table, matching rows of a new table are found and joined.

2 A merge scan join is used. The current composite table and the new table are scanned in the order of the join columns, and matching rows are joined.

3 Sorts are needed by ORDER BY, GROUP BY, SELECT DISTINCT, UNION, INTERSECT, EXCEPT, a quantified predicate, or an IN predicate. This step does not access a new table.

4 A hybrid join was used. The current composite table is scanned in the order of the join-column rows of the new table. The new table is accessed using list prefetch.
<table>

<td>G</td>
</tr>
<tr>
<td>PREFETCH</td>
<td>CHAR(1)</td>
<td>Indication of whether data pages are to be read in advance by prefetch:</td>
<td>G</td>
</tr>
</tbody>
</table>

The data in this column is right justified. For example, IX appears as a blank, followed by I, followed by X. If the column contains a blank, then no lock is acquired.

If the access method in the ACCESSTYPE column is DX, DI, or DU, no latches are acquired on the XML index page and no lock is acquired on the new base table data page or row, nor on the XML table and the corresponding table spaces. The value of TSLOCKMODE is a blank in this case.

D Optimizer expects dynamic prefetch S Pure sequential prefetch L Prefetch through a page list blank Unknown or no prefetch

R While the data is being read from the table or index
S While performing a sort to satisfy a GROUP BY clause
blank After data retrieval and after any sorts

For the steps of the multiple index procedure (ACCESSTYPE is MX, MI, MU, DX, DI, or DU), or the sequence number of range list access (ACCESSTYPE is 'NR').

0 For any other rows.

**SYSIBM.SYSROUTINESTEXT table**

The SYSIBM.SYSROUTINESTEXT is an auxiliary table for the TEXT column of SYSIBM.SYSROUTINES and is required to hold the LOB data.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>TEXT</td>
<td>CLOB(2M)</td>
<td>The source text of the CREATE PROCEDURE statement for the routine. TEXT can also hold the source text of the ALTER PROCEDURE statement for the routine if the routine is a native SQL procedure and the SQL procedure body is included in the ALTER PROCEDURE statement.</td>
<td>G</td>
</tr>
</tbody>
</table>
SYSIBM.SYSROUTINES_OPTS table

The SYSIBM.SYSROUTINES_OPTS table Contains a row for each generated routine, such as one created by DB2 for z/OS Procedure Processor DSNTPSMP, that records the build options for the routine.

Rows in this table can be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMA</td>
<td>VARCHAR(128)</td>
<td>Schema of the routine.</td>

<tr>
<td>STATUS</td>
<td>CHAR(1) NOT NULL WITH DEFAULT</td>
<td>Status of binding the statement: A Distributed - statement uses DB2 private protocol access. The statement will be parsed and executed at the server using defaults for input variables during access path selection. B Distributed - statement uses DB2 private protocol access. The statement will be parsed and executed at the server using values for input variables during access path selection. C Compiled - statement was bound successfully using defaults for input variables during access path selection. D Distributed - statement references a remote object using a three-part name. DB2 will implicitly use DRDA access either because the DBPROTOCOL bind option was not specified (defaults to DRDA), or the bind option DBPROTOCOL(DRDA) was explicitly specified. This option allows the use of three-part names with DRDA access but it requires that the package be bound at the target remote site. E Explain - statement is an SQL EXPLAIN statement. The explain is done at bind time using defaults for input variables during access path selection. F Parsed - statement did not bind successfully and VALIDATE(RUN) was used. The statement will be rebound at execution time using values for input variables during access path selection. G Compiled - statement bound successfully, but REOPT is specified. The statement will be rebound at execution time using values for input variables during access path selection. H Parsed - statement is either a data definition statement or a statement that did not bind successfully and VALIDATE(RUN) was used. The statement will be rebound at execution time using defaults for input variables during access path selection. Data manipulation statements use defaults for input variables during access path selection. I Indefinite - statement is dynamic. The statement will be bound at execution time using defaults for input variables during access path selection.</td>

</table>
SYSIBM.SYSSTRINGS table

The SYSIBM.SYSSTRINGS table contains information about character conversion. Each row describes a conversion from one coded character set to another.

Also refer to z/OS C/C++ Programming Guide for information on the additional conversions that are supported.

Each row in the table must have a unique combination of values for its INCCSID, OUTCCSID, and IBMREQD columns. Rows for which the value of IBMREQD is N can be deleted, inserted, and updated subject to this uniqueness constraint and to the constraints imposed by a VALIDPROC defined on the table. An inserted row could have values for the INCCSID and OUTCCSID columns that match those of a row for which the value of IBMREQD is Y. DB2 then uses the information in the inserted row instead of the information in the IBM-supplied row. Rows for which the value of IBMREQD is Y cannot be deleted, inserted, or updated. For information about the use of inserted rows for character conversion, see DB2 Installation Guide.

DB2 has two methods for character conversions and applies them in the following order:
1. Conversions specified by the various combinations of the INCCSID and OUTCCSID columns in the SYSIBM.SYSSTRINGS catalog table.
2. Conversions provided by z/OS support for Unicode. For more information, see z/OS Support for Unicode: Using Conversion Services.

If neither of these methods can be used for a particular character conversion, DB2 returns an error.

**SYSIBM.SYSTABLEPART table**

The SYSIBM.SYSTABLEPART table contains one row for each nonpartitioned table space and one row for each partition of a partitioned table space.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>PARTITION</td>
<td>SMALLINT</td>
<td>Partition number; 0 if table space is not partitioned.</td>
<td>G</td>
</tr>
<tr>
<td>TSNAME</td>
<td>VARCHAR(24)</td>
<td>Name of the table space.</td>
<td>G</td>
</tr>
<tr>
<td>DBNAME</td>
<td>VARCHAR(24)</td>
<td>Name of the database that contains the table space.</td>
<td>G</td>
</tr>
<tr>
<td>IXNAME</td>
<td>VARCHAR(128)</td>
<td>Name of the partitioning index. This column is blank unless this is a table that uses index-controlled partitioning.</td>
<td>G</td>
</tr>
<tr>
<td>IXCREATOR</td>
<td>VARCHAR(128)</td>
<td>The schema of the partitioning index. This column is blank unless this is a table that uses index-controlled partitioning.</td>
<td>G</td>
</tr>
<tr>
<td>PQTY</td>
<td>INTEGER</td>
<td>For user-managed data sets, the value is the primary space allocation in units of 4 KB storage blocks or -1.</td>
<td>G</td>
</tr>
<tr>
<td>SQTY</td>
<td>SMALLINT</td>
<td>For user-managed data sets, the value is the secondary space allocation in units of 4 KB storage blocks or -1.</td>
<td>G</td>
</tr>
<tr>
<td>STORTYPE</td>
<td>CHAR(1)</td>
<td>Type of storage allocation:</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td>E  Explicit (storage group not used)</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>I  Implicit (storage group used)</td>
<td></td>
</tr>
</tbody>
</table>

A value of -1 indicates that either of the following cases is true:

- PRIQTY was not specified for a CREATE TABLESPACE statement or for any subsequent ALTER TABLESPACE statements.
- -1 was the most recently specified value for PRIQTY, either on the CREATE TABLESPACE statement or a subsequent ALTER TABLESPACE statement.

SQTY is based on a value of SECQTY in the appropriate CREATE or ALTER TABLESPACE statement. Unlike PQTY, however, PRIQTY asks for space in 1 KB units.

A value of -1 indicates that either of the following cases is true:

- SECQTY was not specified for a CREATE TABLESPACE statement or for any subsequent ALTER TABLESPACE statements.
- -1 was the most recently specified value for SECQTY, either on the CREATE TABLESPACE statement or a subsequent ALTER TABLESPACE statement.

If the value does not fit into the column, the value of the column is 32767. See the description of column SECQTY.

<td>SMALLINT</td>
<td>Number of columns in the primary key of the table. The value is 0 if the row describes a view, an alias, or a created temporary table.</td>
<td>G</td>
</tr>
</tbody>
</table>

**RECLENGTH**

For user tables, the maximum length of any record in the table. Length is $8+N+L$, where:
- The number 8 accounts for the header (6 bytes) and the ID map entry (2 bytes).
- $N$ is 10 if the table has an edit procedure, or 0 otherwise.
- $L$ is the sum of the maximum column lengths. In determining the maximum length of a column, take into account whether the column allows nulls and the data type of the column. If the column can contain nulls and is not a LOB or ROWID column, add 1 byte for a null indicator. Use 4 bytes for the length of a LOB column and 19 bytes for the length of a ROWID column. If the column has a varying-length data type (for example, VARCHAR, CLOB, or BLOB), add 2 bytes for a length indicator. For more information on column lengths, see “Data types” on page 76.

The value is 0 if the row describes a view, alias, or auxiliary table. For maximum row and record sizes, see Maximum record size.

</tr>
</tbody>
</table>
| VERSION             | SMALLINT NOT NULL WITH DEFAULT | The version of the data row format for this table.  
- A value of zero indicates that a version-creating alter operation has never occurred against this table.  
- A value of -1 indicates that the view has been regenerated because a column of the base table has been altered.  
- A value of 800 indicates that a successful CREATE VIEW or ALTER VIEW statement has occurred against this table in Version 8 or later. | G   |
| PARTKEYCOLNUM       | SMALLINT NOT NULL WITH DEFAULT | The number of columns in the partitioning key. This value is zero for tables that do not have partitioning or use index-controlled partitioning. The value is non-zero for tables that use table-controlled partitioning. | G   |
| SPLIT_ROWS          | CHAR(1) NOT NULL WITH DEFAULT | Value is blank, except for VOLATILE tables, which will have 'Y' in the field to indicate to DB2 to use index access on this table whenever possible. | G   |
| SECURITY_LABEL      | CHAR(1) NOT NULL | This column is only meaningful if the TYPE column is a T (for table) or M (for materialized query table). The value indicates whether the table has multilevel security:  
- Blank: The table does not have multilevel security.  
- R: The table has multilevel security with row granularity. | G   |
| OWNER               | VARCHAR(128) NOT NULL WITH DEFAULT | Authorization ID of the owner of the table, view, or alias, blank for tables, views or aliases that were created in a DB2 release prior to Version 9. | G   |
| APPEND              | CHAR(1) NOT NULL WITH DEFAULT | Indicates whether the APPEND option is specified for the table.  
- Y: The APPEND option is specified.  
- N: The APPEND option is not specified. | G   |
| OWNERTYPE           | CHAR(1) NOT NULL WITH DEFAULT | Indicates the type of owner:  
- blank: Authorization ID  
- L: Role | G   |
| HASHKEYCOLUMNS      | SMALLINT NOT NULL WITH DEFAULT | The number of columns in the hash key of the table. The value is 0 if the row describes a view, an alias, or a created temporary table. | G   |
| CONTROL             | CHAR(1) NOT NULL WITH DEFAULT | Indicates whether access to the table is enforced using row or column access control:  
- blank: No access control enforcement  
- B: The table is enforced using both row and column access control  
- C: The table is enforced using column access control  
- R: The table is enforced using row access control | G   |

**SYSIBM.SYSTABSTATS table**

The SYSIBM.SYSTABSTATS table contains one row for each partition of a partitioned table space.

Rows in this table can be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>CARD</td>
<td>INTEGER NOT NULL</td>
<td>Total number of rows in the partition.</td>
<td>S</td>
</tr>
<tr>
<td>NPAGES</td>
<td>INTEGER NOT NULL</td>
<td>Total number of pages on which rows of the partition appear.</td>
<td>S</td>
</tr>
<tr>
<td>PCTPAGES</td>
<td>SMALLINT NOT NULL</td>
<td>Percentage of total active pages in the partition that contain rows of the table.</td>
<td>S</td>
</tr>
<tr>
<td>NACTIVE</td>
<td>INTEGER NOT NULL</td>
<td>Number of active pages in the partition.</td>
<td>S</td>
</tr>
<tr>
<td>PCTROWCOMP</td>
<td>SMALLINT NOT NULL</td>
<td>Percentage of rows compressed within the total number of active rows in the partition. This includes any row in a table space that is defined with COMPRESS YES.</td>
<td>S</td>
</tr>
<tr>
<td>STATTIME</td>
<td>TIMESTAMP NOT NULL</td>
<td>If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1) NOT NULL</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see <a href="#">Release dependency indicators</a>.</td>
<td>G</td>
</tr>
<tr>
<td>DBNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>Database that contains the table space named in TSNAME.</td>
<td>G</td>
</tr>
<tr>
<td>TNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>Table space that contains the table.</td>
<td>G</td>
</tr>
<tr>
<td>PARTITION</td>
<td>SMALLINT NOT NULL</td>
<td>Partition number of the table space that contains the table.</td>
<td>G</td>
</tr>
<tr>
<td>OWNER</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The schema of the table.</td>
<td>G</td>
</tr>
<tr>
<td>NAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Name of the table.</td>
<td>G</td>
</tr>
<tr>
<td>CARDF</td>
<td>FLOAT NOT NULL WITH DEFAULT -1</td>
<td>Total number of rows in the partition.</td>
<td>S</td>
</tr>
</tbody>
</table>
**SYSIBM.SYSTABSTATS_HIST table**

The SYSIBM.SYSTABSTATS_HIST table contains rows from SYSTABSTATS.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>NPAGES</td>
<td>INTEGER NOT NULL</td>
<td>Total number of pages on which rows of the partition appear.</td>
<td>S</td>
</tr>
<tr>
<td>STATTIME</td>
<td>TIMESTAMP NOT NULL</td>
<td>If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics.</td>
<td>G</td>
</tr>
<tr>
<td>DBNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>Database that contains the table space named in TSNAME.</td>
<td>G</td>
</tr>
<tr>
<td>TSNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>Table space that contains the table.</td>
<td>G</td>
</tr>
<tr>
<td>PARTITION</td>
<td>SMALLINT NOT NULL</td>
<td>Partition number of the table space that contains the table.</td>
<td>G</td>
</tr>
<tr>
<td>OWNER</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The schema of the table.</td>
<td>G</td>
</tr>
<tr>
<td>NAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Name of the table.</td>
<td>G</td>
</tr>
<tr>
<td>CARDF</td>
<td>FLOAT(8) NOT NULL WITH DEFAULT -1</td>
<td>Total number of rows in the partition. The value is -1 if statistics have not been gathered.</td>
<td>S</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1) NOT NULL WITH DEFAULT 'N'</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see <a href="#">Release dependency indicators</a>.</td>
<td>G</td>
</tr>
</tbody>
</table>

Appendix. Additional information for DB2 SQL  2243
### SYSIBM.SYSTRIGGERS table

The SYSIBM.SYSTRIGGERS table contains one row for each trigger.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Name of the trigger and trigger package.</td>
<td>G</td>
</tr>
<tr>
<td>SCHEMA</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Schema of the trigger. This implicit or explicit qualifier for the trigger name is also used for the collection ID of the trigger package.</td>
<td>G</td>
</tr>
<tr>
<td>DBID</td>
<td>SMALLINT NOT NULL</td>
<td>Internal identifier of the database for the trigger.</td>
<td>G</td>
</tr>
<tr>
<td>OBID</td>
<td>SMALLINT NOT NULL</td>
<td>Internal identifier of the trigger.</td>
<td>G</td>
</tr>
<tr>
<td>OWNER</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Owner of the trigger.</td>
<td>G</td>
</tr>
<tr>
<td>CREATEDBY</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Primary authorization ID of the user who created the trigger.</td>
<td>G</td>
</tr>
<tr>
<td>TBNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Name of the table or view.</td>
<td>G</td>
</tr>
<tr>
<td>TBOWNER</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Qualifier of the name of the table or view to which this trigger applies.</td>
<td>G</td>
</tr>
<tr>
<td>TRIGTIME</td>
<td>CHAR(1) NOT NULL</td>
<td>Time when triggered actions are applied to the base table, relative to the event that activated the trigger:</td>
<td>G</td>
</tr>
<tr>
<td>TRIGEVENT</td>
<td>CHAR(1) NOT NULL</td>
<td>Operation that activates the trigger:</td>
<td>G</td>
</tr>
<tr>

<td>G</td>
</tr>
<tr>
<td>XMLTBNAME</td>
<td>VARCHAR(128)</td>
<td>Name of the XML table.</td>
<td>G</td>
</tr>
<tr>
<td>XMLRELOBID</td>
<td>INTEGER</td>
<td>Internal identifier of the relationship between the base table and the XML table.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators.</td>
<td>G</td>
</tr>
<tr>
<td>CREATEDTS</td>
<td>TIMESTAMP</td>
<td>Time when the XML table was created.</td>
<td>G</td>
</tr>
<tr>
<td>RELCREATED</td>
<td>CHAR(1)</td>
<td>The release of DB2 that is used to create the object. See Release dependency indicators for the values.</td>
<td>G</td>
</tr>
</tbody>
</table>
### SYSIBM.SYXMLSTRINGS table

Each row of the SYSIBM.SYXMLSTRINGS table contains a single string and its unique ID that are used to condense XML data. The string can be an element name, attribute name, name space prefix, or a namespace URI.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRINGID</td>
<td>INTEGER</td>
<td>Unique ID for the string.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>GENERATED</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>ALWAYS</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>AS IDENTITY</td>
<td></td>
<td></td>
</tr>
<tr>
<td>STRING</td>
<td>VARCHAR(1000)</td>
<td>The string data.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**SYSIBM.USERNAMES table**

Each row in the SYSIBM.USERNAMES table is used to carry out one outbound ID translation or inbound ID translation and "come from" checking.

Rows in this table can be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE</td>
<td>CHAR(1) NOT NULL</td>
<td>How the row is to be used:</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>I</td>
<td>For inbound translation and “come from” checking.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>O</td>
<td>For outbound translation.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>S</td>
<td>For outbound system AUTHID to establish a trusted connection.</td>
<td></td>
</tr>
<tr>
<td>AUTHID</td>
<td>VARCHAR(128) NOT NULL WITH DEFAULT</td>
<td>Authorization ID to be translated. Applies to any authorization ID if blank.</td>
<td>G</td>
</tr>
<tr>
<td>LINKNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>Identifies the VTAM or TCP/IP network locations associated with this row. A blank value in this column indicates this name translation rule applies to any TCP/IP or SNA partner. If a non-blank LINKNAME is specified, one or both of the following statements must be true: • A row exists in SYSIBM.LUNAMES whose LUNAME matches the value specified in the SYSIBM.USERNAMES LINKNAME column. This row specifies the VTAM site associated with this name translation rule. • A row exists in SYSIBM.IPNAMES whose LINKNAME matches the value specified in the SYSIBM.USERNAMES LINKNAME column. This row specifies the TCP/IP host associated with this name translation rule. Inbound name translation and “come from” checking are not performed for TCP/IP clients.</td>
<td>G</td>
</tr>
<tr>
<td>NEWAUTHID</td>
<td>VARCHAR(128) NOT NULL WITH DEFAULT</td>
<td>Translated value of AUTHID. Blank specifies no translation. NEWAUTHID can be stored as encrypted data by calling the DSNLEUSR stored procedure. To send the encrypted value of AUTHID across a network, one of the encryption security options in the SYSIBM.IPNAMES table should be specified.</td>
<td>G</td>
</tr>
<tr>
<td>PASSWORD</td>
<td>VARCHAR(24) NOT NULL WITH DEFAULT</td>
<td>Password to accompany an outbound request, if passwords are not encrypted by RACF. If passwords are encrypted, or the row is for inbound requests, the column is not used. PASSWORD can be stored as encrypted data by calling the DSNLEUSR stored procedure. To send the encrypted value of PASSWORD across a network, one of the encryption security options in the SYSIBM.IPNAMES table should be specified.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1) NOT NULL WITH DEFAULT 'N'</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see <a href="#">Release dependency indicators</a>.</td>
<td>G</td>
</tr>
</tbody>
</table>
**SYSIBM.SYXMLTYPMOD table**

The SYSIBM.SYXMLTYPMOD table contains rows about the XML type modifiers of XML columns. Rows in this table can be inserted, updated and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>XML_TYPEMOD_ID</td>
<td>INTEGER</td>
<td>An id generated for the XML type modifier, it is an identity column and primary key.</td>
<td>G</td>
</tr>
<tr>
<td>TYPE_ANNOTATION</td>
<td>CHAR(1)</td>
<td>Indicate whether there is type annotation.</td>
<td>G</td>
</tr>
<tr>
<td>CREATEDTS</td>
<td>TIMESTAMP</td>
<td>The timestamp when this type modifier is created.</td>
<td>G</td>
</tr>
<tr>
<td>ALTEREDTS</td>
<td>TIMESTAMP</td>
<td>The timestamp when this type modifier is altered</td>
<td>G</td>
</tr>
<tr>
<td>RELCREATED</td>
<td>CHAR(1)</td>
<td>The release of DB2 that is used to create the object. See Release dependency indicators for the values.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators.</td>
<td>G</td>
</tr>
<tr>
<td>CREATEDBY</td>
<td>VARCHAR(128)</td>
<td>Primary authorization ID of the user who created the database.</td>
<td>G</td>
</tr>
</tbody>
</table>
**SYSIBM.SYXMLTYPMSCHEMA table**

The SYSIBM.SYXMLTYPMSCHEMA table contains the XML schema information for an XML type modifier. It contains one row per XML schema for an XML type modifier.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>XML_TYPEMOD_ID</td>
<td>INTEGER</td>
<td>The id for the XML type modifier.</td>
<td>G</td>
</tr>
<tr>
<td>XSROBJECTID</td>
<td>INTEGER</td>
<td>The id for an XML schema registered in XSR.</td>
<td>G</td>
</tr>
<tr>
<td>ELEMENT_NAMESPACE</td>
<td>INTEGER</td>
<td>String id for the namespace name of the root element node.</td>
<td>G</td>
</tr>
<tr>
<td>ELEMENT_NAME</td>
<td>INTEGER</td>
<td>String id for the local name of the root element node.</td>
<td>G</td>
</tr>
<tr>
<td>CREATEDTS</td>
<td>TIMESTAMP</td>
<td>The timestamp when this type modifier is created.</td>
<td>G</td>
</tr>
<tr>
<td>ALTEREDTS</td>
<td>TIMESTAMP</td>
<td>The timestamp when this type modifier is altered</td>
<td>G</td>
</tr>
<tr>
<td>RELCREATED</td>
<td>CHAR(1)</td>
<td>The release of DB2 that is used to create the object. See Release dependency indicators for the values.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators.</td>
<td>G</td>
</tr>
</tbody>
</table>
DB2 directory tables

DB2 for z/OS maintains a set of tables (in database DSND01) called the DB2 directory. Three of those tables allow SELECT operations.

About these topics

These topics describe the directory tables that allow SELECT operations by describing the columns of those tables.

Authorized users can query the directory; however, it is primarily intended for use by DB2 and is therefore subject to change.

Users must have one of the following privileges to execute SELECT statements on the directory tables:
- Install SYSADM
- SYSADM
- SYSCTRL
- ACCESSCTRL
- DATAACCESS
- SECADM
- SQLADM
- System DBADM
- DBADM on DSND01
- The SELECT privilege on a specific table

All directory tables are qualified by SYSIBM. Do not use this qualifier for user-defined tables.

The directory tables are updated by DB2 during normal operations in response to certain SQL statements, commands, and utilities.

Programming interface information

Not all directory table columns are part of the general-use programming interface. Whether a column is part of this interface is indicated in a column labeled “Use” in the table that describes the column. The values that “Use” can assume are as follows:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>S</td>
<td>Column is part of the product-sensitive interface</td>
</tr>
<tr>
<td>I</td>
<td>Column is for internal use only</td>
</tr>
</tbody>
</table>

For columns for which “Use” is I, the name of the column and its description do not appear in the explanation of the column.
### Directory table spaces and indexes

DB2 directory tables are contained in certain table spaces and have indexes.

The following table lists the table space and indexes for each directory table and lists the index fields for each index. The indexes are in ascending order.

<table>
<thead>
<tr>
<th>TABLE SPACE</th>
<th>TABLE</th>
<th>INDEX</th>
<th>INDEX FIELDS</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSNDB01. ...</td>
<td>SYSLGRNX</td>
<td>SYSLGRNX</td>
<td>DSNLLX01 LGRDBID LGRPSID LGRPART LGRMEMB LGRSLRSN</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>DSNLLX02 LGRDBID LGRPSID LGRSLRSN</td>
</tr>
<tr>
<td>SYSUTILX</td>
<td>SYSUTIL</td>
<td>DSNLUX01</td>
<td>USUID</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>DSNLUX02 UTILID SEQNO</td>
</tr>
</tbody>
</table>
**SYSIBM.SYSLGRNX table**

The SYSLGRNX table stores recovery log ranges that record the time an index space defined with COPY YES or a table space was open for updates. This provides an efficient way for DB2 to access the appropriate log records for recovery, rather than having to scan every record in the recovery log for a particular table.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>LGRDBID</td>
<td>CHAR(2) FOR BIT DATA</td>
<td>DBID of the modified object</td>
<td>S</td>
</tr>
<tr>
<td>LGRPSID</td>
<td>CHAR(2) FOR BIT DATA</td>
<td>OBID of the modified object</td>
<td>S</td>
</tr>
<tr>
<td>LGRUCDT</td>
<td>CHAR(6)</td>
<td>Modification date in the form mmddyy</td>
<td>S</td>
</tr>
<tr>
<td>LGRUCTM</td>
<td>CHAR(8)</td>
<td>Modification time in the form hhmmsssth</td>
<td>S</td>
</tr>
<tr>
<td>LGRSRBA</td>
<td>CHAR(6) FOR BIT DATA</td>
<td>Starting RBA</td>
<td>S</td>
</tr>
<tr>

</tr>
<tr>
<td>LGRPART</td>
<td>SMALLINT</td>
<td>Partition number in the table space or index space</td>
<td>S</td>
</tr>
<tr>
<td>LGRSLRSN</td>
<td>CHAR(6) FOR BIT DATA</td>
<td>Starting LRSN of the update log records for data sharing. X'000000000000' otherwise.</td>
<td>S</td>
</tr>
<tr>
<td>LGRELRSN</td>
<td>CHAR(6) FOR BIT DATA</td>
<td>Ending LRSN of update log records for data sharing. X'000000000000' otherwise.</td>
<td>S</td>
</tr>
<tr>
<td>LGRMEMB</td>
<td>CHAR(2)</td>
<td>Data sharing member ID of the modifying DB2 subsystem. X'0000' for a non-data-sharing environment.</td>
<td>S</td>
</tr>
</tbody>
</table>
### SYSIBM.SYSUTIL table

The SYSUTIL table stores status information about DB2 utilities that are active or stopped. Each record is uniquely identified by the utility identifier. Each row of the table contains the information for one utility execution step. When the utility completes, the corresponding entries in the SYSUTIL table are deleted.

<table>
<thead>
<tr>
<th>Name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>USUUID</td>
<td>CHAR(16)</td>
<td>UTILID value that was passed in a JOB statement parameter</td>

</table>

Performance information for SQL application programming

Efficient applications are an important first step to good system and application performance. As you code applications that access data in DB2, consider performance objectives in your application design.

The following topics can help you understand how application programmers can consider performance as they write applications that access data in DB2 for z/OS.

Concurrency and programming

The goal is to program and prepare applications in a way that:

- Protects the integrity of the data in the following data that being read or updated from being changed by other applications.
- Minimizes the length of time that other access to the data is prevented.

For more information about DB2 concurrency and recommendations for improving concurrency in your application programs, see the following topics:

- Concurrency recommendations for application designers (Introduction to DB2 for z/OS)
- Concurrency and locks (DB2 Performance)
- Improving concurrency (DB2 Performance)
- Improving concurrency in data sharing environments (DB2 Data Sharing Planning and Administration)

Writing efficient queries

The predicates, subqueries, and other structures in SQL statements affect the access paths that DB2 uses to access the data.

For information about how to write SQL statements that access data efficiently, see the following topics:

- Ways to improve query performance (Introduction to DB2 for z/OS)
- Writing efficient queries (DB2 Performance)
Analyzing data access

By analyzing the access path that DB2 uses to access the data for an SQL statement, you can discover potential problems. You can use this information to modify your statement to perform better.

For information about how you can use EXPLAIN tables, and SQL optimization tools, to analyze the access paths for your SQL statements, see the following topics:

- Using EXPLAIN to understand the access path (Introduction to DB2 for z/OS)
- Using EXPLAIN to capture information about SQL statements. (DB2 Performance)
- Interpreting data access by using EXPLAIN (DB2 Performance)
- EXPLAIN tables (DB2 Performance)
- "EXPLAIN" on page 1518
- Tuning SQL with Optim Query Tuner, Part 1: Understanding access paths
- Diagramming access plans with Visual Explain

Distributed data access performance

The goal is to reduce the amount of network traffic that is required to access the distributed data, and to manage the use of system resources such as distributed database access threads and connections.

For information about improving the performance of applications that access distributed data, see the following topics:

- Ways to reduce network traffic (Introduction to DB2 for z/OS)
- Distributed database access threads (DB2 Performance)
- Tuning distributed applications (DB2 Performance)
- SQL statement options for distributed applications (DB2 Performance)

Stored procedures performance

For information about stored procedures and DB2 performance, see the following topics:

- Implementing DB2 stored procedures (DB2 Administration Guide)
- Improving the performance of stored procedures and user-defined functions (DB2 Performance)

Related concepts:

- Structured query language (Introduction to DB2 for z/OS)

DB2 XML schema repository tables

The DB2 for z/OS XML schema repository (XSR) is a set of DB2 tables where you can store XML schemas.

DB2 creates the XSR tables during installation or migration. After you add XML schemas to the DB2 XSR, you can use them to validate XML documents before you store them in XML columns.

An XML schema consists of a set of XML schema documents. To add an XML schema to the DB2 XSR, you register XML schema documents to DB2. The XML schema documents must be in the Unicode encoding scheme.

