A prepared statement can be executed many times. Indeed, if a prepared statement is not executed more than once and does not contain parameter markers, it is more efficient to use the EXECUTE IMMEDIATE statement rather than the PREPARE and EXECUTE statements.

**Prepared statement persistence:** All prepared statements created by a unit of work are destroyed when the unit of work is terminated, with the following exceptions:

- A SELECT statement whose cursor is declared with the option WITH HOLD persists over the execution of a commit operation if the cursor is open when the commit operation is executed.
- SELECT, INSERT, UPDATE, MERGE, and DELETE statements that are bound with KEEPDYNAMIC(YES) are kept past the commit operation if your system is enabled for dynamic statement caching, and none of the following are true:
  - SQL RELEASE has been issued for the site
  - Bind option DISCONNECT(AUTOMATIC) was used
  - Bind option DISCONNECT(CONDITIONAL) was used and there are no hold cursors for the site
- INSERT, UPDATE, MERGE, and DELETE statements that are bound with or use the RELEASE(DEALLOCATE) option and that reference a declared global temporary table are kept past commit operations unless one of the following statements is true:
  - The declared global temporary table is defined with the ON COMMIT DROP TABLE option.
  - The statement also references a DB2 base object (for example, a table or view), and one of the following statements is true:
    - The base object reference is for a DB2 catalog table.
    - At the commit point, DB2 determines that another DB2 thread is waiting for an X-lock on the base object's database descriptor (DBD).
    - The statement references an XML function or operation, and at the commit point DB2 determines that the base object DBD S-lock for the XML operation must be released.
    - At the commit point, DB2 determines that a base object DBD S-lock that is used by the statement must be released and cannot be maintained across the commit point.
  - DB2 determines that another DB2 thread is waiting for an X-lock on the DB2 package that contains the statement.

**Scope of a statement name:** The scope of a statement-name is the same as the scope of a cursor-name. See [DECLARE CURSOR](#) on page 1598 for more information about the scope of a cursor-name.

**Preparation with PREPARE INTO and REOPT bind option:** If bind option REOPT(ALWAYS) or REOPT(ONCE) is in effect, PREPARE INTO is equivalent to a PREPARE and a DESCRIBE being performed. If a statement has input variables, the DESCRIBE causes the statement to be prepared with default values, and the statement must be prepared again when it is opened or executed. When REOPT(ONCE) is in effect, the statement is always prepared twice even if there are no input variables. Therefore, to avoid having a statement prepared twice, avoid using PREPARE INTO when REOPT(ALWAYS) or REOPT(ONCE) is in effect.

**Relationship of cursor attributes on PREPARE statements and SELECT or DECLARE CURSOR statements:** Cursor attributes that are specified as part of the `select-statement` are used instead of any corresponding options that specified with
the ATTRIBUTES clause on PREPARE. Attributes that are specified as part of the
ATTRIBUTES clause of PREPARE take precedence over any corresponding option
that is specified with the DECLARE CURSOR statement. The order for using
cursor attributes is as follows:

- SELECT (highest priority)
- PREPARE statement ATTRIBUTES clause
- DECLARE CURSOR (lowest priority)

For example, assume that host variable MYQ has been set to the following SELECT
statement:

```
SELECT WORKDEPT, EMPNO, SALARY, BONUS, COMM
FROM EMP
WHERE WORKDEPT IN ('D11', 'D21')
FOR UPDATE OF SALARY, BONUS, COMM
```

If the following PREPARE statement were issued, then the FOR UPDATE clause
specified as part of the SELECT statement would be used instead of the FOR
READ ONLY clause specified with the ATTRIBUTES clause as part of the
PREPARE statement. Thus, the cursor would be updatable.

```
attrstring = 'FOR READ ONLY';
EXEC SQL PREPARE stmt1 ATTRIBUTES :attrstring FROM :MYQ;
```

Effect of the CURRENT EXPLAIN MODE special register:
If the CURRENT EXPLAIN MODE special register is set to EXPLAIN, the
statement is prepared for explain only and is not executable, unless the
statement is a SET statement. Attempting to execute the prepared
statement will return an error. See the "CURRENT EXPLAIN MODE” on
page 180 special register for more information.

Precedence of attributes for SELECT and UPDATE WHERE CURRENT OF for
positioned updates:
If an UPDATE WHERE CURRENT OF statement and the associated
SELECT statement are both prepared and both statements have the same
PREPARE attributes, the values of the PREPARE attributes for the UPDATE
WHERE CURRENT OF statement override the values of the PREPARE
attributes for the SELECT statement.

Effect of extended indicator PREPARE attributes on dynamically executed
positioned updates:
If an UPDATE statement with the WHERE CURRENT OF clause and the
associated SELECT statement are both prepared, if extended indicator
variables are used depends on the WITH EXTENDED INDICATORS or
WITHOUT EXTENDED INDICATORS attributes in each of the PREPARE
statements.
Table 156. Interaction between EXTENDED INDICATOR attributes of PREPARE statements for SELECT and UPDATE statements

<table>
<thead>
<tr>
<th>Extended indicator attribute of PREPARE for SELECT statement</th>
<th>Extended indicator attribute of PREPARE for UPDATE statement with WHERE CURRENT OF clause</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>WITH EXTENDED INDICATORS</td>
<td>WITH EXTENDED INDICATORS</td>
<td>The PREPARE attributes of the UPDATE statement override the PREPARE attributes of the SELECT statement. Non-updatable columns can be in the select-list.</td>
</tr>
<tr>
<td>WITH EXTENDED INDICATORS</td>
<td>WITHOUT EXTENDED INDICATORS</td>
<td>The UPDATE statement is executed without extended indicator parameters.</td>
</tr>
<tr>
<td>WITH EXTENDED INDICATORS</td>
<td>Default (without attribute specified)</td>
<td>The PREPARE attributes of the SELECT statement override the default PREPARE attributes for the UPDATE statement. Non-updatable columns can be in the select-list.</td>
</tr>
<tr>
<td>WITHOUT EXTENDED INDICATORS</td>
<td>WITH EXTENDED INDICATORS</td>
<td>The PREPARE attributes of the UPDATE statement override the PREPARE attributes of the SELECT statement. Non-updatable columns are not in the implicit or explicit select-list.</td>
</tr>
<tr>

<td>The UPDATE statement is executed without extended indicator parameters.</td>
</tr>
</tbody>
</table>

Interactions between the SKIPUNCI subsystem parameter and the PREPARE statement: When the PREPARE statement is specified with either the CURRENTLY COMMITTED or WAIT FOR OUTCOME clauses and the subsystem parameter SKIPUNCI is in effect, the following table describes whether uncommitted inserts are skipped, or if the transaction will wait until a commit or rollback before completing:

Table 157. Interaction between SKIPUNCI subsystem parameter and PREPARE statement

<table>
<thead>
<tr>
<th>Value of SKIPUNCI subsystem parameter</th>
<th>PREPARE statement attribute working</th>
<th>Skip uncommitted inserts, or wait for commit or rollback</th>

</tr>
<tr>
<td>NO</td>
<td>Not specified</td>
<td>Wait</td>
</tr>
</tbody>
</table>

Extended indicator variables and deferred error checks:
When extended indicator variables are enabled, the indicator value of unassigned causes the associated target column to be omitted from the statement. Because of that, validation that is normally done in statement preparation (to recognize an INSERT into, or UPDATE of, a non-updatable column) is deferred until statement execution. If statement validation fails, an error is returned when the statement is run, not when the statement is prepared.

Reuse of prepared statements in the dynamic statement cache with CONCENTRATE STATEMENTS WITH LITERALS:

To be eligible for reuse of constants, the constants in both the new statement and the cached statement must have the same:
1. immediate usage context
2. data type
3. data type length and size

If DB2 determines that both instances of the constant meet the criteria for reuse, a cached statement that is prepared using the CONCENTRATE STATEMENTS WITH LITERALS option can be shared by the same SQL statement with different constants. Even though the new dynamic SQL statement will share the cached statement, the new statement will use its own literal constants when the statement is run, not the constants of the cached statement.
There are some exceptions. For example, the built-in function SUBSTR, for which, because of the immediate usage context, constant reuse in the cached statement that uses a different constant value can not be done without the risk of returning incorrect output or results. In such cases, only an SQL statement instance with the exact same constant value as the cached version of the statement is eligible for reuse. DB2 determines when and where this immediate usage context restriction applies.

When the **CONCENTRATE STATEMENTS WITH LITERALS** option is specified, DB2 considers the values of the literal constants for access path selection only for statements that are bound with the REOPT(ONCE) or REOPT(AUTO) bind options.

The DECFLOAT defined constants NAN, SNAN, and INFINITY can qualify for literal constant reuse.

The following examples show how PREPARE is used with **CONCENTRATE STATEMENTS WITH LITERALS**. X, Y, and Z are columns of defined as DECIMAL data type:

```
DECLARE C1 CURSOR
  FOR DYN_TABLE1;

DYN_TABLE1_SELECT = 'SELECT X, Y, Z
  FROM TABLE1
  WHERE X < 9';

attrstring = 'CONCENTRATE STATEMENTS WITH LITERALS';

EXEC SQL PREPARE DYN_TABLE1
  ATTRIBUTES :attrstring
  FROM :DYN_TABLE1_SELECT;

EXEC SQL OPEN C1;

DYN_TABLE1_INSERT = 'INSERT INTO
  TABLE1 (X, Y, Z)
  VALUES (8,109,29)';

attrstring = 'CONCENTRATE STATEMENTS WITH LITERALS';

EXEC SQL PREPARE DYN_TABLE1_INSERT
  ATTRIBUTES :attrstring
  FROM :DYN_TABLE1_INSERT;

EXEC SQL EXECUTE DYN_TABLE1_INSERT;
```

**Examples**

*Example 1:* In this PL/I example, an INSERT statement with parameter markers is prepared and executed. Before execution, values for the parameter markers are read into the host variables S1, S2, S3, S4, and S5.

```pli
EXEC SQL PREPARE DEPT_INSERT FROM
  'INSERT INTO DSN8B10.DEPT VALUES(?,?,?,?,?)';
-- Check for successful execution and read values into host variables
EXEC SQL EXECUTE DEPT_INSERT USING :S1, :S2, :S3, :S4, :S5;
```

*Example 2:* Prepare a dynamic SELECT statement specifying the attributes of the cursor with a host variable on the PREPARE statement. Assume that the text of the SELECT statement is in a variable named stmttxt, and that the attributes of the cursor are in a variable named attrvar.

```pli
EXEC SQL PREPARE stmttxt WITH LITERAL
  ATTRIBUTES :attrvar
  FROM :stmttxt;

EXEC SQL OPEN C1;

EXEC SQL EXECUTE stmttxt WITH LITERAL
  ATTRIBUTES :attrvar
  FROM :stmttxt;
```
EXEC SQL DECLARE mycursor CURSOR FOR mystmt;
EXEC SQL PREPARE mystmt ATTRIBUTES :attrvar
   FROM :stmttxt;
EXEC SQL DESCRIBE mystmt INTO :mysqlda;
EXEC SQL OPEN mycursor;
EXEC SQL FETCH FROM mycursor USING DESCRIPTOR :mysqlda;
The REFRESH TABLE statement refreshes the data in a materialized query table. The statement deletes all rows in the materialized query table, executes the fullselect in the table definition to recalculate the data from the tables specified in the fullselect, inserts the calculated result into the materialized query table, and updates the catalog for the refresh timestamp and cardinality of the table. The table can exist at the current server or at any DB2 subsystem with which the current server can establish a connection.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.

Authorization

The privilege set for REFRESH TABLE must include at least one of the following authorities:

- Ownership of the materialized query table
- DBADM or DBCTRL authority on the database that contains the materialized query table
- SYSADM or SYSCTRL authority
- DATAACCESS authority

If the database is implicitly created, the database privileges must be on the implicit database or on DSNDB04.

Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. If the statements dynamically prepared, the privilege set is determined by the DYNAMICRULES behavior in effect (run, bind, define, or invoke). For more information on these behaviors, including a list of the DYNAMICRULES bind option values, see “Authorization IDs and dynamic SQL” on page 77.

Syntax

```
REFRESH TABLE table-name [QUERYNO integer]
```

Description

table-name

Identifies the table to be refreshed. The name must identify a materialized query table. REFRESH TABLE evaluates the fullselect in the materialized-query-definition clause to refresh the table. The isolation level for the fullselect is the isolation level of the materialized query table recorded when CREATE TABLE or ALTER TABLE was issued.

QUERYNO integer

Specifies the number to be used for this SQL statement in EXPLAIN output.
and trace records. The number is used for the QUERYNO column of the plan table for the rows that contain information about this SQL statement. This number is also used in the QUERYNO column of the SYSBM.SYSTM and SYSBM.SYSPACKSTM catalog tables.

If the clause is omitted, the number associated with the SQL statement is the statement number assigned during precompilation. Thus, if the application program is changed and then precompiled, that statement number might change.

**Notes**

Automatic query rewrite using materialized query tables is not attempted for the fullselect in the materialized query table definition during the processing of REFRESH TABLE statement.

After successful execution of a REFRESH TABLE statement, the SQLCA field SQLERRD(3) will contain the number of rows inserted into the materialized query table.

The EXPLAIN output for REFRESH TABLE table-name is the same as the EXPLAIN output for INSERT INTO table-name fullselect where fullselect is from the materialized query table definition.

If the materialized query table has a security label column, the REFRESH TABLE statement does not do any checking for multilevel security with row-level granularity when it deletes and repopulates the data in the table by executing the fullselect. Instead, DB2 performs the checking for multilevel security with row-level granularity when the materialized query table is exploited in automatic query rewrite or is used directly.

The REFRESH TABLE statement can be used to remove a table space from the logical page list and reset recover-pending status. This can only be done by using REFRESH TABLE to repopulate a materialized query table where the materialized query table is the only table in the table space.

**Example**

Issue a statement to refresh the content of a materialized query table that is named SALESCOUNT. The statement recalculates the data from the fullselect that was used to define SALESCOUNT and refreshes the content of SALESCOUNT with the recalculated results.

REFRESH TABLE SALESCOUNT;
RELEASE (connection)

The RELEASE (connection) statement places one or more connections in the release pending state.

Invocation

This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared. It must not be specified in Java.

Authorization

None required.

Syntax

```
RELEASE location-name
host-variable
CURRENT SQL
ALL SQL
```

Description

**location-name or host-variable**

Identifies an SQL connection by the specified location name or the location name contained in the host variable. If a host variable is specified:

- It must be a character string variable with a length attribute that is not greater than 16. (A C NUL-terminated character string can be up to 17 bytes.)
- It must not be followed by an indicator variable.
- The location name must be left-justified within the host variable and must conform to the rules for forming an ordinary location identifier.
- If the length of the location name is less than the length of the host variable, it must be padded on the right with blanks.

The specified location name or the location name contained in the host variable must identify an existing SQL connection of the application process.

**CURRENT**

Identifies the current SQL connection of the application process. The application process must be in the connected state.

**ALL or ALL SQL**

Identifies all existing connections (including local, and SQL) of the application process. An error or warning does not occur if no connections exist when the statement is executed.

If the RELEASE (connection) statement is successful, each identified connection is placed in the release-pending state and, therefore, will be ended during the next commit operation. If the RELEASE (connection) statement is unsuccessful, the
connection state of the application process and the states of its connections are unchanged.

Notes

RELEASE and CONNECT (Type 1): Using CONNECT (Type 1) semantics does not prevent using RELEASE (connection).

Scope of RELEASE: RELEASE (connection) does not close cursors, does not release any resources, and does not prevent further use of the connection.

Resource considerations for remote connections: Resources are required to create and maintain remote connections. Thus, a remote connection that is not going to be reused should be in the release pending status and one that is going to be reused should not be in the release pending status. Remote connections can also be ended during a commit operation as a result of the DISCONNECT(AUTOMATIC) or DISCONNECT(CONDITIONAL) bind option.

If the current SQL connection is in the release pending status when a commit operation is performed, the connection is ended and the application process is in the unconnected state. In this case, the next executed SQL statement should be CONNECT or SET CONNECTION.

Connection states: ROLLBACK does not reset the state of a connection from release pending to held.

If the current SQL connection is in the release pending state when a commit operation is performed, the connection is ended and the application process is in the unconnected state. In this case, the next executed SQL statement must be CONNECT or SET CONNECTION.

For further information, see "Application process connection states" on page 41.

Location names CURRENT and ALL: A database server named CURRENT or ALL can only be identified by a host variable or a delimited identifier. A connection in the release pending state is ended during a commit operation even though it has an open cursor defined with WITH HOLD.

Encoding scheme of a host variable: If the RELEASE statement contains host variables, the contents of the host variables are assumed to be in the encoding scheme that was specified in the ENCODING parameter when the package or plan that contains the statement was bound.

Examples

Example 1: The SQL connection to TOROLAB1 is not needed in the next unit of work. The following statement causes it to be ended during the next commit operation:

```
EXEC SQL RELEASE TOROLAB1;
```

Example 2: The current SQL connection is not needed in the next unit of work. The following statement causes it to be ended during the next commit operation:

```
EXEC SQL RELEASE CURRENT;
```
RELEASE SAVEPOINT

The RELEASE SAVEPOINT statement releases the identified savepoint and any subsequently established savepoints within a unit of recovery.

Invocation

This statement can be imbedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

```
RELEASE SAVEPOINT savepoint-name
```

Description

`savepoint-name`

Identifies the savepoint to release. If the named savepoint does not exist, an error occurs. The name must identify a savepoint that exists at the current server. After a savepoint is released, it is no longer maintained and rollback to the savepoint is no longer possible.

Notes

`Savepoint names`: The name of the savepoint that was released can be reused in another SAVEPOINT statement, regardless of whether the UNIQUE keyword was specified on an earlier SAVEPOINT statement that specified this same savepoint name.

Example

Assume that a main routine sets savepoint A and then invokes a subroutine that sets savepoints B and C. When control returns to the main routine, release savepoint A and any subsequently set savepoints. Savepoints B and C, which were set by the subroutine, are released in addition to A.

```
: RELEASE SAVEPOINT A;
```
The RENAME statement renames an existing table or index.

**Invocation**

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.

**Authorization**

To rename a table, the privilege set that is defined below must include at least one of the following privileges:
- Ownership of the table
- DBADM, DBCTRL, or DBMAINT authority for the database that contains the table
- SYSADM or SYSCTRL authority
- System DBADM

If the database is implicitly created, the database privileges must be on the implicit database or on DSNDB04.

To rename an index, the privilege set that is defined below must include at least one of the following privileges:
- Ownership of the table for which the index is defined
- Ownership of the index that is being renamed
- DBADM, DBCTRL, or DBMAINT authority for the database that contains the index
- SYSADM or SYSCTRL authority
- System DBADM

If the database is implicitly created, the database privileges must be on the implicit database or on DSNDB04.

**Privilege set:** If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. If the statement is dynamically prepared, the privilege set is the union of the privilege sets that are held by each authorization ID of the process.

**Syntax**

```
TABLE RENAME source-table-name TO new-table-identifier
INDEX source-index-name TO new-index-identifier
```
implicit or explicit qualifier, must identify a table that exists at the current server. The name must not identify any of the following types of tables:

- A declared temporary table
- A catalog table
- An active resource limit specification table
- A materialized query table
- A clone table
- A system-period temporal table
- A history table for a system-period temporal table
- A table with a trigger defined on it
- A table that is referenced in the definition of a row permission
- A table that is referenced in the definition of a column mask
- A view
- A synonym
- An archive-enabled table
- An archive table
- An SQL table function

If you specify a three-part name or alias for the source table, the source table must exist at the current server. If any view definitions or materialized query table definitions currently reference the source table, an error occurs.

`new-table-identifier`
Specifies the new name for the table without a qualifier. The qualifier of the `source-table-name` is used to qualify the new name for the table. The qualified name must not identify a table, view, alias, or synonym that exists at the current server, or a table that exists in the SYSCATALOG.SYSIBM.SYSPENDINGOBJECTS catalog table.

`source-index-name`
Identifies the existing index that is to be renamed. The name, including an implicit or explicit qualifier, must identify an index that exists at the current server. The name must not identify a system-defined catalog index, an index for a declared temporary table, or an index for an active resource limit specification table.

`new-index-identifier`
Specifies that new name for the index without a qualifier. The qualifier of the `source-index-name` is used to qualify the new name for the index. The qualified name must not identify an index that exists at the current server or an index that exists in the SYSCATALOG.SYSIBM.SYSPENDINGOBJECTS catalog table.

**Notes**

**Effects of the statement:** The specified table or index is renamed to the new name. For a renamed table, all privileges and indexes on the table are preserved. For a renamed index, all privileges are preserved.

**Invalidation of packages:** When any table except an auxiliary table is renamed, packages that refer to that table are invalidated. When an auxiliary table is renamed, packages that refer to the auxiliary table are not invalidated.

**Restriction when there are pending changes to the definition:** A RENAME INDEX statement is not allowed if there are pending changes to the definition of the index.
**Considerations for aliases:** If an alias name is specified for `table-name`, the table must exist at the current server, and the table that is identified by the alias is renamed. The name of the alias is not changed and continues to refer to the old table name after the rename.

Changing the name of an alias with the RENAME statement is not supported. To change the name to which an alias refers, you must drop the alias and then re-create it.

**Considerations for plan tables:** The RENAME INDEX statement does not update the contents of a plan table. Rows that exist in a plan table that are generated from a EXPLAIN statement can contain the name of an index in the access path selections. When an index is renamed, any entries in existing plan tables that refer to the old index name are not updated.

**Transfer of authorization, referential integrity constraints, and indexes:** All authorizations associated with the source table name are transferred to the new (target) table name. The authorization catalog tables are updated appropriately.

Referential integrity constraints involving the source table are updated to refer to the new table. The catalog tables are updated appropriately.

Indexes that are defined for the source table are transferred to the new table. The index catalog tables are updated appropriately.

**Object identifier:** Renamed tables and indexes keep the same object identifier as the original table or index.

**Renaming registration tables:** If an application registration table (ART) or object registration table (ORT) or an index of an ART or ORT is specified as the source table for RENAME, when RENAME completes, it is as if that table had been dropped. There is no ART or ORT once the ART or ORT table has been renamed.

**Catalog table updates:** Entries in the following catalog tables are updated to reflect the new table:

- `SYSAUXRELS`
- `SYSCHECKS`
- `SYSCHECKS2`
- `SYSCHECKDEP`
- `SYSCOLAUTH`
- `SYSCOLDIST`
- `SYSCOLDIST_HIST`
- `SYSCOLDISTSTATS`
- `SYSCOLSTATS`
- `SYSCOLUMNS`
- `SYSCOLUMNS_HIST`
- `SYSCONSTDEP`
- `SYSFIELDS`
- `SYSFOREIGNKEYS`
- `SYSINDEXES`
- `SYSINDEXES_HIST`
- `SYSENCOLUSE`
Entries in SYSSTMT and SYSPACKSTMT are not updated.

Entries in the following catalog tables are updated to reflect the new index:

- SYSDEPENDENCIES
- SYSINDEXES
- SYSINDEXES_HIST
- SYSINDEXESPART
- SYSINDEXESPART_HIST
- SYSINDEXSPACESTATS
- SYSINDEXSTATS
- SYSINDEXSTATS_HIST
- SYSKEYS
- SYSKEYTARGETS
- SYSKEYTARGETS_HIST
- SYSKEYTARGETSTATS
- SYSKEYTGTDIST
- SYSKEYTGTDIST_HIST
- SYSKEYTGTDISTSTATS
- SYSOBJROLEDEP
- SYSPACKDEP
- SYSPLANDEP
- SYSRELS
- SYSTABAUTH
- SYSTABCONST
- SYSTABLES
- SYSTABLES_HIST
- SYSTABLES_HIST
- SYSTABLESTATS
- SYSTABLESTATS_HIST
- SYSTABSTATS
- SYSTABSTATS_HIST
- SYSTABAUTH
- SYSTABCONST
- SYSTABLES
- SYSTABLES_HIST
- SYSTABLESTATS
- SYSTABLESTATS_HIST
- SYSTABAUTH
- SYSTABCONST
- SYSTABLES
- SYSTABLES_HIST
- SYSTABLESTATS
- SYSTABLESTATS_HIST

Examples

Example 1: Change the name of the EMP table to EMPLOYEE:

```
RENAME TABLE EMP TO EMPLOYEE;
```

Example 2: Change the name of the EMP_USA_HIS2002:

```
RENAME TABLE EMP_USA_HIS2002 TO EMPLOYEE_UNITEDSTATES_HISTORY2002;
```

Example 3: Change the name of the EMPINDEX1 to EMPLOYEE_INDEX:

```
RENAME INDEX COMPANY.EMPINDEX1 TO EMPLOYEE_INDEX;
```
The REVOKE statement revokes privileges from authorization IDs. There is a separate form of the statement for each of these classes of privilege:

- Collection
- Database
- Distinct type
- Function or stored procedure
- Package
- Plan
- Schema
- Sequence
- System
- Table or view
- Use

The applicable objects are always at the current server.

**Invocation**

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.

If the authorization mechanism was not activated when the DB2 subsystem was installed, an error condition occurs.

**Authorization**

If the BY clause is not specified, the authorization ID of the statement must have granted at least one of the specified privileges to every authorization-name specified in the FROM clause (including PUBLIC, if specified). If the BY clause is specified, the authorization ID of the statement must have SECADM or ACCESSCTRL authority.

**Note:** If installation parameter SEPARATE SECURITY is NO, SYSADM authority has implicit SECADM authority and SYSCTRL authority has implicit ACCESSCTRL authority.

If the BY clause is specified and the privilege set includes ACCESSCTRL, all privileges and authorities can be revoked except for the following:

- System DBADM
- ACCESSCTRL
- DATAACCESS
- CREATE_SECURE_OBJECT privilege

To revoke the CREATE_SECURE_OBJECT privilege, with or without the BY clause, the privilege set must include SECADM authority.

If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. The owner can be a role. If the statement is dynamically prepared, the privilege set is the privileges
that are held by the SQL authorization ID of the process. However, if the process is running in a trusted context that is defined with the ROLE AS OBJECT OWNER AND QUALIFIER CLAUSE, the privilege set is the privileges that are held by the role that is in effect.

**Syntax**

```
REVOKE authorization-specification FROM authorization-name,
    ROLE role-name, PUBLIC

BY authorization-name,
    ROLE role-name

INCLUDING DEPENDENT PRIVILEGES
NOT INCLUDING DEPENDENT PRIVILEGES

(1) RESTRICT
```

**Notes:**
1. The RESTRICT clause is the default only for the forms of the REVOKE statement that allow it.

**Description**

`authorization-specification`

Specifies one or more privileges for the class of privilege. The same privilege must not be specified more than once.

`FROM`

Specifies from what authorization IDs the privileges are revoked.

`authorization-name,...`

Lists one or more authorization IDs. Do not use the same authorization ID more than one time. If the `authorization-name` is specified in lowercase, it must be delimited using double quotes.

The value of CURRENT RULES determines if you can use the ID of the REVOKE statement itself (to revoke privileges from yourself). When CURRENT RULES is:

- **DB2** You cannot use the ID of the REVOKE statement.
- **STD**

You can use the ID of the REVOKE statement.

`ROLE role-name`

Lists one or more roles. Do not specify the same role more than one time.

`PUBLIC`

Revokes a grant of privileges to PUBLIC.

`BY` Lists grantors who have granted privileges and revokes each named privilege
that was explicitly granted to some named user by one of the named grantors.
Only an authorization ID or role with SYSADM or SYSCTRL authority can use
BY, even if the authorization ID or role names only itself in the BY clause.

authorization-name,...
Lists one or more authorization IDs of users who were the grantors of the
privileges named. Do not use the same authorization ID more than once. Each 
grantor that is listed must have explicitly granted some named privilege to all of the named users or roles.

ROLE role-name
Lists one or more roles that were the grantors of the privileges named. Do not
specify the same role more than one time. Each grantor that is listed must have explicitly granted some named privilege to all of the named users or roles.

ALL
Revolves each named privilege from all named users who were explicitly
granted the privilege, regardless of who granted it.

INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES
Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:
• When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, NOT INCLUDING DEPENDENT PRIVILEGES is assumed and the clause must be specified on the REVOKE statement.
• When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, NOT INCLUDING DEPENDENT PRIVILEGES is assumed and an error is returned if the statement includes INCLUDING DEPENDENT PRIVILEGES.
• Otherwise, INCLUDING DEPENDENT PRIVILEGES is assumed and the clause must be specified on the REVOKE statement.

INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

INCLUDING DEPENDENT PRIVILEGES cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

NOT INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

NOT INCLUDING DEPENDENT PRIVILEGES must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.
NOT INCLUDING DEPENDENT PRIVILEGES cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to YES, which enforces the behavior to include dependent privileges in the revoke.

RESTRICT
Prevents the named privilege from being revoked when certain conditions apply. RESTRICT is the default only for the forms of the REVOKE statement that allow it. These forms are revoking the USAGE privilege on distinct types, the EXECUTE privilege on user-defined functions and stored procedures, and the USAGE privilege on sequences.

Notes

Revoked privileges: The privileges revoked from an authorization ID or a role are those that are identified in the statement and which were granted to the user by the grantor. Other privileges can be revoked as the result of revoking dependent privileges. For more on DB2 privileges, see DB2 Administration Guide.

Revoke dependent privileges: Revoking a privilege from a user can also cause that privilege to be revoked from other users. This was previously known as cascade revoke. When revoking a privilege from an authorization ID or a role, DB2 looks for and revokes any grants of the privilege where the grantor is the same as the authorization ID or role of the original revoke. The following rules must be true for privilege P’ to be revoked from U3 when U1 revokes privilege P from U2:

- P and P’ are the same privilege.
- U2 granted privilege P’ to U3.
- No one granted privilege P to U2 prior to the grant by U1.
- U2 does not have installation SYSADM authority.

The rules also apply to the implicit grants that are made as a result of a CREATE VIEW statement.

Revoking dependent privileges does not occur under any of the following conditions:

- The privilege was granted by a current installation SYSADM user.
- The privilege is the USAGE privilege on a distinct type and the revokee owns any of these items:
  - A user-defined function or stored procedure that uses the distinct type
  - A table that has a column that uses the distinct type
  - A sequence whose data type is the distinct type
- The privilege is the USAGE privilege on a sequence and the revokee owns any of these items:
  - A trigger that has a NEXT VALUE or PREVIOUS VALUE expression that specifies the sequence
  - An inline SQL function that has a NEXT VALUE or PREVIOUS VALUE expression in the function body that specifies the sequence
- The privilege is the EXECUTE privilege on a user-defined function and the revokee owns any of these items:
  - A user-defined function that is sourced on the function
  - A view that uses the function
  - A trigger package that uses the function
- A table that uses the function in a check constraint or a user-defined default type
- The privilege is the EXECUTE privilege on a stored procedure and the revokee owns any of these items:
  - A trigger package that refers to the stored procedure in a CALL statement.
- If the ACCESSCTRL administrative authority is revoked from a user, grants that are made by this ACCESSCTRL user are not revoked.
  
  If this user revoked grants made by it, those revokes will continue to revoke the dependent privileges, unless the behavior to not include the dependent privileges was specified either by using the system parameter REVOKE_DEP_PRIVILEGES or by using the REVOKE statement if REVOKE_DEP_PRIVILEGES is set to SQLSTMT.
- If SECADM is removed from a user, grants that are made by this SECADM user are not revoked.
  
  If this user revoked grants made by it, those revokes will continue to revoke the dependent privileges, unless the behavior to not include the dependent privileges was specified either by using the system parameter REVOKE_DEP_PRIVILEGES or by using the REVOKE statement if REVOKE_DEP_PRIVILEGES is set to SQLSTMT.
- **If NOT INCLUDING DEPENDENT PRIVILEGES option is specified, the grants made by this user are not revoked.**

Refer to the diagrams for the following example:

1. Suppose BOB grants SYSADM authority to WADE. Later, CLAIRE grants the SELECT privilege on a table with the WITH GRANT OPTION to WADE.

   ![Diagram 1](image1)

   **User: WADE**
   - Authority: SYSADM
   - BOB grants SYSADM to WADE
   - CLAIRE grants SELECT WITH GRANT OPTION to WADE

2. WADE grants the SELECT privilege to JOHN on the same table.

   ![Diagram 2](image2)

   **User: JOHN**
   - WADE grants SELECT to JOHN

3. When CLAIRE revokes the SELECT privilege on the table from WADE, the SELECT privilege on that table is also revoked from JOHN.
The grant from WADE to JOHN is removed because WADE had not been granted the SELECT privilege from any other source before CLAIRE made the grant. The SYSADM authority granted to WADE from BOB does not affect the cascade revoke. For more on SYSADM and installation SYSADM authority, see DB2 Administration Guide. For another example of cascading revokes, see DB2 Administration Guide.

Revoking a SELECT privilege that was exercised to create a view or materialized query table causes the view to be dropped, unless the owner of the view was directly granted the SELECT privilege from another source before the view was created. Revoking a SYSADM privilege that was required to create a view causes the view to be dropped. For details on when SYSADM authority is required to create a view, see Authorization in “CREATE VIEW” on page 1590.

Invalidation of packages: A revoke or cascaded revoke of any privilege or role that was exercised to create a package makes the package invalid when the revokee no longer holds the privilege from any other source. Corresponding authorization caches are cleared even if the revokee has the privilege from any other source.

Inoperative packages: A revoke or cascaded revoke of the EXECUTE privilege on a user-defined function that was exercised to create a package makes the package inoperative and causes the corresponding authorization caches to be cleared when the revokee no longer holds the privilege from any other source.

Privileges belonging to an authority: You can revoke an administrative authority, but you cannot separately revoke the specific privileges inherent in that administrative authority.

Let P be a privilege inherent in authority X. A user with authority X can also have privilege P as a result of an explicit grant of P. In this case:
- If X is revoked, the user still has privilege P.
- If P is revoked, the user still has the privilege because it is inherent in X.

Revoking of privileges in a trusted context: Revokes that are made in a trusted context that is defined with the ROLE AS OBJECT OWNER clause result in the revoker being the role in effect. If the statement is prepared dynamically, the revoker is the role that is associated with the user that is running the statement. If the statement is embedded in a program, the revoker is the owner of the plan or

---

41. Dependencies on stored procedures can be checked only if the procedure name is specified as a constant and not via a host variable in the CALL statement.
package. If the ROLE AS OBJECT OWNER clause is not specified for the trusted 
context, the revoker is the authorization ID of the process.