Programming interface information

Not all XSR table columns are part of the general-use programming interface. Whether a column is part of this interface is indicated in a column labeled “Use” in the row that describes the table column. The meaning of the values for the “Use” column is indicated in the following table.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>G</td>
<td>Column is part of the general-use</td>
</tr>
<tr>
<td></td>
<td>programming interface</td>
</tr>
<tr>
<td>S</td>
<td>Column is part of the product-sensitive</td>
</tr>
<tr>
<td></td>
<td>interface</td>
</tr>
<tr>
<td>I</td>
<td>Column is for IBM use only</td>
</tr>
<tr>
<td>N</td>
<td>Column is not used</td>
</tr>
</tbody>
</table>

For columns for which “Use” is N or I, the name of the column and its description do not appear in the explanation of the column.

### XML schema repository (XSR) table spaces and indexes

DB2 XSR tables are contained in certain table spaces and have indexes.

The following tables list the table space and indexes for each XRS table and lists the index fields for each index. The indexes are in ascending order, except where noted.

**Table 176. Table spaces and indexes for the DSNXSR database tables**

<table>
<thead>

<td>VARCHAR(762)</td>
<td>Character string that contains comments about this XML</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td></td>
<td>schema.</td>
<td></td>
</tr>
</tbody>
</table>
**SYSIBM.XSROBJECTCOMPONENTS table**

The SYSIBM.XSROBJECTCOMPONENTS table contains one row for each component (document) in an XML schema.

Rows in this table can only be changed using static SQL statements issued by the DB2-supplied XSR stored procedures.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>XSRCOMPONENTID</td>
<td>INTEGER</td>
<td>Internal identifier of the XML schema document.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td>XSRCOMPONENTID is generated as an identity column.</td>
<td></td>
</tr>
<tr>
<td>TARGETNAMESPACE</td>

<td>The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the target namespace URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS.</td>
<td>G</td>
</tr>
<tr>
<td>SCHEMALOCATION</td>
<td>INTEGER</td>
<td>The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the schema location URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS.</td>
<td>G</td>
</tr>
<tr>
<td>ROWID</td>
<td>ROWID</td>
<td>The ID that is used to support BLOB data type values.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td>GENERATED ALWAYS</td>
<td></td>
</tr>
<tr>
<td>COMPONENT</td>
<td>BLOB(30M)</td>
<td>Contents of the XML schema document.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>
<td>PROPERTIES</td>
<td>BLOB(5M)</td>
<td>If available, additional property information of the XML schema document</td>
<td>G</td>
</tr>
<tr>
<td>CREATEDTS</td>
<td>TIMESTAMP</td>
<td>The time that the XML schema document was registered.</td>
<td>G</td>
</tr>
<tr>
<td>STATUS</td>
<td>CHAR(1)</td>
<td>Registration status of the XML schema:</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td>C Complete</td>
<td></td>
</tr>
<tr>
<td></td>
<td>WITH DEFAULT</td>
<td>I Incomplete</td>
<td></td>
</tr>
<tr>
<td>RELCREATED</td>
<td>CHAR(1)</td>
<td>The release of DB2 that is used to create the object. See Release dependency indicators for the values.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**SYSIBM.XSROBJECTGRAMMAR table**

SYSIBM.XSROBJECTGRAMMAR is an auxiliary table for the BLOB column GRAMMAR in SYSIBM.SYSXSROBJECTS. It is in LOB table space SYSXSRA1.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRAMMAR</td>
<td>BLOB(250M)</td>
<td>Internal binary representation of the XML schema</td>
<td>G</td>
</tr>
</tbody>
</table>
**SYSIBM.XSROBJECTHIERARCHIES table**

The **SYSIBM.XSROBJECTHIERARCHIES** table contains one row for each component (document) in an XML schema to record the XML schema document hierarchy relationship.

Rows in this table can only be changed using static SQL statements issued by the DB2-supplied XSR stored procedures.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>XSROBJECTID</td>
<td>INTEGER</td>
<td>Internal identifier of the XML schema.</td>
<td>G</td>
</tr>
<tr>
<td>XSRCOMPONENTID</td>
<td>INTEGER</td>
<td>Internal identifier of the XML schema document.</td>
<td>G</td>
</tr>
<tr>
<td>HTYPE</td>
<td>CHAR(1)</td>
<td>Hierarchy type:</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td></td>
<td>D Document</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>P Primary document</td>
<td></td>
</tr>
<tr>
<td>TARGETNAMESPACE</td>
<td>INTEGER</td>
<td>The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the target namespace URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS.</td>
<td>G</td>
</tr>
<tr>
<td>SCHEMALOCATION</td>
<td>INTEGER</td>
<td>The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the schema location URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS.</td>
<td>G</td>
</tr>
<tr>
<td>RELCREATED</td>
<td>CHAR(1)</td>
<td>The release of DB2 that is used to create the object. See Release dependency indicators for the values.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**SYSIBM.XSROBJECTPROPERTY table**

SYSIBM.XSROBJECTPROPERTY is an auxiliary table for the BLOB column PROPERTIES in SYSIBM.SYSXSROBJECTS. It is in LOB table space SYSXSRA2.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROPERTIES</td>
<td>BLOB(5M)</td>
<td>Contents of the additional property information of the entire XML schema.</td>
<td>G</td>
</tr>
</tbody>
</table>
**SYSIBM.XSRPROPERTY table**

The SYSIBM.XSRPROPERTY table is an auxiliary table for the BLOB column COMPONENT in SYSIBM.SYSXSROBJECTCOMPONENTS. It is in LOB table space SYSXSRA3.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPONENT</td>
<td>BLOB(5M)</td>
<td>Contents of the additional property information of the XML schema document.</td>
<td>G</td>
</tr>
</tbody>
</table>
EXPLAIN tables

EXPLAIN tables contain information about SQL statements and functions that run on DB2 for z/OS.

You can create and maintain a set of EXPLAIN tables to capture and analyze information about the performance of SQL statements and functions that run on DB2 for z/OS. Each row in an EXPLAIN table describes some aspect of a step in the execution of a query or subquery in an explainable statement. The column values for the row identify, among other things, the query or subquery, the tables and other objects involved, the methods used to carry out each step, and cost information about those methods. DB2 creates EXPLAIN output and populates EXPLAIN tables in the following situations:

- When an EXPLAIN statement is executed.
- At BIND or REBIND with the EXPLAIN(YES) option. Rows are added for every explainable statement in the plan or package being bound. For a plan, these do not include statements in the packages that can be used with the plan. For either a package or plan, they do not include explainable statements within EXPLAIN statements nor do they include explainable statements that refer to declared temporary tables, which are incrementally bound at run time.
- When an explainable dynamic statement is executed and the value of the CURRENT EXPLAIN MODE special register is set to YES or EXPLAIN.
- When the DSNAEXP stored procedure executes successfully.

Important: EXPLAIN tables in any pre-Version 8 format or EXPLAIN tables that are encoded in EBCDIC are not supported.

Related reference:
- BIND and REBIND options (DB2 Commands)
- Interpreting data access by using EXPLAIN (DB2 Performance)
- "EXPLAIN" on page 1518
- Capturing EXPLAIN information (DB2 Performance)
- Creating EXPLAIN tables (DB2 Performance)
The plan table, PLAN_TABLE, contains information about access paths that is collected from the results of EXPLAIN statements.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Important:** EXPLAIN tables in any pre-Version 8 format or EXPLAIN tables that are encoded in EBCDIC are not supported.

**Qualifiers**

Your subsystem or data sharing group can contain more than one of these tables:

**SYSIBM**

One instance of each EXPLAIN table can be created with the SYSIBM qualifier. SQL optimization tools use these tables. These tables are created when you run job DSNTIJSG during DB2 installation or migration.

**userID**

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind, or rebind, a plan or package with the EXPLAIN(YES) option. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

**Optional PLAN_TABLE formats**

A PLAN_TABLE instance can have a format with fewer columns than those shown in the sample CREATE TABLE statement. However instances of PLAN_TABLE must have one of the following formats:

**Version 10 format**

All columns shown up to and including MERGN. (COLCOUNT=64).

**Version 9 format**

All columns up to and including PARENT_PLANNO (COLCOUNT=59). For information about converting tables in this format to the current format, see Migration step 24: Convert EXPLAIN tables to the current format and encoding type (DB2 Installation and Migration).

**Version 8 format**

All columns up to and including STMTTOKEN (COLCOUNT=58). For
information about converting tables in this format to the current format, see Converting EXPLAIN tables for migration from Version 8 (DB2 Installation and Migration).

Important: If the EXPLAIN tables have any format older than the Version 8 or are that encoded in EBCDIC, DB2 returns an error for any operation that inserts rows in the EXPLAIN tables.

Whichever set of columns you choose, the columns must appear in the order in which the CREATE statement indicates. You can add columns to an existing plan table with the ALTER TABLE statement only if the modified table satisfies one of the allowed sets of columns. For example, you cannot add column PREFETCH by itself, but must add columns PREFETCH, COLUMN_FN_EVAL, and MIXOPSEQ. If you add any NOT NULL columns, give them the NOT NULL WITH DEFAULT attribute.

Missing columns are ignored when rows are added to a plan table.

Column descriptions

Your subsystem or data sharing group can contain more than one of these tables, including a table with the qualifier SYSIBM, a table with the qualifier DB2OSCA, and additional tables that are qualified by user IDs.

The following table shows the descriptions of the columns in PLAN_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
</tr>
</tbody>
</table>
|             |                       | **For rows produced by EXPLAIN statements**  
|             |                       | The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.  |
|             |                       | **For rows not produced by EXPLAIN statements**  
|             |                       | DB2 assigns a number that is based on the line number of the SQL statement in the source program.  |
|             |                       | When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.  |
|             |                       | When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.  |
Table 177. Descriptions of columns in PLAN_TABLE (continued)

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QBLOCKNO</td>
<td>SMALLINT NOT NULL</td>
<td>A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td>PROGNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td>PLANNO</td>
<td>SMALLINT NOT NULL</td>
<td>The number of the step in which the query that is indicated in QBLOCKNO was processed. This column indicates the order in which the steps were executed.</td>
</tr>
<tr>
<td>METHOD</td>
<td>SMALLINT NOT NULL</td>
<td>A number that indicates the join method that is used for the step:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0 The table in this step is the first table that is accessed, a continuation of a previous table that was accessed, or a table that is not used.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1 A nested loop join is used. For each row of the current composite table, matching rows of a new table are found and joined.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2 A merge scan join is used. The current composite table and the new table are scanned in the order of the join columns, and matching rows are joined.</td>
</tr>

Notes:
1. For PLAN_TABLE rows in which ACCESSTYPE='A' and QBLOCK_TYPE='PRUNED', the values of all other columns except QUERYNO, APPLNAME, and PROGNAME are the default values for those columns.
2. In rows that are used for optimization hints, NULL values in the following columns indicate a hint for no parallelism:
3. In rows that are used for optimization hints, NULL values in the following columns indicate a hint for no parallel sort:
   - SORTN_PGROUP_ID
   - SORTC_PGROUP_ID

4. The ACCESSTYPE column contains the following values:
   - A  The query is sent to an accelerator server.
   - DI By an intersection of multiple DOCID lists to return the final DOCID list
   - DU By a union of multiple DOCID lists to return the final DOCID list
   - DX By an XML index scan on the index that is named in ACCESSNAME to return a DOCID list
   - E  By direct row access using a row change timestamp column.
   - H  By hash access. If an overflow condition occurs, the hash overflow index that is identified by ACCESSCREATOR and ACCESSNAME is used.
   - HN By hash access using an IN predicate, or an IN predicate that DB2 generates. If a hash overflow condition occurs, the hash overflow index that is identified in ACCESSCREATOR and ACCESSNAME is used.
   - I  By an index (identified in ACCESSCREATOR and ACCESSNAME)
   - IN By an index scan when the matching predicate contains an IN predicate and the IN-list is accessed through an in-memory table.
   - I1 By a one-fetch index scan
   - M  By a multiple index scan. A row that contains this value might be followed by a row that contains one of the following values:
     - DI
     - DU
     - MH
     - MI
     - MU
     - MX
   - MH By the hash overflow index named in ACCESSNAME. A row that contains this value always follows a row that contains M.
   - MI By an intersection of multiple indexes. A row that contains this value always follows a row that contains M.
   - MU By a union of multiple indexes. A row that contains this value always follows a row that contains M.
   - MX By an index scan on the index named in ACCESSNAME. When the access method MX follows the access method DX, DI, or DU, the table is accessed by the DOCID index by using the DOCID list that is returned by DX, DI, or DU. A row that contains this value always follows a row that contains M.
   - N  One of the following types:
     - By an index scan when the matching predicate contains the IN keyword
     - By an index scan when DB2 rewrites a query using the IN keyword
   - O  By a work file scan, as a result of a subquery.
   - NR Range list access.
   - P  By a dynamic pair-wise index scan
   - R  By a table space scan
   - RW By a work file scan of the result of a materialized user-defined table function
   - V  By buffers for an INSERT statement within a SELECT
The PLAN_TABLE_HINT_IX index

The PLAN_TABLE_HINT_IX index improves prepare performance when access path hints are used. This index is required for all types of statement-level optimization hints. The PLAN_TABLE_HINT_IX index is optional, although strongly recommended, for PLAN_TABLE access path hints.

The statement that creates the PLAN_TABLE_HINT_IX index is included as part of the DSNTESC member of the SDSNSAMP library. Related concepts:

- Interpreting data access by using EXPLAIN (DB2 Performance)

Related tasks:

- Enabling optimization hints (DB2 Performance)
- Diagramming access plans with Visual Explain

Related reference:

- “EXPLAIN” on page 1518

- Format of PLAN_TABLE in Version 10 (DB2 for z/OS What's New?)
DSN_COLDIST_TABLE

The column distribution table contains non-uniform column group statistics that
are obtained dynamically by DB2 from non-index leaf pages.

Recommendation: Do not manually insert data into system-maintained EXPLAIN
tables, and use care when deleting obsolete EXPLAIN table data. The data is
intended to be manipulated only by the DB2 EXPLAIN function and optimization
tools. Certain optimization tools depend on instances of the various EXPLAIN
tables. Be careful not to delete data from or drop instances EXPLAIN tables that
are created for these tools.

Important: EXPLAIN tables in any pre-Version 8 format or EXPLAIN tables that
are encoded in EBCDIC are not supported.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM
One instance of each EXPLAIN table can be created with the SYSIBM
qualifier. SQL optimization tools use these tables. These tables are created
when you run job DSNTIJSG during DB2 installation or migration.

userID You can create additional instances of EXPLAIN tables that are qualified by
user ID. These tables are populated with statement cost information when
you issue the EXPLAIN statement or bind, or rebind, a plan or package
with the EXPLAIN(YES) option. SQL optimization tools might also create
EXPLAIN tables that are qualified by a user ID. You can find the SQL
statement for creating an instance of these tables in member DSNTESC of
the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in
member DSNTESC of the SDSNSAMP library.

Column descriptions

The following table shows the descriptions of the columns in the
DSN_COLDIST_TABLE table.
### Table 178. Descriptions of columns in DSN_COLDIST_TABLE

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows not produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>DB2 assigns a number that is based on the line number of the SQL statement in the source program.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.</td>
</tr>
<tr>
<td>PROGNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.</td>
</tr>
<tr>
<td>Column name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>COLLID</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The collection ID:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>DSNDYNAMICSQUCACHE</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The row originates from the dynamic statement cache</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>DSNEXPLAINMODEYES</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>DSNEXPLAINMODEEXPLAIN</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.</td>
</tr>
<tr>
<td>GROUP_MEMBER</td>
<td>VARCHAR(24) NOT NULL</td>
<td>The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.</td>
</tr>
<tr>
<td>SECTNOI</td>
<td>INTEGER NOT NULL</td>
<td>The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.</td>
</tr>
<tr>
<td>VERSION</td>
<td>VARCHAR(122) NOT NULL</td>
<td>The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.</td>
</tr>
<tr>
<td>EXPLAIN_TIME</td>
<td>TIMESTAMP NOT NULL</td>
<td>The time when the EXPLAIN information was captured:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>All cached statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the statement entered the cache, in the form of a full-precision timestamp value.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Non-cached static statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the statement was bound, in the form of a full precision timestamp value.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Non-cached dynamic statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.</td>
</tr>
<tr>
<td>Column name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SCHEMA</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The schema of the table that contains the column.</td>
</tr>
<tr>
<td>TBNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the table that contains the column.</td>
</tr>
<tr>
<td>NAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Name of the column. If the value of NUMCOLUMNS is greater than 1, this name identifies the first column name of the set of columns associated with the statistics.</td>
</tr>
<tr>
<td>COLVALUE</td>
<td>VARCHAR(2000) NOT NULL</td>
<td>Contains the data of a frequently occurring value in the column. Statistics are not collected for an index on a ROWID column. If the value has a non-character data type, the data might not be printable. This column might contain values that depend on the value of the type column:</td>
</tr>
<tr>
<td></td>
<td>BIT DATA</td>
<td></td>
</tr>
<tr>
<td>TYPE</td>
<td>CHAR(1) NOT NULL</td>
<td>The type of statistics:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>C  Cardinality</td>
</tr>
<tr>
<td></td>
<td></td>
<td>F  Frequent value</td>
</tr>
<tr>
<td></td>
<td></td>
<td>H  Histogram</td>
</tr>
<tr>
<td></td>
<td></td>
<td>T  Real-time table cardinality</td>
</tr>
<tr>
<td></td>
<td></td>
<td>L  Real-time column cardinality (unique index only)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P  Real time partition cardinality</td>
</tr>
<tr>
<td>Column name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CARDF</td>
<td>FLOAT NOT NULL</td>
<td>For TYPE='C', the number of distinct values for the column group. For TYPE='H', the number of distinct values for the column group in a quantile indicated by the value of the QUANTILENO column. For TYPE='T', a value related to real time statistics table values that are determined by the COLVALUE column. For TYPE='L', a value related to a real time statistics column value that is determined by the COLVALUE column. The QUANTILENO column contains the column number. The NAME column contains the column name. For TYPE='P', a value related to real time statistics partition value that is determined by the COLVALUE column. The QUANTILENO column contains the partition number.</td>
</tr>
<tr>
<td>COLGROUPCOLNO</td>
<td>VARCHAR(254) NOT NULL FOR BIT DATA</td>
<td>The identity of the set of columns associated with the statistics. If the statistics are only associated with a single column, the field contains a zero length. Otherwise, the field is an array of SMALLINT column numbers with a dimension equal to the value in the NUMCOLUMNS column. This is an updatable column.</td>
</tr>
<tr>
<td>NUMCOLUMNS</td>
<td>SMALLINT NOT NULL</td>
<td>Identifies the number of columns associated with the statistics.</td>
</tr>
<tr>
<td>FREQUENCYF</td>
<td>FLOAT NOT NULL</td>
<td>The percentage of rows in the table with the value that is specified in the COLVALUE column when the number is multiplied by 100. For example, a value of '1' indicates 100%. A value of '.153' indicates 15.3%.</td>
</tr>
<tr>
<td>QUANTILENO</td>
<td>SMALLINT NOT NULL</td>
<td>The ordinary sequence number of a quantile in the whole consecutive value range, from low to high. This column is not updatable. For TYPE='L', this column contains the column number. For TYPE='P', the column contains the partition number.</td>
</tr>
<tr>
<td>LOWVALUE</td>
<td>VARCHAR(2000) NOT NULL FOR BIT DATA</td>
<td>For TYPE='H', this is the lower bound for the quantile indicated by the value of the QUANTILENO column. Not used if the value of the TYPE column is not 'H'. This column is not updatable.</td>
</tr>
<tr>
<td>HIGHVALUE</td>
<td>VARCHAR(2000) NOT NULL FOR BIT DATA</td>
<td>For TYPE='H', this is the higher bound for the quantile indicated by the value of the QUANTILENO column. This column is not used if the value of the TYPE column is not 'H'. This column is not updatable.</td>
</tr>
</tbody>
</table>
PSPI

Dynamic collection of index filtering estimates (DB2 Performance)
DSN_DETCOST_TABLE

The detailed cost table, DSN_DETCOST_TABLE, contains information about detailed cost estimation of the mini-plans in a query.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Important:** EXPLAIN tables in any pre-Version 8 format or EXPLAIN tables that are encoded in EBCDIC are not supported.

**Qualifiers**

Your subsystem or data sharing group can contain more than one of these tables:

**SYSIBM**

One instance of each EXPLAIN table can be created with the SYSIBM qualifier. SQL optimization tools use these tables. These tables are created when you run job DSNTIJSG during DB2 installation or migration.

**userID**

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind, or rebind, a plan or package with the EXPLAIN(YES) option. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTEC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTEC of the SDSNSAMP library.
Column descriptions

The following table describes the columns of DSN_DETCOST_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows not produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.</td>
</tr>
<tr>
<td>QBLOCKNO</td>
<td>SMALLINT NOT NULL</td>
<td>A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.</td>
</tr>
<tr>

The filter table, DSN_FILTER_TABLE, contains information about how predicates are used during query processing.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Important:** EXPLAIN tables in any pre-Version 8 format or EXPLAIN tables that are encoded in EBCDIC are not supported.

**Qualifiers**

Your subsystem or data sharing group can contain more than one of these tables:

**SYSIBM**

One instance of each EXPLAIN table can be created with the SYSIBM qualifier. SQL optimization tools use these tables. These tables are created when you run job DSNTIJSG during DB2 installation or migration.

**userID**

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind, or rebind, a plan or package with the EXPLAIN(YES) option. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.
Column descriptions

The following table describes the columns of DSN_FILTER_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows not produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>DB2 assigns a number that is based on the line number of the SQL statement in the source program.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.</td>
</tr>
<tr>
<td>QBLOCKNO</td>
<td>SMALLINT NOT NULL</td>
<td>A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.</td>
</tr>
<tr>
<td>PLANNO</td>
<td>SMALLINT</td>
<td>The plan number, a number used to identify each miniplan with a query block.</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.</td>
</tr>
<tr>
<td>PROGNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.</td>

<td></td>
<td>When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.</td>
</tr>
<tr>
<td>Column name</td>
<td>Data type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>GROUP_MEMBER</td>
<td>VARCHAR(24) NOT NULL WITH DEFAULT</td>
<td>The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.</td>
</tr>
</tbody>
</table>
| EXPLAIN_TIME | TIMESTAMP NOT NULL WITH DEFAULT | The time when the EXPLAIN information was captured:  
  | | **All cached statements**  
  | | When the statement entered the cache, in the form of a full-precision timestamp value.  
  | | **Non-cached static statements**  
  | | When the statement was bound, in the form of a full precision timestamp value.  
  | | **Non-cached dynamic statements**  
  | | When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros. |
| SCHEMA_NAME  | VARCHAR(128) NOT NULL WITH DEFAULT | The schema name of the function invoked in the explained statement. |
| FUNCTION_NAME| VARCHAR(128) NOT NULL WITH DEFAULT | The name of the function invoked in the explained statement. |
| SPEC_FUNC_NAME| VARCHAR(128) NOT NULL WITH DEFAULT | The specific name of the function invoked in the explained statement. |
| FUNCTION_TYPE| CHAR(2) NOT NULL WITH DEFAULT | The type of function invoked in the explained statement. Possible values are:  
  | | **CU** Column function  
  | | **SU** Scalar function  
<p>| | <strong>TU</strong> Table function |
| VIEW_CREATOR | VARCHAR(128) NOT NULL WITH DEFAULT | If the function specified in the FUNCTION_NAME column is referenced in a view definition, the creator of the view. Otherwise, blank. |
| VIEW_NAME    | VARCHAR(128) NOT NULL WITH DEFAULT | If the function specified in the FUNCTION_NAME column is referenced in a view definition, the name of the view. Otherwise, blank. |
| PATH         | VARCHAR(2048) NOT NULL WITH DEFAULT | The value of the SQL path that was used to resolve the schema name of the function. |
| FUNCTION_TEXT| VARCHAR(1500) NOT NULL WITH DEFAULT | The text of the function reference (the function name and parameters). If the function reference is over 100 bytes, this column contains the first 100 bytes. For functions specified in infix notation, FUNCTION_TEXT contains only the function name. For example, for a function named <code>/</code>, which overloads the SQL divide operator, if the function reference is <code>A/B</code>, FUNCTION_TEXT contains only <code>/</code>. |
| FUNC_VERSION | VARCHAR(122) NOT NULL WITH DEFAULT | For a version of a non-inline SQL scalar function, this column contains the version identifier. For all other cases, this column contains a zero length string. A version of a non-inline SQL scalar function is defined in the SYSIBM.SYSROUTINES table with ORIGIN='Q', FUNCTION_TYPE='S', INLINE='N', and VERSION column containing the version identifier. |
| SECURE       | CHAR(1) NOT NULL WITH DEFAULT | Whether the user-defined function is secure. |</p>
<table>

Your subsystem or data sharing group can contain more than one of these tables:

**SYSIBM**

One instance of each EXPLAIN table can be created with the SYSIBM qualifier. SQL optimization tools use these tables. These tables are created when you run job DSNTIJSG during DB2 installation or migration.

**userID**

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind, or rebind, a plan or package with the EXPLAIN(YES) option. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.
## Column descriptions

The following table describes the columns of DSN_PGRANGE_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The number specified in the QUERYNO clause, which is an optional part of the SQL statement syntax.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows not produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>DB2 assigns a number that is based on the line number of the SQL statement in the source program.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.</td>
</tr>
<tr>
<td>QBLOCKNO</td>
<td>SMALLINT NOT NULL</td>
<td>A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.</td>
</tr>
<tr>
<td>TABNO</td>
<td>SMALLINT NOT NULL</td>
<td>The table number, a number which uniquely identifies the corresponding table reference within a query.</td>
</tr>
<tr>
<td>RANGE</td>
<td>SMALLINT NOT NULL</td>
<td>The sequence number of the current page range.</td>
</tr>
<tr>
<td>FIRSTPART</td>
<td>SMALLINT NOT NULL</td>
<td>The starting partition in the current page range.</td>
</tr>
<tr>
<td>LASTPART</td>
<td>SMALLINT NOT NULL</td>
<td>The ending partition in the current page range.</td>
</tr>
<tr>
<td>NUMPARTS</td>
<td>SMALLINT NOT NULL</td>
<td>The number of partitions in the current page range.</td>
</tr>
<tr>
<td>EXPLAIN_TIME</td>
<td>TIMESTAMP NOT NULL</td>
<td>The time when the EXPLAIN information was captured:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>All cached statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the statement entered the cache, in the form of a full-precision timestamp value.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Non-cached static statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the statement was bound, in the form of a full precision timestamp value.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Non-cached dynamic statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.</td>
</tr>
<tr>
<td>GROUP_MEMBER</td>
<td>VARCHAR(24) NOT NULL</td>
<td>The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.</td>
</tr>
</tbody>
</table>
### Table 183. DSN_PGRANGE_TABLE description (continued)

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SECTNOI</td>
<td>INTEGER NOT NULL WITH DEFAULT</td>
<td>The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>VARCHAR(24) NOT NULL WITH DEFAULT</td>
<td>The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.</td>
</tr>
<tr>
<td>PROGNAME</td>
<td>VARCHAR(128) NOT NULL WITH DEFAULT</td>
<td>The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.</td>
</tr>
</tbody>
</table>
| COLLID      | VARCHAR(128) NOT NULL WITH DEFAULT | The collection ID:  
  - **DSNDYNAMICSQLCACHE**  
    The row originates from the dynamic statement cache  
  - **DSNEXPLAINMODEYES**  
    The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register.  
  - **DSNEXPLAINMODEEXPLAIN**  
    The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register.  
  When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank. |
| VERSION     | VARCHAR(122) NOT NULL WITH DEFAULT | The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank. |
DSN_PGROUP_TABLE

The parallel group table, DSN_PGROUP_TABLE, contains information about the parallel groups in a query.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Important:** EXPLAIN tables in any pre-Version 8 format or EXPLAIN tables that are encoded in EBCDIC are not supported.

**Qualifiers**

Your subsystem or data sharing group can contain more than one of these tables:

**SYSIBM**

One instance of each EXPLAIN table can be created with the SYSIBM qualifier. SQL optimization tools use these tables. These tables are created when you run job DSNTIJSG during DB2 installation or migration.

**userID**

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind, or rebind, a plan or package with the EXPLAIN(YES) option. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.</td>
</tr>
<tr>
<td>GROUPID</td>
<td>SMALLINT NOT NULL</td>
<td>The parallel group identifier within the current query block.</td>
</tr>
<tr>
<td>FIRSTPLAN</td>
<td>SMALLINT NOT NULL</td>
<td>The plan number of the first contributing mini-plan associated within this parallel group.</td>
</tr>
<tr>
<td>LASTPLAN</td>
<td>SMALLINT NOT NULL</td>
<td>The plan number of the last mini-plan associated within this parallel group.</td>
</tr>
<tr>
<td>CPUコスト</td>
<td>REAL NOT NULL</td>
<td>The estimated total CPU cost of this parallel group in milliseconds.</td>
</tr>
<tr>
<td>IOCOST</td>
<td>REAL NOT NULL</td>
<td>The estimated total I/O cost of this parallel group in milliseconds.</td>
</tr>
<tr>
<td>BESTTIME</td>
<td>REAL NOT NULL</td>
<td>The estimated elapsed time for each parallel task for this parallel group.</td>
</tr>
<tr>
<td>DEGREE</td>
<td>SMALLINT NOT NULL</td>
<td>The degree of parallelism for this parallel group determined at bind time. Max parallelism degree if the Table space is large is 255, otherwise 64.</td>
</tr>
<tr>
<td>MODE</td>
<td>CHAR(1) NOT NULL</td>
<td>The parallel mode:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'C'  CPU parallelism</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'X'  multiple CPU SyspleX parallelism (highest level)</td>
</tr>
<tr>
<td>REASON</td>
<td>SMALLINT NOT NULL</td>
<td>The reason code for downgrading parallelism mode.</td>
</tr>
<tr>
<td>LOCALCPU</td>
<td>SMALLINT NOT NULL</td>
<td>The number of CPUs currently online when preparing the query.</td>
</tr>
<tr>
<td>TOTALCPU</td>
<td>SMALLINT NOT NULL</td>
<td>The total number of CPUs in Sysplex. LOCALCPU and TOTALCPU are different only for the DB2 coordinator in a Sysplex.</td>
</tr>
<tr>
<td>Column name</td>
<td>Data type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>FIRSTBASE</td>
<td>SMALLINT</td>
<td>The table number of the table that partitioning is performed on.</td>
</tr>
<tr>
<td>LARGETS</td>
<td>CHAR(1)</td>
<td>'Y' if the TableSpace is large in this group.</td>
</tr>
</tbody>
</table>
| PARTKIND    | CHAR(1)   | The partitioning type:  
|             |           | 'L' Logical partitioning  
|             |           | 'P' Physical partitioning |
| GROUPTYPE   | CHAR(3)   | Determines what operations this parallel group contains: table Access, Join, or Sort 'A' 'AJ' 'AJS' |
| ORDER       | CHAR(1)   | The ordering requirement of this parallel group:  
|             |           | 'N' No order. Results need no ordering.  
|             |           | 'T' Natural Order. Ordering is required but results already ordered if accessed via index.  
|             |           | 'K' Key Order. Ordering achieved by sort. Results ordered by sort key. This value applies only to parallel sort. |
| STYLE       | CHAR(4)   | The Input/Output format style of this parallel group. Blank for IO Parallelism. For other modes:  
|             |           | 'RIRO' Records IN, Records OUT  
|             |           | 'WIRO' Work file IN, Records OUT

</table>
**DSN_PREDICAT_TABLE**

The predicate table, DSN_PREDICAT_TABLE, contains information about all of the predicates in a query.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Important:** EXPLAIN tables in any pre-Version 8 format or EXPLAIN tables that are encoded in EBCDIC are not supported.

**Qualifiers**

Your subsystem or data sharing group can contain more than one of these tables:

**SYSIBM**

One instance of each EXPLAIN table can be created with the SYSIBM qualifier. SQL optimization tools use these tables. These tables are created when you run job DSNTIJSG during DB2 installation or migration.

**userId**

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind, or rebind, a plan or package with the EXPLAIN(YES) option. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.
## Column descriptions

The following table describes the columns of the DSN_PREDICAT_TABLE

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>
**DSN_PTASK_TABLE**

The parallel tasks table, DSN_PTASK_TABLE, contains information about all of the parallel tasks in a query.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Important:** EXPLAIN tables in any pre-Version 8 format or EXPLAIN tables that are encoded in EBCDIC are not supported.

**Qualifiers**

Your subsystem or data sharing group can contain more than one of these tables:

**SYSIBM**

One instance of each EXPLAIN table can be created with the SYSIBM qualifier. SQL optimization tools use these tables. These tables are created when you run job DSNTIJSG during DB2 installation or migration.

**userID**

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind, or rebind, a plan or package with the EXPLAIN(YES) option. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.
# Column descriptions

The following table describes the columns of DSN_PTASK_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
</table>
| QUERYNO     | INTEGER NOT NULL | A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: 
  **For rows produced by EXPLAIN statements** 
  The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. 
  **For rows not produced by EXPLAIN statements** 
  DB2 assigns a number that is based on the line number of the SQL statement in the source program. 
  When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. 
  When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure. |
| QBLOCKNO    | SMALLINT NOT NULL | A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive. |
| APPLNAME    | VARCHAR(24) NOT NULL | The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. 
  When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank. |
| PROGNAME    | VARCHAR(128) NOT NULL | The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. 
  When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank. |
| LPTNO       | SMALLINT NOT NULL | The parallel task number. |
| KEYCOLID    | SMALLINT        | The key column ID (KEY range only). |
| DPSI        | CHAR(1) NOT NULL | Indicates if a data partition secondary index (DPSI) is used. |
| LPTLOKEY    | VARCHAR(40) FOR BIT DATA | The low key value for this key column for this parallel task (KEY range only). |
| LPTHIKEY    | VARCHAR(40) FOR BIT DATA | The high key value for this key column for this parallel task (KEY range only). |
| LPTLOPAG    | CHAR(4) FOR BIT DATA | The low page information if partitioned by page range. |

**Notes:**

1. The name of these columns originally contained the # symbol as the last character in the names. However, the names that contain these characters are obsolete and are no longer supported.
DSN_QUERYINFO_TABLE

The query information table, DSN_QUERYINFO_TABLE, contains information about the eligibility of query blocks for automatic query rewrite, information about the materialized query tables that are considered for eligible query blocks, reasons why ineligible query blocks are not eligible, and information about acceleration of query blocks.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Important: EXPLAIN tables in any pre-Version 8 format or EXPLAIN tables that are encoded in EBCDIC are not supported.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

userID    You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind, or rebind, a plan or package with the EXPLAIN(YES) option. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

<td>VERSION</td>
<td>VARCHAR(122) NOT NULL</td>
<td>The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.</td>
</tr>
</tbody>
</table>
| COLLID      | VARCHAR(128) NOT NULL | The collection ID:  
  DSNDYNAMICSQLCACHE  
  The row originates from the dynamic statement cache  
  DSNEXPLAINMODEYES  
  The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register.  
  DSNEXPLAINMODEEXPLAIN  
  The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register.  
  When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank. |
| GROUP_MEMBER| VARCHAR(24) NOT NULL | The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.                                                                                                                                  |
| SECTNOI     | INTEGER NOT NULL WITH DEFAULT | The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier. |
| EXPLAIN_TIME| TIMESTAMP NOT NULL | The time when the EXPLAIN information was captured:  
  All cached statements  
  When the statement entered the cache, in the form of a full-precision timestamp value.  
  Non-cached static statements  
  When the statement was bound, in the form of a full precision timestamp value.  
  Non-cached dynamic statements  
  When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros. |
| TYPE        | CHAR(8) NOT NULL WITH DEFAULT | The type of the output for this row:  
  A  
  This row is for a query that DB2 attempts to run on an accelerator server. The value in column REASON_CODE indicates the outcome. |
| QI_DATA     | CLOB(2M) NOT NULL WITH DEFAULT | When TYPE='A':  
  • For REASON_CODE values other than 0, this value is the description of the REASON_CODE value.  
  • For a REASON_CODE value of 0, this value is the query text, after it is converted for processing by the accelerator. |
### Table 187. Descriptions of columns in DSN_QUERYINFO_TABLE (continued)

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SERVICE_INFO</td>
<td>BLOB(2M) NOT NULL</td>
<td>IBM internal use only.</td>
</tr>
<tr>
<td></td>
<td>WITH DEFAULT</td>
<td></td>
</tr>
<tr>
<td>QB_INFO_ROWID</td>
<td>ROWID NOT NULL</td>
<td>IBM internal use only.</td>
</tr>
<tr>
<td></td>
<td>GENERATED ALWAYS</td>
<td></td>
</tr>
</tbody>
</table>

**Notes:**

1. The REASON_CODE column has the following values:

   0  The query block qualifies for routing to an accelerator server. The values of QINAME1 and QINAME2 identify the accelerator server.

   For example, for version 1 of the IBM DB2 Analytics Accelerator for z/OS, the associated data mart name is recorded in the QINAME2 column, with the following naming convention: data-mart-name@accelerator-name@digits.

   1  No active accelerator server was found when EXPLAIN was executed.

   2  Special register CURRENT QUERY ACCELERATION is set to NONE.

   3  DB2 classified the query as a short-running query, or DB2 determined that sending the query to an accelerator server provided no performance advantage.

   4  The query is not read-only.

   6  The cursor is defined as a scrollable cursor or rowset cursor.

   7  The query references objects with multiple encoding schemes.

   8  The FROM clause of the query specifies a data change table reference.

   9  The query contains a table expression with one or more correlated references to other tables in the same FROM clause.

   10 The query contains a reference to a recursive common table expression.

   11 The query contains an unsupported expression. The text of the expression is in QI_DATA.

   12 The query references a table that meets one of the following conditions:

       • The table is not defined in the accelerator server.
       • The table is defined in the accelerator server, but is not enabled for processing by an accelerator.

   13 The accelerator server that contains the tables that are referenced by the query is not started.

   14 A column that is referenced in the query was altered by DB2 after the data was loaded in the accelerator server.

   900-999   For IBM internal use only.
Related reference:

[Information about one example of an IBM version 2 accelerator product]
DSN_QUERY_TABLE

The query table, DSN_QUERY_TABLE, contains information about a SQL statement, and displays the statement before and after query transformation.

Unlike other EXPLAIN tables, rows in DSN_QUERY_TABLE are not populated for static SQL statements at BIND or REBIND with the EXPLAIN(YES) option.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Important: EXPLAIN tables in any pre-Version 8 format or EXPLAIN tables that are encoded in EBCDIC are not supported.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM

One instance of each EXPLAIN table can be created with the SYSIBM qualifier. SQL optimization tools use these tables. These tables are created when you run job DSNTIJSG during DB2 installation or migration.

userID

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind, or rebind, a plan or package with the EXPLAIN(YES) option. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

<td>Data type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>APPLNAME</strong></td>
<td>VARCHAR(24) NOT NULL WITH DEFAULT</td>
<td>The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.</td>
</tr>
<tr>
<td><strong>PROGNAME</strong></td>
<td>VARCHAR(128) NOT NULL WITH DEFAULT</td>
<td>The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.</td>
</tr>
</tbody>
</table>
| **COLLID** | VARCHAR(128) NOT NULL WITH DEFAULT | The collection ID:  
**DSNDYNAMICSQ LCACHE**  
The row originates from the dynamic statement cache  
**DSNEXPLAINMODEYES**  
The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register.  
**DSNEXPLAINMODEEXPLAIN**  
The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank. |
| **VERSION** | VARCHAR(122) NOT NULL WITH DEFAULT | The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank. |
**DSN_SORTKEY_TABLE**

The sort key table, DSN_SORTKEY_TABLE, contains information about sort keys for all of the sorts required by a query.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Important:** EXPLAIN tables in any pre-Version 8 format or EXPLAIN tables that are encoded in EBCDIC are not supported.

**Qualifiers**

Your subsystem or data sharing group can contain more than one of these tables:

**SYSIBM**

One instance of each EXPLAIN table can be created with the SYSIBM qualifier. SQL optimization tools use these tables. These tables are created when you run job DSNTIJSG during DB2 installation or migration.

**userID**

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind, or rebind, a plan or package with the EXPLAIN(YES) option. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.
Column descriptions

The following table describes the columns of DSN_SORTKEY_TABLE.

Table 189. DSN_SORTKEY_TABLE description

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>

</tbody>
</table>
The statement cache table, DSN_STATEMENT_CACHE_TABLE, contains information about the SQL statements in the statement cache, information captured as the results of an EXPLAIN STATEMENT CACHE ALL statement.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Important:** EXPLAIN tables in any pre-Version 8 format or EXPLAIN tables that are encoded in EBCDIC are not supported.

**Qualifiers**

Your subsystem or data sharing group can contain more than one of these tables:

- **SYSIBM**
  
  One instance of each EXPLAIN table can be created with the SYSIBM qualifier. SQL optimization tools use these tables. These tables are created when you run job DSNTIJSG during DB2 installation or migration.

- **userID**
  
  You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind, or rebind, a plan or package with the EXPLAIN(YES) option. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

**Column descriptions**

The following table shows the descriptions of the columns in DSN_STATEMENT_CACHE_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STMT_ID</td>
<td>INTEGER NOT NULL</td>
<td>The statement ID; this value is the EDM unique token for the statement.</td>
</tr>
<tr>
<td>STMT_TOKEN</td>
<td>VARCHAR(240)</td>
<td>The statement token; you provide this value as an identification string.</td>
</tr>
<tr>
<td>Column name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>

<tr>
<td></td>
<td></td>
<td>The row originates from an application that specifies</td>
</tr>
<tr>
<td></td>
<td></td>
<td>YES for the value of the CURRENT EXPLAIN MODE special register.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>DSNEXPLAINMODEEXPLAIN</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The row originates from an application that specifies</td>
</tr>
<tr>
<td></td>
<td></td>
<td>EXPLAIN for the value of the CURRENT EXPLAIN MODE special register.</td>
</tr>
<tr>
<td>PROGRAM_NAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the package that performed the initial PREPARE for the statement.</td>
</tr>
<tr>
<td>INV_DROPALT</td>
<td>CHAR(1) NOT NULL</td>
<td>This column indicates if the statement has been invalidated by a DROP or ALTER statement.</td>
</tr>
<tr>
<td>INV_REVOKE</td>
<td>CHAR(1) NOT NULL</td>
<td>This column indicates if the statement has been invalidated by a REVOKE statement.</td>
</tr>
<tr>
<td>INV_LRU</td>
<td>CHAR(1) NOT NULL</td>
<td>This column indicates if the statement has been removed from the cache by LRU.</td>
</tr>
<tr>
<td>INV_RUNSTATS</td>
<td>CHAR(1) NOT NULL</td>
<td>This column indicates if the statement has been invalidated by RUNSTATS.</td>
</tr>
<tr>
<td>CACHED_TS</td>
<td>TIMESTAMP NOT NULL</td>
<td>The timestamp when the statement was stored in the dynamic statement cache.</td>
</tr>
<tr>
<td>USERS</td>
<td>INTEGER NOT NULL</td>
<td>The number of current users of the statement. This number indicates the users that have prepared or run the statement during their current unit of work.</td>
</tr>
<tr>
<td>COPIES</td>
<td>INTEGER NOT NULL</td>
<td>The number of copies of the statement that are owned by all threads in the system.</td>
</tr>
<tr>
<td>LINES</td>
<td>INTEGER NOT NULL</td>
<td>The precompiler line number from the initial PREPARE of the statement.</td>
</tr>
<tr>
<td>PRIMAUTH</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The primary authorization ID that did the initial PREPARE of the statement.</td>
</tr>
<tr>
<td>CURSQLID</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The CURRENT SQLID that did the initial PREPARE of the statement.</td>
</tr>
<tr>
<td>BIND_QUALIFIER</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The BIND qualifier. For unqualified table names, this is the object qualifier.</td>
</tr>
<tr>
<td>BIND_ISO</td>
<td>CHAR(2) NOT NULL</td>
<td>The value of the ISOLATION BIND option that is in effect for this statement. The value will be one of the following values:</td>
</tr>
<tr>

</tbody>
</table>

Notes:
1. If the specified value exceeds 2147483647, the column contains the value 2147483647.
2. Statistics are cumulative, across executions of the same statement, and across threads, if the value of COLLID is DSNDYNAMICSQLCACHE. If the value of COLLID is DSNEXPLAINMODEYES, the values are for a single run of the statement only. If the value of COLLID is DSNEXPLAINMODE EXPLAIN, the values of all statistics columns are 0.
3. The column is not applicable when the value of the COLLID column is ‘DSNEXPLAINMODEYES’ or ‘DSNEXPLAINMODEEXPLAIN’
**DSN_STATEMNT_TABLE**

The statement table, DSN_STATEMNT_TABLE, contains information about the estimated cost of specified SQL statements.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Important:** EXPLAIN tables in any pre-Version 8 format or EXPLAIN tables that are encoded in EBCDIC are not supported.

**Qualifiers**

Your subsystem or data sharing group can contain more than one of these tables:

**SYSIBM**

One instance of each EXPLAIN table can be created with the SYSIBM qualifier. SQL optimization tools use these tables. These tables are created when you run job DSNTIJSG during DB2 installation or migration.

**userID**

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind, or rebind, a plan or package with the EXPLAIN(YES) option. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.
## Column descriptions

The following table describes the content of each column in STATEMNT_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>

DSN_STRUCT_TABLE

The structure table, DSN_STRUCT_TABLE, contains information about all of the query blocks in a query.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Important:** EXPLAIN tables in any pre-Version 8 format or EXPLAIN tables that are encoded in EBCDIC are not supported.

**Qualifiers**

Your subsystem or data sharing group can contain more than one of these tables:

**SYSIBM**

One instance of each EXPLAIN table can be created with the SYSIBM qualifier. SQL optimization tools use these tables. These tables are created when you run job DSNTIJSG during DB2 installation or migration.

**userID**

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind, or rebind, a plan or package with the EXPLAIN(YES) option. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.
## Column descriptions

The following table describes the columns of DSN_STRUCT_TABLE

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
</table>
| QUERYNO     | INTEGER NOT NULL | A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:  
**For rows produced by EXPLAIN statements**  
The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.  
**For rows not produced by EXPLAIN statements**  
DB2 assigns a number that is based on the line number of the SQL statement in the source program.  
When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.  
When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure. |
| QBLOCKNO    | SMALLINT NOT NULL | A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive. |
| APPLNAME    | VARCHAR(24) NOT NULL | The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.  
When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank. |
| PROGNAME    | VARCHAR(128) NOT NULL | The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.  
When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank. |
<p>| PARENT      | SMALLINT NOT NULL | The parent query block number of the current query block in the structure of SQL text; this is the same as the PARENT_QBLOCKNO in PLAN_TABLE. |
| TIMES       | FLOAT NOT NULL | The estimated number of rows returned by Data Manager; also the estimated number of times this query block is executed. |
| ROWCOUNT    | INTEGER NOT NULL | The estimated number of rows returned by RDS (Query Cardinality). |
| ATOPEN      | CHAR(1) NOT NULL | Whether the query block is moved up for do-at-open processing; 'Y' if done-at-open; 'N': otherwise. |</p>
<table>

DSN_VIEWREF_TABLE

The view reference table, DSN_VIEWREF_TABLE, contains information about all of the views and materialized query tables that are used to process a query.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Important:** EXPLAIN tables in any pre-Version 8 format or EXPLAIN tables that are encoded in EBCDIC are not supported.

**Qualifiers**

Your subsystem or data sharing group can contain more than one of these tables:

**SYSIBM**

One instance of each EXPLAIN table can be created with the SYSIBM qualifier. SQL optimization tools use these tables. These tables are created when you run job DSNTIJSG during DB2 installation or migration.

**userID**

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind, or rebind, a plan or package with the EXPLAIN(YES) option. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.
## Column descriptions

The following table describes the columns of DSN_VIEWREF_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
</table>
| QUERYNO     | INTEGER NOT NULL WITH DEFAULT | A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: 

**For rows produced by EXPLAIN statements**

The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.

**For rows not produced by EXPLAIN statements**

DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.

When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure. |
<p>| APPLNAME    | VARCHAR(24) NOT NULL WITH DEFAULT | The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank. |
| PROGNAME    | VARCHAR(128) NOT NULL WITH DEFAULT | The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank. |
| VERSION     | VARCHAR(122) NOT NULL WITH DEFAULT | The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank. |</p>

</table>
Tables that are used by accelerators

For interaction between DB2 and accelerator servers, DB2 requires tables that record characteristics of those accelerator servers.
Table spaces and indexes for accelerators

Tables that are used for accelerators are contained in certain table spaces and have indexes.

The following table lists the table space and indexes for each table that is used for accelerators, and lists the index fields for each index. The indexes are in ascending order, except where noted.

Table 195. Table spaces and indexes for the tables that are used for accelerators

<table>
<thead>

</table>

Using the catalog in database design

Retrieving information from the catalog by using SQL statements, can be helpful in designing your relational database.

DB2 SQL Reference lists all the DB2 catalog tables and the information stored in them.

The information in the catalog is vital to normal DB2 operation. You can retrieve catalog information, but changing it can have serious consequences. Therefore you cannot execute insert or delete operations that affect the catalog, and only a limited number of columns exist that you can update. Exceptions to these restrictions are
the SYSIBM.SYSSTRINGS, SYSIBM.SYSCOLDIST, and SYSIBM.SYSCOLDISTSTATS catalog tables, into which you can insert rows and proceed to update and delete rows.

To retrieve information from the catalog, you need at least the SELECT privilege on the appropriate catalog tables.

**Note:** Some catalog queries can result in long table space scans.

### Retrieving catalog information about DB2 storage groups

Query SYSIBM.SYSTOGROUP and SYSIBM.SYSVOLUMES to obtain information about DB2 storage groups and the volumes in those storage groups.

SYSIBM.SYSTOGROUP and SYSIBM.SYSVOLUMES contain information about DB2 storage groups and the volumes in those storage groups. The following query shows what volumes are in a DB2 storage group, how much space is used, and when that space was last calculated.

```sql
SELECT SGNAME, VOLID, SPACE, SPCDATE
FROM SYSIBM.SYSVOLUMES, SYSIBM.SYSTOGROUP
WHERE SGNAME = NAME
ORDER BY SGNAME;
```

### Retrieving catalog information about a table

Query SYSIBM.SYSTABLES to obtain information about every table, view, and alias in your DB2 system.

SYSIBM.SYSTABLES contains a row for every table, view, and alias in your DB2 system. Each row tells you whether the object is a table, a view, or an alias, its name, who created it, what database it belongs to, what table space it belongs to, and other information. SYSTABLES also has a REMARKS column in which you can store your own information about the table in question.

See ["Adding and retrieving comments" on page 2384](#) for more information about how to do this.

The following statement displays all the information for the project activity sample table:

```sql
SELECT *
FROM SYSIBM.SYSTABLES
WHERE NAME = 'PROJACT'
AND CREATOR = 'DSN81010';
```

### Retrieving catalog information about partition order

Query SYSIBM.SYSTABLEPART to obtain information about the key order or logical partition order of a table.
The LOGICAL_PART column in SYSIBM.SYSTABLEPART contains information for key order or logical partition order.

The following statement displays information on partition order in ascending limit value order:
```
SELECT LIMITKEY, PARTITION
FROM SYSIBM.SYSTABLEPART
ORDER BY LOGICAL_PART;
```

Retrieving catalog information about aliases
Query SYSIBM.SYSTABLES to obtain information about aliases.

Three columns in SYSIBM.SYSTABLES are used only for aliases:
- LOCATION contains your subsystem's location name for the remote system, if the object on which the alias is defined resides at a remote subsystem.
- TBCREATOR contains the schema table or view.
- TBNAME contains the name of the table or the view.

These sample user-defined functions make it easy to find information about aliases. See DB2 SQL Reference for more information.
- TABLE_NAME returns the name of a table, view, or undefined object found after resolving aliases for a user-specified object.
- TABLE_SCHEMA returns the schema name of a table, view, or undefined object found after resolving aliases for a user-specified object.
- TABLE_LOCATION returns the location name of a table, view, or undefined object found after resolving aliases for a user-specified object.

The NAME and CREATOR columns of SYSTABLES contain the name and schema of the alias, and three other columns contain the following information for aliases:
- TYPE is A.
- DBNAME is DSND06.
- TSNAME is SYSTSTAB.

If similar tables at different locations have names with the same second and third parts, you can retrieve the aliases for them with a query like this one:
```
SELECT LOCATION, CREATOR, NAME
FROM SYSIBM.SYSTABLES
WHERE TBCREATOR='DSN81010' AND TBNAME='EMP'
AND TYPE='A';
```

Retrieving catalog information about columns
Query SYSIBM.SYSCOLUMNS to obtain information about the columns of a table or view.
SYSIBM.SYSCOLUMNS has one row for each column of every table and view. Query it, for example, if you cannot remember the column names of a table or view.

The following statement retrieves information about columns in the sample department table:

```sql
SELECT NAME, TBNAME, COLTYPE, LENGTH, NULLS, DEFAULT 
FROM SYSIBM.SYSCOLUMNS 
WHERE TBNAME='DEPT' 
AND TBCREATOR = 'DSN81010';
```

The result is shown below; for each column, the following information about each column is given:
• The column name
• The name of the table that contains it
• Its data type
• Its length attribute
• Whether it allows nulls
• Whether it allows default values

<table>
<thead>
<tr>
<th>NAME</th>
<th>TBNAME</th>
<th>COLTYPE</th>
<th>LENGTH</th>
<th>NULLS</th>
<th>DEFAULT</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEPTNO</td>
<td>DEPT</td>
<td>CHAR</td>
<td>3</td>
<td>N</td>
<td>N</td>
</tr>
<tr>
<td>DEPTNAME</td>
<td>DEPT</td>
<td>VARCHAR</td>
<td>36</td>
<td>N</td>
<td>N</td>
</tr>
<tr>
<td>MGRNO</td>
<td>DEPT</td>
<td>CHAR</td>
<td>6</td>
<td>Y</td>
<td>N</td>
</tr>
<tr>
<td>ADMRDEPT</td>
<td>DEPT</td>
<td>CHAR</td>
<td>3</td>
<td>N</td>
<td>N</td>
</tr>
</tbody>
</table>

For LOB columns, the LENGTH column shows the length of the pointer to the LOB. For an example of a query showing the actual LOB length, see “Retrieving catalog information about LOBs” on page 2383.

### Retrieving catalog information about indexes

Query SYSIBM.SYSINDEXES to obtain information about indexes.

SYSIBM.SYSINDEXES contains a row for every index, including indexes on catalog tables. The following example retrieves a row about an index named XEMPL2.

```sql
SELECT * 
FROM SYSIBM.SYSINDEXES 
WHERE NAME = 'XEMPL2' 
AND CREATOR = 'DSN81010';
```

A table can have more than one index. To display information about all the indexes of a table, enter a statement like this one:

```sql
SELECT * 
FROM SYSIBM.SYSINDEXES 
WHERE TBNAME = 'EMP' 
AND TBCREATOR = 'DSN81010';
```
Retrieving catalog information about views

For every view you create, DB2 stores descriptive information in several catalog tables. Query these catalog tables to obtain information about views in your database.

The following actions occur in the catalog after the execution of CREATE VIEW:

- A row is inserted into SYSIBM.SYSTABLES.
- A row is inserted into SYSIBM.SYSTABAUTH to record the owner's privileges on the view.
- For each column of the view, a row is inserted into SYSIBM.SYSCOLUMNS.
- One or more rows are inserted into the SYSIBM.SYSVIEWS table to record the text of the CREATE VIEW statement.
- For each table or view on which the view is dependent, a row is inserted into SYSIBM.SYSVIEWDEP to record the dependency.

Users might want a view of one or more of those tables, containing information about their own tables and views.

Retrieving catalog information about authorizations

Query SYSIBM.SYSTABAUTH to obtain information about who can access your data.

SYSIBM.SYSTABAUTH contains information about the privileges held by authorization IDs over tables and views.

The following query retrieves the names of all users who have been granted access to the DSN81010.DEPT table.

```sql
SELECT GRANTEE
FROM SYSIBM.SYSTABAUTH
WHERE TNAME = 'DEPT'
  AND GRANTEEETYPE <> 'P'
  AND TCREATOR = 'DSN81010';
```

GRANTEE is the name of the column that contains authorization IDs for users of tables. TNAME and TCREATOR specify the DSN81010.DEPT table. The clause GRANTEEETYPE <> 'P' ensures that you retrieve the names only of users (not application plans or packages) that have authority to access the table.

Retrieving catalog information about primary keys

Query SYSIBM.SYSCOLUMNS for information about primary keys.
SYSIBM.SYSCOLUMNS identifies columns of a primary key in column KEYSEQ; a nonzero value indicates the place of a column in the primary key. To retrieve the creator, database, and names of the columns in the primary key of the sample project activity table using SQL statements, execute:

```
SELECT TBCREATOR, TBNAME, NAME, KEYSEQ
FROM SYSIBM.SYSCOLUMNS
WHERE TBCREATOR = 'DSN81010'
AND TBNAME = 'PROJACT'
AND KEYSEQ > 0
ORDER BY KEYSEQ;
```

SYSIBM.SYSINDEXES identifies the primary index of a table by the value P in column UNIQUERULE. To find the name, creator, database, and index space of the primary index on the project activity table, execute:

```
SELECT TBCREATOR, TBNAME, NAME, CREATOR, DBNAME, INDEXSPACE
FROM SYSIBM.SYSINDEXES
WHERE TBCREATOR = 'DSN81010'
AND TBNAME = 'PROJACT'
AND UNIQUERULE = 'P';
```

### Retrieving catalog information about foreign keys

Query SYSIBM.SYSRELS and SYSIBM.SYSFOREIGNKEYS to obtain information about referential constraints and the columns of the foreign key that defines the constraint.

SYSIBM.SYSRELS contains information about referential constraints, and each constraint is uniquely identified by the schema and name of the dependent table and the constraint name (RELNAME). SYSIBM.SYSFOREIGNKEYS contains information about the columns of the foreign key that defines the constraint. To retrieve the constraint name, column names, and parent table names for every relationship in which the project table is a dependent, execute:

```
SELECT A.CREATOR, A.TBNAME, A.RELNAME, B.COLNAME, B.COLSEQ,
A.REFTBCREATOR, A.REFTBNAME
FROM SYSIBM.SYSRELS A, SYSIBM.SYSFOREIGNKEYS B
WHERE A.CREATOR = 'DSN81010'
AND B.CREATOR = 'DSN81010'
AND A.TBNAME = 'PROJ'
AND B.TBNAME = 'PROJ'
AND A.RELNAME = B.RELNAME
ORDER BY A.RELNAME, B.COLSEQ;
```

You can use the same tables to find information about the foreign keys of tables to which the project table is a parent, as follows:

```
SELECT A.RELNAME, A.CREATOR, A.TBNAME, B.COLNAME, B.COLNO
FROM SYSIBM.SYSRELS A, SYSIBM.SYSFOREIGNKEYS B
WHERE A.REFTBCREATOR = 'DSN81010'
AND A.REFTBNAME = 'PROJ'
AND A.RELNAME = A.RELNAME
ORDER BY A.RELNAME, B.COLNO;
```
Retrieving catalog information about check pending

Query SYSIBM.SYSTABLESPACE to obtain information about table spaces that are in check-pending status.