**Ownership privileges:** The privileges inherent in the ownership of an object cannot 
be revoked.

**Revoke not including dependent privileges:** When a privilege is revoked from a 
user by specifying `NOT INCLUDING DEPENDENT PRIVILEGES`, the grants 
that were made by this user are not revoked and the grantor remains unchanged. 
If that user is later granted the same privilege and then this privilege is revoked by 
specifying `INCLUDING DEPENDENT PRIVILEGES`, that would also revoke all 
the grants that were previously made by this user. Refer to the following examples:

User U1 is granted SELECT on table T1 with GRANT OPTION:
1. U1 grants this privilege to U2.
2. SELECT privilege is revoked from U1 without including dependent privileges. 
   As a result, the grant from U1 to U2 is not revoked.
3. U1 is again granted SELECT on T1.
4. SELECT is now revoked from U1 with including dependent privileges and the 
   grant from U1 to U2 is now revoked.

User U1 is granted SYSADM authority:
1. U1 grants privilege P1 to U2 and privilege P2 to U3.
2. SYSADM is revoked from U1 without including dependent privileges. The 
   grants of privileges P1 and P2 to U2 and U3 are not revoked.
3. U1 is again granted SYSADM. U1 grants privilege P3 to U3.
4. SYSADM is now revoked from U1 including dependent privileges. Now, P1 
   granted to U2 and P2 and P3 granted to U3 are also revoked.
REVOKE (collection privileges)

This form of the REVOKE statement revokes privileges on collections.

Syntax

```
REVOKE
[CREATE
[PACKADM
[IN
[ON
[COLLECTION
[collection-id
[*,

FROM

[authorization-name

[role-name

[PUBLIC

[BY

[authorization-name

[role-name

[ALL

[INCLUDING DEPENDENT PRIVILEGES

[NOT INCLUDING DEPENDENT PRIVILEGES
```

Description

CREATE IN

Revokes the privilege to use the BIND subcommand to create packages in the designated collections.

The word ON can be used instead of IN.

PACKADM ON

Revokes the package administrator authority for the designated collections.

The word IN can be used instead of ON.

COLLECTION collection-id,...

Identifies the collections on which the specified privilege is revoked. For each identified collection, you (or the indicated grantors) must have granted the specified privilege on that collection to all identified users (including PUBLIC if specified). The same collection must not be identified more than once.

COLLECTION *

Indicates that the specified privilege on COLLECTION * is revoked. You (or the indicated grantors) must have granted the specified privilege on COLLECTION * to all identified users (including PUBLIC if specified). Privileges granted on specific collections are not affected.

FROM

Refer to "REVOKE" on page 1878 for a description of the FROM clause.

BY

Refer to "REVOKE" on page 1878 for a description of the BY clause.

INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES

Specifies whether revoking a privilege or an authority from an authorization
ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:

- When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, **NOT INCLUDING DEPENDENT PRIVILEGES** is assumed and the clause must be specified on the REVOKE statement.

- When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, **NOT INCLUDING DEPENDENT PRIVILEGES** is assumed and an error is returned if the statement includes **INCLUDING DEPENDENT PRIVILEGES**.

- Otherwise, **INCLUDING DEPENDENT PRIVILEGES** is assumed and the clause must be specified on the REVOKE statement.

**INCLUDING DEPENDENT PRIVILEGES**

Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

**INCLUDING DEPENDENT PRIVILEGES** cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

**NOT INCLUDING DEPENDENT PRIVILEGES**

Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

**NOT INCLUDING DEPENDENT PRIVILEGES** must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

**NOT INCLUDING DEPENDENT PRIVILEGES** cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to YES, which enforces the behavior to include dependent privileges in the revoke.

### Examples

**Example 1:** Revoke the privilege to create new packages in collections QAAACLONE and DSN8CC61 from CLARK.

```
REVOKE CREATE IN COLLECTION QAAACLONE, DSN8CC61 FROM CLARK;
```

**Example 2:** Revoke the privilege to create new packages in collections DSN8CC91 from role ROLE1:

```
REVOKE CREATE IN COLLECTION DSN8CC91 FROM ROLE ROLE1;
```
REVOKE (database privileges)

This form of the REVOKE statement revokes database privileges.

Syntax

```
REVOKE [DBADM | DBCTRL | DBMAINT | CREATETAB | CREATETS | DISPLAYDB | DROP | IMAGCOPY | LOAD | RECOVERDB | REORG | REPAIR | STARTDB | STATS | STOPDB]
ON DATABASE database-name
FROM authorization-name
[ROLE role-name]
[PUBLIC]

BY authorization-name
[ROLE role-name]
ALL

INCLUDING DEPENDENT PRIVILEGES
NOT INCLUDING DEPENDENT PRIVILEGES
```

Description

Each keyword listed revokes the privilege described, but only as it applies to or within the databases named in the statement.

**DBADM**

Revokes the database administrator authority.

**DBCTRL**

Revokes the database control authority.

**DBMAINT**

Revokes the database maintenance authority.

**CREATETAB**

Revokes the privilege to create new tables. If CREATETAB privilege is revoked from DSND04, tables cannot be created in implicitly created databases. For a work file database, you cannot revoke the privilege from PUBLIC. When a work file database is created, PUBLIC implicitly receives the CREATETAB privilege (without GRANT authority); this privilege is not recorded in the DB2 catalog, and it cannot be revoked.

**CREATETS**

Revokes the privilege to create new table spaces.
**DISPLAYDB**
Revokes the privilege to issue the DISPLAY DATABASE command.

**DROP**
Revokes the privilege to issue the DROP or ALTER statements in the specified databases.

**IMAGCOPY**
Revokes the privilege to run the COPY, MERGECOPY, and QUIESCE utilities against table spaces of the specified databases, and to run the MODIFY RECOVERY utility.

**LOAD**
Revokes the privilege to use the LOAD utility to load tables.

**RECOVERDB**
Revokes the privilege to use the RECOVER and REPORT utilities to recover table spaces and indexes.

**REORG**
Revokes the privilege to use the REORG utility to reorganize table spaces and indexes.

**REPAIR**
Revokes the privilege to use the REPAIR and DIAGNOSE utilities.

**STARTDB**
Revokes the privilege to issue the START DATABASE command.

**STATS**
Revokes the privilege to use the RUNSTATS utility to update statistics, and the CHECK utility to test whether indexes are consistent with the data they index, and the MODIFY STATISTICS utility to delete unwanted statistics history records from the corresponding catalog tables.

**STOPDB**
Revokes the privilege to issue the STOP DATABASE command.

**ON DATABASE database-name,...**
Identifies databases on which you are revoking the privileges. For each database you identify, you (or the indicated grantors) must have granted at least one of the specified privileges on that database to all identified users (including PUBLIC, if specified). The same database must not be identified more than once.

**FROM**
Refer to "REVOKE" on page 1878 for a description of the FROM clause.

**BY**
Refer to "REVOKE" on page 1878 for a description of the BY clause.

**INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES**
Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:
- When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, **NOT INCLUDING DEPENDENT PRIVILEGES** is assumed and the clause must be specified on the REVOKE statement.
- When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, **NOT INCLUDING DEPENDENT PRIVILEGES** is assumed and an error is returned if the statement includes **INCLUDING DEPENDENT PRIVILEGES**.
• Otherwise, **INCLUDING DEPENDENT PRIVILEGES** is assumed and the clause must be specified on the REVOKE statement.

**INCLUDING DEPENDENT PRIVILEGES**

Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

**INCLUDING DEPENDENT PRIVILEGES** cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

**NOT INCLUDING DEPENDENT PRIVILEGES**

Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

**NOT INCLUDING DEPENDENT PRIVILEGES** must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

**NOT INCLUDING DEPENDENT PRIVILEGES** cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to YES, which enforces the behavior to include dependent privileges in the revoke.

**Examples**

*Example 1:* Revoke drop privileges on database DSN8D11A from user PEREZ.

```
REVOKE DROP
   ON DATABASE DSN8D11A
   FROM PEREZ;
```

*Example 2:* Revoke repair privileges on database DSN8D11A from all local users.
(Grants to specific users will not be affected.)

```
REVOKE REPAIR
   ON DATABASE DSN8D11A
   FROM PUBLIC;
```

*Example 3:* Revoke authority to create new tables and load tables in database DSN8D11A from users WALKER, PIANKA, and FUJIMOTO.

```
REVOKE CREATETAB,LOAD
   ON DATABASE DSN8D11A
   FROM WALKER,PIANKA,FUJIMOTO;
```

*Example 4:* Revoke load privileges on database DSN8D11A from role ROLE1:

```
REVOKE LOAD
   ON DATABASE DSN8D11A
   FROM ROLE ROLE1;
```
REVOKE (function or procedure privileges)

This form of the REVOKE statement revokes privileges on user-defined functions, cast functions that were generated for distinct types, and stored procedures.

Syntax

```sql
REVOKE EXECUTE ON FUNCTION function-name,
                  SPECIFIC FUNCTION specific-name,
                  PROCEDURE procedure-name
FROM authorization-name
    ROLE role-name
    PUBLIC
    BY authorization-name
    ROLE role-name
    ALL
    INCLUDING DEPENDENT PRIVILEGES
    NOT INCLUDING DEPENDENT PRIVILEGES
```

parameter-type:
Notes:
1 AS LOCATOR can be specified only for a LOB data type or a distinct type that is based on a LOB data type.
Description

EXECUTE

Revokes the privilege to run the identified user-defined function, cast function that was generated for a distinct type, or stored procedure.

FUNCTION or SPECIFIC FUNCTION

Identifies the function from which the privilege is revoked. The function must exist at the current server, and it must be a function that was defined with the CREATE FUNCTION statement or a cast function that was generated by a CREATE TYPE statement. The function can be identified by name, function signature, or specific name.

If the function was defined with a table parameter (the LIKE TABLE was specified in the CREATE FUNCTION statement to indicate that one of the
input parameters is a transition table), the function signature cannot be used to identify the function. Instead, identify the function with its function name, if unique, or with its specific name.

**FUNCTION function-name**

Identifies the function by its name. The function-name must identify exactly one function. The function can have any number of parameters defined for it. If there is more than one function of the specified name in the specified or implicit schema, an error is returned.

An * can be specified for a qualified or unqualified function-name. An * (or schema-name.*) indicates that the privilege is revoked for all the functions in the schema. You (or the indicated grantors) must have granted the privilege on FUNCTION * to all identified users (including PUBLIC if specified). Privileges granted on specific functions are not affected.

**FUNCTION function-name (parameter-type,...)**

Identifies the function by its function signature, which uniquely identifies the function. The function-name (parameter-type, ...) must identify a function with the specified function signature. The specified parameters must match the data types in the corresponding position that were specified when the function was created. The number of data types, and the logical concatenation of the data types is used to identify the specific function instance on which the privilege is to be granted. Synonyms for data types are considered a match.

If the function was defined with a table parameter (the LIKE TABLE name AS LOCATOR clause was specified in the CREATE FUNCTION statement to indicate that one of the input parameters is a transition table), the function signature cannot be used to uniquely identify the function. Instead, use one of the other syntax variations to identify the function with its function name, if unique, or its specific name.

If function-name () is specified, the function identified must have zero parameters.

**function-name**

Identifies the name of the function. If you do not explicitly qualify the function name with a schema name, the function name is implicitly qualified with a schema name as described in the preceding description for FUNCTION function-name.

**(parameter-type,...)**

Identifies the parameters of the function.

If an unqualified distinct type name is specified, DB2 searches the SQL path to resolve the schema name for the distinct type.

For data types that have a length, precision, or scale attribute, use one of the following:

- Empty parentheses indicate that the database manager ignores the attribute when determining whether the data types match. For example, DEC() will be considered a match for a parameter of a function defined with a data type of DEC(7,2). Similarly, DECFLOAT() will be considered a match for DECFLOAT(16) or DECFLOAT(34). However, FLOAT cannot be specified with empty parenthesis because its parameter value indicates a specific data type (REAL or DOUBLE).
- If a specific value for a length, precision, or scale attribute is specified, the value must exactly match the value that was specified.
(implicitly or explicitly) in the CREATE FUNCTION statement. If the data type is FLOAT, the precision does not have to exactly match the value that was specified because matching is based on the data type (REAL or DOUBLE).

- If length, precision, or scale is not explicitly specified, and empty parentheses are not specified, the default attributes of the data type are implied. The implicit length must exactly match the value that was specified (implicitly or explicitly) in the CREATE FUNCTION statement.

For data types with a subtype or encoding scheme attribute, specifying the FOR subtype DATA clause or the CCSID clause is optional. Omission of either clause indicates that DB2 ignores the attribute when determining whether the data types match. If you specify either clause, it must match the value that was implicitly or explicitly specified in the CREATE FUNCTION statement.

**AS LOCATOR**
Specifies that the function is defined to receive a locator for this parameter. If AS LOCATOR is specified, the data type must be a LOB or a distinct type based on a LOB.

**SPECIFIC FUNCTION specific-name**
Identifies the function by its specific name. The specific-name must identify a specific function that exists at the current server.

**PROCEDURE procedure-name**
Identifies a stored procedure that is defined at the current server.

An * can be specified for a qualified or unqualified procedure-name. An * (or schema-name.*) indicates that the privilege is revoked for all the procedures in the schema. You (or the indicated grantors) must have granted the privilege on PROCEDURE * to all identified users (including PUBLIC if specified). Privileges granted on specific procedures are not affected.

**FROM**
Refer to “REVOKE” on page 1878 for a description of the FROM clause.

**BY**
Refer to “REVOKE” on page 1878 for a description of the BY clause.

**INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES**
Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:

- When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, **NOT INCLUDING DEPENDENT PRIVILEGES** is assumed and the clause must be specified on the REVOKE statement.
- When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, **NOT INCLUDING DEPENDENT PRIVILEGES** is assumed and an error is returned if the statement includes **INCLUDING DEPENDENT PRIVILEGES**.
- Otherwise, **INCLUDING DEPENDENT PRIVILEGES** is assumed and the clause must be specified on the REVOKE statement.

**INCLUDING DEPENDENT PRIVILEGES**
Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any
grants that were made by the user will continue to be revoked, until all 
grants in the chain have been revoked.

**INCLUDING DEPENDENT PRIVILEGES** cannot be specified if the 
system parameter `REVOKE_DEP_PRIVILEGES` is set to NO, which 
enforces the behavior to not include the dependent privileges.

**NOT INCLUDING DEPENDENT PRIVILEGES**
Specifies that revoking a privilege or an authority from an authorization ID 
or a role does not cause the grants that were made by the user to be 
revoked. However, for the revoked privileges, all implications of the 
privilege being revoked are applied. For example, if the revoked privileges 
were required to bind a package successfully, that package would continue 
to be invalidated as a result of the package owner losing these privileges. 
An object might be dropped if a privilege is revoked that was used to 
create the object.

**NOT INCLUDING DEPENDENT PRIVILEGES** must be specified when 
ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

**NOT INCLUDING DEPENDENT PRIVILEGES** cannot be specified if the 
system parameter `REVOKE_DEP_PRIVILEGES` is set to YES, which enforces 
the behavior to include dependent privileges in the revoke.

**RESTRICT**
Prevents the EXECUTE privilege from being revoked on a user-defined 
function or stored procedure if the revokee owns any of the following objects 
and does not have the EXECUTE privilege from another source:

- A function that is sourced on the function
- A view that uses the function
- A trigger package that uses the function or stored procedure
- A table that uses the function in a check constraint or user-defined default 
  clause
- A materialized query table whose fullselect uses the function
- An extended index that uses the function

**Examples**

**Example 1:** Revoke the EXECUTE privilege on function CALC_SALARY for user 
JONES. Assume that there is only one function in the schema with function 
CALC_SALARY.

```
REVOKE EXECUTE ON FUNCTION CALC_SALARY FROM JONES;
```

**Example 2:** Revoke the EXECUTE privilege on procedure VACATION_ACCR from 
all users at the current server.

```
REVOKE EXECUTE ON PROCEDURE VACATION_ACCR FROM PUBLIC;
```

**Example 3:** Revoke the privilege of the administrative assistant to grant EXECUTE 
privileges on function DEPT_TOTAL to other users. The administrative assistant 
will still have the EXECUTE privilege on function DEPT_TOTALS.

```
REVOKE EXECUTE ON FUNCTION DEPT_TOTALS 
FROM ADMIN_A;
```

**Example 4:** Revoke the EXECUTE privilege on function NEW_DEPT_HIRES for HR 
(Human Resources). The function has two input parameters with data types of 
INTEGER and CHAR(10), respectively. Assume that the schema has more than one 
function that is named NEW_DEPT_HIRES.
REVOKE EXECUTE ON FUNCTION NEW_DEPT_HIRES (INTEGER, CHAR(10))
    FROM HR;

You can also code the CHAR(10) data type as CHAR().

Example 5: Revoke the EXECUTE privilege on function FIND_EMPDEPT from role ROLE1:
    REVOKE EXECUTE ON FUNCTION FIND_EMPDEPT
        FROM ROLE ROLE1;
REVOKE (package privileges)

This form of the REVOKE statement revokes privileges on packages.

Syntax

```
REVOKE ALL, BIND, COPY, EXECUTE ON PACKAGE collection-id.package-name FROM authorization-name.Role.role-name PUBLIC BY authorization-name.Role.role-name ALL

INCLUDING DEPENDENT PRIVILEGES
NOT INCLUDING DEPENDENT PRIVILEGES
```

Description

**BIND**

Revokes the privilege to use the BIND and REBIND subcommands for the designated packages. In addition, if the value of field BIND NEW PACKAGE on installation panel DSNTIPP is BIND, the additional BIND privilege of adding new versions of packages is revoked. (For details, see “Notes” on page 1774 for “GRANT (package privileges)” on page 1773.)

**COPY**

Revokes the privilege to use the COPY option of the BIND subcommand for the designated packages.

**EXECUTE**

Revokes the privilege to run application programs that use the designated packages and to specify the packages following PKLIST for the BIND PLAN and REBIND PLAN commands. RUN is an alternate name for the same privilege.

**ALL**

Revokes all package privileges for which you have authority for the packages named in the ON clause.
ON PACKAGE collection-id.package-name,...

Identifies packages for which you are revoking privileges. The revoking of a package privilege applies to all versions of that package. For each package that you identify, you (or the indicated grantors) must have granted at least one of the specified privileges on that package to all identified users (including PUBLIC, if specified). An authorization ID with PACKADM authority over the collection or all collections, SYSADM, or SYSCTRL authority can specify all packages in the collection by using * for package-name. The same package must not be specified more than once.

FROM

Refer to "REVOKE" on page 1878 for a description of the FROM clause.

BY

Refer to "REVOKE" on page 1878 for a description of the BY clause.

INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES

Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:

• When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, NOT INCLUDING DEPENDENT PRIVILEGES is assumed and the clause must be specified on the REVOKE statement.

• When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, NOT INCLUDING DEPENDENT PRIVILEGES is assumed and an error is returned if the statement includes INCLUDING DEPENDENT PRIVILEGES.

• Otherwise, INCLUDING DEPENDENT PRIVILEGES is assumed and the clause must be specified on the REVOKE statement.

INCLUDING DEPENDENT PRIVILEGES

Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

INCLUDING DEPENDENT PRIVILEGES cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

NOT INCLUDING DEPENDENT PRIVILEGES

Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

NOT INCLUDING DEPENDENT PRIVILEGES must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

NOT INCLUDING DEPENDENT PRIVILEGES cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to YES, which enforces the behavior to include dependent privileges in the revoke.
Notes

Alternative syntax and synonyms: To provide compatibility with previous releases of DB2 or other products in the DB2 family, DB2 supports specifying PROGRAM as a synonym for PACKAGE.

Examples

Example 1: Revoke the privilege to copy all packages in collection DSN8CC61 from LEWIS.

    REVOKE COPY ON PACKAGE DSN8CC61.* FROM LEWIS;

Example 2: Revoke the privilege to run all packages in collection DSN9CC13 from role ROLE1:

    REVOKE EXECUTE ON PACKAGE DSN9CC13.* FROM ROLE ROLE1;
**REVOKE (plan privileges)**

This form of the REVOKE statement revokes privileges on application plans.

**Syntax**

```
REVOKE BIND, EXECUTE ON PLAN plan-name FROM authorization-name,
ROLE role-name PUBLIC
BY authorization-name ROLE role-name
INCLUDING DEPENDENT PRIVILEGES
NOT INCLUDING DEPENDENT PRIVILEGES
```

**Description**

**BIND**

Revokes the privilege to use the BIND, REBIND, and FREE subcommands for the identified plans.

**EXECUTE**

Revokes the privilege to run application programs that use the identified plans.

**ON PLAN plan-name,**...

Identifies application plans for which you are revoking privileges. For each plan that you identify, you (or the indicated grantors) must have granted at least one of the specified privileges on that plan to all identified users (including PUBLIC, if specified). The same plan must not be specified more than once.

**FROM**

Refer to "REVOKE" on page 1878 for a description of the FROM clause.

**BY**

Refer to "REVOKE" on page 1878 for a description of the BY clause.

**INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES**

Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:

- When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, **NOT INCLUDING DEPENDENT PRIVILEGES** is assumed and the clause must be specified on the REVOKE statement.
- When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, **NOT INCLUDING DEPENDENT PRIVILEGES** is assumed and an error is returned if the statement includes **INCLUDING DEPENDENT PRIVILEGES**.
• Otherwise, **INCLUDING DEPENDENT PRIVILEGES** is assumed and the clause must be specified on the REVOKE statement.

**INCLUDING DEPENDENT PRIVILEGES**

Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

**INCLUDING DEPENDENT PRIVILEGES** cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

**NOT INCLUDING DEPENDENT PRIVILEGES**

Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

**NOT INCLUDING DEPENDENT PRIVILEGES** must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

**NOT INCLUDING DEPENDENT PRIVILEGES** cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to YES, which enforces the behavior to include dependent privileges in the revoke.

**Examples**

*Example 1:* Revoke authority to bind plan DSN8IP11 from user JONES.

```
REVOKE BIND ON PLAN DSN8IP11 FROM JONES;
```

*Example 2:* Revoke authority previously granted to all users at the current server to bind and execute plan DSN8CP11. (Grants to specific users will not be affected.)

```
REVOKE BIND,EXECUTE ON PLAN DSN8CP11 FROM PUBLIC;
```

*Example 3:* Revoke authority to execute plan DSN8CP11 from users ADAMSON and BROWN.

```
REVOKE EXECUTE ON PLAN DSN8CP11 FROM ADAMSON,BROWN;
```

*Example 4:* Revoke authority to bind plan DSN91PLN from role ROLE1:

```
REVOKE BIND ON PLAN DSN91PLN FROM ROLE ROLE1;
```
REVOKE (schema privileges)

This form of the REVOKE statement revokes privileges on schemas.

Syntax

```
REVOKE
  ALTERIN, CREATEIN, DROPIN
  ON SCHEMA schema-name
  FROM authorization-name
  ROLE role-name
  PUBLIC
  BY authorization-name
    ROLE role-name
    ALL
  \-- INCLUDING DEPENDENT PRIVILEGES
    \-- NOT INCLUDING DEPENDENT PRIVILEGES
```

Description

**ALTERIN**
Revokes the privilege to alter sequences, stored procedures, and user-defined functions, or specify a comment for distinct types, cast functions that are generated for distinct types, sequences, stored procedures, triggers, and user-defined functions in the designated schemas.

**CREATEIN**
Revokes the privilege to create distinct types, sequences, stored procedures, triggers, and user-defined functions in the designated schemas.

**DROPIN**
Revokes the privilege to drop distinct types, sequences, stored procedures, triggers, and user-defined functions in the designated schemas.

**SCHEMA schema-name**
Identifies the schema on which the privilege is revoked.

**SCHEMA ***
Indicates that the specified privilege on all schemas is revoked. You (or the indicated grantors) must have previously granted the specified privilege on SCHEMA * to all identified users (including PUBLIC if specified). Privileges granted on specific schemas are not affected.

**FROM**
Refer to "REVOKE" on page 1878 for a description of the FROM clause.

**BY**
Refer to "REVOKE" on page 1878 for a description of the BY clause.

**INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES**
Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:
• When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, **NOT INCLUDING DEPENDENT PRIVILEGES** is assumed and the clause must be specified on the REVOKE statement.

• When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, **NOT INCLUDING DEPENDENT PRIVILEGES** is assumed and an error is returned if the statement includes **INCLUDING DEPENDENT PRIVILEGES**.

• Otherwise, **INCLUDING DEPENDENT PRIVILEGES** is assumed and the clause must be specified on the REVOKE statement.

**INCLUDING DEPENDENT PRIVILEGES**

Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

**INCLUDING DEPENDENT PRIVILEGES** cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

**NOT INCLUDING DEPENDENT PRIVILEGES**

Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

**NOT INCLUDING DEPENDENT PRIVILEGES** must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

**NOT INCLUDING DEPENDENT PRIVILEGES** cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to YES, which enforces the behavior to include dependent privileges in the revoke.

**Examples**

**Example 1:** Revoke the CREATEIN privilege on schema T_SCORES from user JONES.

```
REVOKE CREATEIN ON SCHEMA T_SCORES FROM JONES;
```

**Example 2:** Revoke the CREATEIN privilege on schema VAC from all users at the current server.

```
REVOKE CREATEIN ON SCHEMA VAC FROM PUBLIC;
```

**Example 3:** Revoke the ALTERIN privilege on schema DEPT from the administrative assistant.

```
REVOKE ALTERIN ON SCHEMA DEPT FROM ADMIN_A;
```

**Example 4:** Revoke the ALTERIN and DROPIN privileges on schemas NEW_HIRE, PROMO, and RESIGN from HR (Human Resources).

```
REVOKE ALTERIN, DROPIN ON SCHEMA NEW_HIRE, PROMO, RESIGN FROM HR;
```

**Example 5:** Revoke the ALTERIN privilege on schemas EMPLOYEE from role ROLE1:
REVOKE ALTER ON SCHEMA EMPLOYEE FROM ROLE ROLE1;
REVOKE (sequence privileges)

This form of the REVOKE statement revokes the privileges on a user-defined sequence.

Syntax

```
REVOKE
    (1)
    USAGE
    ON SEQUENCE
    FROM
    authorization-name
    ROLE role-name
    PUBLIC
    BY
    authorization-name
    ROLE role-name
    ALL
    INCLUDING DEPENDENT PRIVILEGES
    NOT INCLUDING DEPENDENT PRIVILEGES
```

Notes:
1. The keyword SELECT is an alternative keyword for USAGE.

Description

**ALTER**
Revokes the privilege to alter a sequence or record a comment on a sequence.

**USAGE**
Revokes the USAGE privilege to use a sequence. This privilege is needed when the NEXT VALUE or PREVIOUS VALUE expression is invoked for a sequence name.

**SEQUENCE sequence-name**
Identifies the sequence. The name, including the implicit or explicit schema qualifier, must uniquely identify an existing sequence at the current server. If no sequence by this name exists in the explicitly or implicitly specified schema, an error occurs. sequence-name must not be the name of an internal sequence object that is generated by the system for an identity column.

**FROM**
Refer to “REVOKE” on page 1878 for a description of the FROM clause.

**BY**
Refer to “REVOKE” on page 1878 for a description of the BY clause.

**INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES**
Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:

- When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, NOT INCLUDING DEPENDENT PRIVILEGES is assumed and the clause must be specified on the REVOKE statement.
When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, NOT INCLUDING DEPENDENT PRIVILEGES is assumed and an error is returned if the statement includes INCLUDING DEPENDENT PRIVILEGES.

Otherwise, INCLUDING DEPENDENT PRIVILEGES is assumed and the clause must be specified on the REVOKE statement.

**INCLUDING DEPENDENT PRIVILEGES**

Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

INCLUDING DEPENDENT PRIVILEGES cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

**NOT INCLUDING DEPENDENT PRIVILEGES**

Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

NOT INCLUDING DEPENDENT PRIVILEGES must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

NOT INCLUDING DEPENDENT PRIVILEGES cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to YES, which enforces the behavior to include dependent privileges in the revoke.

**RESTRICT**

Prevents the USAGE privilege from being revoked on a sequence if the revokee owns one of the following objects and does not have the USAGE privilege from another source:

- A trigger that specifies the sequence in a NEXT VALUE or PREVIOUS VALUE expression
- An inline SQL function that specifies the sequence in a NEXT VALUE or PREVIOUS VALUE expression

**Examples**

**Example 1:** Revoke USAGE privilege on sequence MYNUM to user JONES.

```sql
REVOKE USAGE ON SEQUENCE MYNUM FROM JONES;
```

**Example 2:** Revoke the USAGE privilege on sequence ORDER_SEQ from role ROLE1:

```sql
REVOKE USAGE ON SEQUENCE ORDER_SEQ FROM ROLE ROLE1;
```
REVOKE (system privileges)

This form of the REVOKE statement revokes system privileges.

Syntax

```
REVOKE [ACCESSCTRL | ARCHIVE | BINDADD | BINDAGENT | BSDS | CREATEALIAS | CREATEDBA | CREATEDBC | CREATESG | CREATETMTAB | CREATE_SECURE_OBJECT | DATAACCESS | DBADM | DEBUGSESSION | DISPLAY | EXPLAIN | MONITOR1 | MONITOR2 | RECOVER | SQLADM | STOPALL | STOSPACE | SYSADM | SYSCtrl | SYSOPR | TRACE ]
   FROM [ROLE role-name] | PUBLIC
   [BY [ROLE role-name] | ALL]
   [INCLUDING DEPENDENT PRIVILEGES] | [NOT INCLUDING DEPENDENT PRIVILEGES]
```

Notes:

1. **INCLUDING DEPENDENT PRIVILEGES** must not be specified when `ACCESSCTRL`, `DATAACCESS`, or `DBADM` is specified.
2. **NOT INCLUDING DEPENDENT PRIVILEGES** must be specified when `ACCESSCTRL`, `DATAACCESS`, or `DBADM` is specified.

Description

**ACCESSCTRL**

Revoke the ACCESSCTRL authority, but does not revoke any privileges that are dependent on it.
ARCHIVE
Revokes the privilege to use the ARCHIVE LOG command.

BINDADD
Revokes the privilege to create plans and packages using the BIND subcommand with the ADD option.

BINDAGENT
Revokes the privilege to issue the BIND, FREE PACKAGE, or REBIND subcommands for plans and packages and the DROP PACKAGE statement on behalf of the grantor. The privilege also allows the holder to copy and replace plans and packages on behalf of the grantor.

A revoke of this privilege does not cascade.

BSDS
Revokes the privilege to issue the RECOVER BSDS command.

CREATEALIAS
Revokes the privilege to use the CREATE ALIAS statement.

CREATEDBA
Revokes the privilege to issue the CREATE DATABASE statement and acquire DBADM authority over those databases.

CREATEDBC
Revokes the privilege to issue the CREATE DATABASE statement and acquire DBCTRL authority over those databases.

CREATESG
Revokes the privilege to create new storage groups.

CREATETMTAB
Revokes the privilege to use the CREATE GLOBAL TEMPORARY TABLE statement.

CREATE_SECURE_OBJECT
Revokes the privilege to create a secure object.

DATAACCESS
Revokes the DATAACCESS authority, but does not revoke any privileges that are dependent on it. Revoking DATAACCESS can result in authorization cache entries (plan, package, routine, and dynamic statement) being updated if they were dependent on it. The RESTRICT semantics on objects prevents the DATAACCESS authority from being revoked if the revokee owns an object that was created with dependencies on the authority to be revoked.

Revoking DATAACCESS is similar to revoking the individual privileges that DATAACCESS includes. For example, if a view was created based on the view owner having the SELECT privilege as acquired through the DATAACCESS authority, revoking DATAACCESS would be the equivalent of revoking the SELECT privilege and the view would be dropped.

DBADM
Revokes the DBADM authority from the user. If this user was also granted DATAACCESS or ACCESSCTRL authority along with DBADM authority, DATAACCESS or ACCESSCTRL would not be revoked.

DISPLAY
Revokes the privilege to use the following commands:
- The DISPLAY ARCHIVE command for archive log information
- The DISPLAY BUFFERPOOL command for the status of buffer pools
• The DISPLAY DATABASE command for the status of all databases
• The DISPLAY FUNCTION SPECIFIC command for statistics about accessed external user-defined functions
• The DISPLAY LOCATION command for statistics about threads with a distributed relationship
• The DISPLAY PROCEDURE command for statistics about accessed stored procedures
• The DISPLAY THREAD command for information on active threads with in DB2
• The DISPLAY TRACE command for a list of active traces

DEBUGSESSION
Revokes the privilege to create a debug session, which prevents client application debugging of native SQL or Java procedures that are executed within the session.

EXPLAIN
Revokes the privilege to issue the following:
• The EXPLAIN statement with the following options:
  – PLAN
  – ALL
• The PREPARE statement
• The DESCRIBE TABLE statement
• The ability to explain dynamic SQL statements that are executing with the special register CURRENT EXPLAIN MODE = EXPLAIN
• The BIND options EXPLAIN(ONLY) and SQLERROR(CHECK)
  EXPLAIN(ONLY) allows to explain the statements. SQLERROR(CHECK) performs all syntax and semantic checks on the SQL statements being bound.

MONITOR1
Revokes the privilege to obtain IFC data classified as serviceability data, statistics, accounting, and other performance data that does not contain potentially secure data.

MONITOR2
Revokes the privilege to obtain IFC data classified as containing potentially sensitive data such as SQL statement text and audit data. (Having the MONITOR2 privilege also implies having MONITOR1 privileges, however, revoking the MONITOR2 privilege does not cause the revoke of an explicitly granted MONITOR1 privilege.)

RECOVER
Revokes the privilege to issue the RECOVER INDOUBT command.

SQLADM
Revokes the privilege to issue the following:
• The DESCRIBE TABLE statement
• The EXPLAIN statement with the following options:
  – PLAN
  – ALL
  – STMTCACHE ALL
  – STMTID
  – STMTTOKEN
– MONITORED STMTS

• The PREPARE statement
• The ability to explain dynamic SQL statements that are executing with the special register CURRENT EXPLAIN MODE = EXPLAIN
• The BIND options EXPLAIN(ONLY) and SQLERROR(CHECK)
  EXPLAIN(ONLY) allows to explain the statements. SQLERROR(CHECK) performs all syntax and semantic checks on the SQL statements being bound.
• The START command
• The STOP command
• The DISPLAY PROFILE command
• The ability to execute the RUNSTATS utility and the MODIFY STATISTICS utility in any database
• MONITOR2 privilege, which allows users to obtain IFC data that is classified as containing potentially sensitive data, such as SQL statement text and audit data, as well as IFC data that is classified as serviceability data, statistics, accounting, and other performance data.

STOPALL

Revokes the privilege to use the STOP DB2 command.

STOSPACE

Revokes the privilege to use the STOSPACE utility.

SYSADM

Revokes the system administrator authority.

SYSCTRL

Revokes the system control authority.

SYSOPR

Revokes the system operator authority.

TRACE

Revokes the privilege to use the MODIFY TRACE, START TRACE, and STOP TRACE commands.

FROM

Refer to "REVOKE" on page 1878 for a description of the FROM clause.

BY

Refer to "REVOKE" on page 1878 for a description of the BY clause.

INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES

Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:

• When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, NOT INCLUDING DEPENDENT PRIVILEGES is assumed and the clause must be specified on the REVOKE statement.
• When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, NOT INCLUDING DEPENDENT PRIVILEGES is assumed and an error is returned if the statement includes INCLUDING DEPENDENT PRIVILEGES.
• Otherwise, INCLUDING DEPENDENT PRIVILEGES is assumed and the clause must be specified on the REVOKE statement.
INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

INCLUDING DEPENDENT PRIVILEGES cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

NOT INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

NOT INCLUDING DEPENDENT PRIVILEGES must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

NOT INCLUDING DEPENDENT PRIVILEGES cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to YES, which enforces the behavior to include dependent privileges in the revoke.

Examples

Example 1: Revoke DISPLAY privileges from user LUTZ.
REVOKE DISPLAY
FROM LUTZ;

Example 2: Revoke BSDS and RECOVER privileges from users PARKER and SETRIGHT.
REVOKE BSDS,RECOVER
FROM PARKER,SETRIGHT;

Example 3: Revoke TRACE privileges previously granted to all local users. (Grants to specific users will not be affected.)
REVOKE TRACE
FROM PUBLIC;

Example 4: Revoke ARCHIVE privileges from role ROLE1:
REVOKE ARCHIVE
FROM ROLE ROLE1;

Example 5: SECADM Mary revokes the privilege to create a secure object from Steve that was granted by another SECADM.
REVOKE CREATE_SECURE_OBJECT
FROM STEVE BY MARY;

Example 6: Revoke system DBADM from the role, ADMINROLE. This only revokes system DBADM authority from the role. If DATAACCESS and ACCESSCTRL authorities were granted during GRANT DBADM, those authorities are not revoked.
REVOKE DBADM ON SYSTEM
FROM ROLE ADMINROLE
NOT INCLUDING DEPENDENT PRIVILEGES;

Example 7: Revoke system DBADM, DATAACCESS, and ACCESSCTRL authorities from the role, ADMINROLE.

REVOKE DBADM, DATAACCESS, ACCESSCTRL ON SYSTEM
FROM ROLE ADMINROLE
NOT INCLUDING DEPENDENT PRIVILEGES;
REVOKE (table or view privileges)

This form of the REVOKE statement revokes privileges on one or more tables or views.

Syntax

```
REVOKE
   ALL
   PRIVILEGES
   ON
   TABLE
   - table-name
   FROM
   - view-name

   ,
   authorization-name
   ROLE
   role-name
   PUBLIC
   BY
   authorization-name
   ROLE
   role-name

   ,
   INCLUDING DEPENDENT PRIVILEGES
   NOT INCLUDING DEPENDENT PRIVILEGES
```

Description

**ALL or ALL PRIVILEGES**

If you specify ALL, the authorization ID of the statement must have granted a least one privilege on each identified table or view to each authorization-name. The privilege revoked from an authorization ID are those privileges on the table or view that the authorization ID of the statement granted to the authorization ID.

If you do not use ALL, you must use one or more of the keywords listed below. Each keyword revokes the privilege described, but only as it applies to the tables or views named in the ON clause.

**ALTER**

Revoke the privilege to alter the specified table or create a trigger on the specified table.

**DELETE**

Revoke the privilege to delete rows in the specified table or view.
INDEX
Revokes the privilege to create an index on the specified table.

INSERT
Revokes the privilege to insert rows into the specified table or view.

REFERENCES
Revokes the privilege to define and drop referential constraints. Although you can use a list of column names with the GRANT statement, you cannot use a list of column names with REVOKE; the privilege is revoked for all columns.

SELECT
Revokes the privilege to create a view or read data from the specified table or view. A view or a materialized query table is dropped when the SELECT privilege that was used to create it is revoked, unless the owner of the view or materialized query table was directly granted the SELECT privilege from another source before the view or materialized query table was created.

TRIGGER
Revokes the privilege to create a trigger on the specified table.

UPDATE
Revokes the privilege to update rows in the specified table or view. A list of column names can be used only with GRANT, not with REVOKE.

ON table-name or view-name
Names one or more tables or views on which you are revoking the privileges. The list can consist of table names, view names, or a combination of the two. A table or view must not be identified more than one time, and a declared temporary table and a table that is implicitly created for an XML column must not be identified.

FROM
Refer to "REVOKE" on page 1878 for a description of the FROM clause.

BY
If you omit BY, you must have granted each named privilege to each of the named users. More precisely, each privilege must have been granted to each user by a GRANT statement whose authorization ID is also the authorization ID of your REVOKE statement. Each of these grants is then revoked. (No single privilege need be granted on all tables and views.)

If BY is specified, each named grantor must satisfy the above requirement. In that case, the authorization ID of the statement need not satisfy the requirement unless it is one of the named grantors.

Refer to "REVOKE" on page 1878 for a description of the BY clause.

INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES
Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEPEND_PRIVILEGES system parameter:

- When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, NOT INCLUDING DEPENDENT PRIVILEGES is assumed and the clause must be specified on the REVOKE statement.

- When the REVOKE_DEPEND_PRIVILEGES system parameter is set to NO, NOT INCLUDING DEPENDENT PRIVILEGES is assumed and an error is returned if the statement includes INCLUDING DEPENDENT PRIVILEGES.

- Otherwise, INCLUDING DEPENDENT PRIVILEGES is assumed and the clause must be specified on the REVOKE statement.
INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID
or a role also results in revoking dependent privileges. This means that any
grants that were made by the user will continue to be revoked, until all
grants in the chain have been revoked.

INCLUDING DEPENDENT PRIVILEGES cannot be specified if the
system parameter REVOKE_DEP_PRIVILEGES is set to NO, which
enforces the behavior to not include the dependent privileges.

NOT INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID
or a role does not cause the grants that were made by the user to be
revoked. However, for the revoked privileges, all implications of the
privilege being revoked are applied. For example, if the revoked privileges
were required to bind a package successfully, that package would continue
to be invalidated as a result of the package owner losing these privileges.
An object might be dropped if a privilege is revoked that was used to
create the object.

NOT INCLUDING DEPENDENT PRIVILEGES must be specified when
ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

NOT INCLUDING DEPENDENT PRIVILEGES cannot be specified if the
system parameter REVOKE_DEP_PRIVILEGES is set to YES, which enforces
the behavior to include dependent privileges in the revoke.

Notes
For a created temporary table, only ALL or ALL PRIVILEGES can be revoked.
Specific table privileges cannot be revoked.

For a view of a created temporary table, either ALL or the specific UPDATE,
DELETE, INSERT and SELECT privileges can be revoked.

For a declared temporary table, no privileges can be revoked because none can be
granted. When a declared temporary table is defined, PUBLIC implicitly receives
all table privileges (without GRANT authority) for the table. These privileges are
not recorded in the DB2 catalog.

Examples

Example 1: Revoke SELECT privileges on table DSN8B10.EMP from user PULASKI.
   REVOKE SELECT ON TABLE DSN8B10.EMP FROM PULASKI;

Example 2: Revoke update privileges on table DSN8B10.EMP previously granted to
all local DB2 users. (Grants to specific users are not affected.)
   REVOKE UPDATE ON TABLE DSN8B10.EMP FROM PUBLIC;

Example 3: Revoke all privileges on table DSN8B10.EMP from users KWAN and
THOMPSON.
   REVOKE ALL ON TABLE DSN8B10.EMP FROM KWAN, THOMPSON;

Example 4: Revoke the grant of SELECT and UPDATE privileges on the table
DSN8B10.DEPT to every user in the network. Doing so does not affect users who
obtained these privileges from some other grant.
Example 5: Revoke the ALTER privileges on the table DSN8B10.EMP that were previously granted to role ROLE1:

REVOKE ALTER ON TABLE DSN8B10.EMP
FROM ROLE ROLE1;
REVOKE (type or JAR file privileges)

This form of the REVOKE statement revokes the privilege to use distinct types, array types, or JAR files.

Syntax

```
REVOKE USAGE ON TYPE type-name, JAR jar-name FROM authorization-name,
BY authorization-name ROLE role-name PUBLIC

INCLUDING DEPENDENT PRIVILEGES
NOT INCLUDING DEPENDENT PRIVILEGES

RESTRICT
```

Description

**USAGE**

Revokes the privilege to use the distinct type in tables, functions procedures, or the privilege to use the JAR file.

**TYPE type-name**

Identifies the user-defined type. The name, including the implicit or explicit schema name, must identify a unique user-defined type that exists at the current server.

**JAR jar-name**

Identifies the JAR file. The name, including the implicit or explicit schema name, must identify a unique JAR file that exists at the current server.

**FROM**

Refer to “REVOKE” on page 1878 for a description of the FROM clause.

**BY**

Refer to “REVOKE” on page 1878 for a description of the BY clause.

**INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES**

Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:

- When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, **NOT INCLUDING DEPENDENT PRIVILEGES** is assumed and the clause must be specified on the REVOKE statement.
- When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, **NOT INCLUDING DEPENDENT PRIVILEGES** is assumed and an error is returned if the statement includes **INCLUDING DEPENDENT PRIVILEGES**.
• Otherwise, **INCLUDING DEPENDENT PRIVILEGES** is assumed and the clause must be specified on the REVOKE statement.

**INCLUDING DEPENDENT PRIVILEGES**
Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

**INCLUDING DEPENDENT PRIVILEGES** cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

**NOT INCLUDING DEPENDENT PRIVILEGES**
Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

**NOT INCLUDING DEPENDENT PRIVILEGES** must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

**NOT INCLUDING DEPENDENT PRIVILEGES** cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to YES, which enforces the behavior to include dependent privileges in the revoke.

**RESTRICT**
Prevents the USAGE privilege from being revoked on a user-defined type or JAR file if any of the following conditions exist and the revokee does not have the USAGE privilege from another source:

- The revokee owns a function or stored procedure that uses the user-defined type or references the JAR file.
- The revokee owns a JAR file whose path references the JAR file for which USAGE is being revoked.
- The revokee owns a table that has a column that uses the user-defined type.
- A sequence exists for which the data type of the sequence is the user-defined type.

**Notes**

*Alternative syntax and synonyms:* To provide compatibility with previous releases of DB2 or other products in the DB2 family, DB2 supports DATA TYPE or DISTINCT TYPE as a synonym for TYPE.

**Examples**

*Example 1:* Revoke the USAGE privilege on distinct type SHOESIZE from user JONES.

```
REVOKE USAGE ON TYPE SHOESIZE FROM JONES;
```

*Example 2:* Revoke the USAGE privilege on distinct type US_DOLLAR from all users at the current server except for those who have been specifically granted USAGE and not through PUBLIC.

```
REVOKE USAGE ON TYPE US_DOLLAR FROM PUBLIC;
```
Example 3: Revoke the USAGE privilege on distinct type CANADIAN_DOLLARS from the administrative assistant (ADMIN_A).

    REVOKE USAGE ON TYPE CANADIAN_DOLLARS
    FROM ADMIN_A;

Example 4: Revoke the USAGE privilege on distinct type MILES from the role ROLE1:

    REVOKE USAGE ON TYPE MILES
    FROM ROLE ROLE1;
REVOKE (variable privileges)

This form of the REVOKE statement revokes privileges on global variables.

Syntax

```
REVOKE PRIVILEGES
    ALL,
    READ
    WRITE
ON VARIABLE variable-name
FROM
    authorization-name
    ROLE role-name
    PUBLIC
BY
    authorization-name
    ROLE role-name
    ALL
RESTRICT
```

Description

**ALL PRIVILEGES**
Revokes both READ and WRITE privileges on the specified global variable.

**READ**
Revokes the privilege to read the value of the specified global variable.

**WRITE**
Revokes the privilege to assign a value to the specified global variable.

**ON VARIABLE variable-name**
Identifies the global variable from which privileges are revoked. `variable-name` must identify a global variable that exists at the current server.

**FROM**
Refer to "REVOKE" on page 1878 for a description of the FROM clause.

**BY**
Refer to "REVOKE" on page 1878 for a description of the BY clause.

**RESTRICT**
Prevents the specified privileges from being revoked on a global variable if the following conditions exist:
- A function that is owned by the revokee references (READ or WRITE privilege) the specified global variable
- A view that is owned by the revokee references (READ or WRITE privilege) the specified global variable
- A trigger that is owned by the revokee references (READ or WRITE privilege) the specified global variable
Notes

Global variables and statements in the dynamic statement cache: If a cached
dynamic statement depends on the revoked authorization for the specified global
variable and the cache statement is not in use, the cached dynamic statement will
be invalidated.

Examples
REVOKE (use privileges)

This form of the REVOKE statement revokes authority to use particular buffer pools, storage groups, or table spaces.

Syntax

```
REVOKE USE OF BUFFERPOOL bpname,
     ALL BUFFERPOOLS,
     STOGROUP stogroup-name,
     TABLESPACE database-name.table-space-name,
     FROM authorization-name,
     ROLE role-name,
     PUBLIC,
     BY authorization-name,
     ROLE role-name,
     ALL,
     INCLUDING DEPENDENT PRIVILEGES,
     NOT INCLUDING DEPENDENT PRIVILEGES
```

Description

**BUFFERPOOL bpname,**...

Revokes the privilege to refer to any of the identified buffer pools in a CREATE INDEX, CREATE TABLESPACE, ALTER INDEX, or ALTER TABLESPACE statement. See "Naming conventions" on page 59 for more details about `bpname`.

**ALL BUFFERPOOLS**

Revokes the privilege to refer to any buffer pool in a CREATE INDEX, CREATE TABLESPACE, ALTER INDEX, or ALTER TABLESPACE statement.

**STOGROUP stogroup-name,**...

Revokes the privilege to refer to any of the identified storage groups in a CREATE INDEX, CREATE TABLESPACE, ALTER INDEX, or ALTER TABLESPACE statement.

**TABLESPACE database-name.table-space-name,**...

Revokes the privilege to refer to any of the specified table spaces in a CREATE TABLE statement. The default `database-name` is DSNDB04.

For table spaces in a work file database you cannot revoke the privilege from PUBLIC. When a table space is created in a work file database, PUBLIC
implicitly receives the TABLESPACE privilege (without GRANT authority); this
privilege is not recorded in the DB2 catalog, and it cannot be revoked.

FROM
Refer to “REVOKE” on page 1878 for a description of the FROM clause.

BY
Refer to “REVOKE” on page 1878 for a description of the BY clause.

INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES
Specifies whether revoking a privilege or an authority from an authorization
ID or a role also results in revoking the grants that were made by that user.
The default value is based on the authority that is being revoked and the
REVOKE_DEP_PRIVILEGES system parameter:

• When ACCESSCTRL, DATAACCESS, or system DBADM authority is
revoked, NOT INCLUDING DEPENDENT PRIVILEGES is assumed and
the clause must be specified on the REVOKE statement.
• When the REVOICE_DEP_PRIVILEGES system parameter is set to NO, NOT
INCLUDING DEPENDENT PRIVILEGES is assumed and an error is
returned if the statement includes INCLUDING DEPENDENT
PRIVILEGES.
• Otherwise, INCLUDING DEPENDENT PRIVILEGES is assumed and the
clause must be specified on the REVOKE statement.

INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID
or a role also results in revoking dependent privileges. This means that any
grants that were made by the user will continue to be revoked, until all
grants in the chain have been revoked.

INCLUDING DEPENDENT PRIVILEGES cannot be specified if the
system parameter REVOKE_DEP_PRIVILEGES is set to NO, which
enforces the behavior to not include the dependent privileges.

NOT INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID
or a role does not cause the grants that were made by the user to be
revoked. However, for the revoked privileges, all implications of the
privilege being revoked are applied. For example, if the revoked privileges
were required to bind a package successfully, that package would continue
to be invalidated as a result of the package owner losing these privileges.
An object might be dropped if a privilege is revoked that was used to
create the object.

NOT INCLUDING DEPENDENT PRIVILEGES must be specified when
ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

NOT INCLUDING DEPENDENT PRIVILEGES cannot be specified if the
system parameter REVOKE_DEP_PRIVILEGES is set to YES, which enforces
the behavior to include dependent privileges in the revoke.

Notes
You can revoke privileges for only one type of object with each statement. Thus
you can revoke the use of several table spaces with one statement, but not the use
of a table space and a storage group.

For each object you name, you (or the indicated grantors) must have granted the
USE privilege on that object to all identified users (including PUBLIC, if specified).
The same object must not be identified more than once.
Revoking the privilege USE OF ALL BUFFERPOOLS does not cascade to all other privileges that can be granted under that privilege. A user with the privilege USE OF ALL BUFFERPOOLS WITH GRANT OPTION can make two types of grants:

- GRANT USE OF ALL BUFFERPOOLS TO *userid*. This privilege is revoked when the original user's privilege is revoked.
- GRANT USE OF BUFFERPOOL BPn TO *userid*. This privilege is not revoked when the original user's privilege is revoked.

**Examples**

*Example 1:* Revoke authority to use buffer pool BP2 from user MARINO.

```sql
REVOKE USE OF BUFFERPOOL BP2
  FROM MARINO;
```

*Example 2:* Revoke a grant of the USE privilege on the table space DSN8S11D in the database DSN8D11A. The grant is to PUBLIC, that is, to everyone at the local DB2 subsystem. (Grants to specific users are not affected.)

```sql
REVOKE USE OF TABLESPACE DSN8D11A.DSN8S11D
  FROM PUBLIC;
```

*Example 3:* Revoke the authority to use storage group SG1 from role ROLE1:

```sql
REVOKE USE OF STOGROUP SG1
  FROM ROLE ROLE1;
```
ROLLBACK

The ROLLBACK statement can be used to end a unit of recovery and back out all the relational database changes that were made by that unit of recovery. If relational databases are the only recoverable resources used by the application process, ROLLBACK also ends the unit of work. ROLLBACK can also be used to back out only the changes made after a savepoint was set within the unit of recovery without ending the unit of recovery. Rolling back to a savepoint enables selected changes to be undone.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared. It can be used in the IMS or CICS environment only if the TO SAVEPOINT clause is specified.

Authorization

None required.

Syntax

```
ROLLBACK WORK
```

Description

When ROLLBACK is used without the SAVEPOINT clause, the unit of recovery in which the ROLLBACK statement is executed is ended and a new unit of recovery is started.

All changes that are made by the following statements during the unit of recovery are backed out:

- ALTER
- COMMENT
- CREATE
- DELETE
- DROP
- EXPLAIN
- GRANT
- INSERT
- LABEL
- MERGE
- REFRESH TABLE
- RENAME
- REVOKE
- SELECT INTO with an SQL data change statement
• select-statement with an SQL data change statement
• TRUNCATE when the IMMEDIATE clause is not specified
• UPDATE

ROLLBACK without the TO SAVEPOINT clause also causes the following actions to occur:
• All locks that are implicitly acquired during the unit of recovery are released. See “LOCK TABLE” on page 1822 for an explanation of the duration of explicitly acquired locks.
• All cursors are closed, all prepared statements are destroyed, and any cursors that are associated with the prepared statements are invalidated.
• All rows and all logical work files of every created temporary table of the application process are deleted. (All the rows of a declared temporary table are not implicitly deleted. As with base tables, any changes that are made to a declared temporary table during the unit of recovery are undone to restore the table to its state at the last commit point.)
• All LOB locators, including those that are held, are freed.

TO SAVEPOINT
Specifies that the unit of recovery is not to be ended and that only a partial rollback (to a savepoint) is to be performed. If a savepoint name is not specified, rollback is to the last active savepoint. For example, if in a unit of recovery, savepoints A, B, and C are set in that order and then C is released, ROLLBACK TO SAVEPOINT causes a rollback to savepoint B.

savepoint-name
Identifies the savepoint to which to roll back. The name must identify a savepoint that exists at the current server.

All database changes (including changes made to a declared temporary tables but excluding changes made to created temporary tables) that were made after the savepoint was set are backed out. Changes that are made to created temporary tables are not logged and are not backed out; a warning is issued instead. (A warning is also issued when a created temporary table is changed and there is an active savepoint.)

In addition, none of the following items are backed out:
• The opening or closing of cursors
• Changes in cursor positioning
• The acquisition and release of locks
• The caching of the rolled back statements

Any savepoints that are set after the one to which rollback is performed are released. The savepoint to which rollback is performed is not released.

ROLLBACK with or without the TO SAVEPOINT clause has no effect on connections.

Notes

The following information applies only to rolling back all changes in the unit of recovery (the ROLLBACK statement without the TO SAVEPOINT clause):
• Stored procedures. The ROLLBACK statement cannot be used if the procedure is in the calling chain of a user-defined function or a trigger or if DB2 is not the commit coordinator.
• **IMS or CICS.** Using a ROLLBACK to SAVEPOINT statement in an IMS or CICS environment only rolls back DB2 resources. Any other recoverable resources updated in the environment are not rolled back. To do a rollback operation in these environments, SQL programs must use the call prescribed by their transaction manager. The effect of these rollback operations on DB2 data is the same as that of the SQL ROLLBACK statement.

  A rollback operation in an IMS or CICS environment might handle the closing of cursors that were declared with the WITH hold option differently than the SQL ROLLBACK statement does. If an application requests a rollback operation from CICS or IMS, but no work has been performed in DB2 since the last commit point, the rollback request will not be broadcast to DB2. If the application had opened cursors using the WITH HOLD option in a previous unit of work, the cursors will not be closed, and any prepared statements associated with those cursors will not be destroyed.

• **Implicit rollback operations:** In all DB2 environments, the abend of a process is an implicit rollback operation.

**ROLLBACK and non-LOB table spaces that are not logged:** If ROLLBACK is executed for a unit of work that includes changes to a non-LOB table space that is not logged (specifies the NOT LOGGED attribute), that table space is marked RECOVER-pending and the table space is placed in the logical page list. The table space is therefore not available after the rollback operation completes. See DB2 Utility Guide and Reference for more information about the RECOVER utility.

**ROLLBACK and declared global temporary tables that are not logged:** When NOT LOGGED is specified on a declared global temporary table and DB2 must roll back because of an error such as a duplicate key error, rows are deleted or preserved depending on the option that was specified for ON ROLLBACK.

  If the ON ROLLBACK DELETE ROWS option was specified for the table, insert, update, and delete activity is not logged. During a ROLLBACK or ROLLBACK TO SAVEPOINT operation, if the table was updated since the last COMMIT statement, all rows are deleted from the table. Any open cursors for the table do not have positions. If the declaration of the declared global temporary table was not committed, the declaration of the table is rolled back.

  If the ON ROLLBACK PRESERVE ROWS option was specified for the table, insert, update, and delete activity is not logged. During a ROLLBACK or ROLLBACK TO SAVEPOINT operation, all rows in the table are preserved regardless of any updates to the table since the last COMMIT statement. Any open cursors for the table do not have positions. If the declaration of the declared global temporary table was not committed, the declaration of the table is rolled back.

**Effect of ROLLBACK on global variables:** Global variables are not controlled at the transaction level. Issuing a ROLLBACK statement does not affect the contents of a global variable.

**Effect of ROLLBACK on insert operations:** If execution of an INSERT statement results in creation of a data set in a table space, and the INSERT operation is rolled back, the inserted data is deleted, but the data set is not deleted.

### Examples

*Example 1:* Roll back all DB2 database changes made since the unit of recovery was started.
ROLLBACK WORK;

*Example 2:* After a unit of recovery started, assume that three savepoints A, B, and C were set and that C was released:

```
...  
  SAVEPOINT A ON ROLLBACK RETAIN CURSORS;  
...  
  SAVEPOINT B ON ROLLBACK RETAIN CURSORS;  
...  
  SAVEPOINT C ON ROLLBACK RETAIN CURSORS;  
...  
  RELEASE SAVEPOINT C;  
...  
```

Roll back all DB2 database changes only to savepoint A:

```
  ROLLBACK WORK TO SAVEPOINT A;  
```

If a savepoint name was not specified (that is, `ROLLBACK WORK TO SAVEPOINT`), the rollback would be to the last active savepoint that was set, which is B.
SAVEPOINT

The SAVEPOINT statement sets a savepoint within a unit of recovery to identify a point in time within the unit of recovery to which relational database changes can be rolled back.

Invocation

This statement can be imbedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

```
SAVEPOINT savepoint-name [UNIQUE] ON ROLLBACK RETAIN CURSORS

ON ROLLBACK RETAIN LOCKS
```

Notes:
1. These clauses can be specified in either order.

Description

`savepoint-name`

Names the savepoint. `savepoint-name` must not begin with 'SYS'.

`UNIQUE`

Specifies that the application program cannot reuse the savepoint name within the unit of recovery. An error occurs if a savepoint with the same name as `savepoint-name` already exists within the unit of recovery.

Omitting `UNIQUE` indicates that the application can reuse the savepoint name within the unit of recovery. If `svpt-name` identifies a savepoint that already exists within the unit of recovery and the savepoint was not created with the `UNIQUE` option, the existing savepoint is destroyed and a new savepoint is created. Destroying a savepoint to reuse its name for another savepoint is not the same as releasing the savepoint. Reusing a savepoint name destroys only one savepoint. Releasing a savepoint with the `RELEASE SAVEPOINT` statement releases the savepoint and all savepoints that have been subsequently set.

`ON ROLLBACK RETAIN CURSORS`

Specifies that any cursors that are opened after the savepoint is set are not tracked, and thus, are not closed upon rollback to the savepoint. Although these cursors remain open after rollback to the savepoint, they might not be usable. For example, if rolling back to the savepoint causes the insertion of a
row on which the cursor is positioned to be rolled back, using the cursor to update or delete the row results in an error.

**ON ROLLBACK RETAIN LOCKS**

Specifies that any locks that are acquired after the savepoint is set are not tracked, and thus, are not released on rollback to the savepoint. ON ROLLBACK RETAIN LOCKS is the default behavior.

**Example**

Assume that you want to set three savepoints at various points in a unit of recovery. Name the first savepoint A and allow the savepoint name to be reused. Name the second savepoint B and do not allow the name to be reused. Because you no longer need savepoint A when you are ready to set the third savepoint, reuse A as the name of the savepoint.

```sql
SAVEPOINT A ON ROLLBACK RETAIN CURSORS;

SAVEPOINT B UNIQUE ON ROLLBACK RETAIN CURSORS;

SAVEPOINT A ON ROLLBACK RETAIN CURSORS;
```
The select-statement is the form of a query that can be directly specified in a DECLARE CURSOR statement, or prepared and then referenced in a DECLARE CURSOR statement. It can also be issued interactively using SPUFI or the command line processor which causes a result table to be displayed at your terminal. In any case, the table specified by select-statement is the result of the fullselect.

For a description of the SELECT statement, see “select-statement” on page 851.
SELECT INTO

The SELECT INTO statement produces a result table that contains at most one row. The statement assigns the values in that row to variables. If the table is empty, the statement does not assign values to the host variables or global variables.

Invocation

This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared.

Authorization

The privilege set that is defined below must include at least one of the following:

- The SELECT privilege on every table and view identified in the statement
- Ownership of every table and view identified in the statement
- READ and WRITE privileges on any global variables that are identified in the statement
- Ownership of any global variables that are identified in the statement
- DBADM authority for the database (tables only)
- DATAACCESS authority
- SYSADM authority
- SYSCTRL authority (catalog tables only)

If the SELECT INTO statement includes an SQL data change statement, the privilege set must also include at least the privileges (INSERT, UPDATE, or DELETE) that are associated with that SQL data change statement on the table or view.

Privilege set: If the statement is embedded in an application program, the privilege set is the set of privileges that are held by the owner of the package.
Syntax

```
WITH common-table-expression

select-clause INTO target-variable

array-variable[array-index]

from-clause

where-clause

group-by-clause

having-clause

order-by-clause

isolation-clause

QUERYNO integer

FETCH FIRST 1 ROWS ONLY
```

target-variable:

```
global-variable-name
host-variable-name
SQL-parameter-name
SQL-variable-name
```

Notes:

1. The select-clause cannot reference both a system-period temporal table and an archive-enabled table.
2. The same clause must not be specified more than once.

Description

The table is derived by evaluating the isolation-clause, from-clause, where-clause, group-by-clause, having-clause, order-by-clause, and the select-clause, in this order. See Chapter 5, "Queries," on page 781 for a description of these clauses.

The tables or views identified in the statement can exist at the current server or at any DB2 subsystem with which the current server can establish a connection.

**WITH common-table-expression**

Refer to "common-table-expression" on page 852 for information about specifying a common-table-expression.

**INTO target-variable or array-variable[array-index]**

Identifies one or more targets for the assignment of output values. The number
of targets in the INTO clause must equal the number of values that are to be assigned. The first value in the result row is assigned to the first target in the list, the second value to the second target, and so on. A target variable must not be specified more than once in the INTO clause. Each assignment to a target is made in sequence through the list, according to the rules described in “Assignment and comparison” on page 123.

The value 'W' is assigned to the SQLWARN3 field of the SQLCA if the number of targets is less than the number of result column values.

If an error occurs on any assignment, the value is not assigned to the target, and no more values are assigned to the specified targets. Any values that have already been assigned remain assigned.

- **global-variable-name**
  Identifies the global variable that is the assignment target.

- **host-variable-name**
  Identifies the host variable that is the assignment target. For LOB output values, the target can be a regular host variable (if it is large enough), a LOB locator variable, or a LOB file reference variable.

- **SQL-parameter-name**
  Identifies the parameter that is the assignment target.

- **SQL-variable-name**
  Identifies the SQL variable that is the assignment target. SQL variables must be declared before they are used.

- **array-variable [array-index]**
  Specifies an array element that is the target of the assignment.
  An array element must not be specified as the target for an assignment if common-table-expression is also specified in the statement.

  - **array-variable**
    Specifies an array variable.

  - **[array-index]**
    An expression that specifies which element in the array is the target of the assignment.
    For an ordinary array, the array index expression must be castable to INTEGER, and must not be the null value. The index value must be between 1 and the maximum cardinality that is defined for the array.
    For an associative array, the array index expression must be castable to the index data type of the associative array, and must not be the null value.

  - **array-index** must not be:
    - An expression that references the CURRENT DATE, CURRENT TIME, or CURRENT TIMESTAMP special register
    - A nondeterministic function
    - A function that is defined with EXTERNAL ACTION
    - A function that is defined with MODIFIES SQL DATA
    - A sequence expression

The data type of a variable must be compatible with the value assigned to it. If the value is numeric, the variable must have the capacity to represent the
integral part of the value. For a date or time value, the variable must be a character string variable of a minimum length as defined in "Assignment and comparison" on page 123.

Each assignment to a variable is made according to the rules described in "Assignment and comparison" on page 123. Assignments are made in sequence through the list.

If an error occurs as the result of an arithmetic expression in the SELECT list of a SELECT INTO statement (division by zero or overflow) or a numeric conversion error occurs, the result is the null value. As in any other case of a null value, an indicator variable must be provided and the main variable is unchanged. In this case, however, the indicator variable is set to -2. Processing of the statement continues as if the error had not occurred. (However, this error causes a positive SQLCODE.) If you do not provide an indicator variable, a negative value is returned in the SQLCODE field of the SQLCA. Processing of the statement terminates when the error is encountered.

If an error occurs, no value is assigned to the variable or to later variables, though any values that have already been assigned to variables remain assigned.

If an error occurs because the result table has more than one row, values might be assigned to the variables. If values are assigned to the variables, the row that is the source of the values is undefined and not predictable.

**isolation-clause**

Specifies the isolation level at which the statement is executed and, optionally, the type of locks that are acquired.

**SKIP LOCKED DATA**

Specifies that rows are skipped when incompatible locks are held on the row by other transactions. These rows can belong to any accessed table that is specified in the statement. SKIP LOCKED DATA can be used only when isolation CS or RS is in effect and applies only to row level or page level locks.

SKIP LOCKED DATA is ignored if it is specified when the isolation level that is in effect is repeatable read (WITH RR) or uncommitted read (WITH UR).

**QUERYNO integer**

Specifies the number to be used for this SQL statement in EXPLAIN output and trace records. The number is used for the QUERYNO columns of the plan tables for the rows that contain information about this SQL statement. This number is also used in the QUERYNO column of the SYSIBM.SYSTMT and SYSIBM.SYSPACKSTMT catalog tables.

If the clause is omitted, the number associated with the SQL statement is the statement number assigned during precompilation. Thus, if the application program is changed and then precompiled, that statement number might change.

Using the QUERYNO clause to assign unique numbers to the SQL statements in a program is helpful:

- For simplifying the use of optimization hints for access path selection
- For correlating SQL statement text with EXPLAIN output in the plan table

For information on using optimization hints, such as enabling the system for optimization hints and setting valid hint values, and for information on accessing the plan table, see *DB2 Performance Monitoring and Tuning Guide*.

**FETCH FIRST ROW ONLY integer**

The FETCH FIRST ROW ONLY clause can be used in the SELECT INTO
statement when the query can result in more than a single row. The clause indicates that only one row should be retrieved regardless of how many rows might be in the result table. When a number is explicitly specified, it must be 1.

Using the FETCH FIRST ROW ONLY clause to explicitly limit the result table to a single row provides a way for the SELECT INTO statement to be used with a query that returns more than a single row. Using the clause helps you to avoid using a cursor when you know that you want to retrieve only one row. To influence which row is returned, you can use the `order-by-clause`. When you specify `order-by-clause`, the rows of the result are ordered and then the first row is returned. If the FETCH FIRST ROW ONLY clause is not specified and the result table contains more than a single row, an error occurs.

**Notes**

**Assignment to targets:**

The $n$th target identified by the INTO clause or described in the SQLDA corresponds to the $n$th column of the result table of the cursor. The data type of target must be compatible with its corresponding value. If the value is numeric, the target must have the capacity to represent the whole part of the value. For a datetime value, the target must be a character string variable of a minimum length as defined in "String representations of datetime values" on page 103. When the target is a host variable, if the value is null, an indicator variable must be specified.

Assignments are made in sequence through the list. Each assignment to a target is made according to the rules described in Chapter 2, "Language elements," on page 55. If the number of targets is less than the number of values in the row, the SQLWARN3 field of the SQLCA is set to 'W'. There is no warning if there are more targets than the number of result columns. If the target is a host variable and the value is null, an indicator variable must be provided. If an assignment error occurs, the value is not assigned to the target and no more values are assigned to targets. Any values that have already been assigned to targets remain assigned.

If more than one assignment is included in the same assignment statement, all expressions are evaluated before the assignments are performed. For example, a reference to a variable in an expression always uses the value of the variable prior to any assignment in the assignment statement.

Normally, you use LOB locators to assign and retrieve data from LOB columns. However, because of compatibility rules, you can also use LOB locators to assign data to targets with other data types. For more information on using locators, see Saving storage when manipulating LOBs by using LOB locators (DB2 Application programming and SQL).