SYSIBM.SYSTABLESPACE indicates that a table space is in check-pending status by a value in column STATUS: P if the entire table space has that status, S if the status has a scope of less than the entire space. To list all table spaces whose use is restricted for any reason, issue this command:

-DISPLAY DATABASE (*) SPACENAM(*) RESTRICT

To retrieve the names of table spaces in check-pending status only, with the names of the tables they contain, execute:

SELECT A.DBNAME, A.NAME, B.CREATOR, B.NAME
FROM SYSIBM.SYSTABLESPACE A, SYSIBM.SYSTABLES B
WHERE A.DBNAME = B.DBNAME
AND A.NAME = B.TSNAME
AND (A.STATUS = 'P' OR A.STATUS = 'S')
ORDER BY 1, 2, 3, 4;

Retrieving catalog information about check constraints

Query SYSIBM.SYSCHECKS and SYSIBM.SYSCHECKDEP to obtain information about check constraints.

Information about check constraints is stored in the DB2 catalog in:
- SYSIBM.SYSCHECKS, which contains one row for each check constraint defined on a table
- SYSIBM.SYSCHECKDEP, which contains one row for each reference to a column in a check constraint

The following query shows all check constraints on all tables named SIMPDEPT and SIMPEMPL in order by column name within table schema. It shows the name, authorization ID of the creator, and text for each constraint. A constraint that uses more than one column name appears more than once in the result.

CREATE TABLE SIMPDEPT
(DEPTNO CHAR(3) NOT NULL,
 DEPTNAME VARCHAR(12) CONSTRAINT CC1 CHECK (DEPTNAME IS NOT NULL),
 MGRNO CHAR(6),
 MGRNAME CHAR(6));

SELECT A.TBOWNER, A.TBNAME, B.COLNAME,
 A.CHECKNAME, A.CREATOR, A.CHECKCONDITION
FROM SYSIBM.SYSCHECKS A, SYSIBM.SYSCHECKDEP B
WHERE A.TBOWNER = B.TBOWNER
AND A.TBNAME = B.TBNAME
AND B.TBNAME = 'SIMPDEPT'
AND A.CHECKNAME = B.CHECKNAME
ORDER BY TBOWNER, TBNAME, COLNAME;
Retrieving catalog information about LOBs

Query SYSIBM.SYSAUXRELS to obtain information about the relationship between a base table and an auxiliary table.

SYSIBM.SYSAUXRELS contains information about the relationship between a base table and an auxiliary table. For example, this query returns information about the name of the LOB columns for the employee table and its associated auxiliary table schema and name:

```
SELECT COLNAME, PARTITION, AUXTBOWNER, AUXTBNAME
FROM SYSIBM.SYSAUXRELS
WHERE TBNAME = 'EMP' AND TBOWNER = 'DSN81010';
```

Information about the length of a LOB is in the LENGTH2 column of SYSCOLUMNS. You can query information about the length of the column as it is returned to an application with the following query:

```
SELECT NAME, TBNAME, COLTYPE, LENGTH2, NULLS, DEFAULT
FROM SYSIBM.SYSCOLUMNS
WHERE TBNAME = 'DEPT'
AND TBCREATOR = 'DSN81010';
```

Retrieving catalog information about user-defined functions and stored procedures

Query SYSIBM.SYSRoutines to obtain information about user-defined functions and stored procedures.

You can use this example to find packages with stored procedure that were created prior to Version 6 and then migrated to SYSIBM.SYSRoutines:

```
SELECT SCHEMA, NAME FROM SYSIBM.SYSRoutines
WHERE ROUTINETYPE = 'P';
```

You can use this query to retrieve information about user-defined functions:

```
SELECT SCHEMA, NAME, FUNCTION_TYPE, PARM_COUNT FROM SYSIBM.SYSRoutines
WHERE ROUTINETYPE = 'F';
```

Stored procedures created before Version 6 have different authorization requirements than those created in Version 6. See DB2 Application Programming and SQL Guide for more information.

Retrieving catalog information about triggers

Query SYSIBM.SYSTRIGGERS to obtain information about the triggers defined in your databases.
To find all the triggers defined on a particular table, their characteristics, and to determine the order they are activated in, issue this query:

```sql
SELECT DISTINCT SCHEMA, NAME, TRIGTIME, TRIGEVENT, GRANULARITY, CREAEDTS
FROM SYSIBM.SYSTRIGGERS
WHERE TBNAME = 'EMP' AND TBOWNER = 'DSN81010';
```

Issue this query to retrieve the text of a particular trigger:

```sql
SELECT TEXT, SEQNO
FROM SYSIBM.SYSTRIGGERS
WHERE SCHEMA = schema_name
AND NAME = trigger_name
ORDER BY SEQNO;
```

Or to determine triggers that must be rebound because they are invalidated after objects are dropped or altered, issue this query:

```sql
SELECT COLLID, NAME
FROM SYSIBM.SYSPACKAGE
WHERE TYPE = 'T'
AND (VALID = 'N' OR OPERATIVE = 'N');
```

### Retrieving catalog information about sequences

Query SYSIBM.SYSEQUENCES and SYSIBM.SYSEQUENCEAUTH to obtain information about sequences.

```sql
SYSIBM.SYSEQUENCES and SYSIBM.SYSEQUENCEAUTH contains information about sequences. To retrieve the attributes of a sequence, issue this query:

```sql
SELECT *
FROM SYSIBM.SYSEQUENCES
WHERE NAME = 'MYSEQ' AND SCHEMA = 'USER1B';
```

Issue this query to determine the privileges that user USER1B has on sequences:

```sql
SELECT GRANTOR, NAME, DATEGRANTED, ALTERAUTH, USEAUTH
FROM SYSIBM.SEQUENCEAUTH
WHERE GRANTEE = 'USER1B';
```

### Adding and retrieving comments

After you create an object, you can provide explanatory information about it for future reference. For example, you can provide information about the purpose of the object, who uses it, and anything unusual about it.

You can create comments about tables, views, indexes, aliases, packages, plans, distinct types, triggers, stored procedures, and user-defined functions. You can store a comment about the table or the view as a whole, and you can also include a comment for each column. A comment must not exceed 762 bytes.
A comment is especially useful if your names do not clearly indicate the contents of columns or tables. In that case, use a comment to describe the specific contents of the column or table.

Below are two examples of COMMENT:

```
COMMENT ON TABLE DSN81010.EMP IS
  'Employee table. Each row in this table represents one employee of the company.';
COMMENT ON COLUMN DSN81010.PROJ.PRSTDATE IS
  'Estimated project start date. The format is DATE.';
```

After you execute a COMMENT statement, your comments are stored in the REMARKS column of SYSIBM.SYSTABLES or SYSIBM.SYSCOLUMNS. (Any comment that is already present in the row is replaced by the new one.) The next two examples retrieve the comments that are added by the previous COMMENT statements.

```
SELECT REMARKS
FROM SYSIBM.SYSTABLES
WHERE NAME = 'EMP'
  AND CREATOR = 'DSN81010';

SELECT REMARKS
FROM SYSIBM.SYSCOLUMNS
WHERE NAME = 'PRSTDATE' AND TBNAME = 'PROJ'
  AND TBCREATOR = 'DSN81010';
```

**Verifying the accuracy of the database definition**

You can use the catalog to verify the accuracy of your database definition.

After you have created the objects in your database, display selected information from the catalog to check that no errors are in your CREATE statements. By examining the catalog tables, you can verify that your tables are in the correct table space, your table spaces are in the correct storage group, and so on.

**Sample user-defined functions**

Some sample user-defined functions are provided with DB2. You can use the functions in your applications just as you would use other user-defined functions, or as examples to help you define your own user-defined functions.

- To use these functions in your applications: Use the functions only if installation job DSNTEJ2U, which prepares the functions for use, has been run. Because the external programs that implement the logic of the sample functions are written in C and C++, the installation job requires that your site has IBM C/C++ for OS/390®. For information on installation job DSNTEJ2U, see DB2 Installation Guide.

- If you want to use these functions as examples to help you define and implement your own user-defined functions: Data set prefix.SD8NSAMP contains the code for the sample functions.
The following table lists the sample user-defined functions. The detailed descriptions of the functions include their external program names and specific names. The functions are in schema DSN8. The functions are defined to treat character or graphic string parameters, both input and output, as EBCDIC-encoded data.

### Table 196. DB2 sample user-defined functions

<table>
<thead>
<tr>
<th>Function Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTDATE</td>
<td>Returns the current date or a user-specified date in a user-specified format</td>
</tr>
<tr>
<td>ALTTIME</td>
<td>Returns the current time or a user-specified time in a user-specified format</td>
</tr>
<tr>
<td>CURRENCY</td>
<td>Returns a floating-point number as a currency value</td>
</tr>
<tr>
<td>DAYNAME</td>
<td>Returns the name of the day of the week on which a date in ISO format falls</td>
</tr>
<tr>
<td>MONTHNAME</td>
<td>Returns the name of the month in which a date in ISO format falls</td>
</tr>
<tr>
<td>TABLE_LOCATION</td>
<td>Returns the location name of a table or view after resolving any aliases</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td>Returns the unqualified name of a table or view after resolving any aliases</td>
</tr>
<tr>
<td>TABLE_SCHEMA</td>
<td>Returns the schema name of a table or view after resolving any aliases</td>
</tr>
<tr>
<td>WEATHER</td>
<td>Shows how to use a user-defined table function to make non-relational data available for SQL manipulation</td>
</tr>
</tbody>
</table>
The ALTDATE function returns the current date in the specified format or converts a user-specified date from one format to another.

The schema is DSN8.

The ALTDATE function returns the current date in one of the following formats or converts a user-specified date from one format to another:

- \( D \) MONTH YY
- \( D \) MONTH YYYY
- DD MONTH YY
- DD MONTH YYYY
- D.M.YY
- D.M.YYYY
- DD.MM.YY
- DD.MM.YYYY
- D-M-YY
- D-M-YYYY
- DD.MM-YY
- DD.MM-YYYY
- D/M/YY
- D/M/YYYY
- DD/MM/YY
- DD/MM/YYYY
- M/D/YY
- M/D/YYYY
- MM/DD/YY
- MM/DD/YYYY
- YY/M/D
- YYYY/M/D
- YY/MM/DD
- YYYY/MM/DD
- YYYY-M-D
- YYYY-MM-DD
- YYYY-DD-XX
- YYYY-DD-DD
- YYYY-XX-D
- YYYY-XX-DD

where:
- D: Suppress leading zero if the day is less than 10
- DD: Retain leading zero if the day is less than 10
- M: Suppress leading zero if the month is less than 10
- MM: Retain leading zero if the month is less than 10
- MONTH: Use English-language name of month
- XX: Use a capital Roman numeral for month
- YY: Use a year format without century
- YYYY: Use a year format with century

The ALTDATE function demonstrates how you can create an overloaded function—a function name for which there are multiple function instances. Each instance supports a different parameter list enabling you to group related but distinct functions in a single user-defined function. The ALTDATE function has two forms.

**Form 1: ALTDATE(output-format)**

This form of the function converts the current date into the specified format.

output-format

A character string that matches one of the 34 date formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 13 bytes.

The result of the function is VARCHAR(17).

**Form 2: ALTDATE(input-date, input-format, output-format)**

This form of the function converts a date (input-date) in one user-specified format (input-format) into another format (output-format).

input-date

The argument must be a date or a character string representation of a date.
in the format specified by input-format. The character string must have a data type of VARCHAR and an actual length that is not greater than 17 bytes.

**input-format**
A character string that matches one of the 34 date formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 13 bytes.

**output-format**
A character string that matches one of the 34 date formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 13 bytes.

The result of the function is VARCHAR(17).

The following table shows the external and specific names for the two forms of the function, which are based on the input to the function.

**Table 197. External program and specific names for ALTDATE**

<table>
<thead>
<tr>
<th>Conversion type</th>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current date</td>
<td>output-format (VARCHAR)</td>
<td>DSN8DUAD</td>
<td>DSN8.DSN8DUADV</td>
</tr>
<tr>
<td>User-specified date</td>
<td>input-date (VARCHAR)</td>
<td>DSN8DUCD</td>
<td>DSN8.DSN8DUCDVVV</td>
</tr>
<tr>
<td></td>
<td>input-format (VARCHAR)</td>
<td>DSN8DUCD</td>
<td>DSN8.DSN8DUCDVVV</td>
</tr>
<tr>
<td></td>
<td>output-format (VARCHAR)</td>
<td>DSN8DUCD</td>
<td>DSN8.DSN8DUCDDVV</td>
</tr>
</tbody>
</table>

**Example 1:** Convert the current date into format 'DD MONTH YY', a format that will include any leading zero for the month, the name of the month in English, and the year without the two digits for the century.

VALUES DSN8.ALTDATE( 'DD MONTH YY' );

**Example 2:** Convert the current date into format 'D.M.YYYY', a format that will suppress any leading zero for the day or month and include the year with the century.

VALUES DSN8.ALTDATE( 'D.M.YYYY' );

**Example 3:** Convert the current date into format 'YYYY-XX-DD', a format that will include the century, the month of the year as a roman numeral, and the day of the month with any leading zero.

VALUES DSN8.ALTDATE( 'YYYY-XX-DD' );

**Example 4:** Convert a date in the format of 'DD MONTH YYYY' to a date in the format of 'YYYY/MM/DD'.

VALUES DSN8.ALTDATE( '11 November 1918', 'DD MONTH YYYY', 'YYYY/MM/DD' );

The result of the above example is '1918/11/18'.
Example 5: Convert the date that employee 000130 was hired, a date in ISO format, into the format of 'D.M.YY'.

```
SELECT FIRSTNAME || ' ' || LASTNAME || ' was hired on ' ||
  DSN8.ALTDATE( HIREDATE,
    'YYYY-MM-DD',
    'D.M.YY' )
FROM EMP
WHERE EMPNO = '000130';
```

Assuming that the HIREDATE is '1971-07-28', the above example returns: 'DELORES QUINTANA was hired on 28.7.71'.
ALTTIME

The ALTTIME function returns the current time in the specified format or converts a user-specified time from one format to another.

```
\text{ALTTIME}(\text{input-time, input-format, output-format})
```

The schema is DSN8.

The ALTTIME function returns the current time in one of the following formats or converts a user-specified time from one of the formats to another:

- \text{H:MM AM/PM} \quad \text{HH:MM AM/PM}
- \text{HH:MM:SS AM/PM} \quad \text{HH:MM:SS}
- \text{H.MM} \quad \text{HH.MM}
- \text{H.MM.SS} \quad \text{HH.MM.SS}

where:

- \text{H}: \text{Suppress leading zero if the hour is less than 10}
- \text{HH}: \text{Retain leading zero if the hour is less than 10}
- \text{M}: \text{Suppress leading zero if the minute is less than 10}
- \text{MM}: \text{Retain leading zero if the minute is less than 10}
- \text{AM/PM}: \text{Return time in 12-hour clock format, else 24-hour}

The ALTTIME function demonstrates how you can create an overloaded function—a function name for which there are multiple function instances. Each instance supports a different parameter list enabling you to group related but distinct functions in a single user-defined function. The ALTTIME function has two forms.

**Form 1: ALTTIME(output-format)**

This form of the function converts the current time into the specified format.

- \text{output-format}
  
  A character string that matches one of the 8 time formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 14 bytes.

  The result of the function is VARCHAR(11).

**Form 2: ALTTIME(input-time, input-format, output-format)**

This form of the function converts a time (input-date) in one user-specified format (input-format) into another format (output-format).

- \text{input-time}
  
  The argument must be a time or a character string representation of a time in the format specified by \text{input-format}. A character string argument must have a data type of VARCHAR and an actual length that is not greater than 11 bytes.

- \text{input-format}
  
  A character string that matches one of the 8 time formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 14 bytes.

- \text{output-format}
  
  A character string that matches one of the 8 time formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 14 bytes.
above. The character string must have a data type of VARCHAR and an actual length that is not greater than 14 bytes.

The result of the function is VARCHAR(11).

The following table shows the external program and specific names for the two forms of the function, which are based on the input to the function.

Table 198. External and specific names for ALTTIME

<table>
<thead>
<tr>
<th>Conversion type</th>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current time</td>
<td>output-format (VARCHAR)</td>
<td>DSN8DUAT</td>
<td>DSN8.DSN8DUATV</td>
</tr>
<tr>
<td>User-specified time</td>
<td>input-time (VARCHAR), input-format (VARCHAR), output-format (VARCHAR)</td>
<td>DSN8DUCT</td>
<td>DSN8.DSN8DUCVVV</td>
</tr>
</tbody>
</table>

Example 1: Convert the current time into a 12-hour clock format without seconds, 'H.MM AM/PM'.

```
VALUES DSN8.ALTTIME( 'H:MM AM/PM' );
```

Example 2: Convert the current time into a 24-hour clock format without seconds, 'HH.MM'.

```
VALUES DSN8.ALTTIME( 'HH.MM' );
```

Example 3: Convert the current time into a 24-hour clock format with seconds, 'HH.MM.SS'.

```
VALUES DSN8.ALTTIME( 'HH.MM.SS' );
```

Example 4: Convert '00:00:00', a time in 24-hour clock format with seconds, to a time in 12-hour clock format without seconds.

```
VALUES DSN8.ALTTIME( '00:00:00','HH:MM:SS','HH:MM AM/PM' );
```

The function returns '12:00 AM'.

Example 5: Convert '00:00:00', a time in 24-hour clock format with seconds, to a time in 12-hour clock format without seconds and without any leading zero on the hour.

```
VALUES DSN8.ALTTIME( '06.42.37','HH.MM.SS','H:MM AM/PM' );
```

The function returns '6:42 AM'.
CURRENCY

The CURRENCY function returns a value that is formatted as an amount with a
user-specified currency symbol and, if specified, one of three symbols that indicate
debit or credit.

\[ \text{CURRENCY(} \text{input-amount, currency-symbol, credit/debit-indicator}\) \]

The schema is DSN8.

\textit{input-amount}

An expression that specifies the value to be formatted. The expression must be
a floating-point value.

\textit{currency-symbol}

A character string that specifies the currency symbol. The string must have a
data type of VARCHAR and an actual length that is not greater than 2 bytes.

\textit{credit/debit-indicator}

A character string that specifies the symbol that is included with the result to
indicate whether the value is negative or positive. The string must have a data
type of VARCHAR and an actual length that is not greater than 5 bytes. If
credit/debit-indicator is not specified or is the value null, the result is formatted
without an indicator symbol. You can specify the following symbols:

- **CR/DB**
  
  Bank style. Negative input values are appended with 'DB'; positive
  input values are appended with 'CR'.

- **+/−**

  Arithmetic style. Negative input values are prefixed with a minus sign
  '−'; positive values are formatted without symbols.

- **(/)**

  Accounting style. Negative input values are enclosed in parentheses '( )';
  positive values are formatted without symbols.

The result of the function is VARCHAR(19).

The CURRENCY function uses the C language functions strfmon to facilitate
formatting of money amounts and setlocale to initialize strfmon for local
conventions. If setlocale fails, the CURRENCY function returns an error.

The following table shows the external program and specific names for
CURRENCY. The specific names differ depending on the input to the function.

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>input-amount</td>
<td>DSN8DUCY</td>
<td>DSN8.DSN8DUCYFV</td>
</tr>
<tr>
<td>currency-symbol</td>
<td>DSN8DUCY</td>
<td>DSN8.DSN8DUCYFVV</td>
</tr>
</tbody>
</table>

2392 SQL Reference
Example 1: Express® ‘-1234.56’ as an amount in US dollars, using the bank style debit/credit indicator to indicate whether the value is negative or positive.

VALUES DSN8.CURRENCY( -1234.56, '$', 'CR/DB' );

The result of the function is '$1,234.56 DB'.

Example 2: Express ‘-1234.56’ as an amount in Deutsche marks, using the accounting style debit/credit indicator to indicate whether the value is negative or positive.

VALUES DSN8.CURRENCY( -1234.56, 'DM', '/( )' );

The result of the function is '(DM 1,234.56)'.

Example 3: Express ‘-1234.56’ as an amount in Canadian dollars, using the accounting style debit/credit indicator to indicate whether the value is negative or positive.

VALUES DSN8.CURRENCY( -1234.56, 'CD', '+/-' );

The result of the function is '-CD 1,234.56'.
DAYNAME

The DAYNAME function returns the name of the weekday on which a given date falls. The name is returned in English.

```
DAYNAME(input-date)
```

The schema is DSN8.

**input-date**

A valid date or valid character string representation of a date. A character string representation The string must have a data type of VARCHAR and an actual length that is not greater than 10 bytes. The date must be in ISO format.

The result of the function is VARCHAR(9).

The DAYNAME function uses the IBM C++ classIDate.

The following table shows the external and specific names for DAYNAME. The specific names differ depending on the data type of the input argument.

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>input-date</td>
<td>DSN8EUDN</td>
<td>DSN8.DSN8EUDNV</td>
</tr>
<tr>
<td>input-date</td>
<td>DSN8EUDN</td>
<td>DSN8.DSN8EUDND</td>
</tr>
</tbody>
</table>

**Example 1:** For the current date, find the day of the week.

```
VALUES DSN8.DAYNAME( CURRENT DATE );
```

**Example 2:** Find the day of the week on which leap year falls in the year 2008.

```
VALUES DSN8.DAYNAME( '2008-02-29' );
```

The result of the function is 'Friday'.

**Example 3:** Find the day of the week on which Delores Quintana, employee number 000130, was hired.

```
SELECT FIRSTNAME || ' ' || LASTNAME || ' was hired on ' || DSN8.DAYNAME( HIREDATE ) || ' ', ' 
FROM EMP
WHERE EMPNO = '000130';
```

The result of the function is 'DELORES QUINTANA was hired on Wednesday, 1971-07-28'.

MONTHNAME

The MONTHNAME function returns the calendar name of the month in which a
given date falls. The name is returned in English.

The schema is DSN8.

input-date

A valid date or valid character string representation of a date. A character
string representation must have a data type of VARCHAR and an actual length
that is no greater than 10 bytes. The date must be in ISO format.

The result of the function is VARCHAR(9).

The MONTHNAME function uses the IBM C++ class IDate.

The following table shows the external and specific names for MONTHNAME. The
specific names differ depending on the data type of the input argument.

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>input-date (VARCHAR)</td>
<td>DSN8EUMN</td>
<td>DSN8.DSN8EUMNV</td>
</tr>
<tr>
<td>input-date (DATE)</td>
<td>DSN8EUMN</td>
<td>DSN8.DSN8EUMND</td>
</tr>
</tbody>
</table>

Example 1: For the current date, find the name of the month.
VALUES DSN8.MONTHNAME( CURRENT DATE );

Example 2: Find the month of the year in which Delores Quintana, employee
number 000130, was hired.

SELECT FIRSTNAME || ' ' || LASTNAME || ' was hired in the month of ' ||
DSN8.MONTHNAME( HIREDATE ) || CHAR( HIREDATE )
FROM EMP
WHERE EMPNO = '000130';

The result of the function is 'DELORES QUINTANA was hired in the month of July'.

Appendix. Additional information for DB2 SQL 2395
**TABLE_LOCATION**

The `TABLE_LOCATION` function searches for an object and returns the location name of the object after any alias chains have been resolved.

```
TABLE_LOCATION(object-name, object-schema, location-name)
```

The schema is DSN8.

The starting point of the resolution is the object that is specified by `object-name` and, if specified, `object-schema` and `location-name`. If the starting point does not refer to an alias, the location name of the starting point is returned. The resulting name can be of a table, view, or undefined object. The function returns a blank if there is no location name.

**object-name**

A character expression that specifies the unqualified name to be resolved. The unqualified name is usually of an existing alias. `object-name` must have a data type of VARCHAR and an actual length that is no greater than 18 bytes.

**object-schema**

A character expression that represents the schema that is used to qualify the value specified in `object-name` before resolution. `object-schema` must have a data type of VARCHAR and an actual length that is no greater than 8 bytes.

If `object-schema` is not specified or is null, the default schema is used for the qualifier.

**location-name**

A character expression that represents the location that is used to qualify the value specified in `object-name` before resolution. `location-name` must have a data type of VARCHAR and an actual length that is no greater than 16 bytes.

If `location-name` is not specified or is null, the location name is equivalent to “any”.

The result of the function is VARCHAR(16). If `object-name` can be null, the result can be null; if `object-name` is null, the result is the null value.

The following table shows the external and specific names for `TABLE_LOCATION`. The specific names differ depending on the number of input arguments to the function.

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>object-name</code> (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTILV</td>
</tr>
<tr>
<td><code>object-name</code> (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTILVV</td>
</tr>
</tbody>
</table>

---

```
Table 202. External and specific names for TABLE_LOCATION (continued)

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>object-name (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTILVVV</td>
</tr>
<tr>
<td>object-schema (VARCHAR)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>location-name (VARCHAR)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Example: Assume that:

- DSN8.ALIAS_RS_SYSTABLES is an alias of SYSIBM.SYSTABLES at location name 'REMOTE_SITE'.
- The CURRENT SQLID is DSN8.

Use TABLE_LOCATION to find the location name where the base object for ALIAS_RS_SYSTABLES resides.

VALUES DSN8.TABLE_LOCATION( 'ALIAS_RS_SYSTABLES' );

The result of the function is 'REMOTE_SITE'.

Appendix. Additional information for DB2 SQL 2397
TABLE_NAME

The TABLE_NAME function searches for an object and returns the unqualified name of the object after any alias chains have been resolved.

\[ \text{TABLE_NAME}(\text{object-name}, \text{object-schema}, \text{location-name}) \]

The schema is DSN8.

The starting point of the resolution is the object that is specified by \text{object-name} and, if specified, \text{object-schema} and \text{location name}. If the starting point does not refer to an alias, the unqualified name of the starting point is returned. The resulting name can be of a table, view, or undefined object.

\text{object-name}

A character expression that specifies the unqualified name to be resolved. The unqualified name is usually of an existing alias. \text{object-name} must have a data type of VARCHAR and an actual length that is no greater than 18 bytes.

\text{object-schema}

A character expression that represents the schema that is used to qualify the value specified in \text{object-name} before resolution. \text{object-schema} must have a data type of VARCHAR and an actual length that is no greater than 8 bytes.

If \text{object-schema} is not specified or is null, the default schema is used for the qualifier.

\text{location-name}

A character expression that represents the location that is used to qualify the value specified in \text{object-name} before resolution. \text{location-name} must have a data type of VARCHAR and an actual length than is no greater than 16 bytes.

If \text{location-name} is not specified or is null, the location name is equivalent to “any”.

The result of the function is VARCHAR(128). If \text{object-name} can be null, the result can be null; if \text{object-name} is null, the result is the null value.

The following table shows the external and specific names for TABLE_NAME. The specific names differ depending on the number of input arguments to the function.

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>\text{object-name} (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTINV</td>
</tr>
<tr>
<td>\text{object-name} (VARCHAR) \text{object-schema} (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTINVV</td>
</tr>
</tbody>
</table>

Table 203. External and specific names for TABLE_NAME
Table 203. External and specific names for TABLE_NAME (continued)

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>object-name (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTINVVV</td>
</tr>
<tr>
<td>object-schema (VARCHAR)</td>
<td>location-name (VARCHAR)</td>
<td></td>
</tr>
</tbody>
</table>

Example: Assume that:
- DSN8.VIEW_OF_SYSTABLES is a view of SYSIBM.SYSTABLES.
- DSN8.ALIAS_OF_VIEW is an alias of DSN8.VIEW_OF_SYSTABLES.
- The CURRENT SQLID is DSN8.

Use TABLE_NAME to find the name of the base object for ALIAS_OF_VIEW.

```sql
VALUES DSN8.TABLE_NAME( 'ALIAS_OF_VIEW' );
```

The result of the function is 'VIEW_OF_SYSTABLES'.
TABLE_SCHEMA

The TABLE_SCHEMA function searches for an object and returns the schema name of the object after any synonyms or alias chains have been resolved.

```plaintext
TABLE_SCHEMA(object-name, object-schema, location-name)
```

The schema is DSN8.

The starting point of the resolution is the object that is specified by `objectname` and `objectschema`. If the starting point does not refer to an alias or synonym, the schema name of the starting point is returned. The resulting schema name can be of a table, view, or undefined object.

`object-name`

A character expression that specifies the unqualified name to be resolved. The unqualified name is usually of an existing alias. `object-name` must have a data type of VARCHAR and an actual length that is no greater than 18 bytes.

`object-schema`

A character expression that represents the schema that is used to qualify the value specified in `object-name` before resolution. `object-schema` must have a data type of VARCHAR and an actual length that is no greater than 8 bytes.

If `object-schema` is not specified or is null, the default schema is used for the qualifier.

`location-name`

A character expression that represents the location that is used to qualify the value specified in `object-name` before resolution. `location-name` must have a data type of VARCHAR and an actual length that is no greater than 16 bytes.

If `location-name` is not specified or is null, the location name is equivalent to “any”.

The result of the function is VARCHAR(128). If `object-name` can be null, the result can be null; if `object-name` is null, the result is the null value.

The following table shows the external and specific names for TABLE_SCHEMA. The specific names differ depending on the number of input arguments.

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>object-name</code></td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTISV</td>
</tr>
<tr>
<td><code>object-schema</code></td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTISVV</td>
</tr>
</tbody>
</table>

Table 204. External and specific names for function TABLE_SCHEMA
Table 204. External and specific names for function TABLE_SCHEMA (continued)

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>object-name (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTISVVV</td>
</tr>
<tr>
<td>object-schema (VARCHAR)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>location-name (VARCHAR)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Example: Assume that:

- DSN8.ALIAS_OF_SYSTABLES is an alias of SYSIBM.SYSTABLES.
- The CURRENT SQLID is DSN8.