A timestamp without time zone value must not be assigned to a timestamp with time zone target.

**Default encoding scheme:**

The default encoding scheme for the data is the value in the bind option ENCODING, which is the option for application encoding. If this statement is used with functions such as LENGTH or SUBSTRING that are operating on LOB locators, and the LOB data that is specified by the locator is in a different encoding scheme from the ENCODING bind option, LOB materialization and character conversion occur. To avoid LOB
materialization and character conversion, select the LOB data from the SYSIBM.SYSDUMMYA, SYSIBM.SYSDUMMYE, or SYSIBM.SYSDUMMYU sample table.

If the result table is empty:
If the table is empty, the statement assigns +100 to SQLCODE, '02000' to SQLSTATE, and does not assign values to the host variables or global variables.

Number of rows inserted:
If the SELECT INTO statement of the cursor contains an SQL data change statement, the SELECT INTO operation sets SQLERRD(3) to the number of rows inserted.

Examples

Example 1: Put the maximum salary in DSN8B10.EMP into the host variable MAXSALRY.
EXEC SQL SELECT MAX(SALARY)
    INTO :MAXSALRY
    FROM DSN8B10.EMP;

Example 2: Put the row for employee 528671, from DSN8B10.EMP, into the host structure EMPREC.
EXEC SQL SELECT * INTO :EMPREC
    FROM DSN8B10.EMP
    WHERE EMPNO = '528671'
END-EXEC.

Example 3: Put the row for employee 528671, from DSN8B10.EMP, into the host structure EMPREC. Assume that the row will be updated later and should be locked when the query executes.
EXEC SQL SELECT * INTO :EMPREC
    FROM DSN8B10.EMP
    WHERE EMPNO = '528671'
    WITH RS USE AND KEEP EXCLUSIVE LOCKS
END-EXEC.

Example 4: Using a SELECT INTO statement, retrieve the value of INTCOL1 from table T1 into an element in array MYINTARRAY1, which is indexed by the value of the expression INTCOL2+MYINTVAR+1.
SELECT INTCOL1 INTO MYINTARRAY1[INTCOL2+MYINTVAR+1]
    FROM T1
    WHERE INTCOL1 = MYINTARRAY1[INTCOL2] ;
SET CONNECTION

The SET CONNECTION statement establishes the database server of the process by identifying one of its existing connections.

Invocation

This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared. It must not be specified in Java.

Authorization

None required.

Syntax

```sql
SET CONNECTION location-name
```

Description

*location-name* or *host-variable*

Identifies the SQL connection by the specified location name or the location name contained in the host variable. If a host variable is specified:

- It must be a character string variable with a length attribute that is not greater than 16. (A C NUL-terminated character string can be up to 17 bytes.)
- It must not be followed by an indicator variable.
- The location name must be left-justified within the host variable and must conform to the rules for forming an ordinary location identifier.
- If the length of the location name is less than the length of the host variable, it must be padded on the right with blanks.

Let S denote the specified location name or the location name contained in the host variable. S must identify an existing SQL connection of the application process. If S identifies the current SQL connection, the state of S and all other connections of the application process are unchanged. The following rules apply when S identifies a dormant SQL connection.

If the SET CONNECTION statement is successful:

- SQL connection S is placed in the current state.
- S is placed in the CURRENT SERVER special register.
- Information about server S is placed in the SQLERRP field of the SQLCA. If the server is an IBM product, the information has the form `ppp|v|rr|rm`.

The format is `ppp|v|rr|rm`. It contains the following information:

- **ppp**  
  The product identifier:
  - 'AQT'  IBM DB2 Analytics Accelerator for z/OS
  - 'ARI'  DB2 Server for VSE & VM
'DSN'  DB2 for z/OS
'JCC'  IBM Data Server Driver for JDBC and SQLJ
'QSQ'  DB2 for i
'SQL'  DB2 for Linux, UNIX, and Windows

The version identifier such as '11' for Version 11.
The release identifier such as '01'.
The modification level:
  - Values '0', '1', '2', '3', and '4' identify modification levels in conversion
    and enabling-new-function mode from Version 10 (CM10, CM10*,
    ENFM10, and ENFM10*)
  - Values '5', '6', '7', '8', and '9' identify modification levels in
    new-function mode.

For example, if the identified product is Version 11 of DB2 for z/OS in
new-function mode, the value is ‘DSN11015’.

• Any previously current SQL connection is placed in the dormant state.

If the SET CONNECTION statement is unsuccessful, the connection state of the
application process and the states of its SQL connections are unchanged.

Notes

SET CONNECTION after CONNECT (Type 1): The use of CONNECT (Type 1)
statements does not prevent the use of SET CONNECTION, but the statement
either fails or does nothing because dormant SQL connections do not exist. The
SQLRULES(DB2) bind option does not prevent the use of SET CONNECTION, but
the statement is unnecessary because CONNECT (Type 2) statements can be used
instead. Use the SET CONNECTION statement to conform to the SQL standard.

Status of locks, cursors, and prepared statements: When an SQL connection is
used, made dormant, and then restored to the current state in the same unit of
work, the status of locks, cursors, and prepared statements for that SQL connection
reflects its last use by the application process.

Host variables: If the SET CONNECTION statement contains host variables, the
contents of the host variables are assumed to be in the encoding scheme that was
specified in the ENCODING parameter when the package or plan that contains the
statement was bound.

Restrictions on array types and array variables: In any SQL statement other than
a CALL statement, array types and array variables must not be referenced after a
connection at a remote server has been established. This restriction includes an
SQL statement that executes at a remote server as a result of a three-part name or
alias that resolves to an object at a remote server. An exception is that an array
element can be the target of a FETCH, SELECT INTO, SET assignment-statement, or
VALUES INTO statement in an SQL routine even when the statement is executed
at a remote server.

Example

Execute SQL statements at TOROLAB1, execute SQL statements at TOROLAB2,
and then execute more SQL statements at TOROLAB1.
EXEC SQL CONNECT TO TOROLAB1;
   -- execute statements referencing objects at TOROLAB1
EXEC SQL CONNECT TO TOROLAB2;
   -- execute statements referencing objects at TOROLAB2
EXEC SQL SET CONNECTION TOROLAB1;
   -- execute statements referencing objects at TOROLAB1

The first CONNECT statement creates the TOROLAB1 connection, the second
CONNECT statement places it in the dormant state, and the SET CONNECTION
statement returns it to the current state.
<table>
<thead>
<tr>
<th><strong>SET assignment-statement</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>The SET assignment-statement statement assigns values to variables and array elements.</td>
</tr>
</tbody>
</table>

**Invocation**

This statement can be embedded in an application program or issued interactively. It is an executable statement that can by dynamically prepared if the targets of all assignments are global variables.

**Authorization**

The privileges that are held by the current authorization ID must include those required to execute any of the expressions.
Syntax

**assignment-clause:**

1. `target-variable` = `expression`
2. `target-variable` = `NULL`
3. `DEFAULT`
4. `(target-variable) = (expression)`
5. `row-subselect` VALUES `expression`

**target-variable:**

- `global-variable-name`
- `host-variable-name`
- `SQL-parameter-name`
- `SQL-variable-name`
- `transition-variable-name`

**Notes:**

1. *target-variable* must not be an array type in this context.
2. When the target is not a transition variable, SQL parameter, or an SQL variable that is used in a native SQL procedure or compiled SQL function, these special registers can be referenced only as a source value in this form of the syntax for this statement.
3. `DEFAULT` must only be specified when the corresponding target is a transition variable.
4. The number of source value specifications (expression, NULL, or DEFAULT) on the right side of the equal sign must match the number of target specifications on the left side of the statement.
5. *row-subselect* can be specified only in the outermost subselect within SQL PL. *target-variable* cannot be a `global-variable-name` or `transition-variable-name`. 

---

1942 SQL Reference
**Description**

`array-variable [array-index]`

Specifies an array element that is the target of the assignment.

An array element must not be specified as the target for an assignment if `common-table-expression` is also specified in the statement.

`array-variable`

Specifies an array variable.

[array-index]

An expression that specifies which element in the array is the target of the assignment.

For an ordinary array, the array index expression must be castable to `INTEGER`, and must not be the null value. The index value must be between 1 and the maximum cardinality that is defined for the array.

For an associative array, the array index expression must be castable to the index data type of the associative array, and must not be the null value.

`array-index` must not be:

- An expression that references the `CURRENT DATE`, `CURRENT TIME`, or `CURRENT TIMESTAMP` special register
- A nondeterministic function
- A function that is defined with `EXTERNAL ACTION`
- A function that is defined with `MODIFIES SQL DATA`
- A sequence expression

The value that is to be assigned to an array element must be specified immediately following the array element. For example:

`array-variable[array-index]=expression`

**expression**

Specifies the value that is to be assigned to the corresponding assignment target. The expression is any expression of the type described in "Expressions" on page 243. The expression cannot contain a reference to the `CURRENT PACKAGESET`, `CURRENT PACKAGE PATH`, or `CURRENT SERVER` special register, unless the expression appears in a native SQL procedure or compiled SQL function. All expressions are evaluated before any result is assigned to a target. If an expression refers to a variable or array element that is used in the list of assignment targets, the value of the variable or array element in the expression is the value of the variable or array element prior to any assignments.

Each assignment to a target is made according to the assignment rules described in "Assignment and comparison" on page 123. When the target variables and expressions are in the following form, the first value is assigned to the first target variable in the list, the second value is assigned to the second target variable in the list, and so on.

`(target-variable,target-variable,...)=(expression,expression,...)`

**DEFAULT**

Specifies that the default value is used based on how the corresponding column is defined in the table. The value that is assigned depends on how the column is defined.

- If the column is defined using the `IDENTITY` clause, the column is generated by the DB2 system.
- If the column is defined as a row change timestamp column, the column value is generated by the DB2 system.
- If the column is defined using the WITH DEFAULT clause, the value is set to the default that is defined for the column.
- If the column is defined without specifying the WITH DEFAULT clause, the GENERATED clause, or the NOT NULL clause, the value is NULL.
- If the column is specified in the INCLUDE column list, the column value is set to null.

A ROWID column must not be set to the DEFAULT keyword.

An identity column or a row change timestamp column that is defined as GENERATED ALWAYS can be set only to the DEFAULT keyword.

If the column is defined using the NOT NULL clause and the GENERATED clause is not used, or the WITH DEFAULT clause is not used, the DEFAULT keyword cannot be specified for that column.

NULL

Specifies the null value and can only be specified for host variables that have an associated indicator variable.

VALUES

Specifies the values that are to be assigned to the corresponding assignment targets. When more than one value is specified, the values must be enclosed in parentheses. Each value can be an expression or NULL, as previously described. The following syntaxes are equivalent:

- \((target-variable, target-variable) = (VALUES(expression, NULL))\)
- \((target-variable, target-variable) = (expression, NULL)\)

The CURRENT APPLICATION ENCODING SCHEME, CURRENT PACKAGESET, CURRENT PACKAGE PATH, or CURRENT SERVER special registers can be referenced only in a SET assignment-statement statement or SQL PL assignment-statement statement that results in the assignment of a single target.

A parameter marker must not be specified.

row-subselect

A subselect that returns a single row. The number of columns corresponds to the number of target variables that are specified for assignment. Each result column value is assigned to the corresponding variable. If the result of the row subselect is no rows, then null values are assigned. An error is returned if there is more than one row in the result. row-subselect can be specified only in the outermost subselect within SQL PL. The target variable must not be a global variable or transition variable.

target-variable

Identifies one or more targets for the assignment of values. The number of targets must equal the number of values that are to be assigned.

The value that is to be assigned to each target variable can be specified immediately following the variable. For example:

\(variable=expression, variable=expression\)

Alternatively, sets of parentheses can be used to specify all of the target variables, and then all of the values. For example:

\((variable,variable)=(expression,expression)\)
The data type of each variable in the variable list must be compatible with its corresponding result column. Each assignment to a target-variable is made in sequence through the list, according to the rules described in “Assignment and comparison” on page 123.

The value 'W' is assigned to the SQLWARN3 field of the SQLCA if the number of targets is less than the number of result column values.

If an error occurs on any assignment, the value is not assigned to the target, and no more values are assigned to the specified targets. Any values that have already been assigned remain assigned.

`global-variable-name`  Identifies the global variable that is the assignment target.

`host-variable-name`  Identifies the host variable that is the assignment target. For LOB output values, the target can be a regular host variable (if it is large enough), a LOB locator variable, or a LOB file reference variable.

`SQL-parameter-name`  Identifies the parameter that is the assignment target.

`SQL-variable-name`  Identifies the SQL variable that is the assignment target. SQL variables must be declared before they are used.

`transition-variable-name`  Identifies the column that is to be updated in the transition row. A transition variable name must identify a column in the subject table of a trigger, and is optionally qualified by a correlation name that identifies the new value.

`transition-variable-name`  must not correspond to a begin column or end column of a BUSINESS_TIME period, and must not be specified if the statement contains a period-clause.

Notes

Multiple assignments:
If more than one assignment is included in the same SET statement, all expressions and row-subselects are completely evaluated before the assignments are performed. Thus, references to a target variable in an expression or row-subselect are always the value of the target variable prior to any assignment in the SET statement.

LOBs assignments:
Normally, you use LOB locators to assign and retrieve data from LOB columns. However, because of compatibility rules, you can also use LOB locators to assign data to targets with other data types. For more information on using locators, see Saving storage when manipulating LOBs by using LOB locators (DB2 Application programming and SQL).

Default encoding scheme:
The default encoding scheme for the data is the value in the bind option ENCODING, which is the option for application encoding. If this statement is used with functions such as LENGTH or SUBSTRING that are operating on LOB locators, and the LOB data that is specifies by the locator is in a different encoding scheme from the ENCODING bind option, LOB materialization and character conversion occur. To avoid LOB
materialization and character conversion, select the LOB data from the
SYSIBM.SYSDUMMYA, SYSIBM.SYSDUMMYE, or SYSIBM.SYSDUMMYU
sample table.

Examples

Example 1: Set the host variable HVL to the value of the CURRENT PATH special
register.

```
SET :HVL = CURRENT PATH;
```

Example 2: Set the host variable PATH to the contents of the SQL PATH special
register, the host variable XTIME to the local time at the current server, and the
host variable MEM to the current member of the data sharing environment.

```
SET :PATH = CURRENT PATH,
     :XTIME = CURRENT TIME,
     :MEM = CURRENT MEMBER;
```

Example 3: Set the host variable DETAILS to a portion of a LOB value, using a LOB
expression with a LOB locator to refer the extracted portion of the value.

```
SET :DETAILS = SUBSTR(:LOCATOR,1,35);
```

If the LOB data that is specified by the LOB locator LOCATOR is in a different
encoding scheme from the value of the ENCODING bind option, and you want to
avoid LOB materialization and character conversion, use the following statement
instead of the SET statement:

```
SELECT SUBSTR(:LOCATOR,1,35)
INTO :DETAILS
FROM SYSIBM.SYSDUMMYU;
```

Example 4: Set host variable HV1 to the results of external function CALC_SALARY
and host variable HV2 to the value of special register CURRENT PATH. Use an
indicator value with HV1 in case CALC_SALARY returns a null value.

```
SET (:HV1:IND1, :HV2) =
  (CALC_SALARY(:HV3, :HF4), CURRENT PATH);
```

Example 5: Assume that you want to create a before trigger that sets the salary and
commission columns to default values for newly inserted rows in the EMPLOYEE
table and that you will define the trigger only with NEW in the REFERENCING
clause. Assign the default values to the SALARY and COMMISSION columns.

```
SET (SALARY, COMMISSION) = (50000, 8000);
```

Example 6: Assume that you want to create a before trigger that detects any
commission increases greater than 10% for updated rows in the EMPLOYEE table
and limits the commission increase to 10%. You will define the trigger with both
OLD and NEW in the REFERENCING clause. Limit an increase to the
COMMISSION column to 10%.

```
SET NEWROW.COMMISSION = 1.1 * OLDROW.COMMISSION;
```

Example 7: Suppose that the associative array variable CANADACAPITALS has
array type CAPITALSARRAY. Use SET assignment-statement statements to assign
values to CANADACAPITALS.

```
SET CANADACAPITALS['British Columbia'] = 'Victoria';
SET CANADACAPITALS['Alberta'] = 'Edmonton';
SET CANADACAPITALS['Manitoba'] = 'Winnipeg';
SET CANADACAPITALS['Ontario'] = 'Toronto';
SET CANADACAPITALS['Nova Scotia'] = 'Halifax';
```
In the CANADACAPITALS array, the array index values are province names, and
the associated array element values are the names of the corresponding capital
cities. The order in which values are assigned to associative array elements does
not matter. The elements of an associative array are stored in the array in
ascending order of the associated array index values.

Example 8: Suppose that the associative array variables CANADACAPITALSA and
CANADACAPITALSB have array type CAPITALSARRAY. The following SET
assignment-statement statements have been used to assign values to
CANADACAPITALSA.

SET CANADACAPITALSA['British Columbia'] = 'Victoria';
SET CANADACAPITALSA['Alberta'] = 'Edmonton';
SET CANADACAPITALSA['Manitoba'] = 'Winnipeg';
SET CANADACAPITALSA['Ontario'] = 'Toronto';
SET CANADACAPITALSA['Nova Scotia'] = 'Halifax';

Use a single SET assignment-statement statement to assign all of the values that are
in CANADACAPITALSA to CANADACAPITALSB.

SET CANADACAPITALSB = CANADACAPITALSA;

Example 9: Suppose that P_PHONENUMBERS SQL array variable is defined as an
ordinary array. Set P_PHONENUMBERS to an array of fixed numbers.

SET P_PHONENUMBERS = ARRAY[9055553907, 4165554213, 4085553678];

Example 10: Set the SQL array variable P_PHONENUMBERS to an array of
numbers that are retrieved from the PHONENUMBER table.

SET P_PHONENUMBERS =
ARRAY ([SELECT NUMBER
FROM PHONENUMBERS
WHERE EMPID = 624]);

Example 11: Suppose that no values have been assigned to SQL array variable
P_PHONENUMBERS. Assign the value of SQL variable P_MYNUMBER to the first
and tenth elements of P_PHONENUMBERS. After the first assignment, the
cardinality of P_PHONENUMBERS is 1. After the second assignment, the
cardinality is 10, and elements 2 to 9 have been implicitly assigned the null value.

SET P_PHONENUMBERS[1] = P_MYNUMBER;
SET P_PHONENUMBERS[10] = P_MYNUMBER;
SET CURRENT APPLICATION COMPATIBILITY

The SET CURRENT APPLICATION COMPATIBILITY statement assigns a value to the CURRENT APPLICATION COMPATIBILITY special register. This special register allows users to control the package compatibility level behavior for dynamic SQL.

Invocation

This statement can be embedded in an application program or dynamically prepared.

Authorization

None required.

Syntax

```
SET CURRENT APPLICATION COMPATIBILITY = string-constant
```

Description

`string-constant`

The following values are supported:

- **V10R1** The dynamic SQL statements in the package have V10R1 compatibility behavior.
- **V11R1** The dynamic SQL statements in the package will V11R1 compatibility behavior. This value is only allowed in Version 11 new-function mode.

`host-variable`

A variable with a data type of CHAR or VARCHAR. The value of `host-variable` must not be null and must represent a valid release compatibility level.

The value must:

- Be left-aligned within the `host-variable`
- Be padded on the right with blanks if its length is less than the `host-variable`

Examples

The following examples set the CURRENT APPLICATION COMPATIBILITY special register to 'V10R1' (in the second example, Host variable HV1 = 'V10R1').

```
EXEC SQL SET CURRENT APPLICATION COMPATIBILITY = 'V10R1';
EXEC SQL SET CURRENT APPLICATION COMPATIBILITY = :HV1;
```

Related reference:

“CURRENT APPLICATION COMPATIBILITY” on page 166
SET CURRENT APPLICATION ENCODING SCHEME

The SET CURRENT APPLICATION ENCODING SCHEME statement assigns a value to the CURRENT APPLICATION ENCODING SCHEME special register. This special register allows users to control which encoding scheme will be used for dynamic SQL statements after the SET statement has been executed.

Invocation

This statement can be embedded only in an application program. It is an executable statement that cannot be dynamically prepared.

Authorization

None required.

Syntax

```
SET CURRENT APPLICATION ENCODING SCHEME = 'string-constant'
```

Description

string-constant

A character string constant that represents a valid encoding scheme (ASCII, EBCDIC, UNICODE, or a character representation of a number between 1 and 65533).

host variable

A variable with a data type of CHAR or VARCHAR. The value of host-variable must not be null and must represent a valid encoding scheme or a character representation of a number between 1 and 65533). An associated indicator variable must not be provided.

The value must:

- Be left justified within the host variable
- Be padded on the right with blanks if its length is less than that of the host variable

Examples

The following examples set the CURRENT APPLICATION ENCODING SCHEME special register to 'EBCDIC' (in the second example, Host variable HV1 = 'EBCDIC').

```
EXEC SQL SET CURRENT APPLICATION ENCODING SCHEME = 'EBCDIC';
EXEC SQL SET CURRENT ENCODING SCHEME = :HV1;
```

Related reference:

“CURRENT APPLICATION ENCODING SCHEME” on page 167
SET CURRENT DEBUG MODE

The SET CURRENT DEBUG MODE statement assigns a value to the CURRENT DEBUG MODE special register.

The special register sets the default value for the DEBUG MODE option for the following statements:
- CREATE FUNCTION statements that define an SQL scalar function
- ALTER FUNCTION statements that create or replace a version of an SQL scalar function
- CREATE PROCEDURE statements that define a native SQL or Java procedure
- ALTER PROCEDURE statements that create or replace a version of a native SQL procedure

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

```
SET CURRENT DEBUG MODE host-variable
```

Description

*host-variable*

Specifies a host variable that contains the debugging option. The host variable must conform to the following rules:
- Be a CHAR, VARCHAR, GRAPHIC, or VARGRAPHIC variable. The actual length of the contents of the host variable must not exceed the length of the special register.
- Include a keyword value of DISALLOW, ALLOW, or DISABLE that is left justified
- Be padded on the right with blanks if the host variable is a fixed length character
- Not contain lowercase letters or characters that cannot be specified in an ordinary identifier
- Not be empty or contain only blanks
- Not be the null value

DISALLOW

Specifies that DISALLOW DEBUG MODE is the default option for CREATE statements when defining an SQL scalar function, a native SQL procedure, or a
Java procedure, or ALTER statements that create or replace a version of an SQL scalar function or a native SQL procedure.

**ALLOW**

Specifies that ALLOW DEBUG MODE is the default option for CREATE statements when defining an SQL scalar function, a native SQL procedure, a Java procedure, or ALTER statements that create or replace a version of an SQL scalar function or a native SQL procedure.

**DISABLE**

Specifies that DISABLE DEBUG MODE is the default option for CREATE statements when defining an SQL scalar function, a native SQL procedure, a Java procedure, or ALTER statements that create or replace a version of an SQL scalar function or a native SQL procedure.

**Examples**

*Example:* The following statement sets the CURRENT DEBUG MODE special register so that the default option for CREATE PROCEDURE statements will be ALLOW DEBUG MODE:

```
SET CURRENT DEBUG MODE = ALLOW;
```

**Related reference:**

"CURRENT DEBUG MODE" on page 176
SET CURRENT DECFLOAT Rounding Mode

The `SET CURRENT DECFLOAT Rounding MODE` statement assigns a value to the `CURRENT DECFLOAT Rounding MODE` special register. The special register sets the default rounding mode that is used with decimal floating point values (DECFLOAT).

**Invocation**

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

**Authorization**

None required.

**Syntax**

```
SET CURRENT DECFLOAT Rounding MODE

ROUND_CEILING
ROUND_DOWN
ROUND_FLOOR
ROUND_HALF_DOWN
ROUND_HALF_EVEN
ROUND_HALF_UP
ROUND_UP
string-constant
host-variable
```

**Description**

**ROUND_CEILING**

Round towards positive infinity. If all of the discarded digits are zero or if the sign is negative, the result is unchanged other than the removal of discarded digits. Otherwise, the result coefficient is incremented by 1 (round up).

**ROUND_DOWN**

Round towards 0 (truncation). The discarded digits are ignored.

**ROUND_FLOOR**

Round towards negative infinity. If all of the discarded digits are zero or if the sign is positive, the result is unchanged other than the removal of discarded digits. Otherwise, the sign is negative and the result coefficient is incremented by 1 (round down).

**ROUND_HALF_DOWN**

Round to nearest value; if values are equidistant, rounds down. If the discarded digits represent greater than half (0.5) of the value of a number in the next left position, the result coefficient is incremented by 1 (round up). Otherwise, the discarded digits are ignored. This rounding mode is not recommended when creating a portable application because it is not supported by the IEEE draft standard for floating-point arithmetic.

**ROUND_HALF_EVEN**

Round to nearest value; if values are equidistant, round so that the final digit
is even. If the discarded digits represent greater than half (0.5) of the value of a number in the next left position, the result coefficient is incremented by 1 (round up). If the discarded digits represent less than half of the value, the result coefficient is not adjusted (that is, the discarded digits are ignored). Otherwise, the result coefficient is unaltered if its rightmost digit is even, or is incremented by 1 (round up) if its rightmost digit is odd (to make an even digit).

**ROUND_HALF_UP**
Round to nearest value; if values are equidistant, round up. If the discarded digits represent greater than or equal to half (0.5) of the value of a number in the next left position, the result coefficient is incremented by 1 (round up). Otherwise the discarded digits are ignored.

**ROUND_UP**
Round away from 0. If all of the discarded digits are zero, the result is unchanged other than the removal of discarded digits. Otherwise, the result coefficient is incremented by 1 (round up). This rounding mode is not recommended when creating a portable application because it is not supported by the IEEE draft standard for floating-point arithmetic.

**string-constant**
Specifies a string constant that contains a specification of the rounding mode. The string-constant must have the following characteristics:
- Must be a string constant. The actual length of the contents of the string constant, after trailing blanks have been removed, must not exceed 19 characters.
- Must not be the null value.
- Must not contain lower case letters or characters that cannot be specified in an ordinary identifier.
- Must specify one of the seven rounding mode keywords as a string constant.

**host-variable**
Specifies a variable that contains a specification of the rounding mode. The variable must have the following characteristics:
- Must have a length, after trailing blanks have been removed, that does not exceed 19 bytes.
- Must not be followed by an indicator variable.
- Must not be a CLOB or DBCLOB.
- Must include a rounding mode that is left justified and conforms to the rules for forming an ordinary identifier.
- Must not contain lower case letters or characters that cannot be specified in an ordinary identifier.
- Must be padded on the right with blanks if the variable is a fixed length string.
- Must contain one of the seven rounding mode keywords.

**Examples**

*Example:* The following statement sets the CURRENT DECFLOAT Rounding MODE to ROUND_CEILING, using a string constant and a keyword.

```
SET CURRENT DECFLOAT Rounding MODE = ROUND_CEILING;
```

**Related reference:**
“CURRENT DECFLOAT Rounding MODE” on page 177
SET CURRENT DEGREE

The SET CURRENT DEGREE statement assigns a value to the CURRENT DEGREE special register.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

```
SET CURRENT DEGREE = string-constant
```

Description

The value of CURRENT DEGREE is replaced by the value of the string constant or host variable. The value must be a character string that is not longer than 3 bytes and the value must be 'ANY', '1', or '1'.

Notes

If the value of CURRENT DEGREE is '1' when a query is dynamically prepared, the execution of that query will not use parallel operations. If the value of CURRENT DEGREE is 'ANY' when a query is dynamically prepared, the execution of that query can involve parallel operations.

For distributed applications, the default value at the server is used unless the requesting application issues the SQL statement SET CURRENT DEGREE. For requests using DRDA, the SET CURRENT DEGREE statement must be within the scope of the CONNECT statement.

The value specified in the SET CURRENT DEGREE statement remains in effect until it is changed by the execution of another SET CURRENT DEGREE statement or until deallocation of the application process. For applications that connect to DB2 using the call attachment facility, the value of register CURRENT DEGREE can be requested to remain in effect for a longer duration. For more information, see the description of the call attachment facility CONNECT statement in DB2 Application Programming and SQL Guide.

Examples

Example 1: The following statement inhibits parallel operations:

```
SET CURRENT DEGREE = '1';
```

Example 2: The following statement allows parallel operations:

```
SET CURRENT DEGREE = 'ANY';
```
Related concepts:
- Parallel processing (DB2 Performance)
- Call attachment facility (DB2 Application programming and SQL)

Related tasks:
- Enabling parallel processing (DB2 Performance)
- Disabling query parallelism (DB2 Performance)

Related reference:
- “CURRENT DEGREE” on page 179
- CURRENT DEGREE field (CDSSRDEF subsystem parameter) (DB2 Installation and Migration)
- “CONNECT” on page 1193
The SET CURRENT EXPLAIN MODE statement assigns a value to the CURRENT EXPLAIN MODE special register.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

```
SET CURRENT EXPLAIN MODE "NO" | "YES" | "EXPLAIN" | host-variable
```

Description

This statement replaces the value of the CURRENT EXPLAIN MODE special register with the value of the specified keyword or host variable.

**NO** Specifies that no EXPLAIN information is captured. NO is the initial value of the EXPLAIN MODE special register.

**YES** Enables the EXPLAIN facility and causes EXPLAIN information to be inserted into the EXPLAIN tables for eligible dynamic SQL statements after the statement is prepared and executed. All dynamic SQL statements are compiled and executed normally.

**EXPLAIN** Enables the EXPLAIN facility and causes EXPLAIN information to be captured for any eligible dynamic SQL statement after the statement is prepared. This setting behaves similarly to YES, however, dynamic statements, except for SET statements, are not executed.

**host-variable**

*host-variable* must be a CHAR or VARCHAR value and must be NO, YES, or EXPLAIN. Leading blanks are not allowed. All input values must be uppercase, must be left justified within the host variable, and must be padded on the right with blanks if the length of the value is less than the length of the host variable.

For values YES and EXPLAIN, prepared statements are not saved into the dynamic statement cache.
Examples

Example 1: The following statement sets the CURRENT EXPLAIN MODE special register, so that EXPLAIN information will be captured for any subsequent eligible dynamic SQL statements during execution.

SET CURRENT EXPLAIN MODE = YES;

Related reference:
"CURRENT EXPLAIN MODE" on page 180
**SET CURRENT GET_ACCEL_ARCHIVE**

The SET CURRENT GET_ACCEL_ARCHIVE statement changes the value of the CURRENT GET_ACCEL_ARCHIVE special register.

**Invocation**

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

**Authorization**

None required.

**Syntax**

```
SET CURRENT GET_ACCEL_ARCHIVE host-variable
```

**Description**

- **NO**  Specifies that if a table is archived in an accelerator server, and a query references that table, the query does not use the data that is archived.

- **YES**  Specifies that if a table is archived in an accelerator server, and a query references that table, the query uses the data that is archived.

- **host-variable**  A variable with a data type of CHAR or VARCHAR. The length must not exceed 255 bytes. Valid values are YES or NO. If host-variable has an associated indicator variable, the value of that indicator variable must not indicate a null value. The value of host-variable must be left justified and must be padded on the right with blanks.

**Examples**

The following statement sets the CURRENT GET_ACCEL_ARCHIVE special register to NO to indicate that when a table is archived in an accelerator server, the table reference does not include the archived data.

```
SET CURRENT GET_ACCEL_ARCHIVE=NO;
```

**Related reference:**

“CURRENT GET_ACCEL_ARCHIVE” on page 182
SET CURRENT LOCALE LC_CTYPE

The SET CURRENT LOCALE LC_CTYPE statement assigns a value to the CURRENT LOCALE LC_CTYPE special register. The special register allows control over the LC_CTYPE locale for statements that use a built-in function that refers to a locale, such as LCASE, UCASE, and TRANSLATE (with a single argument).

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

```
SET CURRENT LC_CTYPE = string-constant
```

Description

The value of CURRENT LOCALE LC_CTYPE is replaced by the value specified.

string-constant

A character string constant that must not be longer than 50 bytes and must represent a valid locale.

host-variable

A variable with a data type of CHAR or VARCHAR and a length that is not longer than 50 bytes. The value of host-variable must not be null and must represent a valid locale. If the host variable has an associated indicator variable, the value of the indicator variable must not indicate a null value.

The locale must:

• Be left justified within the host variable
• Be padded on the right with blanks if its length is less than that of the host variable

A locale can be specified in uppercase characters, lowercase characters, or a combination of the two. For more information, see CURRENT LOCALE LC_CTYPE.

Note: The existence of a locale is not validated when the CURRENT LOCALE LC_CTYPE special register is set. For example, a locale name that is misspelled is not detected, which could affect the way subsequent SQL operates. When the special register value is used at execution time, an error is returned if the locale does not exist. For example, if the LOWER function is invoked without specifying a locale name, the special register determines the locale that is used.
Examples

Example 1: Set the CURRENT LOCALE LC_CTYPE special register to the locale 'En_US'.
EXEC SQL SET CURRENT LOCALE LC_CTYPE = 'En_US';

Example 2: Set the CURRENT LOCALE LC_CTYPE special register to the value of host variable HV1, which contains 'Fr_FR@EURO'.
EXEC SQL SET CURRENT LOCALE LC_CTYPE = :HV1;

Related concepts:
- z/OS: Unicode Services User’s Guide and Reference

Related reference:
“CURRENT LOCALE LC_CTYPE” on page 183
SET CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION

The SET CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION statement changes the value of the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION special register.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

```
SET CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION
```

Description

The value indicates which materialized query tables that are enabled for optimization are considered when optimizing the processing of dynamic SQL queries.

**ALL**

Indicates that all materialized query tables will be considered.

**NONE**

Indicates that no materialized query tables will be considered.

**SYSTEM**

Indicates that only system-maintained materialized query tables that are refresh deferred will be considered.

**USER**

Indicates that only user-maintained materialized query tables that are refresh deferred will be considered.

**host-variable**

A variable of type CHAR or VARCHAR. The length of the contents of `host-variable` must not exceed 255 bytes. It cannot be set to null. If `host-variable` has an associated indicator variable, the value of that indicator variable must not indicate a null value.

The characters of `host-variable` must be left justified. The content of the host variable must be a string that would match what can be specified as keywords for the special register in the exact case intended as there is no conversion to uppercase characters.
Notes

The CURRENT REFRESH AGE special register needs to be set to a value other than zero in order for the specified types of objects to be considered for optimizing the processing of dynamic SQL queries.

The CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION special register affects dynamic statement cache matching.

Examples

Example 1: The following statement sets the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION special register:

```
SET CURRENT MAINTAINED TABLE TYPES ALL;
```

Example 2: The following example retrieves the current value of the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION special register into the host variable called CURMAINTYPES.

```
EXEC SQL VALUES (CURRENT MAINTAINED TABLE TYPES) INTO :CURMAINTYPES;
```

The value would be ALL if set by the previous example.

Example 3: The following example resets the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION special register so that no materialized query tables can be considered to optimize the processing of dynamic SQL queries.

```
SET CURRENT MAINTAINED TABLE TYPES NONE;
```

Related reference:

“CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION” on page 185
SET CURRENT OPTIMIZATION HINT

The SET CURRENT OPTIMIZATION HINT statement assigns a value to the CURRENT OPTIMIZATION HINT special register.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

```
SET CURRENT OPTIMIZATION HINT = string-constant
```

Description

The value of special register CURRENT OPTIMIZATION HINT is replaced by the value of the string constant or host variable. The value must be a character string that is not longer than 128 bytes.

Notes

Using the OPTIMIZATION HINT special register: The CURRENT OPTIMIZATION HINT special register specifies whether optimization hints are used in determining the access path of dynamic statements. An empty string or all blanks indicates that DB2 uses normal optimization techniques and ignores optimization hints.

Example

Example 1: Assume that string constant 'NOHYB' identifies a user-defined optimization hint in owner.PLAN_TABLE. Set the CURRENT OPTIMIZATION HINT special register so that DB2 uses this optimization hint to generate the access path for dynamic statements.

```
SET CURRENT OPTIMIZATION HINT = 'NOHYB';
```

If you set the register this way, DB2 validates and considers information in the rows in owner.PLAN_TABLE where the value in the OPTHINT column matches 'NOHYB' for dynamic SQL statements.

Example 2: Clear the CURRENT OPTIMIZATION HINT special register by specifying an empty string.

```
SET CURRENT OPTIMIZATION HINT = '';
```

Related reference:

“CURRENT OPTIMIZATION HINT” on page 187
SET CURRENT PACKAGE PATH

The SET CURRENT PACKAGE PATH statement assigns a value to the CURRENT PACKAGE PATH special register.

Invocation

This statement can be embedded only in an application program. It is an executable statement that cannot be dynamically prepared.

Authorization

None required.

Syntax

```
SET CURRENT PACKAGE PATH
```

Notes:

1. SESSION_USER (or USER), CURRENT PACKAGE PATH, and CURRENT PATH can each be specified only once on the right side of the statement.

Description

The value of CURRENT PACKAGE PATH is replaced by the values specified.

```
collection-id
```

Identifies a collection. `collection-id` must not be a delimited identifier that is empty or contains only blanks.

```
SESSION_USER or USER
```

 Specifies the value of the SESSION_USER (USER) special register.

```
CURRENT PACKAGE PATH
```

 Specifies the value of the CURRENT PACKAGE PATH special register before the execution of the SET CURRENT PACKAGE PATH statement.

```
CURRENT PATH
```

 Specifies the value of the CURRENT PATH special register.

```
host-variable
```

Specifies a host variable that contains one or more collection IDs, separated by commas. The host variable must:

- Have a data type of CHAR or VARCHAR. The actual length of the contents of the host variable must not exceed the maximum length of the CURRENT PACKAGE PATH special register.
- Not be the null value if an indicator variable is provided.
• Contain an empty or blank string, or one or more collection IDs that are
  separated by commas.
• Be padded on the right with blanks if the host variable is fixed-length, or if
  the actual length of the host variable is longer than the content.
• Not contain a delimited identifier that is empty or contains only blanks.

`string-constant`
Specifications a string constant that contains one or more collection IDs, separated
by commas. The string constant must:
• Have a length that does not exceed the maximum length of the CURRENT
  PACKAGE PATH special register.
• Contain an empty or blank string, or one or more collection IDs separated
  by commas.
• Not contain a delimited identifier that is empty or contains only blanks.

Notes

Contents of host variable or string constant: The contents of a host variable or
string constant are interpreted as a list of collection IDs if the value contains at
least one comma. If multiple collection IDs are specified, they must be separated
by commas. Each collection ID in the list must conform to the rules for forming an
ordinary identifier or be specified as a delimited identifier.

Checking for the existence of collections: No validation that the collections exist is
made at the time that the CURRENT PACKAGE PATH special register is set. For
example, a collection ID that is misspelled is not detected, which could affect the
way subsequent SQL operates. At package execution time, authorization to the
specific package is checked, and if this authorization check fails, an error is issued.

Resulting contents of the special register: The special register string is built by
taking each collection ID specified and removing trailing blanks, delimiting with
double quotation marks, doubling any double quotation marks within the
collection ID as necessary, and then separating each collection ID by a comma. If
the same collection ID appears more than once in the list, the first occurrence of
the collection is used, and a warning is issued. The length of the resulting list
cannot exceed the length of the special register. For example, assume that the
following statements are issued:

```
SET CURRENT PACKAGE PATH = MYPKGS, "ABC E", SYSIBM
SET :HVPKLIST = CURRENT PACKAGE PATH
```

These statements result in the value of the host variable being set to: "MYPKGS",
"ABC E", "SYSIBM".

A collection ID that does not conform to the rules for an ordinary identifier must
be specified as a delimited collection ID and must not be specified within a host
variable or string constant.

Considerations for keywords: A difference exists between specifying a single
keyword, such as SESSION_USER, as a single keyword or as a delimited identifier.
To indicate that the current value of a special register that is specified as a single
keyword should be used in the package path, specify the name of the special
register as a keyword. If you specify the name of the special register as a delimited
identifier, it is interpreted as a collection ID of that value. For example, assume
that the current value of the SESSION_USER special register is SMITH and that the
following statement is issued:

```

The result is that the value of the CURRENT PACKAGE PATH special register is set to: "SYSIBM, "SMITH", "USER".

**Specifying a collection ID in an SQL procedure:** Because a host variable (SQL variable) in an SQL procedure does not begin with a colon, DB2 uses the following rules to determine whether a value that is specified in a SET PACKAGE PATH = name statement is a variable or a collection ID:

- If name is the same as a parameter or SQL variable in the SQL procedure, DB2 uses name as a parameter or SQL variable and assigns the value in name to the package path.
- If name is not the same as a parameter or SQL variable in the SQL procedure, DB2 uses name as a collection ID and assigns and the value in name is the package path.

**DRDA classification:** The SET CURRENT PACKAGE PATH statement is executed by the database server and, therefore, is classified as a non-local SET statement in DRDA. The SET CURRENT PACKAGE PATH statement requires a new level of DRDA support. If SET CURRENT PACKAGE PATH is issued when connected to the local server, the SET CURRENT PACKAGE PATH special register at the local server is set. Otherwise, when SET CURRENT PACKAGE PATH is issued when connected to a remote server, the SET CURRENT PACKAGE PATH special register at the remote server is set.

**Examples**

**Example 1:** Set the CURRENT PACKAGE PATH special register to the list of collections COLL4 and COLL5, where :hvar1 contains the value COLL4,COLL5:

```
SET CURRENT PACKAGE PATH :hvar1;
```

The value of CURRENT PACKAGE PATH is set to the following two collection IDs: "COLL4","COLL5".

**Example 2:** Set the CURRENT PACKAGE PATH special register to the list of collections: COLL1, COLL#2, COLL3, COLL4, and COLL5, where :hvar1 contains the value COLL4,COLL5:

```
SET CURRENT PACKAGE PATH = "COLL1","COLL#2","COLL3", :hvar1;
```

The value of CURRENT PACKAGE PATH is set to the following five collection IDs: "COLL1","COLL#2","COLL3","COLL4","COLL5".

**Example 3:** Clear the CURRENT PACKAGE PATH special register.

```
SET CURRENT PACKAGE PATH = ' ';
```

**Example 4:** In preparation of calling a stored procedure that is named SUMARIZE, temporarily add two collections, COLL_PROD1" and "COLL_PROD2, to the end of the CURRENT PACKAGE PATH special register (the values of the collections are in host variables :prodcoll1 and prodcoll2, respectively). Because the stored procedure SUMARIZE is not defined with a COLLID value and is defined with INHERIT SPECIAL REGISTERS, the stored procedure will inherit the value of CURRENT PACKAGE PATH. When the stored procedure returns, set the value of the CURRENT PACKAGE PATH special register back to its original value.
SET :oldCPP = CURRENT PACKAGE PATH;
SET CURRENT PACKAGE PATH = CURRENT PACKAGE PATH, :prodcoll1, :prodcoll2;
CALL SUMARIZE(:V1,:V2);
SET CURRENT PACKAGE PATH = :oldCPP;

Related reference:
“CURRENT PACKAGE PATH” on page 188
SET CURRENT PACKAGESET

The SET CURRENT PACKAGESET statement assigns a value to the CURRENT PACKAGESET special register.

Invocation

This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared.

Authorization

None required.

Syntax

```
SET CURRENT PACKAGESET = SESSION_USER
```

Description

The value of CURRENT PACKAGESET is replaced by the value of the SESSION_USER special register, string-constant, or host-variable. The value specified by string-constant or host-variable must be a character string that is not longer than 128 bytes.

Notes

Selection of plan elements: A plan element is a DBRM that has been bound into the plan or a package that is implicitly or explicitly identified in the package list of the plan. Plan elements contain the control structures used to execute certain SQL statements.

Since a plan can have many elements, one of the first steps involved in the execution of an SQL statement that requires a control structure is the selection of the plan element that contains its control structure. The information used by DB2 to select plan elements includes the value of CURRENT PACKAGESET.

SET CURRENT PACKAGESET is used to specify the collection ID of a package that exists at the current server. SET CURRENT PACKAGESET is optional and should not be used without an understanding of the following rules for selecting a plan element.

If the CURRENT PACKAGESET special register is an empty string, DB2 searches for a DBRM or a package in one of these sequences:

At the local location (if CURRENT SERVER is blank or explicitly names that location), the order is:
1. All DBRMs bound directly to the plan
2. All packages that have already been allocated for the application process
3. All unallocated packages explicitly named in, and all collections completely included in, the package list of the plan. The order of search is the order those packages are named in the package list.

At a remote location, the order is:
1. All packages that have already been allocated for the application process at that location
2. All unallocated packages explicitly named in, and all collections completely included in, the package list of the plan, whose locations match the value of CURRENT SERVER. The order of search is the order those packages are named in the package list.

If the special register CURRENT PACKAGESET is set, DB2 skips the check for programs that are part of the plan and uses the value of CURRENT PACKAGESET as the collection. For example, if CURRENT PACKAGESET contains COL5, then DB2 uses COL5.PROG1.timestamp for the search. For additional information, see DB2 Application Programming and SQL Guide.

DRDA classification: SET CURRENT PACKAGESET is executed by the requester and is therefore classified as a local SET statement in DRDA.

CURRENT PACKAGESET special register with stored procedures and user-defined functions: The initial value of the CURRENT PACKAGESET special register in a stored procedure or user-defined function is the value of the COLLID parameter with which the stored procedure or user-defined function was defined. If the routine was defined without a value for the COLLID parameter, the value of the special register is inherited from the calling program. A stored procedure or user-defined function can use the SET CURRENT PACKAGESET statement to change the value of the special register. This allows the routine to select the version of the DB2 package that is used to process the SQL statements in a called routine that is not defined with a COLLID value.

When control returns from the stored procedure to the calling program, the special register CURRENT PACKAGESET is restored to the value it contained before the stored procedure was called.

Examples

Example 1: Limit the plan element selection to packages in the PERSONNEL collection at the current server.
   EXEC SQL SET CURRENT PACKAGESET = 'PERSONNEL';

Example 2: Eliminate collections as a factor in plan element selection.
   EXEC SQL SET CURRENT PACKAGESET = '';

Related reference:
"CURRENT PACKAGESET" on page 189
SET CURRENT PRECISION

The SET CURRENT PRECISION statement assigns a value to the CURRENT PRECISION special register.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

```
SET CURRENT PRECISION = string-constant

SET CURRENT PRECISION = host-variable
```

Description

This statement replaces the value of the CURRENT PRECISION special register with the value of the string constant or host variable. The value must be a character string 5 bytes in length. The value must be 'DEC15,' 'DEC31,' or 'Dpp.s', where 'pp' is either 15 or 31 and 's' is a number between 1 and 9. If the form 'Dpp.s' is used, 'pp' represents the precision that will be used with the rules that are used for DEC15 or DEC31, and 's' represents the minimum divide scale to use for division operations. The separator used in the form 'Dpp.s' can be either the '.' or the ',' character, regardless of the setting of the default decimal point.

Example

Set the CURRENT PRECISION special register so that subsequent statements that are prepared use DEC15 rules for decimal arithmetic.

```
EXEC SQL SET CURRENT PRECISION = 'DEC15';
```

Related reference:

“CURRENT PRECISION” on page 191
SET CURRENT QUERY ACCELERATION

The SET CURRENT QUERY ACCELERATION statement changes the value of the CURRENT QUERY ACCELERATION special register.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

![Syntax Diagram]

Description

NONE
Specifies that no query acceleration is done.

ENABLE
Specifies that queries are accelerated only if DB2 determines that it is advantageous to do so. If an accelerator failure occurs while a query is running or if the accelerator returns an error, DB2 returns a negative SQLCODE to the application.

ENABLE WITH FAILBACK
Specifies that queries are accelerated only if DB2 determines that it is advantageous to do so. If the accelerator returns an error during the PREPARE or first OPEN for the query, DB2 executes the query without the accelerator. If the accelerator returns an error during a FETCH or a subsequent OPEN, DB2 returns the error to the user and does not execute the query.

ELIGIBLE
Specifies that queries are accelerated if they are eligible for acceleration. DB2 does not use cost information to determine whether to accelerate the queries. Queries that are not eligible for acceleration are executed by DB2. If an accelerator failure occurs while a query is running or if the accelerator returns an error, DB2 returns a negative SQLCODE to the application.

ALL
Specifies that queries are accelerated if they are eligible for acceleration. DB2 does not use cost information to determine whether to accelerate the queries. Queries that are not eligible for acceleration are not executed by DB2, and an
SQL error is returned. If an accelerator failure occurs while a query is running or if the accelerator returns an error, DB2 returns a negative SQLCODE to the application.

**host-variable**
A variable with a data type of CHAR or VARCHAR. The length must not exceed 255 bytes. Valid values are NONE, ENABLE, or ENABLE WITH FAILBACK. If *host-variable* has an associated indicator variable, the value of that indicator variable must not indicate a null value. The value of *host-variable* must be left justified and must be padded on the right with blanks.

**Examples**

The following statement sets the CURRENT QUERY ACCELERATION special register to NONE to indicate that no acceleration is done.

```
SET CURRENT QUERY ACCELERATION NONE;
```

**Related reference:**

“CURRENT QUERY ACCELERATION” on page 192
SET CURRENT REFRESH AGE

The SET CURRENT REFRESH AGE statement changes the value of the CURRENT REFRESH AGE special register.

The CURRENT REFRESH AGE value corresponding to ANY (99 999 999 999 999) cannot be used in timestamp arithmetic operations because the result would be outside the valid range of dates.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

```
SET CURRENT REFRESH AGE numeric-constant
ANY
host-variable
```

Description

`numeric-constant`

A DECIMAL(20,6) value representing a timestamp duration. The value must be 0 or 99 999 999 999 999, the partial seconds of which is ignored and thus can be any value.

0

Indicates that query optimization using materialized query tables will not be attempted.

99999999999999

Indicates that any materialized query tables identified by the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION special register may be used to optimize the processing of a query. This value represents 9999 years, 99 months, 99 days, 99 hours, 99 minutes, and 99 seconds.

`ANY`

Shorthand for 99999999999999.

`host-variable`

A variable of type DECIMAL(20,6) or other type that is assignable to DECIMAL(20,6). It cannot be set to null. If `host-variable` has an associated indicator variable, the value of that indicator variable must not indicate a null value. The value of `host-variable` must be 0 or 99 999 999 999 999, the partial seconds of which is ignored and thus can be any value.
Notes

Materialized query tables created or altered with DISABLE QUERY OPTIMIZATION specified are not eligible for automatic query rewrite. Thus, they are not affected by the setting of this special register.

Setting the CURRENT REFRESH AGE special register to a value other than zero should be done with caution. Allowing a materialized query table that may not represent the values of the underlying base table to be used to optimize the processing of a query may produce results that do not accurately represent the data in the underlying table. This situation may be acceptable when you know the underlying data has not changed or you are willing to accept the degree of error in the results based on your knowledge of the data.

Examples

*Example:* Set the CURRENT REFRESH AGE special register to 99 999 999 999 999 to indicate that any materialized query tables identified by the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION special register can be used to optimize the processing of a query.

```
SET CURRENT REFRESH AGE ANY;
```

Related reference:

"CURRENT REFRESH AGE” on page 194
SET CURRENT ROUTINE VERSION

The SET CURRENT ROUTINE VERSION statement assigns a value to the CURRENT ROUTINE VERSION special register. The special register sets the override value for the version identifier of native SQL procedures when they are invoked.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

routine-version-id
Specifies a routine version identifier.

host-variable
Specifies a host variable that contains a version identifier. The host variable must conform to the following rules:
- Be a CHAR, VARCHAR, GRAPHIC, or VARGRAPHIC variable. The actual length of the contents of the host variable must not exceed the length of a version identifier.
- Include a routine version identifier that is left justified and conforms to the rules for forming an ordinary identifier or a delimited identifier, or must be blank or empty.
- Be padded on the right with blanks if the host variable is a fixed length character.
- Not be empty or contain only blanks if the identifier is delimited.
- Not be the null value.

string-constant
Specifies a string constant that contains a version identifier. The string constant must conform to the following rules:
- Have a length that does not exceed the length of a routine-version-id.
- Include a routine version identifier that is left justified and conforms to the rules for forming an ordinary identifier or a delimited identifier, or must be blank or an empty string.
- Not be empty or contain only blanks if the identifier is delimited.
Notes

*Resetting the special register:* To reset the special register, specify an empty string constant, a string of blanks, or a host variable that is empty or contains only blanks. A routine version override is not in effect when the special register is reset.

*Implications of using the special register:* Setting the CURRENT ROUTINE VERSION special register to a version identifier will affect all SQL procedures that are subsequently invoked using CALL statements that specify the name of the procedure using a host variable, until the value of CURRENT ROUTINE VERSION is changed. If a version of the procedure that is identified by the version identifier in the special register exists for an SQL procedure that is being invoked, that version of the procedure is used. Otherwise, the currently active version of the procedure (as noted in the catalog) is used.

When you use the CURRENT ROUTINE VERSION special register to test a version of one or more native SQL procedures, you should use a routine version identifier that is a value other than the default value (V1) on the CREATE PROCEDURE statement. This will avoid having the special register affect more procedures that you intend when testing a new version of a procedure. For example, assume that you want to run version VER2 of procedure P1, and procedure P1 invokes another procedure, P2. If a version exists for both procedures P1 and P2 with the routine version identifier VER2, that version will be used for both procedures.

Examples

*Example:* The following statement sets the CURRENT ROUTINE VERSION special register so that the override value for the version identifier of native SQL procedures will be the value that is specified in the host variable `rvid`:

```
SET CURRENT ROUTINE VERSION = :rvid;
```

Related reference:

"CURRENT ROUTINE VERSION" on page 195
SET CURRENT RULES

The SET CURRENT RULES statement assigns a value to the CURRENT RULES special register.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

```
SET CURRENT RULES = string-constant
```

```
SET CURRENT RULES = host-variable
```

Description

This statement replaces the value of the CURRENT RULES special register with the value of the string constant or host variable. The value must be a character string that is 3 bytes in length, and the value must be 'DB2' or 'STD'.

Notes

For the effect of the values 'DB2' and 'STD' on the execution of certain SQL statements, see "CURRENT RULES" on page 196.

Example

Set the SQL rules to be followed to DB2.

```
EXEC SQL SET CURRENT RULES = 'DB2';
```

Related reference:

"CURRENT RULES" on page 196
SET CURRENT SQLID

The SET CURRENT SQLID statement assigns a value to the CURRENT SQLID special register.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared. The value to which special register CURRENT SQLID is set is used as the SQL authorization ID for dynamic SQL statements only if DYNAMICRULES run behavior is in effect. The CURRENT SQLID value is ignored for the other DYNAMICRULES behaviors.

Authorization

If any of the authorization IDs of the process has SYSADM authority, CURRENT SQLID can be set to any value when the system parameter, SEPARATE SECURITY, is set to NO. Otherwise, the specified value must be equal to one of the authorization IDs of the application process. This rule always applies, even when SET CURRENT SQLID is a static statement.CURRENT SQLID cannot be set to the name of a role.

Syntax

```
SET CURRENT SQLID = SESSION_USER
```

Description

The value of CURRENT SQLID is replaced by the value of SESSION_USER, string-constant, or host-variable. The value specified by a string-constant or host-variable must be a character string that contains 8 characters or less. Unless some authorization ID of the process has SYSADM authority, the value must be equal to one of the authorization IDs of the process.

Notes

Effect on authorization IDs: SET CURRENT SQLID does not change the primary authorization ID of the process.

If the SET CURRENT SQLID statement is executed in a stored procedure or user-defined function package that has a dynamic SQL behavior other than run behavior, the SET CURRENT SQLID statement does not affect the authorization ID that is used for dynamic SQL statements in the package. The dynamic SQL behavior determines the authorization ID. For more information, see the discussion of DYNAMICRULES in DB2 Command Reference.

Effect on special register CURRENT PATH: When the value of the PATH special register depends on the value of the CURRENT SQLID special register, any changes to the CURRENT SQLID special register are not reflected in the value of
the PATH special register until a commit operation is performed or a SET PATH statement is issued to change the SQL path to use the new value of the CURRENT SQLID.

**DRDA classification:** SET CURRENT SQLID is executed by the database server and is therefore classified as a non-local SET statement in DRDA.

**Examples**

*Example 1:* Set the CURRENT SQLID to the primary authorization ID.

```sql
SET CURRENT SQLID = SESSION_USER;
```
SET CURRENT TEMPORAL BUSINESS_TIME

The SET CURRENT TEMPORAL BUSINESS_TIME statement changes the value of the CURRENT TEMPORAL BUSINESS_TIME special register.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

```
SET CURRENT TEMPORAL BUSINESS_TIME = expression
```

Description

NULL

Specifies the null value.

expression

Specifies an expression that returns the null value or the value of one of the following built-in data types:

- Timestamp
- Character string
- Graphic string

If the expression is a character or graphic string, it must meet the following requirements:

- It must not be a CLOB or DBCLOB.
- The value of the expression must be a valid character-string or graphic-string representation of a timestamp.
- The result of the expression must be castable to TIMESTAMP(12).

expression can contain any of the following supported operands:

- Constant
- Special register
- Variable (host variable, SQL parameter, SQL variable, or global variable)
- Scalar function whose arguments are supported operands
- CAST specification where the cast operand is a supported operand
- Expression that uses arithmetic operators and operands

Related information:

- “String representations of datetime values” on page 103
- “Casting between data types” on page 113
Notes

Transactions

The SET CURRENT TEMPORAL BUSINESS_TIME statement is not a committable operation. The ROLLBACK statement has no effect on CURRENT TEMPORAL BUSINESS_TIME.

Effects on other special registers

The setting of the CURRENT TEMPORAL BUSINESS_TIME special register does not affect other special registers, such as the CURRENT DATE and CURRENT TIMESTAMP special registers.

Examples

Example of setting the special register to a valid value

Both of the following statements set the CURRENT TEMPORAL BUSINESS_TIME special register to '2008-01-06-00.00.00.000000000000'.

- SET CURRENT TEMPORAL BUSINESS_TIME = CURRENT_TIMESTAMP + 5 DAYS;
  - SET CURRENT TEMPORAL BUSINESS_TIME = '2008-01-06-00.00.00.000000000000';

Example of how setting the special register affects subsequent SQL statements

In the following example, the first statement sets the CURRENT TEMPORAL BUSINESS_TIME special register to last month. Assume that table att1 is an application-period temporal table. The setting of the CURRENT TEMPORAL BUSINESS_TIME special register affects the update of att1.

- SET CURRENT TEMPORAL BUSINESS_TIME = CURRENT_TIMESTAMP - 1 MONTH
- UPDATE att1 SET c1 = 5 WHERE pk = 100

Assume that the att1 table has columns bt_begin and bt_end to indicate the beginning and end of the BUSINESS_TIME period. In this example, DB2 interprets the UPDATE statement as follows:

- UPDATE att1 SET c1 = 5 WHERE pk = 100
  - AND bt_begin <= CURRENT TEMPORAL BUSINESS_TIME
  - AND bt_end > CURRENT TEMPORAL BUSINESS_TIME

Example of setting the special register so that it does not affect subsequent SQL statements

The following statement sets the CURRENT TEMPORAL BUSINESS_TIME special register to the null value. Subsequent SQL statements that reference application-period temporal tables are not affected by the CURRENT TEMPORAL BUSINESS_TIME special register.

- SET CURRENT TEMPORAL BUSINESS_TIME = NULL

- “CURRENT TEMPORAL BUSINESS_TIME” on page 201
**SET CURRENT TEMPORAL SYSTEM_TIME**

The SET CURRENT TEMPORAL SYSTEM_TIME statement changes the value of the CURRENT TEMPORAL SYSTEM_TIME special register.

**Invocation**

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

**Authorization**

None required.

**Syntax**

```
SET CURRENT TEMPORAL SYSTEM_TIME = NULL expression
```

**Description**

**NULL**

Specifies the null value.

**expression**

Specifies an expression that returns the null value or the value of one of the following built-in data types:
- Timestamp
- Character string
- Graphic string

If the expression is a character or graphic string, it must meet the following requirements:
- It must not be a CLOB or DBCLOB.
- The value of the expression must be a valid character-string or graphic-string representation of a timestamp.
- The result of the expression must be castable to TIMESTAMP(12).

**expression** can contain any of the following supported operands:
- Constant
- Special register
- Variable (host variable, SQL parameter, SQL variable, or global variable)
- Scalar function whose arguments are supported operands
- CAST specification where the cast operand is a supported operand
- Expression that uses arithmetic operators and operands

**Related information:**

[“String representations of datetime values” on page 103](#)
[“Casting between data types” on page 113](#)
Notes

Transactions

The SET CURRENT TEMPORAL SYSTEM_TIME statement is not a committable operation. The ROLLBACK statement has no effect on CURRENT TEMPORAL SYSTEM_TIME.

Effects on other special registers

The setting of the CURRENT TEMPORAL SYSTEM_TIME special register does not affect other special registers, such as the CURRENT DATE and CURRENT TIMESTAMP special registers.

Examples

Example of setting the special register to a valid value

Both of the following statements set the CURRENT TEMPORAL SYSTEM_TIME special register to '2008-01-06-00.00.00.000000000000'.

| SET CURRENT TEMPORAL SYSTEM_TIME = TIMESTAMP('2008-01-01') + 5 DAYS; |
| SET CURRENT TEMPORAL SYSTEM_TIME = '2008-01-06-00.00.00.000000000000'; |

Example of setting the special register so that it does not affect subsequent SQL statements

The following statement sets the CURRENT TEMPORAL SYSTEM_TIME special register to the null value. Subsequent SQL statements that reference system-period temporal tables are not affected by the CURRENT TEMPORAL SYSTEM_TIME special register.

| SET CURRENT TEMPORAL SYSTEM_TIME = NULL |

“CURRENT TEMPORAL SYSTEM_TIME” on page 203
SET ENCRYPTION PASSWORD

The SET ENCRYPTION PASSWORD statement sets the value of the encryption password and, optionally, the password hint. The encryption and decryption built-in functions use this password and password hint for data encryption unless the functions are invoked with an explicitly specified password and hint. The password is not tied to DB2 authentication and is used only for data encryption.

Invocation

The statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

```
SET ENCRYPTION PASSWORD = password-variable
                        password-string-constant

WITH HINT = hint-variable
            hint-string-constant
```

Description

**password-variable**

Specifies a variable that contains an encryption password. The variable:

- Must be a CHAR or VARCHAR variable. The actual length of the contents of the variable must be between 6 and 127 inclusive or must be an empty string. If an empty string is specified, the default encryption password is set to no value.
- Must not be the null value.
- All characters are case-sensitive and are not converted to uppercase characters.

**password-string-constant**

A character constant that contains an encryption password. The length of the constant must be between 6 and 127 inclusive or must be an empty string. If an empty string is specified, the default encryption password is set to no value. All characters are case-sensitive and are not converted to uppercase characters.

**WITH HINT**

Indicates that a value is specified that will help you remember passwords (for example, 'Ocean' as a hint to remember 'Pacific'). If a hint value is specified, the hint is used as the default for encryption functions. The hint can subsequently be retrieved for an encrypted value using the GETHINT function.
If this clause is not specified and a hint is not explicitly specified on the encryption function, no hint will be embedded in encrypted data result.

**hint-variable**
Specifies a variable that contains an encryption password hint. The variable:
- Must be a CHAR or VARCHAR variable. The actual length of the contents of the variable must not be greater than 32. If an empty string is specified, the default encryption password hint is set to an empty string.
- Must not be the null value.
- All characters are case-sensitive and are not converted to uppercase characters.

**hint-string-constant**
A character string constant that contains an encryption password hint. The length of the constant must not be greater than 32. If the value is an empty string, the default encryption password hint is set to an empty string.

**Notes**
Normal DB2 mechanisms are used to transmit the host variable or constant to the database server.

**Examples**

*Example 1:* Set the ENCRYPTION PASSWORD to the value in :hv1. Do not specify a hint for the password.

```
SET ENCRYPTION PASSWORD = :hv1
```

*Example 2:* Set the ENCRYPTION PASSWORD to the value in :hv1. Specify the value in :hv2 as the hint for the password.

```
SET ENCRYPTION PASSWORD = :hv1 WITH HINT :hv2
```

**Related reference:**
- “ENCRYPTION PASSWORD” on page 208
- “ENCRYPT_TDES” on page 481
- “DECRYPT_BINARY, DECRYPT_BIT, DECRYPT_CHAR, and DECRYPT_DB” on page 468
SET PATH

The SET PATH statement assigns a value to the CURRENT PATH special register.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

```
SET CURRENT PATH = /SV040000,
```

Notes:
1. SYSTEM PATH, SESSION_USER or USER, and CURRENT PATH can be specified only once each.

Description

The value of PATH is replaced by the values specified.

**schema-name**

Identifies a schema. DB2 does not verify that the schema exists. For example, a schema name that is misspelled is not detected, which could affect the way subsequent SQL operates.

**SYSTEM PATH**

Specifies the schema names "SYSIBM", "SYSFUN", "SYSPROC", "SYSIBMADM".

**SESSION_USER or USER**

Specifies the value of the SESSION_USER (USER) special register.

**PATH**

Specifies the value of the CURRENT PATH special register before the execution of this statement.

**CURRENT PACKAGE PATH**

Specifies the value of the CURRENT PACKAGE PATH special register.

**host-variable**

A variable with a data type of CHAR or VARCHAR. The value of host-variable must not be null and must represent a valid schema name.
The schema name must:
- Be left justified within the host variable
- Be padded on the right with blanks if its length is less than that of the host variable

`string-constant`
A character string constant that represents a valid schema name.

If the schema name specified in `string-constant` will also be specified in other SQL statements and the schema name does not conform to the rules for ordinary identifiers, the schema name must be specified as a delimited identifier in the other SQL statements.

**Notes**

**Restrictions on SET PATH:**
These restrictions apply to the SET PATH statement:
- If the same schema name appears more than one time in the path, the first occurrence of the name is used and a warning is issued.
- The length of the CURRENT PATH special register limits the number of schema names that can be specified. The special register string is built by taking each schema name that is specified and removing trailing blanks, delimiting with double quotes, changing each double quote character to two double quote characters within the schema name as necessary, and then separating each schema name with a comma. The length of the resulting string cannot exceed 2048 bytes.
- The schema name SYSPUBLIC cannot be specified in the SQL path, even if you specify the value as a delimited identifier.

**Specifying "SYSIBM", "SYSFUN", "SYSPROC", "SYSBMADM":**
Schemas “SYSIBM”, “SYSFUN”, “SYSPROC”, “SYSBMADM” do not need to be specified in the special register. If these schemas are not explicitly specified in the CURRENT PATH special register, each schema is implicitly assumed at the front of the SQL path; if any of these schemas are not specified, they are assumed in the order of “SYSIBM”, “SYSFUN”, “SYSPROC”, “SYSBMADM” (see [SQL path](#) on page 66 for an example). Only the schemas that are explicitly specified in the CURRENT PATH register are included in the 2048 byte limit.

To avoid having “SYSIBM”, “SYSFUN”, “SYSPROC”, “SYSBMADM” implicitly added to the front of the SQL path, explicitly specify them in the path when setting the value of the register. If you specify them at the end of the path, DB2 will check all the other schemas in the path first.

**Specifying keywords versus delimited identifiers:**
There is a difference between specifying a keyword and specifying a delimited identifier. For example, specifying `SESSION_USER` with and without escape characters. To indicate that the value of the `SESSION_USER` special register should be used in the SQL path, specify the keyword `SESSION_USER`. If you specify `SESSION_USER` as a delimited identifier instead (for example, "SESSION_USER"), it is interpreted as a schema name of 'SESSION_USER'. For example, assume that the current value of the `SESSION_USER` special register is SMITH and that the following statement is issued:

```sql
SET PATH = SYSIBM, SYSPROC, SESSION_USER, "SESSION_USER"
```

The result is that the value of the SQL path is set to:
"SYSIBM","SYSPROC","SMITH","SESSION_USER".
Specifying a schema name in an SQL procedure:

Because a host variable (SQL variable) in an SQL procedure does not begin with a colon, DB2 uses the following rules to determine whether a value that is specified in a SET PATH= name statement is a variable or a schema-name:

- If name is the same as a parameter or SQL variable in the SQL procedure, DB2 uses name as a parameter or SQL variable and assigns the value in name to PATH.
- If name is not the same as a parameter or SQL variable in the SQL procedure, DB2 uses name as a schema-name and assigns the value name to PATH.

The use of the path to resolve object names:

For information on when the SQL path is used to resolve unqualified data type, function, and procedure names and when the CURRENT PATH special register provides the SQL path, see “SQL path” on page 66.

DRDA classification:

The SET PATH statement is executed by the database server and, therefore, is classified as a non-local SET statement in DRDA.

Alternative syntax and synonyms:

For compatibility with previous releases of DB2 or other products in the DB2 family, DB2 supports CURRENT FUNCTION PATH or CURRENT_PATH as a synonym for CURRENT PATH. CURRENT_PATH is consistent with the SQL standard name of the special register.

Examples

Example 1: Set the CURRENT PATH special register to the list of schemas: "SCHEMA1", "SCHEMA#2", "SYSIBM".