Find the name of the schema of the base table for ALIAS_OF_SYSTABLES.

```
VALUES DSN8.TABLE_SCHEMA('ALIAS_OF_SYSTABLES');
```

The result of the function is 'SYSIBM'.

---

Appendix. Additional information for DB2 SQL
The WEATHER function returns information from a TSO data set as a DB2 table. The TSO data set contains sample weather statistics for various cities in the United States. The statistics are returned to the client with a row for each city and a column for each statistic. The WEATHER function is provided primarily to help you design and implement table functions.

```
<table>
<thead>
<tr>
<th>name-of-city</th>
</tr>
</thead>
<tbody>
<tr>
<td>temperature-in-fahrenheit</td>
</tr>
<tr>
<td>percent-humidity</td>
</tr>
<tr>
<td>wind-direction</td>
</tr>
<tr>
<td>wind-velocity</td>
</tr>
<tr>
<td>barometer</td>
</tr>
<tr>
<td>forecast</td>
</tr>
</tbody>
</table>
```

The schema is DSN8.

Unlike the other sample user-defined functions, which are scalar functions, WEATHER is a table function. WEATHER shows how to use a table function to make non-relational data available to a client for manipulation by SQL.

`input-data-set-name`

The name of the TSO data set that contains sample weather statistics. The name is a character string with a data type of VARCHAR and an actual length that is not greater than 44 bytes.

The result of the function is a DB2 table with the following columns. Each column can be null.

- **name-of-city**: VARCHAR(30)
- **temperature-in-fahrenheit**: INTEGER
- **percent-humidity**: INTEGER
- **wind-direction**: VARCHAR(5)
- **wind-velocity**: INTEGER
- **barometer**: FLOAT
- **forecast**: VARCHAR(25)

The external program name for the function is DSN8DUWF, and the specific name is DSN8.DSN8DUWF.

**Example:** Find the name of and the forecast for the cities that have a temperature less than 25 degrees.

```
SELECT CITY, FORECAST
FROM TABLE(DSN8.WEATHER('prefix.SDSNIVPD(DSN8LWC)')) AS W
WHERE TEMP_IN_F < 25
ORDER BY CITY;
```
This example returns:

<table>
<thead>
<tr>
<th>Location</th>
<th>Weather Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bessemer, MI</td>
<td>Slight chance of snow</td>
</tr>
<tr>
<td>Cheyenne, WY</td>
<td>Continued cooling</td>
</tr>
<tr>
<td>Helena, MT</td>
<td>Heavy snow</td>
</tr>
<tr>
<td>Pierre, SD</td>
<td>Continued cold</td>
</tr>
</tbody>
</table>
Information resources for DB2 for z/OS and related products

Many information resources are available to help you use DB2 for z/OS and many related products. A large amount of technical information about IBM products is now available online in information centers or on library websites.

Disclaimer: Any web addresses that are included here are accurate at the time this information is being published. However, web addresses sometimes change. If you visit a web address that is listed here but that is no longer valid, you can try to find the current web address for the product information that you are looking for at either of the following sites:

- [http://www.ibm.com/shop/publications/order](http://www.ibm.com/shop/publications/order) which is the IBM Publications Center, where you can download online PDF books or order printed books for various IBM products

DB2 for z/OS product information

The primary place to find and use information about DB2 for z/OS is the Information Management Software for z/OS Solutions Information Center ([http://publib.boulder.ibm.com/infocenter/imzic](http://publib.boulder.ibm.com/infocenter/imzic)), which also contains information about IMS, QMF, and many DB2 and IMS Tools products. This information center is also available as an installable information center that can run on a local system or on an intranet server. You can order the Information Management for z/OS Solutions Information Center DVD (SK5T-7377) for a low cost from the IBM Publications Center ([http://www.ibm.com/shop/publications/order](http://www.ibm.com/shop/publications/order)).

The majority of the DB2 for z/OS information in this information center is also available in the books that are identified in the following table. You can access these books at the DB2 for z/OS library website ([http://www.ibm.com/software/data/db2/zos/library.html](http://www.ibm.com/software/data/db2/zos/library.html)) or at the IBM Publications Center ([http://www.ibm.com/shop/publications/order](http://www.ibm.com/shop/publications/order)).

- z/OS RMF™
- z/OS Security Server
- z/OS UNIX System Services

The following information resources from IBM are not necessarily specific to a single product:
- IBM Educational resources:
– A collection of glossaries of IBM terms in multiple languages is available on the IBM Terminology website at: http://www.ibm.com/software/globalization/terminology/index.jsp

• SQL Reference for Cross-Platform Development; available at the following developerWorks® site: http://www.ibm.com/developerworks/db2/library/techarticle/0206sqlref/0206sqlref.html

The following information resources are not published by IBM but can be useful to users of DB2 for z/OS and related products:

• Database design topics:

• Distributed Relational Database Architecture (DRDA) specifications; http://www.opengroup.org

• Microsoft Open Database Connectivity (ODBC) information; http://msdn.microsoft.com/library/

• Unicode information; http://www.unicode.org
How to obtain DB2 information

You can access the official information about the DB2 product in a number of ways.

- "DB2 on the web"
- "DB2 product information"
- "DB2 education" on page 2412
- "How to order the DB2 library" on page 2412

**DB2 on the web**

Stay current with the latest information about DB2 by visiting the DB2 home page on the web:

http://www.ibm.com/software/db2zos

On the DB2 home page, you can find links to a wide variety of information resources about DB2. You can read news items that keep you informed about the latest enhancements to the product. Product announcements, press releases, fact sheets, and technical articles help you plan and implement your database management strategy.

**DB2 product information**

The official DB2 for z/OS information is available in various formats and delivery methods. IBM provides mid-version updates to the information in the information center and in softcopy updates that are available on the web and on CD-ROM.

**Information Management Software for z/OS Solutions Information Center**

DB2 product information is viewable in the information center, which is the primary delivery vehicle for information about DB2 for z/OS, IMS, QMF, and related tools. This information center enables you to search across related product information in multiple languages for data management solutions for the z/OS environment and print individual topics or sets of related topics. You can also access, download, and print PDFs of the publications that are associated with the information center topics. Product technical information is provided in a format that offers more options and tools for accessing, integrating, and customizing information resources. The information center is based on Eclipse open source technology.

The Information Management Software for z/OS Solutions Information Center is viewable at the following website:

http://publib.boulder.ibm.com/infocenter/imzic

**CD-ROMs and DVD**

Books for DB2 are available on a CD-ROM that is included with your product shipment:

- DB2 10 for z/OS Licensed Library Collection, LKST-7390, in English

The CD-ROM contains the collection of books for DB2 10 for z/OS in PDF format. Periodically, IBM refreshes the books on subsequent editions of this CD-ROM.
The books for DB2 for z/OS are also available on the following DVD collection kit, which contains online books for many IBM products:

- IBM z/OS Software Products DVD Collection, SK3T-4271, in English

PDF format

Many of the DB2 books are available in PDF (Portable Document Format) for viewing or printing from CD-ROM or the DB2 home page on the web or from the information center. Download the PDF books to your intranet for distribution throughout your enterprise.

DB2 education

IBM Education and Training offers a wide variety of classroom courses to help you quickly and efficiently gain DB2 expertise. IBM schedules classes in cities all over the world. You can find class information, by country, at the IBM Learning Services website:

http://www.ibm.com/services/learning

IBM also offers classes at your location, at a time that suits your needs. IBM can customize courses to meet your exact requirements. For more information, including the current local schedule, contact your IBM representative.

How to order the DB2 library

To order books, visit the IBM Publication Center on the web:

http://www.ibm.com/shop/publications/order

From the IBM Publication Center, you can go to the Publication Notification System (PNS). PNS users receive electronic notifications of updated publications in their profiles. You have the option of ordering the updates by using the publications direct ordering application or any other IBM publication ordering channel. The PNS application does not send automatic shipments of publications. You will receive updated publications and a bill for them if you respond to the electronic notification.

You can also order DB2 publications and CD-ROMs from your IBM representative or the IBM branch office that serves your locality. If your location is within the United States or Canada, you can place your order by calling one of the toll-free numbers:

- In the U.S., call 1-800-879-2755.
- In Canada, call 1-800-426-4968.

To order additional copies of licensed publications, specify the SOFTWARE option. To order additional publications or CD-ROMs, specify the PUBLICATIONS option. Be prepared to give your customer number, the product number, and either the feature codes or order numbers that you want.
How to use the DB2 library

Titles of books in the library begin with DB2 10 for z/OS. However, references from one book in the library to another are shortened and do not include the product name, version, and release. Instead, they point directly to the section that holds the information. The primary place to find and use information about DB2 for z/OS is the Information Management Software for z/OS Solutions Information Center [http://publib.boulder.ibm.com/infocenter/imzic].

If you are new to DB2 for z/OS, Introduction to DB2 for z/OS provides a comprehensive introduction to DB2 10 for z/OS. Topics included in this book explain the basic concepts that are associated with relational database management systems in general, and with DB2 for z/OS in particular.

The most rewarding task associated with a database management system is asking questions of it and getting answers, the task called end use. Other tasks are also necessary—defining the parameters of the system, putting the data in place, and so on. The tasks that are associated with DB2 are grouped into the following major categories.

Installation

If you are involved with installing DB2, you will need to use a variety of resources, such as:

- DB2 Program Directory
- DB2 Installation and Migration Guide
- DB2 Administration Guide
- DB2 Application Programming Guide and Reference for Java
- DB2 Codes
- DB2 Internationalization Guide
- DB2 Messages
- DB2 Managing Performance
- DB2 Managing Security
- DB2 RACF Access Control Module Guide
- DB2 Utility Guide and Reference

If you will be using data sharing capabilities you also need DB2 Data Sharing: Planning and Administration, which describes installation considerations for data sharing.

If you will be installing and configuring DB2 ODBC, you will need DB2 ODBC Guide and Reference.

If you are installing IBM Spatial Support for DB2 for z/OS, you will need IBM Spatial Support for DB2 for z/OS User’s Guide and Reference.

If you are installing IBM Text Search for DB2 for z/OS, you will need IBM Text Search for DB2 for z/OS Installation, Administration, and Reference.
End use

End users issue SQL statements to retrieve data. They can also insert, update, or delete data, with SQL statements. They might need an introduction to SQL, detailed instructions for using SPUFI, and an alphabetized reference to the types of SQL statements. This information is found in DB2 Application Programming and SQL Guide, and DB2 SQL Reference.

End users can also issue SQL statements through the DB2 Query Management Facility (QMF) or some other program, and the library for that licensed program might provide all the instruction or reference material they need.

Application programming

Some users access DB2 without knowing it, using programs that contain SQL statements. DB2 application programmers write those programs. Because they write SQL statements, they need the same resources that end users do.

Application programmers also need instructions for many other topics:

- How to transfer data between DB2 and a host program—written in Java, C, or COBOL, for example
- How to prepare to compile a program that embeds SQL statements
- How to process data from two systems simultaneously, for example, DB2 and IMS or DB2 and CICS
- How to write distributed applications across operating systems
- How to write applications that use Open Database Connectivity (ODBC) to access DB2 servers
- How to write applications that use JDBC and SQLJ with the Java programming language to access DB2 servers
- How to write applications to store XML data on DB2 servers and retrieve XML data from DB2 servers.

The material needed for writing a host program containing SQL is in DB2 Application Programming and SQL Guide.

The material needed for writing applications that use JDBC and SQLJ to access DB2 servers is in DB2 Application Programming Guide and Reference for Java. The material needed for writing applications that use DB2 CLI or ODBC to access DB2 servers is in DB2 ODBC Guide and Reference. The material needed for working with XML data in DB2 is in DB2 pureXML Guide. For handling errors, see DB2 Messages and DB2 Codes.

System and database administration

Administration covers almost everything else. DB2 Administration Guide divides some of those tasks among the following sections:

- Designing a database: Discusses the decisions that must be made when designing a database and tells how to implement the design by creating and altering DB2 objects, loading data, and adjusting to changes.
- Operation and recovery: Describes the steps in normal day-to-day operation and discusses the steps one should take to prepare for recovery in the event of some failure.
**DB2 Managing Performance** explains how to monitor the performance of the DB2 system and its parts. It also lists things that can be done to make some parts run faster.

**DB2 Managing Security** describes ways of controlling access to the DB2 system and to data within DB2, ways to audit aspects of DB2 usage, and ways to answer other security and auditing concerns.

If you will be using the RACF access control module for DB2 authorization checking, you will need *DB2 RACF Access Control Module Guide*.

If you are involved with DB2 only to design the database, or plan operational procedures, you need *DB2 Administration Guide*. If you also want to carry out your own plans by creating DB2 objects, granting privileges, running utility jobs, and so on, you also need:

- *DB2 SQL Reference*, which describes the SQL statements you use to create, alter, and drop objects and grant and revoke privileges
- *DB2 Utility Guide and Reference*, which explains how to run utilities
- *DB2 Command Reference*, which explains how to run commands

If you will be using data sharing, you need *DB2 Data Sharing: Planning and Administration*, which describes how to plan for and implement data sharing.

Additional information about system and database administration can be found in *DB2 Messages* and *DB2 Codes*, which list messages and codes issued by DB2, with explanations and suggested responses.

**Diagnosis**

Diagnosticians detect and describe errors in the DB2 program. They might also recommend or apply a remedy. The documentation for this task is in *DB2 Diagnosis Guide and Reference, DB2 Messages, and DB2 Codes*.
Notices

This information was developed for products and services offered in the U.S.A.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user’s responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not give you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
IBM Corporation
North Castle Drive
Armonk, NY 10504-1785
U.S.A.

For license inquiries regarding double-byte (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

Intellectual Property Licensing
Legal and Intellectual Property Law
IBM Japan, Ltd.
1623-14, Shimotsuruma, Yamato-shi
Kanagawa 242-8502 Japan

The licensed program described in this document and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement, or any equivalent agreement between us.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

COPYRIGHT LICENSE:

This information contains sample application programs in source language, which illustrate programming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application programs conforming to the application programming interface for the operating platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs. The sample programs are provided "AS IS", without warranty of any kind. IBM shall not be liable for any damages arising out of your use of the sample programs.

If you are viewing this information softcopy, the photographs and color illustrations may not appear.
Programming Interface Information

This information is intended to help you to code SQL statements. This information primarily documents General-use Programming Interface and Associated Guidance Information provided by DB2 10 for z/OS. This information also documents Product-sensitive Programming Interface and Associated Guidance Information provided by DB2 10 for z/OS.

General-use Programming Interface and Associated Guidance Information

General-use Programming Interfaces allow the customer to write programs that obtain the services of DB2 10 for z/OS.

Product-sensitive Programming Interface and Associated Guidance Information

Product-sensitive Programming Interfaces allow the customer installation to perform tasks such as diagnosing, modifying, monitoring, repairing, tailoring, or tuning of this IBM software product. Use of such interfaces creates dependencies on the detailed design or implementation of the IBM software product. Product-sensitive Programming Interfaces should be used only for these specialized purposes. Because of their dependencies on detailed design and implementation, it is to be expected that programs written to such interfaces may need to be changed in order to run with new product releases or versions, or as a result of service.

Product-sensitive Programming Interface and Associated Guidance Information is identified where it occurs by the following markings:

Product-sensitive Programming Interface and Associated Guidance Information...

Trademarks

IBM, the IBM logo, and ibm.com® are trademarks or registered marks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the web at http://www.ibm.com/legal/copytrade.shtml.

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

Microsoft, Windows, Windows NT, and the Windows logo are trademarks of Microsoft Corporation in the United States, other countries, or both.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Java and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle and/or its affiliates.

</table>
application
A program or set of programs that performs a task; for example, a payroll application.

application period
A pair of columns with application-maintained values that indicates the period of time when a row is valid. See also application-period temporal table.

application-period temporal table
A table that includes an application period. See also application period and bitemporal table.

application plan
The control structure that is produced during the bind process. DB2 uses the application plan to process SQL statements that it encounters during statement execution.

application process
The unit to which resources and locks are allocated. An application process involves the execution of one or more programs.

application programming interface (API)
A functional interface that is supplied by the operating system or by a separately ordered licensed program that allows an application program that is written in a high-level language to use specific data or functions of the operating system or licensed program.

application requester
The component on a remote system that generates DRDA requests for data on behalf of an application.

application server
The target of a request from a remote application. In the DB2 environment, the application server function is provided by the distributed data facility and is used to access DB2 data from remote applications.

archive log
The portion of the DB2 log that contains log records that have been copied from the active log. See also active log.

ASCII
An encoding scheme that is used to represent strings in many environments, typically on personal computers and workstations. Contrast with EBCDIC and Unicode.

ASID
See address space identifier.

attachment facility
An interface between DB2 and TSO, IMS, CICS, or batch address spaces. An attachment facility allows application programs to access DB2.

attribute
A characteristic of an entity. For example, in database design, the phone number of an employee is an attribute of that employee.

authorization ID
A string that can be verified for connection to DB2 and to which a set of privileges is allowed. An authorization ID can represent an individual or an organizational group.

authorized program analysis report (APAR)
A report of a problem that is caused by a suspected defect in a current release of an IBM supplied program.

authorized program facility (APF)
A facility that allows an installation to identify system or user programs that can use sensitive system functions.

automatic bind
(More correctly automatic rebind.) A process by which SQL statements are bound automatically (without a user issuing a BIND command) when an application process begins execution and the bound application plan or package it requires is not valid.

automatic query rewrite
A process that examines an SQL statement that refers to one or more base tables or materialized query tables, and, if appropriate, rewrites the query so that it performs better.

auxiliary index
An index on an auxiliary table in which each index entry refers to a LOB or XML document.

auxiliary table
A table that contains columns outside the actual table in which they are defined. Auxiliary tables can contain either LOB or XML data.

backout
The process of undoing uncommitted changes that an application process made.
A backout is often performed in the event of a failure on the part of an application process, or as a result of a deadlock situation.

**backward log recovery**
The final phase of restart processing during which DB2 scans the log in a backward direction to apply UNDO log records for all aborted changes.

**base table**
A table that is created by the SQL CREATE TABLE statement and that holds persistent data. Contrast with clone table, materialized query table, result table, temporary table, and transition table.

**base table space**
A table space that contains base tables.

**basic row format**
A row format in which values for columns are stored in the row in the order in which the columns are defined by the CREATE TABLE statement. Contrast with reordered row format.

**basic sequential access method (BSAM)**
An access method for storing or retrieving data blocks in a continuous sequence, using either a sequential-access or a direct-access device.

**BEFORE trigger**
A trigger that is specified to be activated before a defined trigger event (an insert, an update, or a delete operation on the table that is specified in a trigger definition). Contrast with AFTER trigger and INSTEAD OF trigger.

**begin column**
In a system period or an application period, the column that indicates the beginning of the period. See also period.

**binary large object (BLOB)**
A binary string data type that contains a sequence of bytes that can range in size from 0 bytes to 2 GB, less 1 byte. This string does not have an associated code page and character set. BLOBs can contain, for example, image, audio, or video data. In general, BLOB values are used whenever a binary string might exceed the limits of the VARBINARY type.

**binary string**
A sequence of bytes that is not associated with a CCSID. Binary string data type can be further classified as BINARY, VARBINARY, or BLOB.

**binary XML format**
A representation of XML data that uses binary values, an approach that facilitates more efficient storage and exchange.

**bind**
A process by which a usable control structure with SQL statements is generated; the structure is often called an access plan, an application plan, or a package. During this bind process, access paths to the data are selected, and some authorization checking is performed. See also automatic bind.

**bit data**
- Data with character type CHAR or VARCHAR that is defined with the FOR BIT DATA clause. Note that using BINARY or VARBINARY rather than FOR BIT DATA is highly recommended.
- Data with character type CHAR or VARCHAR that is defined with the FOR BIT DATA clause.
- A form of character data. Binary data is generally more highly recommended than character-for-bit data.

**bitemporal table**
A table that is both a system-period temporal table and an application-period temporal table. See also application-period temporal table and system-period temporal table.

**BLOB** See binary large object.

**block fetch**
A capability in which DB2 can retrieve, or fetch, a large set of rows together. Using block fetch can significantly reduce the number of messages that are being sent across the network. Block fetch applies only to non-rowset cursors that do not update data.

**bootstrap data set (BSDS)**
A VSAM data set that contains name and status information for DB2 and RBA range specifications for all active and archive log data sets. The BSDS also contains passwords for the DB2 directory.
and catalog, and lists of conditional restart and checkpoint records.

**BSAM**
See [basic sequential access method](#).

**BSDS**
See [bootstrap data set](#).

**buffer pool**
An area of memory into which data pages are read, modified, and held during processing.

**built-in data type**
A data type that IBM supplies. Among the built-in data types for DB2 for z/OS are string, numeric, XML, ROWID, and datetime. Contrast with **distinct type**.

**built-in function**
A function that is generated by DB2 and that is in the SYSIBM schema. Contrast with **user-defined function**. See also [function](#), [cast function](#), [external function](#), [sourced function](#) and [SQL function](#).

**business dimension**
A category of data, such as products or time periods, that an organization might want to analyze.

**cache structure**
A coupling facility structure that stores data that can be available to all members of a Sysplex. A DB2 data sharing group uses cache structures as group buffer pools.

**CAF**
See [call attachment facility](#).

**call attachment facility (CAF)**
A DB2 attachment facility for application programs that run in TSO or z/OS batch. The CAF is an alternative to the DSN command processor and provides greater control over the execution environment. Contrast with **Resource Recovery Services attachment facility**.

**call-level interface (CLI)**
A callable application programming interface (API) for database access, which is an alternative to using embedded SQL.

**cascade delete**
A process by which DB2 enforces referential constraints by deleting all descendent rows of a deleted parent row.

**CASE expression**
An expression that is selected based on the evaluation of one or more conditions.

**cast function**
A function that is used to convert instances of a (source) data type into instances of a different (target) data type.

**castout**
The DB2 process of writing changed pages from a group buffer pool to disk.

**castout owner**
The DB2 member that is responsible for casting out a particular page set or partition.

**catalog**
In DB2, a collection of tables that contains descriptions of objects such as tables, views, and indexes.

**catalog table**
Any table in the DB2 catalog.

**CCSID**
See [coded character set identifier](#).

**CDB**
See [communications database](#).

**CDRA**
See [Character Data Representation Architecture](#).

**CEC**
See [central processor complex](#).

**central electronic complex (CEC)**
See [central processor complex](#).

**central processor complex (CPC)**
A physical collection of hardware that consists of main storage, one or more central processors, timers, and channels.

**central processor (CP)**
The part of the computer that contains the sequencing and processing facilities for instruction execution, initial program load, and other machine operations.

**CFRM**
See [coupling facility resource management](#).

**CFRM policy**
The allocation rules for a coupling facility structure that are declared by a z/OS administrator.

**character conversion**
The process of changing characters from one encoding scheme to another.

**Character Data Representation Architecture (CDRA)**
An architecture that is used to achieve...
consistent representation, processing, and interchange of string data.

**character large object (CLOB)**
A character string data type that contains a sequence of bytes that represent characters (single-byte, multibyte, or both) that can range in size from 0 bytes to 2 GB, less 1 byte. In general, CLOB values are used whenever a character string might exceed the limits of the VARCHAR type.

**character set**
A defined set of characters.

**character string**
A sequence of bytes that represent bit data, single-byte characters, or a mixture of single-byte and multibyte characters. Character data can be further classified as CHARACTER, VARCHAR, or CLOB.

**check constraint**
A user-defined constraint that specifies the values that specific columns of a base table can contain.

**check integrity**
The condition that exists when each row in a table conforms to the check constraints that are defined on that table.

**check pending**
A state of a table space or partition that prevents its use by some utilities and by some SQL statements because of rows that violate referential constraints, check constraints, or both.

**checkpoint**
A point at which DB2 records status information on the DB2 log; the recovery process uses this information if DB2 abnormally terminates.

**child lock**
For explicit hierarchical locking, a lock that is held on either a table, page, row, or a large object (LOB). Each child lock has a parent lock. See also parent lock.

**CLI**
See call-level interface.

**client**
See requester.

**CLOB**
See character large object.

**clone object**
An object that is associated with a clone table, including the clone table itself and check constraints, indexes, and BEFORE triggers on the clone table.

**clone table**
A table that is structurally identical to a base table. The base and clone table each have separate underlying VSAM data sets, which are identified by their data set instance numbers. Contrast with base table.

**closed application**
An application that requires exclusive use of certain statements on certain DB2 objects, so that the objects are managed solely through the external interface of that application.

**clustering index**
An index that determines how rows are physically ordered (clustered) in a table space. If a clustering index on a partitioned table is not a partitioning index, the rows are ordered in cluster sequence within each data partition instead of spanning partitions.
coexistence
During migration, the period of time in which two releases exist in the same data sharing group.

cold start
A process by which DB2 restarts without processing any log records. Contrast with warm start.

collection
A group of packages that have the same qualifier.

column
The vertical component of a table. A column has a name and a particular data type (for example, character, decimal, or integer).

column function
See aggregate function.

"come from" checking
An LU 6.2 security option that defines a list of authorization IDs that are allowed to connect to DB2 from a partner LU.

command
A DB2 operator command or a DSN subcommand. A command is distinct from an SQL statement.

command prefix
A 1- to 8-character command identifier. The command prefix distinguishes the command as belonging to an application or subsystem rather than to z/OS.

command recognition character (CRC)
A character that permits a z/OS console operator or an IMS subsystem user to route DB2 commands to specific DB2 subsystems.

command scope
The scope of command operation in a data sharing group.

commit
The operation that ends a unit of work by releasing locks so that the database changes that are made by that unit of work can be perceived by other processes. Contrast with rollback.

commit point
A point in time when data is considered consistent.

common service area (CSA)
In z/OS, a part of the common area that
contains data areas that are addressable by all address spaces. Most DB2 use is in the extended CSA, which is above the 16-MB line.

**communications database (CDB)**
A set of tables in the DB2 catalog that are used to establish conversations with remote database management systems.

**comparison operator**
A token (such as =, >, or <) that is used to specify a relationship between two values.

**compatibility mode**
See [conversion mode](#).

**compatibility mode* (CM*)**
See [conversion mode*](#).

**composite key**
An ordered set of key columns or expressions of the same table.

**compression dictionary**
The dictionary that controls the process of compression and decompression. This dictionary is created from the data in the table space or table space partition.

**concurrency**
The shared use of resources by more than one application process at the same time.

**conditional restart**
A DB2 restart that is directed by a user-defined conditional restart control record (CRCR).

**connection**
In SNA, the existence of a communication path between two partner LUs that allows information to be exchanged (for example, two DB2 subsystems that are connected and communicating by way of a conversation).

**connection context**
In SQLJ, a Java object that represents a connection to a data source.

**connection declaration clause**
In SQLJ, a statement that declares a connection to a data source.

**connection handle**
The data object containing information that is associated with a connection that DB2 ODBC manages. This includes general status information, transaction status, and diagnostic information.

**connection ID**
An identifier that is supplied by the attachment facility and that is associated with a specific address space connection.

**consistency token**
A timestamp that is used to generate the version identifier for an application. See also [version](#).

**constant**
A language element that specifies an unchanging value. Constants are classified as string constants or numeric constants. Contrast with [variable](#).

**constraint**
A rule that limits the values that can be inserted, deleted, or updated in a table. See [referential constraint](#), [check constraint](#) and [unique constraint](#).

**context**
An application's logical connection to the data source and associated DB2 ODBC connection information that allows the application to direct its operations to a data source. A DB2 ODBC context represents a DB2 thread.

**contracting conversion**
A process that occurs when the length of a converted string is smaller than that of the source string. For example, this process occurs when an EBCDIC mixed-data string that contains DBCS characters is converted to ASCII mixed data; the converted string is shorter because the shift codes are removed.

**control interval (CI)**
- A unit of information that VSAM transfers between virtual and auxiliary storage.
- In a key-sequenced data set or file, the set of records that an entry in the sequence-set index record points to.

**conversation**
Communication, which is based on LU 6.2 or Advanced Program-to-Program Communication (APPC), between an application and a remote transaction program over an SNA logical unit-to-logical unit (LU-LU) session that allows communication while processing a transaction.
conversion mode* (CM*)  
A stage of the version-to-version migration process that applies to a DB2 subsystem or data sharing group that was in enabling-new-function mode (ENFM), enabling-new-function mode* (ENFM*), or new-function mode (NFM) at one time. Fallback to a prior version is not supported. When in conversion mode*, a DB2 data sharing group cannot coexist with members that are still at the prior version level. Contrast with conversion mode, enabling-new-function mode, enabling-new-function mode*, and new-function mode.  
Previously known as compatibility mode* (CM*).

conversion mode (CM)  
The first stage of the version-to-version migration process. In a DB2 data sharing group, members in conversion mode can coexist with members that are still at the prior version level. Fallback to the prior version is also supported. When in conversion mode, the DB2 subsystem cannot use most new functions of the new version. Contrast with conversion mode*, enabling-new-function mode, enabling-new-function mode*, and new-function mode.  
Previously known as compatibility mode (CM).

correlated columns  
A relationship between the value of one column and the value of another column.

correlated subquery  
A subquery (part of a WHERE or HAVING clause) that is applied to a row or group of rows of a table or view that is named in an outer subselect statement.

correlation ID  
An identifier that is associated with a specific thread. In TSO, it is either an authorization ID or the job name.

correlation name  
An identifier that is specified and used within a single SQL statement as the exposed name for objects such as a table, view, table function reference, nested table expression, or result of a data change statement. Correlation names are useful in an SQL statement to allow two distinct references to the same base table and to allow an alternative name to be used to represent an object.

cost category  
A category into which DB2 places cost estimates for SQL statements at the time the statement is bound. The cost category is externalized in the COSTCATEGORY column of the DSN_STATEMNT_TABLE when a statement is explained.

coupling facility  
A special PR/SM logical partition (LPAR) that runs the coupling facility control program and provides high-speed caching, list processing, and locking functions in a Parallel Sysplex.

coupling facility resource management (CFRM)  
A component of z/OS that provides the services to manage coupling facility resources in a Parallel Sysplex. This management includes the enforcement of CFRM policies to ensure that the coupling facility and structure requirements are satisfied.

copy pool  
A collection of names of storage groups that are processed collectively for fast replication operations.

copy target  
A named set of SMS storage groups that are to be used as containers for copy pool volume copies. A copy target is an SMS construct that lets you define which storage groups are to be used as containers for volumes that are copied by using FlashCopy functions.

copy version  
A point-in-time FlashCopy copy that is managed by HSM. Each copy pool has a version parameter that specifies the number of copy versions to be maintained on disk.
CPC  See central processor complex.
CRC  See command recognition character.

created temporary table
A persistent table that holds temporary data and is defined with the SQL statement CREATE GLOBAL TEMPORARY TABLE. Information about created temporary tables is stored in the DB2 catalog and can be shared across application processes. Contrast with declared temporary table. See also temporary table.

cross-system coupling facility (XCF)
A component of z/OS that provides functions to support cooperation between authorized programs that run within a Sysplex.

cross-system extended services (XES)
A set of z/OS services that allow multiple instances of an application or subsystem, running on different systems in a Sysplex environment, to implement high-performance, high-availability data sharing by using a coupling facility.

CS  See cursor stability.
CSA  See common service area.
CT  See cursor table.

current data
Data within a host structure that is current with (identical to) the data within the base table.

current status rebuild
The second phase of restart processing during which the status of the subsystem is reconstructed from information on the log.

cursor
A control structure that an application program uses to point to a single row or multiple rows within some ordered set of rows of a result table. A cursor can be used to retrieve, update, or delete rows from a result table.

cursor sensitivity
The degree to which database updates are visible to the subsequent FETCH statements in a cursor.

cursor stability (CS)
The isolation level that provides maximum concurrency without the ability to read uncommitted data. With cursor stability, a unit of work holds locks only on its uncommitted changes and on the current row of each of its cursors. See also read stability, repeatable read, and uncommitted read.

cursor table (CT)
The internal representation of a cursor.

cycle
A set of tables that can be ordered so that each table is a descendent of the one before it, and the first table is a descendent of the last table. A self-referencing table is a cycle with a single member. See also referential cycle.

database
A collection of tables, or a collection of table spaces and index spaces.

database access thread (DBAT)
A thread that accesses data at the local subsystem on behalf of a remote subsystem.

database administrator (DBA)
An individual who is responsible for designing, developing, operating, safeguarding, maintaining, and using a database.

database alias
The name of the target server if it is different from the location name. The database alias is used to provide the name of the database server as it is known to the network.

database descriptor (DBD)
An internal representation of a DB2 database definition, which reflects the data definition that is in the DB2 catalog. The objects that are defined in a database descriptor are table spaces, tables, indexes, index spaces, relationships, check constraints, and triggers. A DBD also contains information about accessing tables in the database.

database exception status
In a data sharing environment, an indication that something is wrong with a database.

database identifier (DBID)
An internal identifier of the database.

database management system (DBMS)
A software system that controls the
creation, organization, and modification of a database and the access to the data that is stored within it.

**database request module (DBRM)**
A data set member that is created by the DB2 precompiler and that contains information about SQL statements. DBRMs are used in the bind process.

**database server**
The target of a request from a local application or a remote intermediate database server.

**data currency**
The state in which the data that is retrieved into a host variable in a program is a copy of the data in the base table.

**data-dependent pagination**
The process used when applications need to access part of a DB2 result set that is based on a logical key value.

**data dictionary**
A repository of information about an organization's application programs, databases, logical data models, users, and authorizations.

**data partition**
A VSAM data set that is contained within a partitioned table space.

**data-partitioned secondary index (DPSI)**
A secondary index that is partitioned according to the underlying data. Contrast with nonpartitioned secondary index.

**data set instance number**
A number that indicates the data set that contains the data for an object.

**data sharing**
A function of DB2 for z/OS that enables applications on different DB2 subsystems to read from and write to the same data concurrently.

**data sharing group**
A collection of one or more DB2 subsystems that directly access and change the same data while maintaining data integrity.

**data sharing member**
A DB2 subsystem that is assigned by XCF services to a data sharing group.

**data source**
A local or remote relational or non-relational data manager that is capable of supporting data access via an ODBC driver that supports the ODBC APIs. In the case of DB2 for z/OS, the data sources are always relational database managers.

**data type**
An attribute of columns, constants, variables, parameters, special registers, and the results of functions and expressions.

**data warehouse**
A system that provides critical business information to an organization. The data warehouse system cleanses the data for accuracy and currency, and then presents the data to decision makers so that they can interpret and use it effectively and efficiently.

**DBA** See database administrator.

**DBAT** See database access thread.

**DB2 catalog**
A collection of tables that are maintained by DB2 and contain descriptions of DB2 objects, such as tables, views, and indexes.

**DBCLOB**
See double-byte character large object.

**DB2 command**
An instruction to the DB2 subsystem that a user enters to start or stop DB2, to display information on current users, to start or stop databases, to display information on the status of databases, and so on.

**DBCS** See double-byte character set.

**DBD** See database descriptor.

**DB2I** See DB2 Interactive.

**DBID** See database identifier.

**DB2 Interactive (DB2I)**
An interactive service within DB2 that facilitates the execution of SQL statements, DB2 (operator) commands, and programmer commands, and the invocation of utilities.

**DBMS** See database management system.
DBRM  
See database request module.

DB2 thread  
The database manager structure that describes an application's connection, traces its progress, processes resource functions, and delimits its accessibility to the database manager resources and services. Most DB2 for z/OS functions execute under a thread structure.

DCLGEN  
See declarations generator.

DDF  
See distributed data facility.

deadlock  
Unresolved contention for the use of a resource, such as a table or an index.

declarations generator (DCLGEN)  
A subcomponent of DB2 that generates SQL table declarations and COBOL, C, or PL/I data structure declarations that conform to the table. The declarations are generated from DB2 system catalog information.

declared temporary table  
A non-persistent table that holds temporary data and is defined with the SQL statement DECLARE GLOBAL TEMPORARY TABLE. Information about declared temporary tables is not stored in the DB2 catalog and can be used only by the application process that issued the DECLARE statement. Contrast with created temporary table. See also temporary table.

default value  
A predetermined value, attribute, or option that is assumed when no other value is specified. A default value can be defined for column data in DB2 tables by specifying the DEFAULT keyword in an SQL statement that changes data (such as INSERT, UPDATE, and MERGE).

deferred embedded SQL  
SQL statements that are neither fully static nor fully dynamic. These statements are embedded within an application and are prepared during the execution of the application.

deferred write  
The process of asynchronously writing changed data pages to disk.

degree of parallelism  
The number of concurrently executed operations that are initiated to process a query.

delete hole  
The location on which a cursor is positioned when a row in a result table is refetched and the row no longer exists on the base table. See also update hole.

delete rule  
The rule that tells DB2 what to do to a dependent row when a parent row is deleted. Delete rules include CASCADE, RESTRICT, SET NULL, or NO ACTION.

delete trigger  
A trigger that is defined with the triggering delete SQL operation.

delimited identifier  
A sequence of one or more characters enclosed by escape characters, such as quotation marks ("").

delimiter token  
A string constant, a delimited identifier, an operator symbol, or any of the special characters that are shown in DB2 syntax diagrams.

denormalization  
The intentional duplication of columns in multiple tables to increase data redundancy. Denormalization is sometimes necessary to minimize performance problems. Contrast with normalization.

dependent  
An object (row, table, or table space) that has at least one parent. The object is also said to be a dependent (row, table, or table space) of its parent. See also parent row, parent table, and parent table space.

dependent row  
A row that contains a foreign key that matches the value of a primary key in the parent row.

dependent table  
A table that is a dependent in at least one referential constraint.

descendent  
An object that is a dependent of an object or is the dependent of a descendent of an object.
descendent row
A row that is dependent on another row, or a row that is a descendent of a dependent row.

descendent table
A table that is a dependent of another table, or a table that is a descendent of a dependent table.

deterministic function
A user-defined function whose result is dependent on the values of the input arguments. That is, successive invocations with the same input values produce the same answer. Sometimes referred to as a not-variant function. Contrast with nondeterministic function (sometimes called a variant function).

dimension
A data category such as time, products, or markets. The elements of a dimension are referred to as members. See also dimension table.

dimension table
The representation of a dimension in a star schema. Each row in a dimension table represents all of the attributes for a particular member of the dimension. See also dimension, star schema and star join.
directory
The DB2 system database that contains internal objects such as database descriptors and skeleton cursor tables.
disk
A direct-access storage device that records data magnetically.
distinct type
A user-defined data type that is represented as an existing type (its source type), but is considered to be a separate and incompatible type for semantic purposes.

distributed data
Data that resides on a DBMS other than the local system.

distributed data facility (DDF)
A set of DB2 components through which DB2 communicates with another relational database management system.

Distributed Relational Database Architecture (DRDA)
A connection protocol for distributed relational database processing that is used by IBM relational database products. DRDA includes protocols for communication between an application and a remote relational database management system, and for communication between relational database management systems. See also DRDA access.

DNS
See domain name server.

DOCID
See document ID.

document ID
A value that uniquely identifies a row that contains an XML column. This value is stored with the row and never changes.
domain
The set of valid values for an attribute.
domain name
The name by which TCP/IP applications refer to a TCP/IP host within a TCP/IP network.
domain name server (DNS)
A special TCP/IP network server that manages a distributed directory that is used to map TCP/IP host names to IP addresses.

double-byte character large object (DBCLOB)
A graphic string data type in which a sequence of bytes represent double-byte characters that range in size from 0 bytes to 2 GB, less 1 byte. In general, DBCLOB values are used whenever a double-byte character string might exceed the limits of the VARGRAPHIC type.

double-byte character set (DBCS)
A set of characters, which are used by national languages such as Japanese and Chinese, that have more symbols than can be represented by a single byte. Each character is 2 bytes in length. Contrast with single-byte character set and multibyte character set.

double-precision floating point number
A 64-bit approximate representation of a real number.

DPSI
See data-partitioned secondary index.

drain
The act of acquiring a locked resource by quiescing access to that object. Contrast with claim.
drain lock
A lock on a claim class that prevents a claim from occurring.

DRDA
See Distributed Relational Database Architecture.

DRDA access
An open method of accessing distributed data that you can use to connect to another database server to execute packages that were previously bound at the server location.

DSN
- The default DB2 subsystem name.
- The name of the TSO command processor of DB2.
- The first three characters of DB2 module and macro names.

dynamic cursor
A named control structure that an application program uses to change the size of the result table and the order of its rows after the cursor is opened. Contrast with static cursor.

dynamic dump
A dump that is issued during the execution of a program, usually under the control of that program.

dynamic SQL
SQL statements that are prepared and executed at run time. In dynamic SQL, the SQL statement is contained as a character string in a host variable or as a constant, and it is not precompiled.

EA-enabled table space
A table space or index space that is enabled for extended addressability and that contains individual partitions (or pieces, for LOB table spaces) that are greater than 4 GB.

EB
See exabyte

EBCDIC
Extended binary coded decimal interchange code. An encoding scheme that is used to represent character data in the z/OS, VM, VSE, and iSeries environments. Contrast with ASCII and Unicode.

embedded SQL
SQL statements that are coded within an application program. See static SQL.

enabling-new-function mode* (ENFM*)
A transitional stage of the version-to-version migration process that applies to a DB2 subsystem or data sharing group that was in new-function mode (NFM) at one time. When in enabling-new-function mode*, a DB2 subsystem or data sharing group is preparing to use the new functions of the new version but cannot yet use them. A data sharing group that is in enabling-new-function mode* cannot coexist with members that are still at the prior version level. Fallback to a prior version is not supported. Contrast with conversion mode, conversion mode*, enabling-new-function mode, and new-function mode.

enabling-new-function mode (ENFM)
A transitional stage of the version-to-version migration process during which the DB2 subsystem or data sharing group is preparing to use the new functions of the new version. When in enabling-new-function mode, a DB2 data sharing group cannot coexist with members that are still at the prior version level. Fallback to a prior version is not supported, and most new functions of the new version are not available for use in enabling-new-function mode. Contrast with conversion mode, conversion mode*, enabling-new-function mode, and new-function mode.

enclave
In Language Environment, an independent collection of routines, one of which is designated as the main routine. An enclave is similar to a program or run unit. See also WLM enclave.

encoding scheme
A set of rules to represent character data (ASCII, EBCDIC, or Unicode).

end column
In a system period or an application period, the column that indicates the end of the period. See also period.

ENFM See enabling-new-function mode
See enabling-new-function mode.

entity
A person, object, or concept about which information is stored. In a relational database, entities are represented as tables. A database includes information about the entities in an organization or business, and their relationships to each other.

enumerated list
A set of DB2 objects that are defined with a LISTDEF utility control statement in which pattern-matching characters (*, %, _, or ?) are not used.

environment
A collection of names of logical and physical resources that are used to support the performance of a function.

environment handle
A handle that identifies the global context for database access. All data that is pertinent to all objects in the environment is associated with this handle.

equijoin
A join operation in which the join-condition has the form expression = expression. See also join [full outer join] inner join [left outer join] outer join and right outer join.

error page range
A range of pages that are considered to be physically damaged. DB2 does not allow users to access any pages that fall within this range.

escape character
The symbol, a double quotation ("), for example, that is used to enclose an SQL delimited identifier.

exabyte
A unit of measure for processor, real and virtual storage capacities, and channel volume that has a value of 1,152,921,504,606,846,976 bytes or $2^{60}$.

exception
An SQL operation that involves the EXCEPT set operator, which combines two result tables. The result of an exception operation consists of all of the rows that are in only one of the result tables.

exception table
A table that holds rows that violate referential constraints or check constraints that the CHECK DATA utility finds.

exclusive lock
A lock that prevents concurrently executing application processes from reading or changing data. Contrast with share lock.

executable statement
An SQL statement that can be embedded in an application program, dynamically prepared and executed, or issued interactively.

execution context
In SQLJ, a Java object that can be used to control the execution of SQL statements.

exit routine
A user-written (or IBM-provided default) program that receives control from DB2 to perform specific functions. Exit routines run as extensions of DB2.

expanding conversion
A process that occurs when the length of a converted string is greater than that of the source string. For example, this process occurs when an ASCII mixed-data string that contains DBCS characters is converted to an EBCDIC mixed-data string; the converted string is longer because shift codes are added.

explicit hierarchical locking
Locking that is used to make the parent-child relationship between resources known to IRLM. This kind of locking avoids global locking overhead when no inter-DB2 interest exists on a resource.

explicit privilege
A privilege that has a name and is held as the result of an SQL GRANT statement and revoked as the result of an SQL REVOKE statement. For example, the SELECT privilege.

exposed name
A correlation name or a table or view name for which a correlation name is not specified.

expression
An operand or a collection of operators and operands that yields a single value.
Extended Recovery Facility (XRF)
A facility that minimizes the effect of failures in z/OS, VTAM, the host processor, or high-availability applications during sessions between high-availability applications and designated terminals. This facility provides an alternative subsystem to take over sessions from the failing subsystem.

Extensible Markup Language (XML)
A standard metalanguage for defining markup languages that is a subset of Standardized General Markup Language (SGML).

external function
A function that has its functional logic implemented in a programming language application that resides outside the database, in the file system of the database server. The association of the function with the external code application is specified by the EXTERNAL clause in the CREATE FUNCTION statement. External functions can be classified as external scalar functions and external table functions. Contrast with sourced function, built-in function, and SQL function.

external procedure
A procedure that has its procedural logic implemented in an external programming language application. The association of the procedure with the external application is specified by a CREATE PROCEDURE statement with a LANGUAGE clause that has a value other than SQL and an EXTERNAL clause that implicitly or explicitly specifies the name of the external application. Contrast with external SQL procedure and native SQL procedure.

external routine
A user-defined function or stored procedure that is based on code that is written in an external programming language.

external SQL procedure
An SQL procedure that is processed using a generated C program that is a representation of the procedure. When an external SQL procedure is called, the C program representation of the procedure is executed in a stored procedures address space. Contrast with external procedure and native SQL procedure.

failed member state
A state of a member of a data sharing group in which the member's task, address space, or z/OS system terminates before the state changes from active to quiesced.

fallback
The process of returning to a previous release of DB2 after attempting or completing migration to a current release. Fallback is supported only from a subsystem that is in conversion mode.

false global lock contention
A contention indication from the coupling facility that occurs when multiple lock names are hashed to the same indicator and when no real contention exists.

fan set
A direct physical access path to data, which is provided by an index, hash, or link; a fan set is the means by which DB2 supports the ordering of data.

federated database
The combination of a DB2 server (in Linux, UNIX, and Windows environments) and multiple data sources to which the server sends queries. In a federated database system, a client application can use a single SQL statement to join data that is distributed across multiple database management systems and can view the data as if it were local.

fetch orientation
The specification of the desired placement of the cursor as part of a FETCH statement. The specification can be before or after the rows of the result table (with BEFORE or AFTER). The specification can also have either a single-row fetch orientation (for example, NEXT, LAST, or ABSOLUTE n) or a rowset fetch orientation (for example, NEXT ROWSET, LAST ROWSET, or ROWSET STARTING AT ABSOLUTE n).

field procedure
A user-written exit routine that is designed to receive a single value and transform (encode or decode) it in any way the user can specify.
file reference variable
A host variable that is declared with one of the derived data types (BLOB_FILE, CLOB_FILE, DBCLOB_FILE); file reference variables direct the reading of a LOB from a file or the writing of a LOB into a file.

filter factor
A number between zero and one that estimates the proportion of rows in a table for which a predicate is true.

fixed-length string
A character, graphic, or binary string whose length is specified and cannot be changed. Contrast with varying-length string.

FlashCopy
A function on the IBM Enterprise Storage Server that can, in conjunction with the BACKUP SYSTEM utility, create a point-in-time copy of data while an application is running.

foreign key
A column or set of columns in a dependent table of a constraint relationship. The key must have the same number of columns, with the same descriptions, as the primary key of the parent table. Each foreign key value must either match a parent key value in the related parent table or be null.

forest
An ordered set of subtrees of XML nodes.

forward log recovery
The third phase of restart processing during which DB2 processes the log in a forward direction to apply all REDO log records.

free space
The total amount of unused space in a page; that is, the space that is not used to store records or control information is free space.

full outer join
The result of a join operation that includes the matched rows of both tables that are being joined and preserves the unmatched rows of both tables. See also join, equijoin, inner join, left outer join, outer join, and right outer join.

crnsresult
A subselect, a fullselect in parentheses, or a number of both that are combined by set operators. Fullselect specifies a result table. If a set operator is not used, the result of the fullselect is the result of the specified subselect or fullselect.

fully escaped mapping
A mapping from an SQL identifier to an XML name when the SQL identifier is a column name.

function
A mapping, which is embodied as a program (the function body) that can be invoked by means of zero or more input values (arguments) to a single value (the result). See also aggregate function and scalar function.

Functions can be user-defined, built-in, or generated by DB2. (See also built-in function, cast function, external function, sourced function, SQL function, and user-defined function.)

function definer
The authorization ID of the owner of the schema of the function that is specified in the CREATE FUNCTION statement.

function package
A package that results from binding the DBRM for a function program.

function package owner
The authorization ID of the user who binds the function program’s DBRM into a function package.

function signature
The logical concatenation of a fully qualified function name with the data types of all of its parameters.

GB
Gigabyte. A value of (1 073 741 824 bytes).

GBP
See group buffer pool.

GBP-dependent
The status of a page set or page set partition that is dependent on the group buffer pool. Either read/write interest is active among DB2 subsystems for this page set, or the page set has changed pages in the group buffer pool that have not yet been cast out to disk.

generalized trace facility (GTF)
A z/OS service program that records significant system events such as I/O.
interrupts, SVC interrupts, program interrupts, or external interrupts.

**generated column**
A column for which the database manager assigns the value. An example of a generated column is an identity column, row change timestamp column, or row-begin column. See also generated expression column.

**generated expression column**
A generated column that is defined using an expression. See also generated column.

**generic resource name**
A name that VTAM uses to represent several application programs that provide the same function in order to handle session distribution and balancing in a Sysplex environment.

**getpage**
An operation in which DB2 accesses a data page.

**global lock**
A lock that provides concurrency control within and among DB2 subsystems. The scope of the lock is across all DB2 subsystems of a data sharing group.

**global lock contention**
Conflicts on locking requests between different DB2 members of a data sharing group when those members are trying to serialize shared resources.

**governor**
See resource limit facility.

**graphic string**
A sequence of DBCS characters. Graphic data can be further classified as GRAPHIC, VARGRAPHIC, or DBCLOB.

**GRECP**
See group buffer pool recovery pending.

**gross lock**
The shared, update, or exclusive mode locks on a table, partition, or table space.

**group buffer pool duplexing**
The ability to write data to two instances of a group buffer pool structure: a primary group buffer pool and a secondary group buffer pool. z/OS publications refer to these instances as the “old” (for primary) and “new” (for secondary) structures.

**group buffer pool (GBP)**
A coupling facility cache structure that is used by a data sharing group to cache data and to ensure that the data is consistent for all members.

**group buffer pool recovery pending (GRECP)**
The state that exists after the buffer pool for a data sharing group is lost. When a page set is in this state, changes that are recorded in the log must be applied to the affected page set before the page set can be used.

**group level**
The release level of a data sharing group, which is established when the first member migrates to a new release.

**group name**
The z/OS XCF identifier for a data sharing group.

**group restart**
A restart of at least one member of a data sharing group after the loss of either locks or the shared communications area.

**GTF**
See generalized trace facility.

**handle**
In DB2 ODBC, a variable that refers to a data structure and associated resources. See also statement handle, connection handle, and environment handle.

**hash access**
Access to a table using the hash value of a key that is defined by the organization-clause of a CREATE TABLE statement or ALTER TABLE statement.

**hash overflow index**
A DB2 index used to track data rows that do not fit into the fixed hash space, and therefore, reside in the hash overflow space. DB2 accesses the hash overflow index to fetch rows from the hash overflow area.

**help panel**
A screen of information that presents tutorial text to assist a user at the workstation or terminal.

**heuristic damage**
The inconsistency in data between one or more participants that results when a heuristic decision to resolve an indoubt
LUW at one or more participants differs from the decision that is recorded at the coordinator.

**heuristic decision**
A decision that forces indoubt resolution at a participant by means other than automatic resynchronization between coordinator and participant.

**histogram statistics**
A way of summarizing data distribution. This technique divides up the range of possible values in a data set into intervals, such that each interval contains approximately the same percentage of the values. A set of statistics are collected for each interval.

**historical row**
A row in a history table. See also **history table**.

**history table**
A table that is used by the database manager to store historical versions of the rows from the associated system-period temporal table. See also **historical row** and **system-period temporal table**.

**hole**
A row of the result table that cannot be accessed because of a delete or an update that has been performed on the row. See also **delete hole** and **update hole**.

**home address space**
The area of storage that z/OS currently recognizes as **dispatched**.

**host**
The set of programs and resources that are available on a given TCP/IP instance.

**host expression**
A Java variable or expression that is referenced by SQL clauses in an SQLJ application program.

**host identifier**
A name that is declared in the host program.

**host language**
A programming language in which you can embed SQL statements.

**host program**
An application program that is written in a host language and that contains embedded SQL statements.

**host structure**
In an application program, a structure that is referenced by embedded SQL statements.

**host variable**
In an application program written in a host language, an application variable that is referenced by embedded SQL statements.

**host variable array**
An array of elements, each of which corresponds to a value for a column. The dimension of the array determines the maximum number of rows for which the array can be used.

**IBM System z9 Integrated Processor (zIIP)**
A specialized processor that can be used for some DB2 functions.

**IDCAMS**
An IBM program that is used to process access method services commands. It can be invoked as a job or jobstep, from a TSO terminal, or from within a user's application program.

**IDCAMS LISTCAT**
A facility for obtaining information that is contained in the access method services catalog.

**identity column**
A generated column that is defined with the AS IDENTITY clause. An identity column provides a way for the database manager to automatically generate a numeric value for each row that is inserted into a table. A table can have no more than one identity column.

**IFCID**
See **instrumentation facility component identifier**.

**IFI**
See **instrumentation facility interface**.

**IFI call**
An invocation of the instrumentation facility interface (IFI) by means of one of its defined functions.

**image copy**
An exact reproduction of all or part of a table space. DB2 provides utility programs to make full image copies (to copy the entire table space) or incremental image copies (to copy only those pages that have been modified since the last image copy).
IMS attachment facility
A DB2 subcomponent that uses z/OS subsystem interface (SSI) protocols and cross-memory linkage to process requests from IMS to DB2 and to coordinate resource commitment.

in-abort
A status of a unit of recovery. If DB2 fails after a unit of recovery begins to be rolled back, but before the process is completed, DB2 continues to back out the changes during restart.

in-commit
A status of a unit of recovery. If DB2 fails after beginning its phase 2 commit processing, it “knows,” when restarted, that changes made to data are consistent. Such units of recovery are termed in-commit.

independent
An object (row, table, or table space) that is neither a parent nor a dependent of another object.

index
A set of pointers that are logically ordered by the values of a key. Indexes can provide faster access to data and can enforce uniqueness on the rows in a table.

index-controlled partitioning
A type of partitioning in which partition boundaries for a partitioned table are controlled by values that are specified on the CREATE INDEX statement. Partition limits are saved in the LIMITKEY column of the SYSIBM.SYSINDEXPART catalog table.

index key
The set of columns in a table that is used to determine the order of index entries.

index partition
A VSAM data set that is contained within a partitioning index space.

index space
A page set that is used to store the entries of one index.

indicator column
A 4-byte value that is stored in a base table in place of a LOB column.

indicator variable
A variable that is used to represent the null value in an application program. If the value for the selected column is null, a negative value is placed in the indicator variable.

indoubt
A status of a unit of recovery. If DB2 fails after it has finished its phase 1 commit processing and before it has started phase 2, only the commit coordinator knows if an individual unit of recovery is to be committed or rolled back. At restart, if DB2 lacks the information it needs to make this decision, the status of the unit of recovery is indoubt until DB2 obtains this information from the coordinator. More than one unit of recovery can be indoubt at restart.

indoubt resolution
The process of resolving the status of an indoubt logical unit of work to either the committed or the rollback state.

inflight
A status of a unit of recovery. If DB2 fails before its unit of recovery completes phase 1 of the commit process, it merely backs out the updates of its unit of recovery at restart. These units of recovery are termed inflight.

inheritance
The passing downstream of class resources or attributes from a parent class in the class hierarchy to a child class.

initialization file
For DB2 ODBC applications, a file containing values that can be set to adjust the performance of the database manager.

inline copy
A copy that is produced by the LOAD or REORG utility. The data set that the inline copy produces is logically equivalent to a full image copy that is produced by running the COPY utility with read-only access (SHRLEVEL REFERENCE).

inline SQL PL
A subset of SQL procedural language that can be used in SQL functions and dynamic compound statements. See also SQL procedural language.

inner join
The result of a join operation that includes only the matched rows of both tables that are being joined. See also join.
equijoin, full outer join, left outer join, outer join, and right outer join.

Inoperative package
In DB2 Version 9.1 for z/OS and earlier, a package that cannot be used because one or more user-defined functions or procedures that the package depends on were dropped. Such a package must be explicitly rebound. Contrast with invalid package.

Insensitive cursor
A cursor that is not sensitive to inserts, updates, or deletes that are made to the underlying rows of a result table after the result table has been materialized.

Insert trigger
A trigger that is defined with the triggering SQL operation, an insert.

Install
The process of preparing a DB2 subsystem to operate as a z/OS subsystem.

INSTEAD OF trigger
A trigger that is associated with a single view and is activated by an insert, update, or delete operation on the view and that can define how to propagate the insert, update, or delete operation on the view to the underlying tables of the view. Contrast with BEFORE trigger and AFTER trigger.

Instrumentation facility component identifier (IFCID)
A value that names and identifies a trace record of an event that can be traced. As a parameter on the START TRACE and MODIFY TRACE commands, it specifies that the corresponding event is to be traced.

Instrumentation facility interface (IFI)
A programming interface that enables programs to obtain online trace data about DB2, to submit DB2 commands, and to pass data to DB2.

Interactive System Productivity Facility (ISPF)
An IBM licensed program that provides interactive dialog services in a z/OS environment.

Inter-DB2 R/W interest
A property of data in a table space, index, or partition that has been opened by more than one member of a data sharing group and that has been opened for writing by at least one of those members.

Intermediate database server
The target of a request from a local application or a remote application requester that is forwarded to another database server.

Internal resource lock manager (IRLM)
A z/OS subsystem that DB2 uses to control communication and database locking.

Intersection
An SQL operation that involves the INTERSECT set operator, which combines two result tables. The result of an intersection operation consists of all of the rows that are in both result tables.

Invalid package
In DB2 Version 9.1 for z/OS and earlier, a package that depends on an object (other than a user-defined function) that is dropped. Such a package is implicitly rebound on invocation. Contrast with inoperative package.

IP address
A value that uniquely identifies a TCP/IP host.

IRLM
See internal resource lock manager.

Isolation level
The degree to which a unit of work is isolated from the updating operations of other units of work. See also cursor stability, read stability, repeatable read, and uncommitted read.

ISPF
See Interactive System Productivity Facility.

Iterator
In SQLJ, an object that contains the result set of a query. An iterator is equivalent to a cursor in other host languages.

Iterator declaration clause
In SQLJ, a statement that generates an iterator declaration class. An iterator is an object of an iterator declaration class.

JAR
See Java Archive.

Java Archive (JAR)
A file format that is used for aggregating many files into a single file.

JDBC
A Sun Microsystems database application
Programming interface (API) for Java that allows programs to access database management systems by using callable SQL.