```sql
SET PATH = SCHEMA1,"SCHEMA#2", SYSIBM;
```

When the SQL path specified in the special register is used for name resolution the system schemas which were not explicitly specified in the special register are implicitly assumed at the front of the SQL path, making the effective value of the path:

```
SYSFUN, SYSPROC, SYSIBMADM, SCHEMA1, SCHEMA#2, SYSIBM
```

Example 2: Add schema SMITH and SYSPROC to the value of the CURRENT PATH special register that was set in Example 1.

```sql
SET PATH = CURRENT PATH, SMITH, SYSPROC;
```

The effective value of the SQL path specified by the special register becomes:

```
SYSFUN, SYSIBMADM, SCHEMA1, SCHEMA#2, SYSIBM, SMITH, SYSPROC
```

Related reference:

“CURRENT PATH” on page 190
SET SCHEMA

The SET SCHEMA statement assigns a value to the CURRENT SCHEMA special register. If the package is bound with the DYNAMICRULES BIND option, this statement does not affect the qualifier that is used for unqualified database object references.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

```
SET CURRENT_SCHEMA = schema-name
SESSION_USER
USER
host-variable
string-constant
DEFAULT
```

Description

`schema-name`

Identifies a schema. No validation that the schema exists is made at the time the CURRENT SCHEMA is set. For example, if a schema name is misspelled, it could affect the way subsequent SQL operates.

`SESSION_USER` or `USER`

Specifies the value of the SESSION_USER (USER) special register.

`host-variable`

Specifies a host variable that contains a schema name. The content is not folded to uppercase.

The host variable must:

- Be a CHAR, VARCHAR, GRAPHIC, or VARGRAPHIC variable. The actual length of the contents of the `host-variable` must not exceed the length of a schema name.
- Not be set to null. If `host-variable` has an associated indicator variable, the value of that indicator variable must not indicate a null value.
- Include a schema name that is left justified and conforms to the rules for forming an ordinary identifier or delimited identifier. If the identifier is delimited, it must not be empty or contain only blanks.
- Be padded on the right with blanks if the host variable is fixed length.
- Not contain SESSION_USER, USER, or DEFAULT.
string-constant
Specifies a string constant that contains a schema name. The content is not folded to uppercase.

The string constant must:
• Have a length that does not exceed the maximum length of a schema name.
• Include a schema name that is left justified and conforms to the rules for forming an ordinary identifier or delimited identifier. If the identifier is delimited, it must not be empty or contain only blanks.
• Not contain SESSION_USER, USER, or DEFAULT.

DEFAULT
Specifies that CURRENT SCHEMA is to be set to its initial value, as if it had never been explicitly set during the application process. For information about the initial value of CURRENT SCHEMA, see "CURRENT SCHEMA" on page 198.

Notes
Considerations for keywords:
There is a difference between specifying a single keyword (such as SESSION_USER or DEFAULT) as a single keyword or as a delimited identifier. To indicate that the current value of the SESSION_USER special register should be used for setting the current schema, specify SESSION_USER as a keyword. To indicate that the special register should be set to its default value, specify DEFAULT as a keyword. If SESSION_USER or DEFAULT is specified as a delimited identifier instead (for example, "SESSION_USER"), it is interpreted as a schema name of that value ("SESSION_USER").

Transaction considerations:
The SET SCHEMA statement is not a committable operation. ROLLBACK has no effect on CURRENT SCHEMA.

Usage of the assigned value:
The value of the CURRENT SCHEMA special register, as set by this statement, is used as the schema name in all dynamic SQL statements. The QUALIFIER bind option specifies the schema name for use as the qualifier for unqualified database object names in static SQL statements.

Impact on other special registers:
Setting the CURRENT SCHEMA special register does not affect any other special register. Therefore, the CURRENT SCHEMA is not be included in the SQL path that is used to resolve the schema name for unqualified references to function, procedures and user-defined types in dynamic SQL statements. To include the current schema value in the SQL path, whenever the SET SCHEMA statement is issued, also issue the SET PATH statement including the schema name from the SET SCHEMA statement.

Examples
Example 1: The following statement sets the CURRENT SCHEMA special register.
EXEC SQL SET SCHEMA RICK;

Example 2: The following example retrieves the current value of the CURRENT SCHEMA special register into the host variable called CURSCHEMA.
EXEC SQL SELECT CURRENT SCHEMA INTO :CURSCHEMA
FROM SYSIBM.SYSDUMMY1;
The value of the host variable is RICK.

Example 3: Assume that the following statements are issued:

```
SET CURRENT SQLID = 'USRT001';
SET CURRENT SCHEMA = 'USRT002';
```

At this point, the two special registers contain different values. Any subsequent CREATE statements will use USRT002 as the implicit qualifier, but the owner of the newly created objects is USRT001.

Example 4: Assume that the value of CURRENT SCHEMA is 'Jane' and that the default value of the PATH special register was established using that value (that is, the value of PATH is "SYSIBM", "SYSFUN", "SYSPROC", "SYSIBMADM", "JANE"). Change the value of the CURRENT SCHEMA special register to 'John'.

```
SET CURRENT SCHEMA = 'JOHN';
```

To change the SQL path to use the updated CURRENT SCHEMA value of "JOHN", issue a SET PATH statement to change the value of the PATH special register to specify "JOHN" as the first schema to check:

```
SET PATH = 'JOHN', CURRENT PATH;
```

Alternatively, a commit would cause PATH to be re-initialized. Otherwise, the path remains "SYSIBM", "SYSFUN", "SYSPROC", "SYSIBMADM", "JANE"), which might cause unqualified object names to resolve to "JANE" when you want them to resolve to "JOHN".
SET SESSION TIME ZONE

The SET SESSION TIME ZONE statement assigns a value to the SESSION TIME ZONE special register.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

```sql
SET SESSION TIME ZONE = string-constant
SET SESSION TIME ZONE = variable
```

Description

*string-constant*

Identifies a time zone with a value of the form '±th:tm', where *th* represents the time zone hour between -12 and +14, and *tm* represents the time zone minutes between 0 and 59, with values ranging from -12:59 to +14:00.

*variable*

Specifies a variable that contains a time zone. The variable must be a CHAR or VARCHAR variable that is not followed by an indicator variable. The variable must not be the null value. The value must be left justified and be of the form '±th:tm', where *th* represents the time zone hour between -12 and +14, and *tm* represents the time zone minutes between 0 and 59, with values ranging from -12:59 to +14:00.

Notes

**Impact on other special registers:**

Setting the SESSION TIME ZONE special register does not affect the CURRENT TIMEZONE special register.

**Syntax alternatives:**

SESSIONTIMEZONE, SESSION TIMEZONE, and TIMEZONE can be specified as an alternative to SESSION TIME ZONE or TIME ZONE.

Example

Set the SESSION TIME ZONE as -8:00:

```sql
SET SESSION TIME ZONE = '-8:00';
```

Related reference:

“SESSION TIME ZONE” on page 210
The SIGNAL statement is used to signal an error. It causes an error to be returned with the specified SQLSTATE and error description.

For a description of the statement, see "SIGNAL statement" on page 2072.
TRUNCATE

The DB2 TRUNCATE statement deletes all rows for either base tables or declared
global temporary tables. The base table can be in a simple table space, a segmented

  table space, a partitioned table space, or a universal table space. If the table

  contains LOB or XML columns, the corresponding table spaces and indexes are

  also truncated.

Invocation

This statement can be embedded in an application program or issued interactively.
It is an executable statement that can be dynamically prepared.

Authorization

The privilege set that is defined below must include at least one of the following

  privileges:

  - The DELETE privilege for the table
  - Ownership of the table
  - DBADM authority for the database
  - DATAACCESS authority
  - SYSADM authority

If the database is implicitly created, the database privileges must be on the implicit
database or on DSNDB04.

If the IGNORE DELETE TRIGGERS option is specified, the privilege set must

  include at least one of the following privileges:

  - The ALTER privilege for the table
  - Ownership of the table
  - DBADM authority for the database
  - System DBADM authority
  - SYSADM authority

If row access control is activated for the table, the privilege set must include at

  least one of the following privileges or authorities:

  - Ownership of the table
  - DBADM authority
  - SYSADM authority
  - SYSCTRL authority
  - System DBADM authority

Privilege set: If the statement is embedded in an application program, the

  privilege set is the privileges that are held by the owner of the plan or package. If

  the statement is dynamically prepared, the privilege set is determined by the

  DYNAMICRULES behavior in effect (run, bind, define, or invoke) and is

  summarized in Table 97 on page 873. (For more details on these behaviors,

  including a list of the DYNAMICRULES bind option values that determine them,

  see Authorization IDs and dynamic SQL on page 77.)
Syntax

\[
\text{TRUNCATE} \quad \text{table name} \quad \text{DROP STORAGE} \quad \text{IGNORE DELETE TRIGGERS} \quad \text{REUSE STORAGE} \quad \text{RESTRICT WHEN DELETE TRIGGERS} \quad \text{IMMEDIATE}
\]

Description

*table-name*

Identifies the table that is to be truncated. The name must identify a table that exists at the current server. The name must not identify the following objects:

- a view
- an auxiliary table
- an XML table
- a catalog table
- a system-period temporal table

If *table-name* is a base table of a table space, all tables that are defined under the table will also be truncated (for example: auxiliary LOB table spaces and XML table spaces), and all of its associated indexes will also be truncated.

**DROP STORAGE or REUSE STORAGE**

Specifies whether to drop or reuse the existing storage that is allocated for the table.

**DROP STORAGE**

Specifies that all storage that is allocated for the table is released and made available for use for the same table or any other table that resides in the table space. The scope of **DROP STORAGE** is always at the table space level and the deallocated space is always available for reuse by all tables in the table space.

**DROP STORAGE** is the default.

**REUSE STORAGE**

Specifies that all storage that is allocated for the table will be emptied, but will continue to be allocated for the table. **REUSE STORAGE** is ignored for a table in a simple table space and the statement is processed as if **DROP STORAGE** is specified.

**RESTRICT WHEN DELETE TRIGGERS or IGNORE DELETE TRIGGERS**

Specifies what to do when delete triggers are defined on the table.

**RESTRICT WHEN DELETE TRIGGERS**

Specifies that an error is returned if delete triggers are defined on the table.

**IGNORE DELETE TRIGGERS**

Specifies that any delete triggers that are defined for the table are not activated by the truncate operation.

**IGNORE DELETE TRIGGERS** is the default.
**IMMEDIATE**

Specifies that the truncate operation is processed immediately and cannot be undone. If the **IMMEDIATE** option is specified, the table must not contain any uncommitted updates. In the case of a table in a multi-table table space, if there are any uncommitted updates to any table in the table space, the truncate operation will fail. Also, if there are any uncommitted CREATE, ALTER or DROP statements for any table in the table space, the truncate operation will fail.

The truncated table is immediately available for use in the same unit of work. Although a ROLLBACK statement is allowed to execute after a TRUNCATE statement, the truncate operation is not undone, and the table remains in a truncated state. For example, if another data change operation is done on the table after the TRUNCATE IMMEDIATE statement and then the ROLLBACK statement is executed, the truncate operation will not be undone, but all other data change operations are undone.

If **IMMEDIATE** is not specified, a ROLLBACK statement can undo the truncate operation.

The **IMMEDIATE** option can be specified for a table in a segmented table space or a universal table space which allows deallocated spaces to be reclaimed immediately for subsequent insert operations in the same unit of work without committing the truncate operation.

**Notes**

**Rules and restrictions:**

The truncate operation cannot be executed if the table is a parent table in an enforced referential constraint. The DB2 subsystem issues an error when it detects the existence of rule violations. Therefore, if the referential integrity constraint exists, the TRUNCATE statement will be restricted regardless of whether the child table contains rows.

The TRUNCATE statement cannot be used if the table is a system-maintained temporal table.

If the TRUNCATE statement is used on a tables where any of the following conditions is true, the truncate operation will perform in a similar way to a mass delete operation:

- **Tables with Change Data Capture (CDC) attribute**
  
  The DB2 subsystem allows a table with the CDC-enabled attribute to be truncated without imposing any new restrictions.

- **Tables with multi-level security**
  
  If the table contains a column that is defined as a security label, the truncate operation needs to examine each row to determine if the security label of the authorization ID or role has the authority to delete that row. However, if the primary authorization ID or role has write-down privilege, verification of each row in the table is not necessary.

- **Tables with a VALIDPROC attribute**
  
  If a VALIDPROC is defined for the table, the truncate operation needs to verify the validity of each row in the table.

**TRUNCATE and table spaces that are not logged:**

The TRUNCATE TABLE statement can be used to remove a table space from the logical page list and to reset recover-pending status. When the table space is segmented or universal, the table is the only table in the
table space, and the table does not have a VALIDPROC, referential constraints, delete triggers, or a SECURITY LABEL column, use the TRUNCATE TABLE statement to empty the table and the table space will be removed from the LPL and recover-pending status will be reset.

**Truncating rows from a table with activated row permissions or column access control:**
Row permissions and column access control is not enforced for the TRUNCATE statement.

**Examples**

*Example 1:* Empty an unused inventory table regardless of any existing triggers and return its allocated space.

```
TRUNCATE TABLE INVENTORY
DROP STORAGE
IGNORE DELETE TRIGGERS;
```

*Example 2:* Empty an unused inventory table regardless of any existing delete triggers but preserve its allocated space for later reuse.

```
TRUNCATE TABLE INVENTORY
REUSE STORAGE
IGNORE DELETE TRIGGERS;
```

*Example 3:* Empty an unused inventory table permanently (a ROLLBACK statement cannot undo the truncate operation when the IMMEDIATE option is specified) regardless of any existing delete triggers and preserve its allocated space for immediate use.

```
TRUNCATE TABLE INVENTORY
REUSE STORAGE
IGNORE DELETE TRIGGERS
IMMEDIATE;
```
The UPDATE statement updates the values of specified columns in rows of a table or view or activates an instead of update trigger. Updating a row of a view updates a row of the table on which the view is based if no instead of update trigger is defined for the update operation on the view. If such a trigger is defined, the trigger is activated instead of the UPDATE statement. The table or view can exist at the current server or at any DB2 subsystem with which the current server can establish a connection.

There are two forms of this statement:
- The searched UPDATE form is used to update one or more rows optionally determined by a search condition.
- The positioned UPDATE form specifies that one or more rows corresponding to the current cursor position are to be updated.

Invocation

This statement can be embedded in an application program or issued interactively. A positioned UPDATE can be embedded in an application program. Both forms are executable statements that can be dynamically prepared.

Authorization

Authority requirements depend on whether the object identified in the statement is a user-defined table, a catalog table for which updates are allowed, or a view, and whether SQL standard rules are in effect:

When a user-defined table is identified: The privilege set must include at least one of the following:
- The UPDATE privilege on the table
- The UPDATE privilege on each column to be updated
- Ownership of the table
- DBADM authority on the database that contains the table
- SYSADM authority

If the database is implicitly created, the database privileges must be on the implicit database or on DSNDB04.

When a catalog table is identified: The privilege set must include at least one of the following:
- The UPDATE privilege on each column to be updated
- DBADM authority on the catalog database
- SYSCTRL authority
- SYSADM authority

When a view is identified: The privilege set must include at least one of the following:
- The UPDATE privilege on the view
- The UPDATE privilege on each column to be updated
- SYSADM authority
If the expression in the assignment-clause contains a reference to a column of the table or view, or if the search-condition in a searched UPDATE contains a reference to a column of the table or view, the privilege set must include at least one of the following:

- The SELECT privilege on the table or view
- Ownership of the table or view
- DBADM authority on the database that contains the table, if the target is a table and that table is not a catalog table
- DATAACCESS
- SYSADM authority

When FOR PORTION OF BUSINESS_TIME is specified: The privilege set must include at least one of the following:

- The UPDATE privilege on the columns of the BUSINESS_TIME period
- The UPDATE privilege on the table
- Ownership of the table or view
- DBADM authority on the database that contains the table, if the target is a table and that table is not a catalog table
- DATAACCESS
- SYSADM authority

If the search-condition in a searched UPDATE includes a subquery, or if the assignment-clause includes a scalar-fullselect or a row-fullselect, see “Authorization” on page 782 for an explanation of the authorization required.

The owner of a view, unlike the owner of a table, might not have UPDATE authority on the view (or might have UPDATE authority without being able to grant it to others). The nature of the view itself can preclude its use for UPDATE. For more information, see the discussion of authority in “CREATE VIEW” on page 1590.

Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. If the statement is dynamically prepared, the privilege set is determined by the DYNAMICRULES behavior in effect (run, bind, define, or invoke) and is summarized in Table 97 on page 873. For more information on these behaviors, including a list of the DYNAMICRULES bind option values that determine them, see “Authorization IDs and dynamic SQL” on page 77.
Notes:
1  The same clause must not be specified more than one time.

assignment clause:
Notes:
1 The number of expressions, DEFAULT, and NULL keywords must match the number of column-names. Expressions must not refer to UNPACK-function-invocation.
2 The number of columns in the select list must match the number of column-names.
3 The number of items returned from UNPACK-function-invocation must match the number of column names.

Description

table-name or view-name

Identifies the object of the UPDATE statement. The name must identify a table or view that exists at the DB2 subsystem that is identified by the implicitly or explicitly specified location name. The name must not identify one of the following tables:

- An auxiliary table
- A created temporary table or a view of a created temporary table
- A catalog table with no updatable columns or a view of a catalog table with no updatable columns
- A read-only view that has no INSTEAD OF trigger defined for its update operations. (For a description of a read-only view, see "CREATE VIEW" on page 1590)
- A system-maintained materialized query table
- A table that is implicitly created for an XML column
- An archive-enabled table if any of the following conditions are true:
  - The SYSIBMADM.MOVE_TO_ARCHIVE global variable is set to Y.
  - The SYSIBMADM.GET_ARCHIVE global variable is set to Y, the ARCHIVESENSITIVE bind option is set to YES, and the operation is a positioned update.
In an IMS or CICS application, the DB2 subsystem that contains the identified table or view must be a remote server that supports two-phase commit.

A catalog table or a view of a catalog table can be identified if every column identified in the SET clause is an updatable column. If a column of a catalog table is updatable, its description in "DB2 catalog tables" on page 2167 indicates that the column can be updated. If the object table is SYSIBM.SYSSTRINGS, any column other than IBMREQD can be updated, but the rows that are selected for update must be rows that are provided by the user (the value of the IBMREQD column is N) and only certain values can be specified as explained in "How an entry in SYSIBM.SYSSTRINGS works with character conversion (DB2 Installation and Migration)".

**period-clause**

Specifies that a period clause applies to the target of the update operation. The same period name must not be specified more than one time. If the target of the update operation is a view:

- The FROM clause of the outer fullselect of the view definition must include a reference, directly or indirectly, to an application-period temporal table.
- The result table of the outer fullselect of the view definition must include, explicitly or implicitly, the start and end columns of the BUSINESS_TIME period.
- An INSTEAD OF trigger must not be defined for the view.

**FOR PORTION OF BUSINESS_TIME**

Specifies that the update only applies to row values for the portion of the BUSINESS_TIME period in the row that is specified by the period clause. BUSINESS_TIME must be a period that is defined on the table.

FOR PORTION OF BUSINESS_TIME must not be specified if the value of the CURRENT TEMPORAL BUSINESS_TIME special register is not NULL when the BUSTIMESENSITIVE bind option is set to YES.

**FROM value1 TO value2**

Specifies that the update applies to rows for the period that is specified from value1 to value2. No rows are updated if value1 is greater than or equal to value2 or if value1 or value2 is the null value.

For the period condition that is specified with **FROM value1 TO value2**, the period that is specified with **period-name** in a row of the target update covers one of the following ranges:

- If the value of the begin column is less than value1 and the value of the end column is greater than value1, the range overlaps the beginning of the specified period.
- If the value of the end column is greater than or equal to value2 and the value of the begin column is less than value2, the range overlaps the end of the specified period.
- If the value for the begin column is greater than or equal to value1 and the value for the end column is less than or equal to value2, the range is fully contained within the specified period.
- If both columns of **period-name** are less than or equal to value1 or greater than or equal to value2, the range is not contained in the period.
- If the period in the row overlaps the beginning of the specified period or the end of the specified period, but not both, the range is partially contained in the specified period.
- If the period in the row overlaps both the beginning and the end of the specified period, the range fully overlaps the specified period.
If the period, period-name in a row is not contained in the specified period, the row is not updated. Otherwise, the update is applied based on the specification of PORTION OF and how the values in the columns of period-name overlap the specified period as follows:

- If the period, period-name in a row is fully contained within the specified period, the row is updated and the values of the begin column and end column of period-name are unchanged.
- If the period, period-name in a row is partially contained in the specified period and overlaps the beginning of the specified period:
  - The row is updated. In the updated row, the value of the begin column is set to value1 and the value of the end column is the original value of the end column.
  - An additional row is inserted using the original values from the row, except that the end column is set to value1, and new values are used for other generated columns.
- If the period, period-name in a row is partially contained in the specified period and overlaps the end of the specified period:
  - The row is updated. In the updated row, the value of the begin column is the original value of the begin column and the end column is set to value2.
  - An additional row is inserted using the original values from the row, except that the begin column is set to value2, and new values are used for other generated columns.
- If the period, period-name in a row fully overlaps the specified period:
  - The row is updated. In the updated row, the value of the begin column is set to value1 and the value of the end column is set to value2.
  - An additional row is inserted using the original values from the row, except that the end column is set to value1, a column defined as DATA CHANGE OPERATION is set to T, and new values are used for other generated columns.
  - An additional row is inserted using the original values from the row, except that the begin column is set to value2, a column defined as DATA CHANGE OPERATION is set to T, and new values are used for other generated columns.

Any existing update triggers are activated for the updated rows and any existing insert triggers are activated for rows that are implicitly inserted.

value1, value2

Specifies expressions that return a value of a built-in data type. The result of each expression must be comparable to the data type of the columns of the specified period. See the comparison rules described in “Assignment and comparison” on page 123. Each expression can contain any of the following supported operands:

- A constant
- A special register
- A variable
- An array element specification
- A built-in scalar function whose arguments are supported operands
- A CAST specification where the cast operand is a supported operand
- An expression that uses arithmetic operators and operands
Each expression must not have a timestamp precision that is greater than the precision of the columns for the period.

If the begin and end columns of the period are defined as TIMESTAMP WITHOUT TIME ZONE, each expression must not return a value of a timestamp with a time zone.

A period clause for a view must not contain a global variable or an untyped parameter marker.

correlation-name
Can be used within search-condition or assignment-clause to designate the table or view. (For an explanation of correlation-name, see “Correlation names” on page 216.)

include-column
Specifies a set of columns that are included, along with the columns of table-name or view-name, in the result table of the UPDATE statement when it is nested in the FROM clause of the outer fullselect that is used in a subselect, SELECT statement, or in a SELECT INTO statement. The included columns are appended to the end of the list of columns that is identified by table-name or view-name. If no value is assigned to a column that is specified by an include-column, a NULL value is returned for that column.

INCLUDE
Introduces a list of columns that are to be included in the result table of the UPDATE statement. The included columns are only available if the UPDATE statement is nested in the FROM clause of a SELECT statement or a SELECT INTO statement.

column-name
Specifies the name for a column of the result table of the UPDATE statement that is not the same name as another included column nor a column in the table or view that is specified in table-name or view-name.

data-type
Specifies the data type of the included column. The included columns are nullable.

built-in-type
Specifies a built-in data type. See “CREATE TABLE” on page 1446 for a description of each built-in type.

The CCSID 1208 and CCSID 1200 clauses must not be specified for an INCLUDE column.

distinct-type
Specifies a distinct type. Any length, precision, or scale attributes for the column are those of the source type of the distinct type as specified by using the CREATE TYPE statement.

SET
Introduces the assignment of values to column names.

assignment-clause
If row-fullselect is specified, the number of columns in the result of row-fullselect must match the number of column-names that are specified. If row-fullselect is not specified, the number of expressions, and NULL and DEFAULT keywords must match the number of column-names that are specified.
column-name

Identifies a column that is to be updated. column-name must identify a column of the specified table or view, and that column must be updatable if extended indicator variables are not enabled. The column must not identify a generated column or a view column where the column is derived from a scalar function, constant, or expression. column-name can also identify an INCLUDE column that must not be qualified. The same column must not be specified more than one time.

A column that is defined as part of a BUSINESS_TIME period must not be specified if the UPDATE statement contains a period-clause.

Assignments to included columns are only processed when the UPDATE statement is nested in the FROM clause of a SELECT statement or a SELECT INTO statement. There must be at least one assignment clause that specifies a column-name that is not an INCLUDE column. The null value is returned for an included column that is not set by using an explicit SET clause.

For a positioned update, allowable column names can be further restricted to those in a certain list. This list appears in the FOR UPDATE clause of the SELECT statement for the associated cursor. The clause can be omitted by using the conditions that are described in “Positioned updates of columns” on page 336.

A view column that is derived from the same column as another column of the view can be updated, but both columns cannot be updated in the same UPDATE statement.

expression

Indicates the new value of the column. The expression is any expression of the type described in “Expressions” on page 243. It must not include an aggregate function.

If expression is a host variable, the host variable can include an indicator variable. When extended indicator variables are enabled, an expression must not be more complex than a reference to a single host variable if the indicator is set to an extended indicator value of default (-5) or unassigned (-7). In addition, a CAST specification can be used if either of the following is true:

- The target column is defined as nullable.
- the target column is defined as NOT NULL with a non-null default, the source of the CAST specification is a single host variable, and the data attributes (data type, length, precision, and scale) of the host variable are the same as the result of the cast specification.

A column-name in an expression must identify a column of the table or view. For each row that is updated, the value of the column in the expression is the value of the column in the row before the row is updated.

DEFAULT

Specifies that the default value is used based on how the corresponding column is defined in the table. The value that is assigned depends on how the column is defined.

- If the column is defined using the IDENTITY clause, the column is generated by the DB2 system.
- If the column is defined as a row change timestamp column, the column value is generated by the DB2 system.
• If the column is defined using the WITH DEFAULT clause, the value is set to the default that is defined for the column.
• If the column is defined without specifying the WITH DEFAULT clause, the GENERATED clause, or the NOT NULL clause, the value is NULL.
• If the column is specified in the INCLUDE column list, the column value is set to null.

A ROWID column must not be set to the DEFAULT keyword.

An identity column or a row change timestamp column that is defined as GENERATED ALWAYS can be set only to the DEFAULT keyword.

If the column is defined using the NOT NULL clause and the GENERATED clause is not used, or the WITH DEFAULT clause is not used, the DEFAULT keyword cannot be specified for that column.

**NULL**

Specifies the null value as the new value of the column. Specify NULL only for nullable columns.

**row-fullselect**

Specifies a fullselect that returns a single row. The column values are assigned to each of the corresponding column-names. If the fullselect returns no rows, the null value is assigned to each column; an error occurs if any column to be updated is not nullable. An error also occurs if there is more than one row in the result.

For a positioned update, if the table or view that is the object of the UPDATE statement is used in the fullselect, a column from the instance of the table or view in the fullselect cannot be the same as column-name, a column being updated.

If the fullselect refers to columns to be updated, the value of such a column in the fullselect is the value of the column in the row before the row is updated.

**UNPACK-function-invocation**

Specifies an invocation of the UNPACK built-in function. The number of fields that are returned by the UNPACK function invocation must be the same as the number of column-names.

**WHERE**

Specifies the rows to be updated. You can omit the clause, give a search condition, or specify a cursor. If you omit the clause, all rows of the table or view are updated.

**search-condition**

Specifies any search condition described in Chapter 2, “Language elements,” on page 55. Each column-name in the search condition, other than in a subquery, must identify a column of the table or view.

The search-condition is applied to each row of the table or view and the updated rows are those for which the result of the search-condition is true. If the unique key or primary key is a parent key, the constraints are effectively checked at the end of the operation.

If the search condition contains a subquery, the subquery can be thought of as being executed each time the search condition is applied to a row, and the results used in applying the search condition. In actuality, a subquery
with no correlated references is executed just once, whereas it is possible that a subquery with a correlated reference must be executed once for each row.

**WHERE CURRENT OF cursor-name**

Identifies the cursor to be used in the update operation. `cursor-name` must identify a declared cursor as explained in the description of the DECLARE CURSOR statement in “DECLARE CURSOR” on page 1598. If the UPDATE statement is embedded in a program, the DECLARE CURSOR statement must include `select-statement` rather than `statement-name`.

The object of the UPDATE statement must also be identified in the FROM clause of the SELECT statement of the cursor. The columns to be updated can be identified in the FOR UPDATE clause of that SELECT statement though they do not have to be identified. If the columns are not specified, the columns that can be updated include all the updatable columns of the table or view that is identified in the first FROM clause of the fullselect.

The result table of the cursor must not be read-only. For an explanation of read-only result tables, see “Read-only cursors”. Note that the object of the UPDATE statement must not be identified as the object of the subquery in the WHERE clause of the SELECT statement of the cursor.

When the UPDATE statement is executed, the cursor must be open and positioned on a row or rowset of the result table.

- If the cursor is positioned on a single row, that row is the one updated.
- If the cursor is positioned on a rowset, all rows corresponding to the rows of the current rowset are updated.

A positioned UPDATE must not be specified for a cursor that references a view on which an instead of update trigger is defined, even if the view is an updatable view.

**FOR ROW n OF ROWSET**

Specifies which row of the current rowset is to be updated. The corresponding row of the rowset is updated, and the cursor remains positioned on the current rowset.

When this clause is not specified, the cursor position determines the rows that will be affected. If the cursor is positioned on a single row, that row is the one updated. In the case where the most recent FETCH statement returned multiple rows of data (but not as a rowset), this position would be on the last row of data that was returned. If the cursor is positioned on a rowset, all rows corresponding to the current rowset are updated. The cursor position remains unchanged.
It is possible for another application process to update a row in the base table of the SELECT statement so that the specified row of the cursor no longer has a corresponding row in the base table. An attempt to update such a row results in an error.

**isolation-clause**

Specifies the isolation level used when locating the rows to be updated by the statement.

WITH

Introduces the isolation level, which may be one of the following:

- **RR**  Repeatable read
- **RS**  Read stability
- **CS**  Cursor stability

The default isolation level of the statement is the isolation level of the package or plan in which the statement is bound, with the package isolation taking precedence over the plan isolation. When a package isolation is not specified, the plan isolation is the default.

**SKIP LOCKED DATA**

Specifies that rows are skipped when incompatible locks are held on the row by other transactions. These rows can belong to any accessed table that is specified in the statement. **SKIP LOCKED DATA** can be used only when isolation CS or RS is in effect and applies only to row level or page level locks.

**SKIP LOCKED DATA** can be specified only in the searched UPDATE statement (or the searched update operation of a MERGE statement). **SKIP LOCKED DATA** is ignored if it is specified when the isolation level that is in effect is repeatable read (WITH RR) or uncommitted read (WITH UR). The default isolation level of the statement depends on the isolation level of the package or plan with which the statement is bound, with the package isolation taking precedence over the plan isolation. When a package isolation is not specified, the plan isolation is the default.

**QUERYNO integer**

Specifies the number to be used for this SQL statement in EXPLAIN output and trace records. The number is used for the QUERYNO column of the plan table for the rows that contain information about this SQL statement. This number is also used in the QUERYNO column of the SYSIBM.SYSSTMT and SYSIBM.SYSPACKstmt catalog tables.

If the clause is omitted, the number associated with the SQL statement is the statement number assigned during precompilation. Thus, if the application program is changed and then precompiled, that statement number might change.

Using the **QUERYNO** clause to assign unique numbers to the SQL statements in a program is helpful:

- For simplifying the use of optimization hints for access path selection
- For correlating SQL statement text with EXPLAIN output in the plan table

For information on using optimization hints, such as enabling the system for optimization hints and setting valid hint values, and for information on accessing the plan table, see *DB2 Performance Monitoring and Tuning Guide*.

**Notes**

**Update rules:**

Update values must satisfy the following rules. If they do not, or if other
errors occur during the execution of the UPDATE statement, no rows are updated and the position of the cursors are not changed.

- **Assignment.** Update values are assigned to columns using the assignment rules described in [Chapter 2, “Language elements,” on page 55](#).

- **Validity.** Updates must obey the following rules. If they do not, or if any other errors occur during the execution of the UPDATE statement, no rows are updated.
  - **Fullselects:** The row-fullselect and expressions that contain a scalar-fullselect must return no more than one row.
  - **Unique constraints and unique indexes:** If the identified table (or base table of the identified view) has any unique indexes or unique constraints, each row that is updated in the table must conform to the limitations that are imposed by those indexes and constraints. All uniqueness checks are effectively made at the end of the statement. In the case of a multi-row update, this validation occurs after all the rows are updated.
  - **Check constraints:** If the identified table (or base table of the identified view) has any check constraints, each check constraint must be true or unknown for each row that is updated in the table. All checks constraints are effectively validated at the end of the statement. In the case of a multi-row update, this validation occurs after all the rows are updated.
  - **Views and the WITH CHECK OPTION.** For views defined with WITH CHECK OPTION, an updated row must conform to the definition of the view. If the view you name is dependent on other views whose definitions include WITH CHECK OPTION, the updated rows must also conform to the definitions of those views. For an explanation of the rules governing this situation, see [“CREATE VIEW” on page 1590](#). For views that are not defined with WITH CHECK OPTION, you can change the rows so that they no longer conform to the definition of the view. Such rows are updated in the base table of the view and no longer appear in the view.
  - **Field and validation procedures.** The updated rows must conform to any constraints imposed by any field or validation procedures on the identified table (or on the base table of the identified view).

- **Referential constraints.** The value of the parent key in a parent row must not be changed. If the update value produces a foreign key that is nonnull, the foreign key must be equal to some value of the parent key of the parent table of the relationship.

All referential constraints are effectively checked at the end of the statement. In the case of a multi-row update, this validation occurs after all the rows are updated.

- **Indexes with VARBINARY columns.** If the identified table has an index on a VARBINARY column or a column that is a distinct type that is based on VARBINARY data type, that index column cannot specify the DESC attribute. To use the SQL data change operation on the identified table, either drop the index or alter the data type of the column to BINARY and then rebuild the index.

- **Triggers.** An UPDATE statement might cause triggers to activate. A trigger might cause other statements to be executed or raise error conditions based on the update values. If an UPDATE statement for a view causes an instead of trigger to activate, validity, referential integrity,
and check constraints are checked against the data changes that are performed in the trigger and not against the view that causes the trigger to activate or its underlying base tables.

**Number of rows updated:**
Normally, after an UPDATE statement completes execution, the value of SQLERRD(3) in the SQLCA is the number of rows updated. (For a complete description of the SQLCA, including exceptions to the preceding sentence, see “SQL communication area (SQLCA)” on page 2134.)

**Nesting user-defined functions or stored procedures:**
An UPDATE statement can implicitly or explicitly refer to user-defined functions or stored procedures. This is known as nesting of SQL statements. A user-defined function or stored procedure that is nested within the UPDATE must not access the table being updated.

**Locking:**
Unless appropriate locks already exist, one or more exclusive locks are acquired by the execution of a successful update operation. Until a commit or rollback operation releases the locks, only the application process that performed the insert can access the updated row. If LOBs are not updated, application processes that are running with uncommitted read can also access the updated row. The locks can also prevent other application processes from performing operations on the table. However, application processes that are running with uncommitted read can access locked pages and rows.

Locks are not acquired on declared temporary tables.

**Datetime representation when using datetime registers:**
As explained under Datetime special registers, when two or more datetime registers are implicitly or explicitly specified in a single SQL statement, they represent the same point in time. This is also true when multiple rows are updated.

**Rules for positioned UPDATE with a SENSITIVE STATIC scrollable cursor:**
When a SENSITIVE STATIC scrollable cursor has been declared, the following rules apply:

- **Update attempt of delete holes.** If, with a positioned update against a SENSITIVE STATIC scrollable cursor, an attempt is made to update a row that has been identified as a delete hole, an error occurs.

- **Update operations.** Positioned update operations with SENSITIVE STATIC scrollable cursors perform as follows:
  1. The SELECT list items in the target row of the base table of the cursor are compared with the values in the corresponding row of the result table (that is, the result table must still agree with the base table). If the values are not identical, then the update operation is rejected, and an error occurs. The operation may be attempted again after a successful FETCH SENSITIVE has occurred for the target row.
  2. The WHERE clause of the SELECT statement is re-evaluated to determine whether the current values in the base table still satisfy the search criteria. The values in the SELECT list are compared to determine that these values have not changed. If the WHERE clause evaluates as true, and the values in the SELECT have not changed, the update operation is allowed to proceed. Otherwise, the update operation is rejected, an error occurs, and an update hole appears in the cursor.
• *Update of update holes.* Update holes are not permanent. It is possible for another process, or a searched update in the same process, to update an update hole row so that it is no longer an update hole. Update holes become visible with a FETCH SENSITIVE for positioned updates and positioned deletes.

• *Result table.* After the base table is updated, the row is re-evaluated and updated in the temporary result table. At this time, it is possible that the positioned update changed the data such that the row does not qualify the search condition, in which case the row is marked as an update hole for subsequent FETCH operations.

**Updating rows in a table with multilevel security:**

When you update rows in a table with multilevel security, DB2 compares the security label of the user (the primary authorization ID) to the security label of the row. The update proceeds according to the following rules:

• If the security label of the user and the security label of the row are equivalent, the row is updated and the value of the security label is determined by whether the user has write-down privilege:
  – If the user has write-down privilege or write-down control is not enabled, the user can set the security label of the row to any valid security label. The value that is specified for the security label column must be assignable to a column that is defined as CHAR(8) FOR SBCS DATA NOT NULL.
  – If the user does not have write-down privilege and write-down control is enabled, the security label of the row is set to the value of the security label of the user.

• If the security label of the user dominates the security label of the row, the result of the UPDATE statement is determined by whether the user has write-down privilege:
  – If the user has write-down privilege or write-down control is not enabled, the row is updated and the user can set the security label of the row to any valid security label.
  – If the user does not have write-down privilege and write-down control is enabled, the row is not updated.

• If the security label of the row dominates the security label of the user, the row is not updated.

**Updating rows in a table for which row or column access control is enforced:**

When an UPDATE statement is issued for a table for which row or column access control is enforced, the rules specified in the enabled row permissions or column masks determine whether the row can be updated. Typically those rules are based on the authorization ID or role of the process. The following describes how enabled row permissions and column masks are used during UPDATE:

• Row permissions are used to identify the set of rows to be updated.
  When multiple enabled row permissions are defined for a table, a row access control search condition is derived by application of the logical OR operator to the search condition in each enabled permission. This row access control search condition is applied to the table to determine which rows are accessible to the authorization ID or role of the UPDATE statement. If the WHERE clause is specified in the UPDATE statement, the user-specified predicates are applied on the accessible rows to determine the rows to be updated. If there is no WHERE clause, the accessible rows are the rows to be updated.
Column masks are not applicable in this step.
If the table is not enforced by row access control, the WHERE clause determines the rows to be updated, otherwise all rows in the table are to be updated.

• If there are rows to be updated, the following rules determine whether those rows can be updated:
  – For every column to be updated, the new value of the column must not be affected by enabled column masks whose columns are referenced when deriving the new value.

When a column is referenced while deriving the values of a new row, if the column has an enabled column mask, the masked value is used to derive the new values. If the object table is also column access control activated, the column mask applied to derive the new values must ensure the evaluation of the access control rules defined in the column mask resolves the column to itself, not to a constant or an expression. If the column mask does not mask the column to itself, the new value cannot be used for update and an error is returned at run time.

  – If the rows are updatable, and there is a BEFORE UPDATE trigger for the table, the trigger is activated.

Within the trigger actions, the new values for update might be modified in transition variables. When the final values are returned from the trigger, the new values are used for the update.

  – The rows that are to be updated must conform to the enabled row permissions:

For each row that is to be updated, the old values are replaced with the new values that were specified in the UPDATE statement. A row that conforms to the enabled row permissions is a row that, if updated, can be retrieved using the derived row access control search condition.

  – If the rows are updatable, and there is an AFTER UPDATE trigger for the table, the trigger is activated.

The above rules are not applicable to the included columns. The included columns are subject to the rules for the select list because they are not the columns of the object table of the UPDATE statement.

Extended indicator variable usage:
When extended indicator variables are enabled, negative indicator values that are outside the range of -1 through -7 must not be specified, and the default and unassigned extended indicator values must not appear in contexts in which they are not supported.

Extended indicator variables:
Assigning an extended indicator value of unassigned has the effect of leaving the target column set to its current value, as if it had not been specified in the statement. Assigning an extended indicator value of default assigns the default value to the column.

The UPDATE statement must not assign all target columns to the extended indicator value of unassigned.

Extended indicator variables and update triggers:
If a target column has been assigned an extended indicator value of unassigned, the column is not considered to have been updated. The
column is treated as if it had not been specified in the **OF column-name** list of any update trigger that is defined on the target table.

**Considerations for a generated column:**
A generated column that is defined as **GENERATED ALWAYS** should not be specified as the target of an assignment clause unless the value that is to be assigned is specified with the DEFAULT keyword or an extended indicator that specifies that a default value is to be assigned.

**Considerations for a system-period temporal table:**
When a row of a system-period temporal table is updated, **DB2** updates the values of the **row-begin** and **transaction-start-ID** columns as follows:

- A **row-begin** column is assigned a value that is generated by using the time-of-day clock during the execution of the first data change statement in the transaction that requires a value to be assigned to a row-begin column or transaction-start-ID column in a table. This also occurs when a row in a system-period temporal table is deleted. **DB2** ensures the uniqueness of the generated values for a row-begin column across transactions. If multiple rows are updated within a single SQL transaction, the values for the row-begin column are the same for all the rows and are unique from the values that are generated for the column for another transaction.

- A **transaction-start-ID** column is assigned a unique timestamp value per transaction or the null value. The null value is assigned to the transaction-start-ID column if the column is nullable. Otherwise, the value is generated by using the time-of-day clock during execution of the first data change statement in the transaction that requires a value to be assigned to a row-begin column or transaction-start-ID column in a table. This also occurs when a row in a system-period temporal table is deleted. If multiple rows are updated within a single SQL transaction, the values for the transaction-start-ID column are the same for all the rows and are unique from the values that are generated for the column for another transaction.

If the **UPDATE** statement has a search condition that contains a correlated subquery that references historical rows (explicitly referencing the name of the history table or implicitly referenced through the use of a period specification in the FROM clause), the old version of the updated rows that are inserted as historical rows (into the history table) are potentially visible to update operations for the rows that are subsequently processed for the statement.

If the **CURRENT TEMPORAL SYSTEM_TIME** special register is set to a non-null value, the underlying target of the **UPDATE** statement cannot be a system-period temporal table. This restriction applies regardless of whether the system-period temporal table is directly or indirectly referenced.

**Considerations for a history table:**
When a row of a system-period temporal table is updated, a historical copy of the row is inserted into the corresponding history table and the end timestamp of the historical row is captured in the form of a system determined value that corresponds to the time of the data change operation. **DB2** generates the value by using the time-of-day clock during the execution of the first data change statement in the transaction that requires a value to be assigned to a row-begin or transaction-start-ID column in a table. This also occurs when a row in a system-period temporal table is deleted. **DB2** ensures uniqueness of the generated values.
for an end column in a history table across transactions. If a conflicting transaction is updating the same row in the system-period temporal table and the row that is to be inserted into the associated history table would have an end timestamp value that is greater than the begin timestamp value, an error is returned.

Considerations for an application-period temporal table:
An UPDATE statement that contains a FOR PORTION OF BUSINESS_TIME clause for an application-period temporal table indicates the two points in time between which the specified updates are effective.

Suppose that FOR PORTION OF BUSINESS_TIME is specified, and the period value for a row is only partially contained in the period that is specified from \texttt{value1} up to \texttt{value2}. (The period value for a row is specified by the values of the begin column and end column for the BUSINESS_TIME period.) In this case, the row is updated and one or two rows are automatically inserted to represent the portion of the row that is not changed. For each row that is automatically inserted as a result of an update operation on the table, new values are generated for each generated column in the application-period temporal table. If a generated column is defined as part of a unique or primary key, parent key in a referential constraint, or unique index, an automatic insert might violate a constraint or index. In this case, an error is returned.

When an application-period table is the target of an UPDATE statement and the value in effect for the CURRENT TEMPORAL BUSINESS_TIME special register is not the null value, DB2 adds the following additional predicates to the statement:

\begin{verbatim}
   bt_begin <= CURRENT TEMPORAL BUSINESS_TIME 
   AND bt_end > CURRENT TEMPORAL BUSINESS_TIME 
\end{verbatim}

In the preceding code, \texttt{bt_begin} and \texttt{bt_end} are the begin and end columns of the BUSINESS_TIME period of the target table of the UPDATE statement.

If the CURRENT TEMPORAL BUSINESS_TIME special register is set to a non-null value, the target of the UPDATE statement must not be a view if both of the following conditions are true:

\begin{itemize}
\item The view is defined with the WITH CHECK option.
\item The view definition includes a WHERE clause that contains one of the following syntax elements:
  \begin{itemize}
  \item A subquery that directly or indirectly references an application-period temporal table.
  \item An invocation of an SQL routine that has a package associated with it
  \item An invocation of an external routine with a data access indication other than NO SQL
  \end{itemize}
\end{itemize}

Archive-enabled tables:
A reference to an archive-enabled table as the target of the UPDATE statement does not affect rows in the associated archive table.

A data change statement must not reference an archive-enabled table when a system-period temporal table or application-period temporal table is also referenced.

Other SQL statements in the same unit of work:
The following statements cannot follow an UPDATE statement in the same unit of work:
• An ALTER TABLE statement that changes the data type of a column
  (ALTER COLUMN SET DATA TYPE)
• An ALTER INDEX statement that changes the padding attribute of an
  index with varying-length columns (PADDED to NOT PADDED or vice
  versa)

Using UPDATE to reset AREO* status on a table:
An UPDATE statement will reset the AREO* state of a table if all
conditions are true:
• The statement is a searched UPDATE statement. An UPDATE statement
  within a SELECT statement will not reset the AREO* state.
• The expression in the SET clause is not a scalar-fullselect or row-fullselect
• The update operation is against a table in a universal table space
• The table does not have row access control activated
• The SKIP LOCKED DATA clause is not specified
• The WHERE clause is not specified
• A resource unavailable condition is not encountered.

No error or warning SQLCODE is returned if a resource unavailable
condition is encountered. Only a resource unavailable console message
will be displayed.

A DISPLAY DATABASE command can be used to determine if AREO* is
reset.

Examples
Example 1
Change employee 000190’s telephone number to 3565 in DSN8B10.EMP.

UPDATE DSN8B10.EMP
SET PHONENO = '3565'
WHERE EMPNO = '000190';

Example 2
Give each member of department D11 a 100-dollar raise.

UPDATE DSN8B10.EMP
SET SALARY = SALARY + 100
WHERE WORKDEPT = 'D11';

Example 3
Employee 000250 is going on a leave of absence. Set the employee’s pay
values (SALARY, BONUS, and COMMISSION) to null.

UPDATE DSN8B10.EMP
SET SALARY = NULL, BONUS = NULL, COMM = NULL
WHERE EMPNO = '000250';

Alternatively, the statement could also be written as follows:

UPDATE DSN8B10.EMP
SET (SALARY, BONUS, COMM) = (NULL, NULL, NULL)
WHERE EMPNO = '000250';

Example 4
Assume that a column named PROJSIZE has been added to DSN8B10.EMP.
The column records the number of projects for which the employee’s
department has responsibility. For each employee in department E21,
update PROJSIZE with the number of projects for which the department is
responsible.
Example 5
Double the salary of the employee represented by the row on which the cursor C1 is positioned.