Join
A relational operation that allows retrieval of data from two or more tables based on matching column values. See also equijoin, full outer join, inner join, left outer join, right outer join.

Kilobyte
Kilobyte. A value of 1024 bytes.

Kerberos
A network authentication protocol that is designed to provide strong authentication for client/server applications by using secret-key cryptography.

Kerberos ticket
A transparent application mechanism that transmits the identity of an initiating principal to its target. A simple ticket contains the principal's identity, a session key, a timestamp, and other information, which is sealed using the target's secret key.

Key
A column, an ordered collection of columns, or an expression that is identified in the description of a table, index, or referential constraint. The same column or expression can be part of more than one key.

Key-sequenced data set (KSDS)
A VSAM file or data set whose records are loaded in key sequence and controlled by an index.

Linear data set (LDS)
A VSAM data set that contains data but no control information. A linear data set can be accessed as a byte-addressable string in virtual storage.

Limit key
The highest value of the index key for a partition.

Linkage editor
A computer program for creating load modules from one or more object modules or load modules by resolving cross references among the modules and, if necessary, adjusting addresses.

List
A type of object, which DB2 utilities can process, that identifies multiple table spaces, multiple index spaces, or both. A list is defined with the LISTDEF utility control statement.

List structure
A coupling facility structure that lets data be shared and manipulated as elements of a queue.

L-lock
See logical lock.

Load module
A program unit that is suitable for loading into main storage for execution. The output of a linkage editor.

LOB
See large object.
LOB locator
A mechanism that allows an application program to manipulate a large object value in the database system. A LOB locator is a fullword integer value that represents a single LOB value. An application program retrieves a LOB locator into a host variable and can then apply SQL operations to the associated LOB value using the locator.

LOB lock
A lock on a LOB value.

LOB table space
A table space that contains all the data for a particular LOB column in the related base table.

local
A way of referring to any object that the local DB2 subsystem maintains. A local table, for example, is a table that is maintained by the local DB2 subsystem. Contrast with remote.

locale
The definition of a subset of a user’s environment that combines a CCSID and characters that are defined for a specific language and country.

local lock
A lock that provides intra-DB2 concurrency control, but not inter-DB2 concurrency control; that is, its scope is a single DB2.

local subsystem
The unique relational DBMS to which the user or application program is directly connected (in the case of DB2, by one of the DB2 attachment facilities).

location
The unique name of a database server. An application uses the location name to access a DB2 database server. A database alias can be used to override the location name when accessing a remote server.

location alias
Another name by which a database server identifies itself in the network. Applications can use this name to access a DB2 database server.

lock
A means of controlling concurrent events or access to data. DB2 locking is performed by the IRLM.

lock duration
The interval over which a DB2 lock is held.

lock escalation
The promotion of a lock from a row, page, or LOB lock to a table space lock because the number of page locks that are concurrently held on a given resource exceeds a preset limit.

locking
The process by which the integrity of data is ensured. Locking prevents concurrent users from accessing inconsistent data. See also claim, drain, and latch.

lock mode
A representation for the type of access that concurrently running programs can have to a resource that a DB2 lock is holding.

lock object
The resource that is controlled by a DB2 lock.

lock promotion
The process of changing the size or mode of a DB2 lock to a higher, more restrictive level.

lock size
The amount of data that is controlled by a DB2 lock on table data; the value can be a row, a page, a LOB, a partition, a table, or a table space.

lock structure
A coupling facility data structure that is composed of a series of lock entries to support shared and exclusive locking for logical resources.

log
A collection of records that describe the events that occur during DB2 execution and that indicate their sequence. The information thus recorded is used for recovery in the event of a failure during DB2 execution.

log control interval definition
A suffix of the physical log record that tells how record segments are placed in the physical control interval.

logical claim
A claim on a logical partition of a nonpartitioning index.
logical index partition
The set of all keys that reference the same data partition.

logical lock (L-lock)
The lock type that transactions use to control intra- and inter-DB2 data concurrency between transactions. Contrast with physical lock (P-lock).

logically complete
A state in which the concurrent copy process is finished with the initialization of the target objects that are being copied. The target objects are available for update.

logical page list (LPL)
A list of pages that are in error and that cannot be referenced by applications until the pages are recovered. The page is in logical error because the actual media (coupling facility or disk) might not contain any errors. Usually a connection to the media has been lost.

logical partition
A set of key or RID pairs in a nonpartitioning index that are associated with a particular partition.

logical recovery pending (LRECP)
The state in which the data and the index keys that reference the data are inconsistent.

logical unit (LU)
An access point through which an application program accesses the SNA network in order to communicate with another application program. See also LU name.

logical unit of work
The processing that a program performs between synchronization points.

logical unit of work identifier (LUWID)
A name that uniquely identifies a thread within a network. This name consists of a fully-qualified LU network name, an LUW instance number, and an LUW sequence number.

log initialization
The first phase of restart processing during which DB2 attempts to locate the current end of the log.

log record header (LRH)
A prefix, in every log record, that contains control information.

log record sequence number (LRSN)
An identifier for a log record that is associated with a data sharing member. DB2 uses the LRSN for recovery in the data sharing environment.

log truncation
A process by which an explicit starting RBA is established. This RBA is the point at which the next byte of log data is to be written.

LPL See logical page list.
LRECP See logical recovery pending.
LRH See log record header.
LRSN See log record sequence number.
LU See logical unit.
LU name
Logical unit name, which is the name by which VTAM refers to a node in a network.

LUW See logical unit of work.

LUWID See logical unit of work identifier.

mapping table
A table that the REORG utility uses to map the associations of the RIDs of data records in the original copy and in the shadow copy. This table is created by the user.

mass delete
The deletion of all rows of a table.

materialize
- The process of putting rows from a view or nested table expression into a work file for additional processing by a query.
- The placement of a LOB value into contiguous storage. Because LOB values can be very large, DB2 avoids materializing LOB data until doing so becomes absolutely necessary.

materialized query table
A table that is used to contain information
that is derived and can be summarized from one or more source tables. Contrast with base table.

**MB**  
Megabyte (1,048,576 bytes).

**MBCS**  
See multibyte character set.

**member name**  
The z/OS XCF identifier for a particular DB2 subsystem in a data sharing group.

**menu**  
A displayed list of available functions for selection by the operator. A menu is sometimes called a menu panel.

**metalanguage**  
A language that is used to create other specialized languages.

**migration**  
The process of converting a subsystem with a previous release of DB2 to an updated or current release. In this process, you can acquire the functions of the updated or current release without losing the data that you created on the previous release.

**mixed data string**  
A character string that can contain both single-byte and double-byte characters.

**mode name**  
A VTAM name for the collection of physical and logical characteristics and attributes of a session.

**modify locks**  
An L-lock or P-lock with a MODIFY attribute. A list of these active locks is kept at all times in the coupling facility lock structure. If the requesting DB2 subsystem fails, that DB2 subsystem’s modify locks are converted to retained locks.

**multibyte character set (MBCS)**  
A character set that represents single characters with more than a single byte. UTF-8 is an example of an MBCS. Characters in UTF-8 can range from 1 to 4 bytes in DB2. Contrast with single-byte character set and double-byte character set. See also Unicode.

**multidimensional analysis**  
The process of assessing and evaluating an enterprise on more than one level.

**Multiple Virtual Storage (MVS)**  
An element of the z/OS operating system. This element is also called the Base Control Program (BCP).

**multisite update**  
Distributed relational database processing in which data is updated in more than one location within a single unit of work.

**multithreading**  
Multiple TCBs that are executing one copy of DB2 ODBC code concurrently (sharing a processor) or in parallel (on separate central processors).

**MVS**  
See Multiple Virtual Storage.

**native SQL procedure**  
An SQL procedure that is processed by converting the procedural statements to a native representation that is stored in the database directory, as is done with other SQL statements. When a native SQL procedure is called, the native representation is loaded from the directory, and DB2 executes the procedure. Contrast with external procedure and external SQL procedure.

**nested table expression**  
A fullselect in a FROM clause (surrounded by parentheses).

**network identifier (NID)**  
The network ID that is assigned by IMS or CICS, or if the connection type is RRSAF, the RRS unit of recovery ID (URID).

**new-function mode (NFM)**  
The normal mode of operation that exists after successful completion of a version-to-version migration. At this stage, all new functions of the new version are available for use. A DB2 data sharing group cannot coexist with members that are still at the prior version level, and fallback to a prior version is not supported. Contrast with conversion model, conversion mode*, enabling-new-function mode, and enabling-new-function mode*.

**NFM**  
See new-function mode.

**NID**  
See network identifier.

**node ID index**  
See XML node ID index.

**nondeterministic function**  
A user-defined function whose result is
not solely dependent on the values of the input arguments. That is, successive invocations with the same argument values can produce a different answer. This type of function is sometimes called a variant function. Contrast with deterministic function (sometimes called a not-variant function).

nonleaf page
A page that contains keys and page numbers of other pages in the index (either leaf or nonleaf pages). Nonleaf pages never point to actual data. Contrast with leaf page.

nonpartitioned index
An index that is not physically partitioned. Both partitioning indexes and secondary indexes can be nonpartitioned.

nonpartitioned secondary index (NPSI)
An index on a partitioned table space that is not the partitioning index and is not partitioned. Contrast with data-partitioned secondary index.

nonpartitioning index
See secondary index.

nonscrollable cursor
A cursor that can be moved only in a forward direction. Nonscrollable cursors are sometimes called forward-only cursors or serial cursors.

normalization
A key step in the task of building a logical relational database design. Normalization helps you avoid redundancies and inconsistencies in your data. An entity is normalized if it meets a set of constraints for a particular normal form (first normal form, second normal form, and so on). Contrast with denormalization.

not-variant function
See deterministic function.

NPSI See nonpartitioned secondary index.

NUL The null character ('\0'), which is represented by the value X'00'. In C, this character denotes the end of a string. For EBCDIC, ASCII, and Unicode UTF-8 strings, the null terminator is a single-byte value (X'00'). For Unicode UTF-16 or UCS-2 (wide) strings, the null terminator is a double-byte value (X'0000').

ODBC
See Open Database Connectivity.

ODBC driver
A dynamically-linked library (DLL) that implements ODBC function calls and interacts with a data source.

OLAP See online analytical processing.

online analytical processing (OLAP)
The process of collecting data from one or many sources; transforming and analyzing the consolidated data quickly and interactively; and examining the results across different dimensions of the data by looking for patterns, trends, and exceptions within complex relationships of that data.

Open Database Connectivity (ODBC)
A Microsoft database application programming interface (API) for C that allows access to database management systems by using callable SQL. ODBC does not require the use of an SQL preprocessor. In addition, ODBC provides an architecture that lets users add modules called database drivers, which link the application to their choice of database management systems at run time. This means that applications no longer need to be directly linked to the modules of all the database management systems that are supported.

ordinary identifier
An uppercase letter followed by zero or more characters, each of which is an uppercase letter, a digit, or the underscore character. An ordinary identifier must not be a reserved word.

ordinary token
A numeric constant, an ordinary identifier, a host identifier, or a keyword.

originating task
In a parallel group, the primary agent that receives data from other execution units (referred to as parallel tasks) that are executing portions of the query in parallel.
**outer join**
The result of a join operation that includes the matched rows of both tables that are being joined and preserves some or all of the unmatched rows of the tables that are being joined. See also join, equijoin, full outer join, inner join, left outer join, and right outer join.

**overloaded function**
A function name for which multiple function instances exist.

**package**
An object containing a set of SQL statements that have been statically bound and that is available for processing. A package is sometimes also called an application package.

**package list**
An ordered list of package names that may be used to extend an application plan.

**package name**
The name of an object that is used for an application package or an SQL procedure package. An application package is a bound version of a database request module (DBRM) that is created by a BIND PACKAGE or REBIND PACKAGE command. An SQL procedural language package is created by a CREATE or ALTER PROCEDURE statement for a native SQL procedure. The name of a package consists of a location name, a collection ID, a package ID, and a version ID.

**page**
A unit of storage within a table space (4 KB, 8 KB, 16 KB, or 32 KB) or index space (4 KB, 8 KB, 16 KB, or 32 KB). In a table space, a page contains one or more rows of a table. In a LOB or XML table space, a LOB or XML value can span more than one page, but no more than one LOB or XML value is stored on a page.

**page set**
Another way to refer to a table space or index space. Each page set consists of a collection of VSAM data sets.

**page set recovery pending (PSRCP)**
A restrictive state of an index space. In this case, the entire page set must be recovered. Recovery of a logical part is prohibited.

**panel**
A predefined display image that defines the locations and characteristics of display fields on a display surface (for example, a menu panel).

**parallel complex**
A cluster of machines that work together to handle multiple transactions and applications.

**parallel group**
A set of consecutive operations that execute in parallel and that have the same number of parallel tasks.

**parallel I/O processing**
A form of I/O processing in which DB2 initiates multiple concurrent requests for a single user query and performs I/O processing concurrently (in parallel) on multiple data partitions.

**parallelism assistant**
In Sysplex query parallelism, a DB2 subsystem that helps to process parts of a parallel query that originates on another DB2 subsystem in the data sharing group.

**parallelism coordinator**
In Sysplex query parallelism, the DB2 subsystem from which the parallel query originates.

**Parallel Sysplex**
A set of z/OS systems that communicate and cooperate with each other through certain multisystem hardware components and software services to process customer workloads.

**parallel task**
The execution unit that is dynamically created to process a query in parallel. A parallel task is implemented by a z/OS service request block.

**parameter marker**
A question mark (?) that appears in a statement string of a dynamic SQL statement. The question mark can appear where a variable could appear if the statement string were a static SQL statement.

**parameter-name**
An SQL identifier that designates a parameter in a routine that is written by a user. Parameter names are required for SQL procedures and SQL functions, and they are used in the body of the routine...
to refer to the values of the parameters. Parameter names are optional for external routines.

**parent key**
A primary key or unique key in the parent table of a referential constraint. The values of a parent key determine the valid values of the foreign key in the referential constraint.

**parent lock**
For explicit hierarchical locking, a lock that is held on a resource that might have child locks that are lower in the hierarchy. A parent lock is usually the table space lock or the partition intent lock. See also child lock.

**parent row**
A row whose primary key value is the foreign key value of a dependent row.

**parent table**
A table whose primary key is referenced by the foreign key of a dependent table.

**parent table space**
A table space that contains a parent table. A table space containing a dependent of that table is a dependent table space.

**participant**
An entity other than the commit coordinator that takes part in the commit process. The term participant is synonymous with agent in SNA.

**partition**
A portion of a page set. Each partition corresponds to a single, independently extendable data set. The maximum size of a partition depends on the number of partitions in the partitioned page set. All partitions of a given page set have the same maximum size.

**partition-by-growth table space**
A table space whose size can grow to accommodate data growth. DB2 for z/OS manages partition-by-growth table spaces by automatically adding new data sets when the database needs more space to satisfy an insert operation. Contrast with range-partitioned table space and universal table space. See also.

**partitioned data set (PDS)**
A data set in disk storage that is divided into partitions, which are called members.

**partitioned index**
An index that is physically partitioned. Both partitioning indexes and secondary indexes can be partitioned.

**partitioned page set**
A partitioned table space or an index space. Header pages, space map pages, data pages, and index pages reference data only within the scope of the partition.

**partitioned table space**
A table space that is based on a single table and that is subdivided into partitions, each of which can be processed independently by utilities. Contrast with segmented table space and universal table space.

**partitioning index**
An index in which the leftmost columns are the partitioning columns of the table. The index can be partitioned or nonpartitioned.

**partner logical unit**
An access point in the SNA network that is connected to the local DB2 subsystem by way of a VTAM conversation.

**path**
See SQL path.

**PDS**
See partitioned data set.

**period**
In a table, an interval of time that is defined by two datetime columns. A period contains a begin column and an end column. See also begin column and end column.

**physical consistency**
The state of a page that is not in a partially changed state.

**physical lock (P-lock)**
A type of lock that DB2 acquires to provide consistency of data that is cached in different DB2 subsystems. Physical locks are used only in data sharing environments. Contrast with logical lock (L-lock).
physically complete
The state in which the concurrent copy process is completed and the output data set has been created.

piece
A data set of a nonpartitioned page set.

plan
See application plan

plan allocation
The process of allocating DB2 resources to a plan in preparation for execution.

plan member
The bound copy of a DBRM that is identified in the member clause.

plan name
The name of an application plan.

P-lock
See physical lock

point of consistency
A time when all recoverable data that an application accesses is consistent with other data. The term point of consistency is synonymous with sync point or commit point.

policy
See CFRM policy

postponed abort UR
A unit of recovery that was inflight or in-abort, was interrupted by system failure or cancellation, and did not complete backout during restart.

precision
In SQL, the total number of digits in a decimal number (called the size in the C language). In the C language, the number of digits to the right of the decimal point (called the scale in SQL). The DB2 information uses the SQL terms.

precompilation
A processing of application programs containing SQL statements that takes place before compilation. SQL statements are replaced with statements that are recognized by the host language compiler. Output from this precompilation includes source code that can be submitted to the compiler and the database request module (DBRM) that is input to the bind process.

predicate
An element of a search condition that expresses or implies a comparison operation.

prefix
A code at the beginning of a message or record.

preformat
The process of preparing a VSAM linear data set for DB2 use, by writing specific data patterns.

prepare
The first phase of a two-phase commit process in which all participants are requested to prepare for commit.

prepared SQL statement
A named object that is the executable form of an SQL statement that has been processed by the PREPARE statement.

primary authorization ID
The authorization ID that is used to identify the application process to DB2.

primary group buffer pool
For a duplexed group buffer pool, the structure that is used to maintain the coherency of cached data. This structure is used for page registration and cross-validation. The z/OS equivalent is old structure. Compare with secondary group buffer pool.

primary index
An index that enforces the uniqueness of a primary key.

primary key
In a relational database, a unique, nonnull key that is part of the definition of a table. A table cannot be defined as a parent unless it has a unique key or primary key.

principal
An entity that can communicate securely with another entity. In Kerberos, principals are represented as entries in the Kerberos registry database and include users, servers, computers, and others.

principal name
The name by which a principal is known to the DCE security services.

privilege
The capability of performing a specific function, sometimes on a specific object. See also explicit privilege.

privilege set
For the installation SYSADM ID, the set of all possible privileges.
• For any other authorization ID, including the PUBLIC authorization ID, the set of all privileges that are recorded for that ID in the DB2 catalog.

**process**
In DB2, the unit to which DB2 allocates resources and locks. Sometimes called an application process, a process involves the execution of one or more programs. The execution of an SQL statement is always associated with some process. The means of initiating and terminating a process are dependent on the environment.

**program**
A single, compilable collection of executable statements in a programming language.

**program temporary fix (PTF)**
A solution or bypass of a problem that is diagnosed as a result of a defect in a current unaltered release of a licensed program. An authorized program analysis report (APAR) fix is corrective service for an existing problem. A PTF is preventive service for problems that might be encountered by other users of the product. A PTF is temporary, because a permanent fix is usually not incorporated into the product until its next release.

**protected conversation**
A VTAM conversation that supports two-phase commit flows.

**PSRCP**
See page set recovery pending.

**PTF**
See program temporary fix.

**QSAM**
See queued sequential access method.

**query**
A component of certain SQL statements that specifies a result table.

**query block**
The part of a query that is represented by one of the FROM clauses. Each FROM clause can have multiple query blocks, depending on DB2 processing of the query.

**query CP parallelism**
Parallel execution of a single query, which is accomplished by using multiple tasks. See also Sysplex query parallelism.

**query I/O parallelism**
Parallel access of data, which is accomplished by triggering multiple I/O requests within a single query.

**queued sequential access method (QSAM)**
An extended version of the basic sequential access method (BSAM). When this method is used, a queue of data blocks is formed. Input data blocks await processing, and output data blocks await transfer to auxiliary storage or to an output device.

**quiesce point**
A point at which data is consistent as a result of running the DB2 QUIESCE utility.

**RACF**

**range-partitioned table space**
A type of universal table space that is based on partitioning ranges and that contains a single table. Contrast with partition-by-growth table space. See also universal table space.

**RBA**
See relative byte address.

**RCT**
See resource control table.

**RDO**
See resource definition online.

**read stability (RS)**
An isolation level that is similar to repeatable read but does not completely isolate an application process from all other concurrently executing application processes. See also cursor stability, repeatable read, and uncommitted read.

**rebind**
The creation of a new application plan for an application program that has been bound previously. If, for example, you have added an index for a table that your application accesses, you must rebind the application in order to take advantage of that index.

**rebuild**
The process of reallocating a coupling facility structure. For the shared communications area (SCA) and lock structure, the structure is repopulated; for the group buffer pool, changed pages are usually cast out to disk, and the new
structure is populated only with changed
pages that were not successfully cast out.

**record**  
The storage representation of a row or other data.

**record identifier (RID)**  
A unique identifier that DB2 uses to identify a row of data in a table. Compare with row identifier.

**record identifier (RID) pool**  
An area of main storage that is used for sorting record identifiers during list-prefetch processing.

**record length**  
The sum of the length of all the columns in a table, which is the length of the data as it is physically stored in the database. Records can be fixed length or varying length, depending on how the columns are defined. If all columns are fixed-length columns, the record is a fixed-length record. If one or more columns are varying-length columns, the record is a varying-length record.

**Resource Recovery Services attachment facility (RRSAF)**  
A DB2 subcomponent that uses Resource Recovery Services to coordinate resource commitment between DB2 and all other resource managers that also use RRS in a z/OS system.

**recovery**  
The process of rebuilding databases after a system failure.

**recovery log**  
A collection of records that describes the events that occur during DB2 execution and indicates their sequence. The recorded information is used for recovery in the event of a failure during DB2 execution.

**recovery manager**  
A subcomponent that supplies coordination services that control the interaction of DB2 resource managers during commit, abort, checkpoint, and restart processes. The recovery manager also supports the recovery mechanisms of other subsystems (for example, IMS) by acting as a participant in the other subsystem’s process for protecting data that has reached a point of consistency.

A coordinator or a participant (or both), in the execution of a two-phase commit, that can access a recovery log that maintains the state of the logical unit of work and names the immediate upstream coordinator and downstream participants.

**recovery pending (RECP)**  
A condition that prevents SQL access to a table space that needs to be recovered.

**recovery token**  
An identifier for an element that is used in recovery (for example, NID or URID).

**RECP**  
See recovery pending.

**redo**  
A state of a unit of recovery that indicates that changes are to be reapplied to the disk media to ensure data integrity.

**reentrant code**  
Executable code that can reside in storage as one shared copy for all threads. Reentrant code is not self-modifying and provides separate storage areas for each thread. See also threadsafe.

**referential constraint**  
The requirement that nonnull values of a designated foreign key are valid only if they equal values of the primary key of a designated table.

**referential cycle**  
A set of referential constraints such that each base table in the set is a descendent of itself. The tables that are involved in a referential cycle are ordered so that each table is a descendent of the one before it, and the first table is a descendent of the last table.

**referential integrity**  
The state of a database in which all values of all foreign keys are valid. Maintaining referential integrity requires the enforcement of referential constraints on all operations that change the data in a table on which the referential constraints are defined.

**referential structure**  
A set of tables and relationships that includes at least one table and, for every table in the set, all the relationships in which that table participates and all the tables to which it is related.

**refresh age**  
The time duration between the current
time and the time during which a materialized query table was last refreshed.

**registry**
See registry database.

**registry database**
A database of security information about principals, groups, organizations, accounts, and security policies.

**relational database**
A database that can be perceived as a set of tables and manipulated in accordance with the relational model of data.

**relational database management system (RDBMS)**
A collection of hardware and software that organizes and provides access to a relational database.

**relational schema**
See SQL schema.

**relationship**
A defined connection between the rows of a table or the rows of two tables. A relationship is the internal representation of a referential constraint.

**relative byte address (RBA)**
The offset of a data record or control interval from the beginning of the storage space that is allocated to the data set or file to which it belongs.

**remigration**
The process of returning to a current release of DB2 following a fallback to a previous release. This procedure constitutes another migration process.

**remote**
Any object that is maintained by a remote DB2 subsystem (that is, by a DB2 subsystem other than the local one). A remote view, for example, is a view that is maintained by a remote DB2 subsystem. Contrast with local.

**remote subsystem**
Any relational DBMS, except the local subsystem, with which the user or application can communicate. The subsystem need not be remote in any physical sense, and might even operate on the same processor under the same z/OS system.

**reoptimization**
The DB2 process of reconsidering the access path of an SQL statement at run time; during reoptimization, DB2 uses the values of host variables, parameter markers, or special registers.

**reordered row format**
A row format that facilitates improved performance in retrieval of rows that have varying-length columns. DB2 rearranges the column order, as defined in the CREATE TABLE statement, so that the fixed-length columns are stored at the beginning of the row and the varying-length columns are stored at the end of the row. Contrast with basic row format.

**REORG pending (REORP)**
A condition that restricts SQL access and most utility access to an object that must be reorganized.

**REORP**
See REORG pending.

**repeatable read (RR)**
The isolation level that provides maximum protection from other executing application programs. When an application program executes with repeatable read protection, rows that the program references cannot be changed by other programs until the program reaches a commit point. See also cursor stability, read stability, and uncommitted read.

**repeating group**
A situation in which an entity includes multiple attributes that are inherently the same. The presence of a repeating group violates the requirement of first normal form. In an entity that satisfies the requirement of first normal form, each attribute is independent and unique in its meaning and its name. See also normalization.

**replay detection mechanism**
A method that allows a principal to detect whether a request is a valid request from a source that can be trusted or whether an untrustworthy entity has captured information from a previous exchange and is replaying the information exchange to gain access to the principal.
request commit
The vote that is submitted to the prepare phase if the participant has modified data and is prepared to commit or roll back.

requester
The source of a request to access data at a remote server. In the DB2 environment, the requester function is provided by the distributed data facility.

resource
The object of a lock or claim, which could be a table space, an index space, a data partition, an index partition, or a logical partition.

resource allocation
The part of plan allocation that deals specifically with the database resources.

resource control table
A construct of previous versions of the CICS attachment facility that defines authorization and access attributes for transactions or transaction groups. Beginning in CICS Transaction Server Version 1.3, resources are defined by using resource definition online instead of the resource control table. See also resource definition online.

resource definition online (RDO)
The recommended method of defining resources to CICS by creating resource definitions interactively, or by using a utility, and then storing them in the CICS definition data set. In earlier releases of CICS, resources were defined by using the resource control table (RCT), which is no longer supported.

resource limit facility (RLF)
A portion of DB2 code that prevents dynamic manipulative SQL statements from exceeding specified time limits. The resource limit facility is sometimes called the governor.

resource limit specification table (RLST)
A site-defined table that specifies the limits to be enforced by the resource limit facility.

resource manager
- A function that is responsible for managing a particular resource and that guarantees the consistency of all updates made to recoverable resources within a logical unit of work. The resource that is being managed can be physical (for example, disk or main storage) or logical (for example, a particular type of system service).
  - A participant, in the execution of a two-phase commit, that has recoverable resources that could have been modified. The resource manager has access to a recovery log so that it can commit or roll back the effects of the logical unit of work to the recoverable resources.

restart pending (RESTP)
A restrictive state of a page set or partition that indicates that restart (backout) work needs to be performed on the object.

RESTP
See restart pending.

result set
The set of rows that a stored procedure returns to a client application.

result set locator
A 4-byte value that DB2 uses to uniquely identify a query result set that a stored procedure returns.

result table
The set of rows that are specified by a SELECT statement.

retained lock
A MODIFY lock that a DB2 subsystem was holding at the time of a subsystem failure. The lock is retained in the coupling facility lock structure across a DB2 for z/OS failure.

RID
See record identifier.

RID pool
See record identifier pool.

right outer join
The result of a join operation that includes the matched rows of both tables that are being joined and preserves the unmatched rows of the second join operand. See also join, equijoin, full outer join, inner join, left outer join, and outer join.

RLF
See resource limit facility.

RLST
See resource limit specification table.

role
A database entity that groups together one or more privileges and that can be
assigned to a primary authorization ID or to PUBLIC. The role is available only in a trusted context.

**rollback**

The process of restoring data that was changed by SQL statements to the state at its last commit point. All locks are freed. Contrast with **commit**.

**root page**

The index page that is at the highest level (or the beginning point) in an index.

**routine**

A database object that encapsulates procedural logic and SQL statements, is stored on the database server, and can be invoked from an SQL statement or by using the CALL statement. The main classes of routines are procedures and functions.

**row**

The horizontal component of a table. A row consists of a sequence of values, one for each column of the table.

**row-begin column**

A generated column that is defined with the AS ROW BEGIN clause. The value is assigned whenever a row is inserted into the table or any column in the row is updated. A row-begin column is intended for use as the first column of a SYSTEM_TIME period. See also **generated column**, **row-end column**, and **transaction-start-ID column**.

**row change timestamp column**

A generated column that is defined with the AS ROW CHANGE TIMESTAMP clause. A row change timestamp column provides a way for the database manager to automatically generate and maintain a timestamp value for each row that is inserted or updated in a table. A table can have no more than one row change timestamp column.

**row-end column**

A generated column that is defined with the AS ROW END clause. The value is assigned whenever a row is inserted into the table or any column in the row is updated. A row-end column is intended for use as the second column of a SYSTEM_TIME period. See also **generated column**, **row-begin column**, and **transaction-start-ID column**.

**rowid**

A value that uniquely identifies a row in a table and does not change.

**row lock**

A lock on a single row of data.

**row-positioned fetch orientation**

The specification of the desired placement of the cursor as part of a FETCH statement, with respect to a single row (for example, NEXT, LAST, or ABSOLUTE n). Contrast with **rowset-positioned fetch orientation**.

**rowset**

A set of rows for which a cursor position is established.

**rowset cursor**

A cursor that is defined so that one or more rows can be returned as a rowset for a single FETCH statement, and the cursor is positioned on the set of rows that is fetched.

**rowset-positioned fetch orientation**

The specification of the desired placement of the cursor as part of a FETCH statement, with respect to a rowset (for example, NEXT ROWSET, LAST ROWSET, or ROWSET STARTING AT ABSOLUTE n). Contrast with **row-positioned fetch orientation**.

**row trigger**

A trigger that is defined with the trigger granularity FOR EACH ROW.

**RRSAF**

See **Resource Recovery Services attachment facility**.

**RS**

See **read stability**.

**savepoint**

A named entity that represents the state of data and schemas at a particular point in time within a unit of work.

**SBCS**

See **single-byte character set**.

**SCA**

See **shared communications area**.

**scalar function**

An SQL operation that produces a single value from another value and is expressed as a function name, followed by a list of arguments that are enclosed in parentheses.

**scale**

In SQL, the number of digits to the right of the decimal point (called the **precision**).
in the C language). The DB2 information uses the SQL definition.

**schema**
The organization or structure of a database.

A collection of, and a way of qualifying, database objects such as tables, views, routines, indexes or triggers that define a database. A database schema provides a logical classification of database objects.

**scrollability**
The ability to use a cursor to fetch in either a forward or backward direction. The FETCH statement supports multiple fetch orientations to indicate the new position of the cursor. See also [fetch orientation](#).

**scrollable cursor**
A cursor that can be moved in both a forward and a backward direction.

**search condition**
A criterion for selecting rows from a table. A search condition consists of one or more predicates.

**secondary authorization ID**
An authorization ID that has been associated with a primary authorization ID by an authorization exit routine.

**secondary group buffer pool**
For a dupplexed group buffer pool, the structure that is used to back up changed pages that are written to the primary group buffer pool. No page registration or cross-invalidation occurs using the secondary group buffer pool. The z/OS equivalent is new structure.

**secondary index**
A nonpartitioning index that is useful for enforcing a uniqueness constraint, for clustering data, or for providing access paths to data for queries. A secondary index can be partitioned or nonpartitioned. See also [data-partitioned secondary index (DPSI)](#) and [nonpartitioned secondary index (NPSI)](#).

**section**
The segment of a plan or package that contains the executable structures for a single SQL statement. For most SQL statements, one section in the plan exists for each SQL statement in the source program. However, for cursor-related statements, the DECLARE, OPEN, FETCH, and CLOSE statements reference the same section because they each refer to the SELECT statement that is named in the DECLARE CURSOR statement. SQL statements such as COMMIT, ROLLBACK, and some SET statements do not use a section.

**security label**
A classification of users' access to objects or data rows in a multilevel security environment.

**segment**
A group of pages that holds rows of a single table. See also [segmented table space](#).

**segmented table space**
A table space that is divided into equal-sized groups of pages called segments. Segments are assigned to tables so that rows of different tables are never stored in the same segment. Contrast with [partitioned table space](#) and [universal table space](#).

**self-referencing constraint**
A referential constraint that defines a relationship in which a table is a dependent of itself.

**self-referencing table**
A table with a self-referencing constraint.

**sensitive cursor**
A cursor that is sensitive to changes that are made to the database after the result table has been materialized.

**sequence**
A user-defined object that generates a sequence of numeric values according to user specifications.

**sequential data set**
A non-DB2 data set whose records are organized on the basis of their successive physical positions, such as on magnetic tape. Several of the DB2 database utilities require sequential data sets.

**sequential prefetch**
A mechanism that triggers consecutive asynchronous I/O operations. Pages are fetched before they are required, and several pages are read with a single I/O operation.
serialized profile
A Java object that contains SQL statements and descriptions of host variables. The SQLJ translator produces a serialized profile for each connection context.

server
The target of a request from a remote requester. In the DB2 environment, the server function is provided by the distributed data facility, which is used to access DB2 data from remote applications.

service class
An eight-character identifier that is used by the z/OS Workload Manager to associate user performance goals with a particular DDF thread or stored procedure. A service class is also used to classify work on parallelism assistants.

service request block
A unit of work that is scheduled to execute.

session
A link between two nodes in a VTAM network.

session protocols
The available set of SNA communication requests and responses.

set operator
The SQL operators UNION, EXCEPT, and INTERSECT corresponding to the relational operators union, difference, and intersection. A set operator derives a result table by combining two other result tables.

shared communications area (SCA)
A coupling facility list structure that a DB2 data sharing group uses for inter-DB2 communication.

share lock
A lock that prevents concurrently executing application processes from changing data, but not from reading data. Contrast with exclusive lock.

shift-in character
A special control character (X'0F') that is used in EBCDIC systems to denote that the subsequent bytes represent SBCS characters. See also shift-out character.

shift-out character
A special control character (X'0E') that is used in EBCDIC systems to denote that the subsequent bytes, up to the next shift-in control character, represent DBCS characters. See also shift-in character.

sign-on
A request that is made on behalf of an individual CICS or IMS application process by an attachment facility to enable DB2 to verify that it is authorized to use DB2 resources.

simple page set
A nonpartitioned page set. A simple page set initially consists of a single data set (page set piece). If and when that data set is extended to 2 GB, another data set is created, and so on, up to a total of 32 data sets. DB2 considers the data sets to be a single contiguous linear address space containing a maximum of 64 GB. Data is stored in the next available location within this address space without regard to any partitioning scheme.

simple table space
A table space that is neither partitioned nor segmented. Creation of simple table spaces is not supported in DB2 Version 9.1 for z/OS. Contrast with partitioned table space, segmented table space, and universal table space.

single-byte character set (SBCS)
A set of characters in which each character is represented by a single byte. Contrast with double-byte character set or multibyte character set.

single-precision floating point number
A 32-bit approximate representation of a real number.

SMP/E
See System Modification Program/Extended.

SNA
See Systems Network Architecture.

SNA network
The part of a network that conforms to the formats and protocols of Systems Network Architecture (SNA).

socket
A callable TCP/IP programming interface that TCP/IP network applications use to communicate with remote TCP/IP partners.

sourced function
A function that is implemented by another built-in or user-defined function.
that is already known to the database manager. This function can be a scalar function or an aggregate function; it returns a single value from a set of values (for example, MAX or AVG). Contrast with built-in function, external function, and SQL function.

source program
A set of host language statements and SQL statements that is processed by an SQL precompiler.

source table
A table that can be a base table, a view, a table expression, or a user-defined table function.

source type
An existing type that DB2 uses to represent a distinct type.

space
A sequence of one or more blank characters.

special register
A storage area that DB2 defines for an application process to use for storing information that can be referenced in SQL statements. Examples of special registers are SESSION_USER and CURRENT DATE.

specific function name
A particular user-defined function that is known to the database manager by its specific name. Many specific user-defined functions can have the same function name. When a user-defined function is defined to the database, every function is assigned a specific name that is unique within its schema. Either the user can provide this name, or a default name is used.

SPUFI See SQL Processor Using File Input

SQL
See Structured Query Language

SQL authorization ID (SQL ID)
The authorization ID that is used for checking dynamic SQL statements in some situations.

SQLCA
See SQL communication area

SQL communication area (SQLCA)
A structure that is used to provide an application program with information about the execution of its SQL statements.

SQL connection
An association between an application process and a local or remote application server or database server.

SQLDA
See SQL descriptor area

SQL descriptor area (SQLDA)
A structure that describes input variables, output variables, or the columns of a result table.

SQL escape character
The symbol that is used to enclose an SQL delimited identifier. This symbol is the double quotation mark ("'). See also escape character.

SQL function
A user-defined function in which the CREATE FUNCTION statement contains the source code. The source code is a single SQL expression that evaluates to a single value. The SQL user-defined function can return the result of an expression. See also built-in function, external function, and sourced function.

SQL ID
See SQL authorization ID

SQLJ
Structured Query Language (SQL) that is embedded in the Java programming language.

SQL path
An ordered list of schema names that are used in the resolution of unqualified references to user-defined functions, distinct types, and stored procedures. In dynamic SQL, the SQL path is found in the CURRENT PATH special register. In static SQL, it is defined in the PATH bind option.

SQL PL
See SQL procedural language

SQL procedural language (SQL PL)
A language extension of SQL that consists of statements and language elements that can be used to implement procedural logic in SQL statements. SQL PL provides statements for declaring variables and condition handlers, assigning values to variables, and for implementing procedural logic. See also inline SQL PL

SQL procedure
A user-written program that can be
invoked with the SQL CALL statement. An SQL procedure is written in the SQL procedural language. Two types of SQL procedures are supported: external SQL procedures and native SQL procedures. See also external procedure and native SQL procedure.

**SQL processing conversation**
Any conversation that requires access of DB2 data, either through an application or by dynamic query requests.

**SQL Processor Using File Input (SPUFI)**
A facility of the TSO attachment subcomponent that enables the DB2I user to execute SQL statements without embedding them in an application program.

**SQL return code**
Either SQLCODE or SQLSTATE.

**SQL routine**
A user-defined function or stored procedure that is based on code that is written in SQL.

**SQL schema**
A collection of database objects such as tables, views, indexes, functions, distinct types, schemas, or triggers that defines a database. An SQL schema provides a logical classification of database objects.

**SQL statement coprocessor**
An alternative to the DB2 precompiler that lets the user process SQL statements at compile time. The user invokes an SQL statement coprocessor by specifying a compiler option.

**SQL string delimiter**
A symbol that is used to enclose an SQL string constant. The SQL string delimiter is the apostrophe (‘), except in COBOL applications, where the user assigns the symbol, which is either an apostrophe or a double quotation mark (").

**SRB**
See service request block.

**stand-alone**
An attribute of a program that means that it is capable of executing separately from DB2, without using DB2 services.

**star join**
A method of joining a dimension column of a fact table to the key column of the corresponding dimension table. See also join, dimension, and star schema.

**star schema**
The combination of a fact table (which contains most of the data) and a number of dimension tables. See also star join, dimension, and dimension table.

**statement handle**
In DB2 ODBC, the data object that contains information about an SQL statement that is managed by DB2 ODBC. This includes information such as dynamic arguments, bindings for dynamic arguments and columns, cursor information, result values, and status information. Each statement handle is associated with the connection handle.

**statement string**
For a dynamic SQL statement, the character string form of the statement.

**statement trigger**
A trigger that is defined with the trigger granularity FOR EACH STATEMENT.

**static cursor**
A named control structure that does not change the size of the result table or the order of its rows after an application opens the cursor. Contrast with dynamic cursor.

**static SQL**
SQL statements, embedded within a program, that are prepared during the program preparation process (before the program is executed). After being prepared, the SQL statement does not change (although values of variables that are specified by the statement might change).

**storage group**
A set of storage objects on which DB2 for z/OS data can be stored. A storage object can have an SMS data class, a management class, a storage class, and a list of volume serial numbers.

**stored procedure**
A user-written application program that can be invoked through the use of the SQL CALL statement. Stored procedures are sometimes called procedures.

**string**
See binary string, character string, or graphic string.
**strong typing**  
A process that guarantees that only user-defined functions and operations that are defined on a distinct type can be applied to that type. For example, you cannot directly compare two currency types, such as Canadian dollars and U.S. dollars. But you can provide a user-defined function to convert one currency to the other and then do the comparison.

**structure**  
- A name that refers collectively to different types of DB2 objects, such as tables, databases, views, indexes, and table spaces.
- A construct that uses z/OS to map and manage storage on a coupling facility. See also [cache structure](#), [list structure](#), or [lock structure](#).

**Structured Query Language (SQL)**  
A standardized language for defining and manipulating data in a relational database.

**structure owner**  
In relation to group buffer pools, the DB2 member that is responsible for the following activities:
- Coordinating rebuild, checkpoint, and damage assessment processing
- Monitoring the group buffer pool threshold and notifying castout owners when the threshold has been reached

**subcomponent**  
A group of closely related DB2 modules that work together to provide a general function.

**subject table**  
The table for which a trigger is created. When the defined triggering event occurs on this table, the trigger is activated.

**subquery**  
A SELECT statement within the WHERE or HAVING clause of another SQL statement; a nested SQL statement.

**subselect**  
That form of a query that includes only a SELECT clause, FROM clause, and optionally a WHERE clause, GROUP BY clause, HAVING clause, ORDER BY clause, or FETCH FIRST clause.

**substitution character**  
A unique character that is substituted during character conversion for any characters in the source program that do not have a match in the target coding representation.

**subsystem**  
In z/OS, a service provider that performs one or many functions, but does nothing until a request is made. For example, each WebSphere MQ for z/OS queue manager or instance of a DB2 for z/OS database management system is a z/OS subsystem.

**surrogate pair**  
A coded representation for a single character that consists of a sequence of two 16-bit code units, in which the first value of the pair is a high-surrogate code unit in the range U+D800 through U+DBFF, and the second value is a low-surrogate code unit in the range U+DC00 through U+DFFF. Surrogate pairs provide an extension mechanism for encoding 917 476 characters without requiring the use of 32-bit characters.

**SVC dump**  
A dump that is issued when a z/OS or a DB2 functional recovery routine detects an error.

**sync point**  
See [commit point](#).

**syncpoint tree**  
The tree of recovery managers and resource managers that are involved in a logical unit of work, starting with the recovery manager, that make the final commit decision.

**synonym**  
In SQL, an alternative name for a table or view. Synonyms can be used to refer only to objects at the subsystem in which the synonym is defined. A synonym cannot be qualified and can therefore not be used by other users. Contrast with [alias](#).

**Sysplex**  
See [Parallel Sysplex](#).

**Sysplex query parallelism**  
Parallel execution of a single query that is accomplished by using multiple tasks on more than one DB2 subsystem. See also [query CP parallelism](#).
**system administrator**
The person at a computer installation who designs, controls, and manages the use of the computer system.

**system agent**
A work request that DB2 creates such as prefetch processing, deferred writes, and service tasks. See also [allied agent](#).

**system authorization ID**
The primary DB2 authorization ID that is used to establish a trusted connection. A system authorization ID is derived from the system user ID that is provided by an external entity, such as a middleware server.

**system conversation**
The conversation that two DB2 subsystems must establish to process system messages before any distributed processing can begin.

**system-defined routine**
In DB2 10 for z/OS and later, an object (function or procedure) for which system DBADM and SQLADM authorities have implicit execute privilege on the routine and any packages executed within the routine.

**System Modification Program/Extended (SMP/E)**
A z/OS tool for making software changes in programming systems (such as DB2) and for controlling those changes.

**system period**
A pair of columns with system-maintained values that indicates the period of time when a row is valid. See also [system-period temporal table](#) and [system-period data versioning](#).

**system-period data versioning**
Automatic maintenance of historical data by the database manager by using a system period. See also [system period](#) and [system-period temporal table](#).

**system-period temporal table**
A table that is defined with system-period data versioning. See also [system-period data versioning](#) and [history table](#).

**Systems Network Architecture (SNA)**
The description of the logical structure, formats, protocols, and operational sequences for transmitting information through and controlling the configuration and operation of networks.

**table**
A named data object consisting of a specific number of columns and some number of unordered rows. See also [base table](#) or [temporary table](#). Contrast with [auxiliary table](#), [clone table](#), [materialized query table](#), [result table](#), and [transition table](#).

**table-controlled partitioning**
A type of partitioning in which partition boundaries for a partitioned table are controlled by values that are defined in the CREATE TABLE statement.

**table function**
A function that receives a set of arguments and returns a table to the SQL statement that references the function. A table function can be referenced only in the FROM clause of a subselect.

**table locator**
A mechanism that allows access to trigger tables in SQL or from within user-defined functions. A table locator is a fullword integer value that represents a transition table.

**table space**
A page set that is used to store the records in one or more tables. See also [partitioned table space](#), [segmented table space](#), and [universal table space](#).

**table space set**
A set of table spaces and partitions that should be recovered together for one of the following reasons:
- Each of them contains a table that is a parent or descendent of a table in one of the others.
- The set contains a base table and associated auxiliary tables.

A table space set can contain both types of relationships.

**task control block (TCB)**
A z/OS control block that is used to communicate information about tasks within an address space that is connected to a subsystem. See also [address space connection](#).

**TB**
Terabyte. A value of 1 099 511 627 776 bytes.
TCB  See task control block.

TCP/IP
A network communication protocol that computer systems use to exchange information across telecommunication links.

TCP/IP port
A 2-byte value that identifies an end user or a TCP/IP network application within a TCP/IP host.

template
A DB2 utilities output data set descriptor that is used for dynamic allocation. A template is defined by the TEMPLATE utility control statement.

temporal table
A table that records the period of time when a row is valid.

temporary table
A table that holds temporary data. Temporary tables are useful for holding or sorting intermediate results from queries that contain a large number of rows. The two types of temporary table, which are created by different SQL statements, are the created temporary table and the declared temporary table. Contrast with result table. See also created temporary table and declared temporary table.

textual XML format
A representation of XML data that uses character values, an approach that allows for direct reading by people.

thread See DB2 thread.

threadsafe
A characteristic of code that allows multithreading both by providing private storage areas for each thread, and by properly serializing shared (global) storage areas.

three-part name
The full name of a table, view, or alias. It consists of a location name, a schema name, and an object name, separated by a period.

time
A three-part value that designates a time of day in hours, minutes, and seconds.

timeout
Abnormal termination of either the DB2 subsystem or of an application because of the unavailability of resources. Installation specifications are set to determine both the amount of time DB2 is to wait for IRLM services after starting, and the amount of time IRLM is to wait if a resource that an application requests is unavailable. If either of these time specifications is exceeded, a timeout is declared.

Time-Sharing Option (TSO)
An option in z/OS that provides interactive time sharing from remote terminals.

timestamp
A seven-part value that consists of a date and time. The timestamp is expressed in years, months, days, hours, minutes, seconds, and microseconds.

timestamp with time zone
A two-part value that consists of a timestamp and time zone. The timestamp with time zone is expressed in years, months, days, hours, minutes, seconds, microseconds, time zone hours, and time zone minutes.

trace
A DB2 facility that provides the ability to monitor and collect DB2 monitoring, auditing, performance, accounting, statistics, and serviceability (global) data.

transaction
An atomic series of SQL statements that make up a logical unit of work. All of the data modifications made during a transaction are either committed together as a unit or rolled back as a unit.

transaction lock
A lock that is used to control concurrent execution of SQL statements.

transaction program name
In SNA LU 6.2 conversations, the name of the program at the remote logical unit that is to be the other half of the conversation.

transaction-start-ID column
A generated column that is defined with the AS TRANSACTION START ID clause. The value is assigned whenever a row is inserted into the table or any column in the row is updated. A transaction-start-ID column is intended for use in a
system-period temporal table. See also generated column, row-begin column, and row-end column.

**transition table**
A temporary table that contains all the affected rows of the subject table in their state before or after the triggering event occurs. Triggered SQL statements in the trigger definition can reference the table of changed rows in the old state or the new state. Contrast with auxiliary table, base table, clone table, and materialized query table.

**transition variable**
A variable that contains a column value of the affected row of the subject table in its state before or after the triggering event occurs. Triggered SQL statements in the trigger definition can reference the set of old values or the set of new values.

**tree structure**
A data structure that represents entities in nodes, with a most one parent node for each node, and with only one root node.

**trigger**
A database object that is associated with a single base table or view and that defines a rule. The rule consists of a set of SQL statements that run when an insert, update, or delete database operation occurs on the associated base table or view.

**trigger activation**
The process that occurs when the trigger event that is defined in a trigger definition is executed. Trigger activation consists of the evaluation of the triggered action condition and conditional execution of the triggered SQL statements.

**trigger activation time**
An indication in the trigger definition of whether the trigger should be activated before or after the triggered event.

**trigger body**
The set of SQL statements that is executed when a trigger is activated and its triggered action condition evaluates to true. A trigger body is also called triggered SQL statements.

**trigger cascading**
The process that occurs when the triggered action of a trigger causes the activation of another trigger.

**triggered action**
The SQL logic that is performed when a trigger is activated. The triggered action consists of an optional triggered action condition and a set of triggered SQL statements that are executed only if the condition evaluates to true.

**triggered action condition**
An optional part of the triggered action. This Boolean condition appears as a WHEN clause and specifies a condition that DB2 evaluates to determine if the triggered SQL statements should be executed.

**triggered SQL statements**
The set of SQL statements that is executed when a trigger is activated and its triggered action condition evaluates to true. Triggered SQL statements are also called the **trigger body**.

**trigger granularity**
In SQL, a characteristic of a trigger, which determines whether the trigger is activated:
- Only once for the triggering SQL statement
- Once for each row that the SQL statement modifies

**triggering event**
The specified operation in a trigger definition that causes the activation of that trigger. The triggering event is comprised of a triggering operation (insert, update, or delete) and a subject table or view on which the operation is performed.

**triggering SQL operation**
The SQL operation that causes a trigger to be activated when performed on the subject table or view.

**trigger package**
A package that is created when a CREATE TRIGGER statement is executed. The package is executed when the trigger is activated.

**trust attribute**
An attribute on which to establish trust. A trusted relationship is established based on one or more trust attributes.
trusted connection
A database connection whose attributes match the attributes of a unique trusted context defined at the DB2 database server.

trusted connection reuse
The ability to switch the current user ID on a trusted connection to a different user ID.

trusted context
A database security object that enables the establishment of a trusted relationship between a DB2 database management system and an external entity.

trusted context default role
A role associated with a trusted context. The privileges granted to the trusted context default role can be acquired only when a trusted connection based on the trusted context is established or reused.

trusted context user
A user ID to which switching the current user ID on a trusted connection is permitted.

trusted context user-specific role
A role that is associated with a specific trusted context user. It overrides the trusted context default role if the current user ID on the trusted connection matches the ID of the specific trusted context user.

trusted relationship
A privileged relationship between two entities such as a middleware server and a database server. This relationship allows for a unique set of interactions between the two entities that would be impossible otherwise.

TSO
See Time-Sharing Option

TSO attachment facility
A DB2 facility consisting of the DSN command processor and DB2I. Applications that are not written for the CICS or IMS environments can run under the TSO attachment facility.

typed parameter marker
A parameter marker that is specified along with its target data type. It has the general form:
CAST(? AS data-type)

type 2 indexes
Indexes that are created on a release of DB2 after Version 7 or that are specified as type 2 indexes in Version 4 or later.

UCS-2
Universal Character Set, coded in 2 octets, which means that characters are represented in 16-bits per character.

UDF
See user-defined function

UDT
User-defined data type. In DB2 for z/OS, the term distinct type is used instead of user-defined data type. See distinct type

uncommitted read (UR)
The isolation level that allows an application to read uncommitted data. See also cursor stability, read stability, and repeatable read

underlying view
The view on which another view is directly or indirectly defined.

undo
A state of a unit of recovery that indicates that the changes that the unit of recovery made to recoverable DB2 resources must be backed out.

Unicode
A standard that parallels the ISO-10646 standard. Several implementations of the Unicode standard exist, all of which have the ability to represent a large percentage of the characters that are contained in the many scripts that are used throughout the world.

union
An SQL operation that involves the UNION set operator, which combines the results of two SELECT statements. Unions are often used to merge lists of values that are obtained from two tables.

unique constraint
An SQL rule that no two values in a primary key, or in the key of a unique index, can be the same.

unique index
An index that ensures that no identical key values are stored in a column or a set of columns in a table.

unit of recovery (UOR)
A recoverable sequence of operations within a single resource manager, such as an instance of DB2. Contrast with unit of work

unit of work (UOW)
A recoverable sequence of operations within an application process. At any
time, an application process is a single unit of work, but the life of an application process can involve many units of work as a result of commit or rollback operations. In a multisite update operation, a single unit of work can include several units of recovery. Contrast with unit of recovery.

universal table space
A table space that is both segmented and partitioned. Contrast with partitioned table space, segmented table space, partition-by-growth table space, and range-partitioned table space.

unlock
The act of releasing an object or system resource that was previously locked and returning it to general availability within DB2.

untyped parameter marker
A parameter marker that is specified without its target data type. It has the form of a single question mark (?).

updatability
The ability of a cursor to perform positioned updates and deletes. The updatability of a cursor can be influenced by the SELECT statement and the cursor sensitivity option that is specified on the DECLARE CURSOR statement.

update hole
The location on which a cursor is positioned when a row in a result table is fetched again and the new values no longer satisfy the search condition. See also delete hole.

update trigger
A trigger that is defined with the triggering SQL operation update.

UR
See uncommitted read.

user-defined data type (UDT)
See distinct type.

user-defined function (UDF)
A function that is defined to DB2 by using the CREATE FUNCTION statement and that can be referenced thereafter in SQL statements. A user-defined function can be an external function, a sourced function, or an SQL function. Contrast with built-in function.

user view
In logical data modeling, a model or representation of critical information that the business requires.

UTF-16
Unicode Transformation Format, 16-bit encoding form, which is designed to provide code values for over a million characters and a superset of UCS-2. The CCSID value for data in UTF-16 format is 1200. DB2 for z/OS supports UTF-16 in graphic data fields.

UTF-8
Unicode Transformation Format, 8-bit encoding form, which is designed for ease of use with existing ASCII-based systems. The CCSID value for data in UTF-8 format is 1208. DB2 for z/OS supports UTF-8 in mixed data fields.

value
The smallest unit of data that is manipulated in SQL.

variable
A data element that specifies a value that can be changed. A COBOL elementary data item is an example of a host variable. Contrast with constant.

variant function
See nondeterministic function.

varying-length string
A character, graphic, or binary string whose length varies within set limits. Contrast with fixed-length string.

version
A member of a set of similar programs, DBRMs, packages, or LOBs.

• A version of a program is the source code that is produced by precompiling the program. The program version is identified by the program name and a timestamp (consistency token).

• A version of an SQL procedural language routine is produced by issuing the CREATE or ALTER PROCEDURE statement for a native SQL procedure.

• A version of a DBRM is the DBRM that is produced by precompiling a program. The DBRM version is identified by the same program name and timestamp as a corresponding program version.
A version of an application package is the result of binding a DBRM within a particular database system. The application package version is identified by the same program name and consistency token as the DBRM.

A version of a LOB is a copy of a LOB value at a point in time. The version number for a LOB is stored in the auxiliary index entry for the LOB.

A version of a record is a copy of the record at a point in time.

view A logical table that consists of data that is generated by a query. A view can be based on one or more underlying base tables or views, and the data in a view is determined by a SELECT statement that is run on the underlying base tables or views.

Virtual Storage Access Method (VSAM)
An access method for direct or sequential processing of fixed- and varying-length records on disk devices.

Virtual Telecommunications Access Method (VTAM)
An IBM licensed program that controls communication and the flow of data in an SNA network (in z/OS).

volatile table A table for which SQL operations choose index access whenever possible.

VSAM See Virtual Storage Access Method

VTAM See Virtual Telecommunications Access Method

warm start The normal DB2 restart process, which involves reading and processing log records so that data that is under the control of DB2 is consistent. Contrast with cold start

WLM application environment A z/OS Workload Manager attribute that is associated with one or more stored procedures. The WLM application environment determines the address space in which a given DB2 stored procedure runs.

WLM enclave A construct that can span multiple dispatchable units (service request blocks and tasks) in multiple address spaces, allowing them to be reported on and managed by WLM as part of a single work request.

write to operator (WTO)
An optional user-coded service that allows a message to be written to the system console operator informing the operator of errors and unusual system conditions that might need to be corrected (in z/OS).

WTO See write to operator

WTOR Write to operator (WTO) with reply.

XCF See cross-system coupling facility

XES See cross-system extended services

XML See Extensible Markup Language

XML attribute A name-value pair within a tagged XML element that modifies certain features of the element.

XML column A column of a table that stores XML values and is defined using the data type XML. The XML values that are stored in XML columns are internal representations of well-formed XML documents.

XML data type A data type for XML values.

XML element A logical structure in an XML document that is delimited by a start and an end tag. Anything between the start tag and the end tag is the content of the element.

XML index An index on an XML column that provides efficient access to nodes within an XML document by providing index keys that are based on XML patterns.

XML lock A column-level lock for XML data. The operation of XML locks is similar to the operation of LOB locks.

XML node The smallest unit of valid, complete structure in a document. For example, a node can represent an element, an attribute, or a text string.
**XML node ID index**
An implicitly created index, on an XML table that provides efficient access to XML documents and navigation among multiple XML data rows in the same document.

**XML pattern**
A slash-separated list of element names, an optional attribute name (at the end), or kind tests, that describe a path within an XML document in an XML column. The pattern is a restrictive form of path expressions, and it selects nodes that match the specifications. XML patterns are specified to create indexes on XML columns in a database.

**XML publishing function**
A function that returns an XML value from SQL values. An XML publishing function is also known as an XML constructor.

**XML schema**
In XML, a mechanism for describing and constraining the content of XML files by indicating which elements are allowed and in which combinations. XML schemas are an alternative to document type definitions (DTDs) and can be used to extend functionality in the areas of data typing, inheritance, and presentation.

**XML schema repository (XSR)**
A repository that allows the DB2 database system to store XML schemas. When registered with the XSR, these objects have a unique identifier and can be used to validate XML instance documents.

**XML serialization function**
A function that returns a serialized XML string from an XML value.

**XML table**
An auxiliary table that is implicitly created when an XML column is added to a base table. This table stores the XML data, and the column in the base table points to it.

**XML table space**
A table space that is implicitly created when an XML column is added to a base table. The table space stores the XML table. If the base table is partitioned, one partitioned table space exists for each XML column of data.

**X/Open**
An independent, worldwide open systems organization that is supported by most of the world's largest information systems suppliers, user organizations, and software companies. X/Open's goal is to increase the portability of applications by combining existing and emerging standards.

**XRF**
See Extended Recovery Facility.

**XSR**
See XML schema repository.

**z/OS**
An operating system for the System z product line that supports 64-bit real and virtual storage.

**z/OS Distributed Computing Environment (z/OS DCE)**
A set of technologies that are provided by the Open Software Foundation to implement distributed computing.