```sql
EXEC SQL UPDATE DSN8B10.EMP
SET SALARY = 2 * SALARY
WHERE CURRENT OF C1;
```

Example 6
Assume that employee table EMP1 was created with the following statement:

```sql
CREATE TABLE EMP1
(EMP_ROWID ROWID GENERATED ALWAYS,
 EMPNO CHAR(6),
 NAME CHAR(30),
 SALARY DECIMAL(9,2),
 PICTURE BLOB(250K),
 RESUME CLOB(32K));
```

Assume that host variable HV_EMP_ROWID contains the value of the ROWID column for employee with employee number '350000'. Using that ROWID value to identify the employee and user-defined function UPDATE_RESUME, increase the employee's salary by $1000 and update that employee's resume.

```sql
EXEC SQL UPDATE EMP1
SET SALARY = SALARY + 1000,
RESUME = UPDATE_RESUME(:HV_RESUME)
WHERE EMP_ROWID = :HV_EMP_ROWID;
```

Example 7
In employee table X, give each employee whose salary is below average a salary increase of 10%.

```sql
EXEC SQL UPDATE EMP X
SET SALARY = 1.10 * SALARY
WHERE SALARY < (SELECT AVG(SALARY) FROM EMP Y
WHERE X.JOBCODE = Y.JOBCODE);
```

Example 8
Raise the salary of the employees in department 'E11' whose salary is below average to the average salary.

```sql
EXEC SQL UPDATE EMP T1
SET SALARY = (SELECT AVG(T2.SALARY) FROM EMP T2)
WHERE WORKDEPT = 'E11' AND
SALARY < (SELECT AVG(T3.SALARY) FROM EMP T3);
```

Example 9
Give the employees in department 'E11' a bonus equal to 10% of their salary.

```sql
EXEC SQL
DECLARE C1 CURSOR FOR
SELECT BONUS
FROM DSN8710.EMP
WHERE WORKDEPT = 'E12'
FOR UPDATE OF BONUS;
EXEC SQL
UPDATE DSN8710.EMP
        SET BONUS = ( SELECT .10 * SALARY FROM DSN8710.EMP Y
                      WHERE EMPNO = Y.EMPNO )
        WHERE CURRENT OF C1;

Example 10
Assuming that cursor CS1 is positioned on a rowset consisting of 10 rows in table T1, update all 10 rows in the rowset.
EXEC SQL UPDATE T1 SET C1 = 5 WHERE CURRENT OF CS1;

Example 11
Assuming that cursor CS1 is positioned on a rowset consisting of 10 rows in table T1, update the fourth row of the rowset.
    short ind1, ind2;
    int n, updt_value;
    stmt = 'UPDATE T1 SET C1 = ? WHERE CURRENT OF CS1 FOR ROW ? OF ROWSET'
    ind1 = 0;
    ind2 = 0;
    n = 4;
    updt_value = 5;
    ...
    strcpy(my_sqllda.sqldaid,"SQLDA");
    my_sqllda.sqln = 2;
    my_sqllda.sqld = 2;
    my_sqllda.sqlvar[0].sqltype = 497;
    my_sqllda.sqlvar[0].sqlllen = 4;
    my_sqllda.sqlvar[0].sqldata = (int *) &updt_value;
    my_sqllda.sqlvar[0].sqlind = (short *) &ind1;
    my_sqllda.sqlvar[1].sqltype = 497;
    my_sqllda.sqlvar[1].sqlllen = 4;
    my_sqllda.sqlvar[1].sqldata = (int *) &n;
    my_sqllda.sqlvar[1].sqlind = (short *) &ind2;
    EXEC SQL PREPARE S1 FROM :stmt;
    EXEC SQL EXECUTE S1 USING DESCRIPTOR :my_sqllda;

Example 12
Assume that table POLICY exists and that it is defined with a single period, BUSINESS_TIME. The table contains a row where column BK has a value of 'P138' and column CLIENT has a value of 'C882', and column TYPE has a value of 'PPO'. Update the portion of the row beginning from the current date to set the TYPE column to 'HMO':
UPDATE POLICY
        FOR PORTION OF BUSINESS_TIME
        FROM CURRENT DATE TO DATE '9999-12-31'
        SET TYPE='HMO'
        WHERE BK='P138', CLIENT='C882';

After the UPDATE statement is processed, the table contains 2 rows in place of the original row. One row represents a value of 'PPO' for the TYPE
column (the value before the update) and the other row represents a value of 'HMO' for the TYPE column (that began with the UPDATE statement).

Example 13

Suppose that the INTARRAY and CHARARRAY array types, the INTA, CHARA, and SI variables, and the T1 table are defined as follows:

```sql
CREATE TYPE INTARRAY AS INTEGER ARRAY [6];
CREATE TYPE CHARARRAY AS CHAR(20) ARRAY [7];
DECLARE INTA AS INTARRAY;
DECLARE CHARA AS CHARARRAY;
CREATE VARIABLE SI INT;
CREATE TABLE T1 (COL1 CHAR(7), COL2 INT);
```

Assign values to CHARA, INTA, and SI.

```sql
SET CHARA = ARRAY [ 'a', 'b', 'c' ];
SET INTA = ARRAY [ 1, 2, 3, 4, 5 ];
SET SI = 1;
```

Insert a row into table T1, and then update the row values using values from the CHARA and INTA arrays, which are indexed by the value of variable SI.

```sql
INSERT INTO T1 VALUES ('abc', 10);
UPDATE T1
SET COL1 = CHARA[SI],
    COL2 = INTA[SI];
```

In the table row, COL1 now contains 'a', and COL2 contains 1.

Set the value of column COL2 for all rows to the cardinality of array INTA.

```sql
UPDATE T1
SET COL2 = CARDINALITY(INTA);
```

In the table row, COL2 now contains 5.
VALUES

The VALUES statement provides a method for invoking a user-defined function from a trigger. Transition variables and transition tables can be passed to the user-defined function.

Invocation

This statement can only be used in the triggered action of a trigger.

Authorization

Authorization is required for any expressions that are used in the statement. For more information, see “Expressions” on page 243.

Syntax

```
VALUES expression
    (expression)
```

Description

VALUES

Specifies one or more expressions. If more than one expression is specified, the expressions must be enclosed within parentheses.

expression

Any expression of the type described in “Expressions” on page 243. The expression must not contain a host variable.

The expressions are evaluated, but the resulting values are discarded and are not assigned to any output variables.

If a user-defined function is specified as part of an expression, the user-defined function is invoked. If a negative SQLCODE is returned when the function is invoked, DB2 stops executing the trigger and rolls back any triggered actions that were performed.

Example

Example: Create an after trigger EMPISRT1 that invokes user-defined function NEWEMP when the trigger is activated. An insert operation on table EMP activates the trigger. Pass transition variables for the new employee number, last name, and first name to the user-defined function.

```
CREATE TRIGGER EMPISRT1
    AFTER INSERT ON EMP
    REFERENCING NEW AS N
    FOR EACH ROW
    MODE DB2SQL
    BEGIN ATOMIC
        VALUES(NEWEMP(N.EMPNO, N.LASTNAME, N.FIRSTNAME));
    END
```
VALUES INTO

The VALUES INTO statement assigns one or more values to variables.

Invocation

This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared.

Authorization

The privileges that are held by the authorization ID of the statement must include at least one of the following privileges or authorities:

- The SELECT privilege on every table and view identified in the statement
- Ownership of every table and view identified in the statement
- READ and WRITE privileges on any global variables that are identified in the statement
- Ownership of any global variables that are identified in the statement
- DBADM authority for the database (tables only)
- DATAACCESS authority
- SYSADM authority
- SYSCTRL authority (catalog tables only)

Authorization is required for any expressions that are used in the statement. For more information, see “Expressions” on page 243.
Syntax

VALUES

(1) CURRENT PACKAGESET
CURRENT PACKAGE PATH
CURRENT SERVER

expression

(2) NULL

(3) INTO target-variable

array-variable[array-index]

target-variable:

global-variable-name
host-variable-name
SQL-parameter-name
SQL-variable-name

Notes:

1. When the target is not an SQL parameter or an SQL variable that is used in a native SQL procedure or compiled SQL function, these special registers can be referenced only as a source value in this form of the syntax for this statement.

2. If expression is an array-constructor, it must not be the only source value specification in the list.

3. The number of source value specifications (expression, NULL, or DEFAULT) on the right side of the equal sign must match the number of target specifications on the left side of the statement.

Description

VALUES

Introduces a single row that consists of one or more columns. If more than one value is specified, the list of values must be enclosed within parentheses.

expression

The expression is any expression of the type described in "Expressions" on page 243. In a native SQL routine, the expression can contain a reference to the CURRENT PACKAGESET, CURRENT PACKAGE PATH, or CURRENT SERVER special registers if target-variable is an SQL parameter or SQL variable. The expression must not include a column name.

NULL

The null value. NULL can only be specified for host variables that have an associated indicator variable.

INTO target-variable or array-variable[array-index]

Identifies one or more targets for the assignment of output values. The number of targets in the INTO clause must equal the number of values that are to be assigned. The first value in the result row is assigned to the first target in the list, the second value to the second target, and so on. A target variable must
not be specified more than once in the INTO clause. Each assignment to a
target is made in sequence through the list, according to the rules described in
"Assignment and comparison" on page 123.

The value 'W' is assigned to the SQLWARN3 field of the SQLCA if the number
of targets is less than the number of result column values.

If an error occurs on any assignment, the value is not assigned to the target,
and no more values are assigned to the specified targets. Any values that have
already been assigned remain assigned.

global-variable-name
    Identifies the global variable that is the assignment target.

host-variable-name
    Identifies the host variable that is the assignment target. For LOB
output values, the target can be a regular host variable (if it is large
enough), a LOB locator variable, or a LOB file reference variable.

SQL-parameter-name
    Identifies the parameter that is the assignment target.

SQL-variable-name
    Identifies the SQL variable that is the assignment target. SQL variables
must be declared before they are used.

array-variable [array-index]
    Specifies an array element that is the target of the assignment.
    An array element must not be specified as the target for an assignment
    if common-table-expression is also specified in the statement.

array-variable
    Specifies an array variable.

[array-index]
    An expression that specifies which element in the array is the
target of the assignment.
    For an ordinary array, the array index expression must be
castable to INTEGER, and must not be the null value. The
index value must be between 1 and the maximum cardinality
that is defined for the array.
    For an associative array, the array index expression must be
castable to the index data type of the associative array, and
must not be the null value.

array-index must not be:
    • An expression that references the CURRENT DATE,
      CURRENT TIME, or CURRENT TIMESTAMP special register
    • A nondeterministic function
    • A function that is defined with EXTERNAL ACTION
    • A function that is defined with MODIFIES SQL DATA
    • A sequence expression

Notes
Assignment to targets:
The nth target identified by the INTO clause or described in the SQLDA
corresponds to the nth column of the result table of the cursor. The data
type of target must be compatible with its corresponding value. If the
value is numeric, the target must have the capacity to represent the whole part of the value. For a datetime value, the target must be a character string variable of a minimum length as defined in "String representations of datetime values" on page 103. When the target is a host variable, if the value is null, an indicator variable must be specified.

Assignments are made in sequence through the list. Each assignment to a target is made according to the rules described in Chapter 2, "Language elements," on page 55. If the number of targets is less than the number of values in the row, the SQLWARN3 field of the SQLCA is set to 'W'. There is no warning if there are more targets than the number of result columns. If the target is a host variable and the value is null, an indicator variable must be provided. If an assignment error occurs, the value is not assigned to the target and no more values are assigned to targets. Any values that have already been assigned to targets remain assigned. However, if LOB values are involved, there is a possibility that the corresponding target was modified, but the variable’s contents are unpredictable.

If more than one assignment is included in the same assignment statement, all expressions are evaluated before the assignments are performed. For example, a reference to a variable in an expression always uses the value of the variable prior to any assignment in the assignment statement.

Normally, you use LOB locators to assign and retrieve data from LOB columns. However, because of compatibility rules, you can also use LOB locators to assign data to targets with other data types. For more information on using locators, see Saving storage when manipulating LOBs by using LOB locators (DB2 Application programming and SQL).

Default encoding scheme:
The default encoding scheme for the data is the value in the bind option ENCODING, which is the option for application encoding. If this statement is used with functions such as LENGTH or SUBSTRING that are operating on LOB locators, and the LOB data that is specifies by the locator is in a different encoding scheme from the ENCODING bind option, LOB materialization and character conversion occur. To avoid LOB materialization and character conversion, select the LOB data from the SYSIBM.SYSDUMMYA, SYSIBM.SYSDUMMYE, or SYSIBM.SYSDUMMYU sample table.

Examples

Example 1: Assign the value of the CURRENT PATH special register to host variable HV1.
EXEC SQL VALUES(CURRENT PATH) INTO :HV1;

Example 2: Assign the value of the CURRENT MEMBER special register to host variable MEM.
EXEC SQL VALUES(CURRENT MEMBER) INTO :MEM;

Example 3: Assume that LOB locator LOB1 is associated with a CLOB value. Assign a portion of the CLOB value to host variable DETAILS using the LOB locator.
EXEC SQL VALUES (SUBSTR(:LOB1,1,35)) INTO :DETAILS;
If the LOB data that is specified by the LOB locator \textit{LOB1} is in a different encoding scheme from the value of the ENCODING bind option, and you want to avoid LOB materialization and character conversion, use the following statement instead of the VALUES INTO statement:

\begin{verbatim}
   EXEC SQL SELECT SUBSTR(:LOB1,1,35)
               INTO :DETAILS
               FROM SYSIBM.SYSDUMMYU;
\end{verbatim}

\textit{Example 4:} Using a VALUES INTO statement, retrieve the value of \texttt{INTVAR1} into an element in array \texttt{MYINTARRAY1}, which is indexed by the value of the expression \texttt{INTCOL2+MYINTVAR+1}.

\begin{verbatim}
   VALUES INTVAR1 INTO MYINTARRAY1[INTCOL2+MYINTVAR+1];
\end{verbatim}
WHenever

The WHENEVER statement specifies the host language statement to be executed when a specified exception condition occurs.

Invocation

This statement can only be embedded in an application program. It is not an executable statement. It must not be specified in Java or REXX.

Authorization

None required.

Syntax

```
WHENEVER NOT FOUND CONTINUE
SQLERROR GOTO host-label
SQLWARNING GO TO :;
```

Description

The NOT FOUND, SQLERROR, or SQLWARNING clause is used to identify the type of exception condition.

NOT FOUND

Identifies any condition that results in an SQLCODE of +100 (equivalently, an SQLSTATE code of '02000').

SQLERROR

Identifies any condition that results in a negative SQLCODE.

SQLWARNING

Identifies any condition that results in a warning condition (SQLWARN0 is W), or that results in a positive SQLCODE other than +100.

The CONTINUE or GO TO clause specifies the next statement to be executed when the identified type of exception condition exists.

CONTINUE

Specifies the next sequential statement of the source program.

GOTO or GO TO host-label

Specifies the statement identified by host-label. For host-label, substitute a single token, optionally preceded by a colon. The form of the token depends on the host language. In COBOL, for example, it can be section-name or an unqualified paragraph-name.

Notes

There are three types of WHENEVER statements:

- WHENEVER NOT FOUND
- WHENEVER SQLERROR
- WHENEVER SQLWARNING
Every executable SQL statement in an application program is within the scope of one implicit or explicit WHENEVER statement of each type. The scope of a WHENEVER statement is related to the listing sequence of the statements in the application program, not their execution sequence.

An SQL statement is within the scope of the last WHENEVER statement of each type that is specified before that SQL statement in the source program. If a WHENEVER statement of some type is not specified before an SQL statement, that SQL statement is within the scope of an implicit WHENEVER statement of that type in which CONTINUE is specified. If a WHENEVER statement is specified in a Fortran subprogram, its scope is that subprogram, not the source program.

The GET DIAGNOSTICS statement can be used to provide additional information.

Examples

The following statements can be embedded in a COBOL program.

**Example 1:** Go to the label HANDLER for any statement that produces an error.
   EXEC SQL WHENEVER SQLERROR GOTO HANDLER END-EXEC.

**Example 2:** Continue processing for any statement that produces a warning.
   EXEC SQL WHENEVER SQLWARNING CONTINUE END-EXEC.

**Example 3:** Go to the label ENDDATA for any statement that does not return.
   EXEC SQL WHENEVER NOT FOUND GO TO ENDDATA END-EXEC.
Chapter 7. SQL control statements for SQL routines

SQL control statements for SQL routines can be used in SQL functions and native SQL procedures. SQL control statements provide the capability to control the logic flow, declare and set variables, and handle warnings and exceptions. Some SQL control statements include other nested SQL statements.

SQL-control-statement:

Control statements are supported in SQL functions and SQL procedures.

- SQL functions are created by specifying LANGUAGE SQL and an SQL routine body in a CREATE FUNCTION statement. An SQL function can be changed. A new SQL routine body can be specified in an ALTER FUNCTION statement.
- SQL procedures are created by specifying LANGUAGE SQL and an SQL routine body in a CREATE PROCEDURE statement. An SQL procedure can be changed. A new SQL routine body can be specified in an ALTER PROCEDURE statement.

The SQL routine body must be a single SQL statement, which might be an SQL control statement.

The SQL routine body is the executable part of the function or procedure and is transformed by DB2 into a program.

The remainder of the topics about SQL control statements for SQL routines contain information about references to SQL parameters and variables, SQL condition names, SQL cursor names, labels, and reference information for the use of the statements that constitute the SQL routine body.

The two common elements that are used in describing specific SQL control statements are:

- SQL control statements as described above
- “SQL-procedure-statement” on page 2034
References to SQL parameters and SQL variables

SQL parameters and SQL variables can be referenced anywhere in the statement where an expression or a variable can be specified. Host variables cannot be specified in SQL routines. SQL parameters can be referenced anywhere in the routine and can be qualified with the routine name. SQL variables can be referenced anywhere in the compound statement in which they are declared, including any statement that is directly or indirectly nested within that compound statement.

If the compound statement where the variable is declared has a label, references to the variable name can be qualified with that label.

All SQL parameters and SQL variables are considered nullable. The name of an SQL parameter or an SQL variable in an SQL routine can be the same as the name of a column in a table or view that is referenced in the routine. The name of an SQL variable can also be the same as the name of another SQL variable that is declared in the same routine. This can occur when the two SQL variables are declared in different compound-statements. The compound-statement that contains the declaration of an SQL variable determines the scope of that variable. See "compound-statement" on page 2043 for additional information.

Names that are the same should be explicitly qualified. Qualifying a name clearly indicates whether the name refers to a column, an SQL variable, or an SQL parameter. If the name is not qualified or is qualified but is still ambiguous, the following rules describe whether the name refers to a column or to an SQL variable or an SQL parameter in an SQL routine:

• The name is checked to see if it is the name of a column of any existing table or a view that is specified in the SQL routine body at the current server. If the name is found as a column name, but the privilege set that is used to issue the CREATE PROCEDURE or ALTER PROCEDURE statement does not have the proper authority to access the table or view, the VALIDATE option that is in effect for the procedure determines what happens:
  – If VALIDATE BIND is in effect, an error is returned.
  – If VALIDATE RUN is in effect, the name is assumed to be a column name. If the privilege set that is used to issue the CREATE statement does not have the proper authority to access the table or view at run time, an error is returned.

• If the referenced tables or views do not exist at the current server, the name will be checked first as an SQL variable name in the compound statement and then as an SQL parameter name. The variable can be declared within the compound-statement that contains the reference, or within a compound statement in which that compound statement is nested. If two SQL variables are within the same scope and have the same name, the SQL variable that is declared in the innermost compound statement is used. If the name is not found as an SQL parameter or SQL variable, the VALIDATE option that is in effect for the procedure determines what happens:
  – If VALIDATE BIND is in effect, an error is returned.
  – If VALIDATE RUN is in effect, the name is assumed to be a column name. If a column does not exist with that name at run time, an error is returned.
The name of an SQL variable or an SQL parameter in an SQL routine can be the name of an identifier that is used in certain SQL statements. If the name is not qualified, the following rules describe whether the name refers to an identifier, an SQL variable, or an SQL parameter:

- In the SET CURRENT PACKAGE PATH, SET PATH and SET SCHEMA statements, the name is checked as an SQL variable name or an SQL parameter name. If an SQL variable or SQL parameter with that name is not found, the name is assumed to be an identifier.
- In the ASSOCIATE LOCATORS, CONNECT, RELEASE (connection), and SET CONNECTION statements, the name is used as an identifier.

### References to SQL condition names

A condition name can only be referenced within the compound statement in which it is declared, including any compound statements that are nested within that compound statement. When there is a reference to a condition name, the condition that is declared in the innermost compound statement is the condition that is used.

The name of an SQL condition can be the same as the name of another SQL condition that is declared in the same routine. This can occur when the two SQL conditions are declared in different compound statements. The compound statement that contains the declaration of an SQL condition name determines the scope of that condition name. A condition name must be unique within the compound statement in which it is declared, excluding any declarations in compound statements that are nested within that compound statement. A condition name can only be referenced within the compound statement in which it is declared, including any compound statements that are nested within that compound statement. When there is a reference to a condition name, the condition that is declared in the innermost compound statement is the condition that is used. See "compound-statement" on page 2043 for additional information.

### References to SQL cursor names

A cursor name can only be referenced within the compound statement in which it is declared, including any compound statements that are nested within that compound statement.

The name of an SQL cursor can not be the same as the name of another SQL cursor that is declared on the same routine. The compound statement that contains the declaration of an SQL cursor name determines the scope of that cursor name. A cursor name can only be referenced within the compound statement in which it is declared, including any compound statements that are nested within that compound statement. See "compound-statement" on page 2043 for additional information.

### References to labels

Specifying a label for an SQL procedure statement defines that label and determines the scope of that label. A label name can only be referenced within the compound statement in which it is defined, including a reference from any statement that is directly or indirectly nested within that compound statement. The FOR statement is considered the same as a compound statement with respect to defining and referencing labels. A label can be specified as the target of a GOTO, LEAVE, or ITERATE statement, subject to the rules for the statement that references the label as a target.
Labels can be specified on most SQL procedure statements. If a label is specified on an SQL procedure statement, it must be unique from other labels within the same scope. A label must not be the same as any other label within the same compound statement, must not be the same as a label specified on the compound statement itself, and if the compound statement is nested within another compound statement, the label must not be the same as the label specified on any higher level compound statement. The label must not be the same as the name of the SQL procedure.

Nested compound statements and scope of names

Nested compound statements can be used within an SQL routine to define the scope of SQL variable declarations, cursors, condition names, and condition handlers.

In addition, labels have a defined scope in the context of nested compound statements. However, the rules for name spaces and how non-unique names can be referenced, differs depending on the type of name. The following table summarizes these differences:

<table>
<thead>
<tr>
<th>Type of name</th>
<th>Name can be qualified</th>
<th>Name must be unique within</th>
<th>Name can be referenced within</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQL variable</td>
<td>Yes. The name can be qualified with the label of the compound statement in which the variable is declared</td>
<td>the compound statement in which it is declared, excluding any declarations in compound statements that are nested within that compound statement</td>
<td>The compound statement in which it is declared, including any compound statements that are nested within that compound statement. When multiple SQL variables are defined with the same name, a label can be used to explicitly refer to a specific variable that is not the most local in scope</td>
</tr>
<tr>
<td>condition name</td>
<td>No</td>
<td>the compound statement in which it is declared, excluding any declarations in compound statements that are nested within that compound statement</td>
<td>The compound statement in which it is declared, including any compound statements that are nested within that compound statement. Condition names can be used in the declaration of a condition handler, or in a SIGNAL or RESIGNAL statement. If multiple conditions are defined with the same name, there is no way to explicitly refer to the condition that is not the most local in scope</td>
</tr>
<tr>
<td>Type of name</td>
<td>Name can be qualified</td>
<td>Name must be unique within</td>
<td>Name can be referenced within</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------</td>
<td>-----------------------------</td>
<td>------------------------------</td>
</tr>
<tr>
<td>cursor name</td>
<td>No</td>
<td>the routine</td>
<td>The compound statement in which it is declared, including any compound statements that are nested within that compound statement. If the cursor is defined as a result set cursor, the invoking application can access the result set.</td>
</tr>
<tr>
<td>label</td>
<td>No</td>
<td>the compound statement that defined the label, including any definitions in compound statements that are nested within that compound statement</td>
<td>The compound statement in which it is defined, including any compound statements that are nested within that compound statement. Use a label to qualify the name of an SQL variable or as the target of a GOTO, LEAVE, or ITERATE statement, subject to the rules for these statements.</td>
</tr>
</tbody>
</table>
An SQL control statement can allow multiple SQL statements to be specified within the SQL control statement. These statements are defined as SQL procedure statements.

Syntax

Notes:
1. The statement is not allowed in an SQL-routine-body for an SQL function.
2. An ALTER FUNCTION statement (SQL scalar) or an ALTER PROCEDURE statement (SQL - native) with an ADD VERSION or REPLACE clause is not allowed in an SQL-routine-body.
3. The COMMIT, ROLLBACK, CONNECT, and SET CONNECTION statements must only be specified within the body of an SQL procedure. The COMMIT statement and the ROLLBACK statement (without the TO SAVEPOINT clause) must not be issued in a routine body if the routine is in the calling chain of an SQL routine, or an external routine.
Notes:

1. The statement is not allowed in an *SQL-routine-body* for an SQL function.
2. A FETCH statement must not specify a *fetch-orientation* clause, *multiple-row-fetch clause*, the WITH CONTINUE or the CURRENT CONTINUE clauses.
3. The COMMIT, ROLLBACK, CONNECT, and SET CONNECTION statements must only be specified within the body of an SQL procedure. The COMMIT statement and the ROLLBACK statement (without the TO SAVEPOINT clause) must not be issued in a routine body if the routine is in the calling chain of an SQL routine, or an external routine.

Description

*SQL-control-statement*

Specifies an SQL statement that provides the capability to control logic flow, declare and set variables, and handle warnings and exceptions, as defined in this section. Control statements are supported in SQL routines.

*SQL-statement*

Specifies an SQL statement. These statements are described in Chapter 6, "Statements," on page 865.

Notes

*Comments*: Comments can be included within the body of an SQL routine. In addition to the double-dash form of comments (--), a comment can begin with /* and end with */. The following rules apply to this form of comment:

- The beginning characters /* must be adjacent and on the same line.
- The ending characters */ must be adjacent and on the same line.
- Comments can be started wherever a space is valid.
- Comments can be continued to the next line.
Detecting and processing error and warning conditions: As an SQL statement is executed, DB2 stores information about the processing of the statement in a diagnostics area (including the SQLSTATE and SQLCODE), unless otherwise noted in the description of the SQL statement. A completion condition can indicate that the SQL statement completed successfully, completed with a warning condition, or completed with a not found condition. An exception condition indicates that the SQL statement was not successful.

A condition handler can be defined to execute when an exception condition, a warning condition, or a not found condition occurs in a compound statement. The declaration of a condition handler includes the code that is executed when the condition handler is activated. When a condition other than a successful completion occurs in the processing of SQL-procedure-statement and a condition handler that can handle the condition is within scope, one such condition handler will be activated to process the condition. See "compound-statement" on page 2043 for information about defining condition handlers. The code in the condition handler can check for a warning condition, a not found condition, or an exception condition and can take the appropriate action. Use one of the following methods at the beginning of the body of a condition handler to check the condition in the diagnostics area that caused the handler to be activated.

- Issue a GET DIAGNOSTICS statement to request the information from the diagnostics area. See "GET DIAGNOSTICS" on page 1744.
- Test the SQLSTATE and SQLCODE SQL variables.

If the condition is a warning and no handler exists for the condition, the previous two methods can be used outside of the body of a condition handler, if they are used immediately following the statement for which the condition is wanted. If the condition is an error and no handler exists for the condition, the routine terminates with the error condition.
**assignment-statement**

The assignment statement assigns a value to variables or array elements. The target value can be an SQL parameter or an SQL variable.

**Syntax**

```
label: SET assignment-clause
```

**Description**

`label`

Specifies the label for assignment-statement. The label name cannot be the same as the name of the SQL routine, or another label within the same scope. For additional information, see "References to labels" on page 2031.

See "SET assignment-statement" on page 1941 for details.

**Notes**

*Assignment rules:* Assignment statements in SQL routines must conform to the SQL assignment rules. For example, the data type of the target and source must be compatible. See "Assignment and comparison" on page 123 for assignment rules.

When a string is assigned to a fixed-length variable and the length of the string is less than the length attribute of the target, the string is padded on the right with the necessary number of single-byte or double-byte blanks. When a string is assigned to a variable and the string is longer than the length attribute of the variable, the value is truncated and a warning is returned.

If truncation of the whole part of a number occurs on assignment to a numeric variable, the value is truncated and a warning is returned.

*Assignments involving SQL parameters for SQL procedures:* An IN parameter can appear on the left or right side in an assignment statement. When control returns to the caller, the original value of the IN parameter is retained. An OUT parameter can also appear on the left or right side in an assignment statement. If used without first being assigned a value, the value is undefined. When control returns to the caller, the last value that is assigned to an OUT parameter is returned to the caller. For an INOUT parameter, the first value of the parameter is determined by the caller, and the last value that is assigned to the parameter is returned to the caller.

*Multiple assignments:* If more than one assignment is included in the same assignment statement, all expressions are evaluated before the assignments are performed. Thus, references to an SQL variable or SQL parameter in an expression always use the value of the SQL variable or SQL parameter prior to any assignment in the assignment statement.

*Considerations for SQLSTATE and SQLCODE SQL variables:* Assignment to these variables is not prohibited. However, it is not recommended as assignment does not affect the diagnostic area or result in the activation of condition handlers.
Furthermore, processing an assignment to these SQL variables causes the specified values for the assignment to be overlayed with the SQL return codes returned from executing the statement that does the assignment.
CALL statement

The CALL statement invokes a stored procedure.

Syntax

\[ \text{CALL} \text{ procedure-name} \text{ argument-list} \]

Description

label
Specifies the label for the CALL statement. The label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 2031.

procedure-name
Identifies the stored procedure to call. The procedure name must identify a stored procedure that exists at the current server.

argument-list
Identifies a list of values to be passed as parameters to the stored procedure. The \( n \)th value corresponds to the \( n \)th parameter in the procedure. The number of parameters must be the same as the number of parameters defined for the stored procedure. See "CALL" on page 1163 for more information.

Control is passed to the stored procedure according to the calling conventions for SQL routines. When execution of the stored procedure is complete, the value of each parameter of the stored procedure is assigned to the corresponding parameter of the CALL statement defined as OUT or INOUT.

SQL-variable-name
Specifies an SQL variable as an argument to the stored procedure. For an explanation of references to SQL variables, see "References to SQL parameters and SQL variables" on page 2030.

SQL-parameter-name
Specifies an SQL parameter as an argument to the stored procedure. For an explanation of references to SQL parameters, see "References to SQL parameters and SQL variables" on page 2030.

expression
The parameter is the result of the specified expression, which is evaluated.
before the stored procedure is invoked. If *expression* is a single
*SQL-parameter-name* or *SQL-variable-name*, the corresponding parameter of
the procedure can be defined as IN, INOUT, or OUT. Otherwise, the
corresponding parameter of the procedure must be defined as IN. If the
result of the *expression* can be the null value, either the description of the
procedure must allow for null parameters or the corresponding parameter
of the stored procedure must be defined as OUT.

The following additional rules apply depending on how the corresponding
parameter was defined in the CREATE PROCEDURE statement for the
procedure:

- **IN** *expression* can contain references to multiple SQL parameters or
  variables. In addition to the rules stated in “Expressions” on page 243
  for *expression*, *expression* cannot include a column name, an aggregate
  function, or a user-defined function that is sourced on an aggregate
  function.
- **INOUT** or **OUT** *expression* can only be a single SQL parameter or
  variable.

**NULL**
The parameter is a null value. The corresponding parameter of the
procedure must be defined as IN and the description of the procedure
must allow for null parameters.

**Notes**
See “CALL” on page 1163 for more information on the SQL CALL statement.

**Examples**

Call stored procedure procl and pass SQL variables as parameters.

```
CALL procl(v_empno, v_salary)
```
The CASE statement selects an execution path based on multiple conditions. A CASE statement operates in the same way as a CASE expression.

**Syntax**

```sql
CASE label:
  simple-when-clause
  searched-when-clause
  else-clause
END CASE
```

**Description**

- **label**
  Specifies the label for the CASE statement. The label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 2031.

- **CASE**
  Begins a case-expression.

- **simple-when-clause**
  The value of the expression prior to the first WHEN keyword is tested for equality with the value of the expression that follows each WHEN keyword. If the comparison is true, the statements in the associated THEN clause are...
executed and processing of the CASE statement ends. If the result is unknown or false, processing continues to the next comparison. If the result does not match any of the comparisons, and an ELSE clause is present, the statements in the ELSE clause are executed.

**searched-when-clause**

The search-condition following the WHEN keyword is evaluated. If it evaluates to true, the statements in the associated THEN clause are executed and processing of the CASE statement ends. If it evaluates to false, or unknown, the next search-condition is evaluated. If no search-condition evaluates to true and an ELSE clause is present, the statements in the ELSE clause are executed.

When searched-when-clause is used, search-condition cannot contain a fullselect.

**SQL-procedure-statement**

Specifies a statement to execute. See “SQL-procedure-statement” on page 2034.

**search-condition**

Specifies a condition that is true, false, or unknown about a row or group of table data.

**ELSE SQL-procedure-statement**

If none of the conditions specified in the simple-when-clause or searched-when-clause are true, the statements specified in SQL-procedure-statement are executed.

If none of the conditions specified in the WHEN clauses are true and an ELSE is not specified, an error is issued when the statement executes, and the execution of the CASE statement is terminated.

**END CASE**

Ends a case-statement.

**Examples**

**Example 1:** Use a simple case statement WHEN clause to update column DEPTNAME in table DEPT, depending on the value of SQL variable v_workdept.

```sql
CASE v_workdept
  WHEN 'A00'
    THEN UPDATE DEPT SET DEPTNAME = 'DATA ACCESS 1';
  WHEN 'B01'
    THEN UPDATE DEPT SET DEPTNAME = 'DATA ACCESS 2';
  ELSE UPDATE DEPT SET DEPTNAME = 'DATA ACCESS 3';
END CASE
```

**Example 2:** Use a searched case statement WHEN clause to update column DEPTNAME in table DEPT, depending on the value of SQL variable v_workdept.

```sql
CASE
  WHEN v_workdept < 'B01'
    THEN UPDATE DEPT SET DEPTNAME = 'DATA ACCESS 1';
  WHEN v_workdept < 'C01'
    THEN UPDATE DEPT SET DEPTNAME = 'DATA ACCESS 2';
  ELSE UPDATE DEPT SET DEPTNAME = 'DATA ACCESS 3';
END CASE
```
compound-statement

A compound statement groups other statements together in an SQL routine. A compound statement allows the declaration of SQL variables, cursors, and condition handlers.

Syntax

SQL-variable-declaration:

SQL-condition-declaration:

return-codes-declaration:
**statement-declaration:**

\[
\text{DECLARE statement-name }
\]

**Notes:**
1. The statement is not allowed in an *SQL-routine-body* for an SQL function.

**handler-declaration:**

\[
\text{DECLARE CONTINUE HANDLER FOR specific-condition-value SQL-procedure-statement }
\]

**specific-condition-value:**

\[
\text{SQLSTATE VALUE string-constant condition-name }
\]

**general-condition-value:**

\[
\text{SQLWARNING NOT FOUND }
\]

**Description**

*label*

Specifies the label for the *compound-statement*. If the beginning label is specified, it can be used to qualify SQL variables declared in the compound statement and can also be specified as the target on a LEAVE statement. If the ending
label is specified, it must be the same as beginning label. The label name
cannot be the same as the routine name or another label within the same
scope.

**NOT ATOMIC**

NOT ATOMIC indicates that an unhandled exception condition within the
compound-statement does not cause the compound-statement to be rolled back.

**SQL-variable-declaration**

Declares a variable that is local to the compound statement.

**SQL-variable-name**

Defines the name of a variable. DB2 converts all SBCS SQL variable names
that are not delimited to uppercase. **SQL-variable-name** must be unique
within the compound statement in which it is declared, excluding any
declarations in compound statements that are nested within that
compound statement. **SQL-variable-name** must not be the same as a
parameter name. See "References to SQL parameters and SQL variables" on page 2030 for information about how SQL variable names are resolved
when there are columns with the same name as an SQL variable involved
in a statement, or when multiple SQL variables exist with the same name
in the routine body.

**SQL-variable-name** can only be referenced within the compound statement
in which it is declared, including any compound statement that is nested
within that compound statement. If the compound statement where the
variable is declared has a label, references to the variable name can be
qualified with that label. For example, an SQL variable V that is declared
in a compound statement that is labeled C can be referenced as C.V.

**data-type**

Specifies the data type and length of the variable. SQL variables follow the
same rules for default lengths and maximum lengths as SQL routine
parameters. See "CREATE FUNCTION (compiled SQL scalar)" on page
1212 and "CREATE PROCEDURE (SQL - native)" on page 1405 for
descriptions of SQL data types and lengths.

**DEFAULT constant or NULL**

Defines the default for the SQL variable. The specified constant must
represent a value that could be assigned to the variable in accordance with
the rules of assignment as described in "Assignment and comparison" on
page 123. The variable is initialized when the compound statement begins
processing. If a default value is not specified, the SQL variable is initialized
to NULL. Only DEFAULT NULL can be explicitly specified if
**array-type-name** is specified.

**RESULT_SET_LOCATOR VARYING**

Specifies the data type for a result set locator variable.

**SQL-condition-declaration**

Declares a condition name and corresponding SQLSTATE value.

**SQL-condition-name**

Specifies the name of the condition. The condition name must be unique
within the compound statement in which it is declared, excluding any
declarations that are in compound statements that are nested within that
compound statement. A condition name can only be referenced within the
compound statement in which it is declared, including any compound
statements that are nested within that compound statement.
FOR SQLSTATE string-constant
 Specifies the SQLSTATE that is associated with the condition. The string
 must be specified as five characters enclosed in single quotes, and the
 SQLSTATE class (the first two characters) must not be '00'.

return-codes-declaration
 Declares special variables named SQLSTATE and SQLCODE. These variables
 are automatically set to the SQLSTATE and SQLCODE values for the first
 condition in the diagnostics area after executing an SQL statement other than
 GET DIAGNOSTICS or an empty compound statement.

The SQLSTATE and SQLCODE SQL variables are only intended to be used as
a means of obtaining the SQL return codes that resulted from processing the
previous SQL statement other than GET DIAGNOSTICS. If there is any
intention to use the SQLSTATE and SQLCODE values, save the values
immediately to other SQL variables to avoid having the values replaced by the
SQL return codes returned after executing the next SQL statement. If a handler
is defined that handles an SQLSTATE, you can use an assignment statement to
save that SQLSTATE (or the associated SQLCODE) value in another SQL
variable, if the assignment is the first statement in the handler.

Assignment to these variables is not prohibited; however, it is not
recommended. Assignment to these variables is ignored by condition handlers,
and processing an assignment to these special variables causes the specified
values for the assignment to be overlayed with the SQL return codes returned
from executing the statement that does the assignment. The SQLSTATE and
SQLCODE SQL variables cannot be set to NULL.

statement-declaration
 Declares a list of one or more names that are local to the compound statement.
A statement name cannot be the same as another statement name within the
same compound statement.

DECLARE-CURSOR-statement
 Declares a cursor in the procedure body. Each cursor must have a unique name
within the routine. The cursor can only be referenced from within the
compound statement in which it is declared, including any compound
statements that are nested within that compound statement. Use an OPEN
statement to open the cursor, a FETCH statement to read a row using the
cursor, and a CLOSE statement to close the cursor. If the cursor is intended for
use as a result set cursor:
• Specify WITH RETURN when the cursor is declared
• Create the procedure using the DYNAMIC RESULT SETS clause with a
  non-zero value
• Do not specify a CLOSE statement for the cursor in the compound statement

For additional information about declaring a cursor, see “DECLARE CURSOR”
on page 1598.

handler-declaration
 Specifies a condition handler, an SQL-procedure-statement to execute when an
exception or completion condition occurs in the compound-statement. The
SQL-procedure-statement executes when a condition handler receives control.

A condition handler declaration cannot reference the same condition value or
SQLSTATE value more than one time. It cannot reference an SQLSTATE value
and a condition name that represent the same SQLSTATE value.

When two or more condition handlers are declared in a compound statement,
no two condition handler declarations can specify the same:
• general condition category
• specific condition, either as an SQLSTATE value or as a condition name that represents the same value

A condition handler is active for the set of SQL-procedure-statements that follow the condition handler declarations within the compound statement in which the condition handler is declared, including any nested compound statements.

CONTINUE
Specifies that after the condition handler is activated and completes successfully, control is returned to the SQL statement that follows the statement that raised the condition. However, if the condition is an error condition and it was encountered while evaluating a search condition, as in a CASE, FOR, IF, REPEAT or WHILE statement, control returns to the statement that follows the corresponding END CASE, END FOR, END IF, END REPEAT, or END WHILE.

EXIT
Specifies that after the condition handler is activated and completes successfully, control is returned to the end of the compound statement that declared the condition handler.

The conditions that can cause the handler to gain control are:

**SQLSTATE** *string-constant*
Specifies that the handler is invoked when the specific SQLSTATE occurs. The first two characters of the SQLSTATE value must not be '00'.

**SQL-condition-name**
Specifies that the handler is invoked when the specific SQLSTATE that is associated with the condition name occurs. The SQL-condition-name must be declared within the compound statement that contains the handler declarations, or within a compound statement in which that compound statement is nested.

**SQLEXCEPTION**
Specifies that the handler is invoked when an SQLEXCEPTION occurs. An SQLEXCEPTION is an SQLSTATE in which the class code is a value other than '00', '01', or '02'. For more information on SQLSTATE values, see DB2 Codes.

**SQLWARNING**
Specifies that the handler is invoked when an SQLWARNING occurs. An SQLWARNING is an SQLSTATE value with a class code of '01'.

**NOT FOUND**
Specifies that the handler is invoked when a NOT FOUND condition occurs. NOT FOUND corresponds to an SQLSTATE value with a class code of '02'.

Notes
Unlike host variables, SQL variables are not preceded by colons when they are used in SQL statements.

*Nesting compound statements:* Compound statements can be nested. Nested compound statements can be used to scope variable definitions, condition names, condition handlers, and cursors to a subset of the statements in a routine. This can
simplify the processing that is done for each SQL routine statement. Nested compound statements enable the use of a compound statement within the declaration of a condition handler.

**The scope of a cursor:** The scope of a cursor name is the compound statement in which it is declared, including any compound statements that are nested within that compound statement. A cursor name can only be referenced within the compound statement in which it is declared, including any compound statements that are nested within that compound statement.

**Considerations for statement-name:** The scope of a statement-name that is declared in a compound statement is the compound statement and any nested compound statements (unless the same statement-name is declared in a nested compound statement). If a statement-name is used in a DECLARE CURSOR statement or a PREPARE statement and has not been declared in the compound statement where it is used or any outer compound statements in which it is nested, the statement-name is assumed to be declared globally for the routine.

**Condition handlers:** Condition handlers in SQL routines are similar to WHENEVER statements that are used in external SQL application programs. A condition handler can be defined to automatically get control when an exception, warning, or not found condition occurs. The body of a condition handler contains code that is executed when the condition handler is activated. A condition handler can be activated as the result of an exception, a warning, or a not found condition that is returned by DB2 for the processing of an SQL statement. Or the condition that activates the handler can be the result of a SIGNAL or RESIGNAL statement that is issued within the SQL routine body.

A condition handler is declared within a compound statement, and it is active for the set of SQL-procedure-statements that follow all of the condition handler declarations within the compound statement in which the condition handler is declared. For example, the scope of a condition handler declaration H is the list of SQL-procedure-statements that follow the condition handler declarations that are contained within the compound statement in which H appears. This means that the scope of H does not include the statements that are contained in the body of the condition handler H, implying that a condition handler cannot handle conditions that arise inside its own body. Similarly, for any two condition handlers H1 and H2 that are declared in the same compound statement, H1 will not handle conditions that arise in the body of H2, and H2 will not handle conditions that arise in the body of H1.

The declaration of a condition handler specifies the condition that activates it, the type of condition handler (CONTINUE or EXIT), and the handler action. The type of condition handler determines to where control is returned after the handler action successfully completes.

**Condition handler activation:** When a condition other than a successful completion occurs in the processing of SQL-procedure-statement, if a condition handler that could handle the condition is within scope, one such condition handler will be activated to process the condition.

In a routine with nested compound statements, condition handlers that could handle a specific condition might exist at several levels of the nested compound statements. The condition handler that is activated is a condition handler that is declared innermost to the scope in which the condition was encountered. If more
than one condition handler at the nesting level could handle the condition, the condition handler that is activated is the most appropriate handler that is declared in that compound statement.

The most appropriate handler is the condition handler that most closely matches the SQLSTATE or the exception or completion condition. For a given compound statement, when both a specific handler for a condition and a general handler are declared that address the same condition, the specific handler takes precedence over the general handler.

For example, if the innermost compound statement declares a specific handler for SQLSTATE '22001', as well as a general handler for SQLEXCEPTION, the specific handler for SQLSTATE '22001' is the most appropriate handler when SQLSTATE '22001' is encountered. In this case, the specific handler is activated.

When a condition handler is activated, the condition handler action is executed. If the handler action completes successfully or with an unhandled warning, the diagnostics area is cleared, and the type of the condition handler (CONTINUE or EXIT handler) determines to where control is returned. Additionally, the SQLSTATE and SQLCODE SQL variables are cleared when a handler completes successfully or with an unhandled warning.

If the handler action does not complete successfully and an appropriate handler exists for the condition that is encountered in the handler action, that condition handler is activated. Otherwise, the condition that is encountered within the condition handler is unhandled.

**Unhandled conditions:** If a condition is encountered and an appropriate handler does not exist for that condition, the condition is unhandled.

- If the unhandled condition is an exception, the SQL routine that contains the failing statement is terminated with an unhandled exception condition.
- If the unhandled condition is a warning or is a not found condition, processing continues with the next statement. Note that the processing of the next SQL statement will cause information about the unhandled condition in the diagnostics area to be overwritten, and evidence of the unhandled condition will no longer exist.

**Considerations for using SIGNAL and RESIGNAL statements with nested compound statements:** If an SQL-procedure-statement that is specified in the condition handler is either a SIGNAL or RESIGNAL statement with an exception SQLSTATE, the compound statement terminates with the specified exception. This happens even when this condition handler or another condition handler in the same compound statement specifies CONTINUE, since these condition handlers are not in the scope of this exception. If a compound statement is nested in another compound statement, condition handlers in the higher level compound statement can handle the exception because those condition handlers are within the scope of the exception.

**SQLSTATE and SQLCODE variables in SQL routines:** To help debug your SQL routines, you might find it useful to check the SQLSTATE and SQLCODE value after executing a statement. An SQLCODE or SQLSTATE variable can be declared and subsequently referenced in an SQL routine. You could insert the value of the SQLCODE and SQLSTATE into a table at various points in the SQL routine, or return the SQLCODE and SQLSTATE values in a diagnostics string as an OUT
parameter. To use the SQLCODE and SQLSTATE values, you must declare the following SQL variables in the SQL routine body:

```sql
DECLARE SQLCODE INTEGER DEFAULT 0;
DECLARE SQLSTATE CHAR(5) DEFAULT '00000';
```

When you reference the SQLCODE or SQLSTATE variables in an SQL routine, DB2 sets the value of SQLCODE to 0 and SQLSTATE to '00000' for the subsequent statement. You can also use CONTINUE condition handlers to assign the value of the SQLSTATE and SQLCODE variables to variables in your SQL routine body. You can then use these SQL variables to control your routine logic, or pass the value back as an output parameter. In the following example, the SQL routine returns control to the statement following each SQL statement with the SQLCODE set in a SQL variable called RETCODE:

```sql
DECLARE SQLCODE INTEGER DEFAULT 0;
DECLARE retcode INTEGER DEFAULT 0;
DECLARE CONTINUE HANDLER FOR SQLexception SET retcode = SQLCODE;
DECLARE CONTINUE HANDLER FOR SQLwarning SET retcode = SQLCODE;
DECLARE CONTINUE HANDLER FOR NOT FOUND SET retcode = SQLCODE;
```

The compound statement itself does not affect the SQLSTATE and SQLCODE SQL variables. However, SQL statements contained within the compound statement can affect the SQLSTATE and SQLCODE SQL variables. At the end of the compound statement, the SQLSTATE and SQLCODE SQL variables reflect the result of the last SQL statement executed within the compound statement that caused a change to the SQLSTATE and SQLCODE SQL variables. If the SQLSTATE and SQLCODE SQL variables were not changed within the compound statement, they contain the same values as when the compound statement was entered.

**Null values in SQL parameters and SQL variables:** If the value of an SQL parameter or SQL variable is null and it is used in an SQL statement that does not allow an indicator variable, an error is returned.

**Effect on open cursors:** At the end of the compound statement, all open cursors that are declared in that compound statement, except cursors that are used to return result sets, are closed.

**Atomic processing of a compound statement:** Atomic processing is not supported for a compound statement. If atomic behavior is needed for a block of code in a compound statement, set a savepoint before the nested compound statement is entered. This will allow changes to be undone with a ROLLBACK TO SAVEPOINT statement.

### Examples

**Example 1:** Create a procedure body with a compound statement that performs the following actions:

- Declares SQL variables.
- Declares a cursor to return the salary of employees in a department determined by an IN parameter.
- Declares an EXIT handler for the condition NOT FOUND (end of file) which assigns the value 6666 to the OUT parameter medianSalary.
- Select the number of employees in the given department into the SQL variable v_numRecords.
- Fetch rows from the cursor in a WHILE loop until 50% + 1 of the employees have been retrieved.
• Return the median salary.

CREATE PROCEDURE DEPT_MEDIAN
(IN deptNumber SMALLINT,
OUT medianSalary DOUBLE)
LANGUAGE SQL
BEGIN
    DECLARE v_numRecords INTEGER DEFAULT 1;
    DECLARE v_counter INTEGER DEFAULT 0;
    DECLARE c1 CURSOR FOR
        SELECT salary FROM staff
        WHERE DEPT = deptNumber
        ORDER BY salary;
    DECLARE EXIT HANDLER FOR NOT FOUND
    SET medianSalary = 6666;
    /* initialize OUT parameter */
    SET medianSalary = 0;
    SELECT COUNT(*) INTO v_numRecords FROM staff
    WHERE DEPT = deptNumber;
    OPEN c1;
    WHILE v_counter < (v_numRecords/2+1) DO
        FETCH c1 INTO medianSalary;
        SET v_counter = v_counter + 1;
    END WHILE;
    CLOSE c1;
END

Example 2: Define an exit handler for any error, warning, or case of end of data.
When this procedure is invoked and it returns to the caller, the value 45000 is returned for the output parameter:

CREATE PROCEDURE JMBLIB.PROCL(OUT MEDIANSALARY INT)
LANGUAGE SQL
BEGIN
    DECLARE CHAR1 CHAR;
    DECLARE C1 CURSOR FOR SELECT *
        FROM SYSDMB.SYSDUMMY1;
    DECLARE EXIT HANDLER FOR NOT FOUND,
        SQLEXCEPTION,
        SQLWARNING;
    OPEN C1;
    FETCH C1 INTO CHAR1;
    SET MEDIANSALARY = 45000;
    FETCH C1 INTO CHAR1;
    END
END
FOR statement

The FOR statement executes a statement for each row of a table. An implicit compound statement is generated to implement the FOR statement.

Syntax

```
label: FOR for-loop-name AS cursor-name CURSOR FOR WITH HOLD

select-statement DO SQL-procedure-statement ; END FOR label
```

Description

**label**

Specifies the label for the FOR statement. If the ending label is specified, it must be the same as the beginning label. The label name cannot be the same as the routine name or another label within the same scope. For more information, see "References to labels" on page 2031.

**for-loop-name**

Specifies the label for the implicit compound statement that is generated to implement the FOR statement. *for-loop-name* follows the rules for the label of a compound statement except that it cannot be used with an ITERATE, GOTO, or LEAVE statement within the FOR statement. *for-loop-name* must not be the same as any label within the same scope.

*for-loop-name* can be used to qualify generated SQL variables that correspond to the columns that are returned by *select-statement*.

**cursor-name**

Names a cursor that is generated to select rows from the result table of *select-statement*. If *cursor-name* is not specified, a unique cursor name is generated.

*cursor-name* cannot be referenced outside of the FOR statement and cannot be specified on an OPEN, FETCH, or CLOSE statement.

**WITH HOLD or WITHOUT HOLD**

Specifies whether the cursor should be prevented from being closed as a consequence of a commit operation.

**WITHOUT HOLD**

Specifies that the cursor is not prevented from being closed as a consequence of a commit operation. **WITHOUT HOLD** is the default.

**WITH HOLD**

Specifies that the cursor should not be closed as a consequence of a commit operation. A cursor that is declared using the **WITH HOLD** clause is implicitly closed at commit time only if the connection that is associated
with the cursor is ended during the commit operation. For more information, see “DECLARE CURSOR” on page 1598.

select-statement

Specifies the select statement of the cursor.

Each expression in the SELECT list must have a name. If an expression is not a simple column name, the AS clause must be used to name the expression. If the AS clause is specified, that name is used for the generated SQL variable that corresponds to the column returned by select-statement. The names for all of the generated SQL variables must be unique.

select-statement must not include a values-clause.

The SELECT list must not include an untyped array value.

SQL-procedure-statement

Specifies the SQL statements to be executed for each row of the table. The SQL statements must not include an OPEN, FETCH, or CLOSE statement that specifies the cursor name of the FOR statement.

Notes

FOR statement rules: The FOR statement executes one or multiple statements for each row in a table. The cursor is defined by specifying a SELECT list that describes the columns and rows selected. The statements within the FOR statement are executed for each row selected.

The SELECT list must consist of unique column names and the table that is specified in the FROM clause of select-statement must exist when the routine is created.

Handler warning: Handlers can be used to handle errors that might occur on the open of the cursor or fetch of a row using the cursor in the FOR statement. Handlers defined to handle these open or fetch conditions should not be CONTINUE handlers as they might cause the FOR statement to loop indefinitely.

Examples

In the following example, the FOR statement is used to specify a cursor that selects three columns from the employee table. For every row selected, SQL variable fullname is set to the last name followed by a comma, the first name, a blank, and the middle initial. Each value for fullname is inserted into table TNI"
GET DIAGNOSTICS statement

The GET DIAGNOSTICS statement obtains information about the previous SQL statement that was executed.

See “GET DIAGNOSTICS” on page 1744.

When you need to specify a variable in a GET DIAGNOSTICS statement that is used within an SQL routine, you would use either SQL-variable-name or SQL-parameter-name. In an embedded GET DIAGNOSTICS statement, you would use a host-variable. You can replace the instances of host-variable in the description of “GET DIAGNOSTICS” on page 1744 with SQL-variable-name or SQL-parameter-name.

Effects of the statement: The GET DIAGNOSTICS statement does not change the contents of the diagnostics area except for DB2_GET_DIAGNOSTICS_DIAGNOSTICS.

Considerations for the SQLSTATE and SQLCODE SQL variables: The GET DIAGNOSTICS statement does not change the value of the SQLSTATE and SQLCODE SQL variables.

The stacked diagnostics area: The stacked diagnostics area is only available within a handler in a native SQL procedure and non-inline SQL functions.
GOTO statement

Syntax

```sql
label: GOTO target-label
```

Description

`label`
Specifies the label for the GOTO statement. The label name cannot be the same as the name of the SQL routine in which the label is used or another label in the same scope.

`target-label`
Specifies a label of the statement where processing is to continue. `target-label` must be defined as a label for an SQL procedure statement. The `target-label` must be accessible to the GOTO statement as defined in "References to labels" on page 2031, subject to the following restrictions:
- If the GOTO statement is in a condition handler, `target-label` must be defined in that condition handler.
- If the GOTO statement is not defined in a condition handler, `target-label` must not be defined in a condition handler.

Notes

*Using a GOTO statement:* It is recommended that the GOTO statement be used sparingly. This statement interferes with the normal sequence of processing SQL statements, thus making a routine more difficult to read and maintain. Before using a GOTO statement, determine whether another statement, such as IF or LEAVE, can be used in place, to eliminate the need for a GOTO statement.

*Effect on open cursors:* When a GOTO statement transfers control out of a compound statement, all open cursors that are declared in the compound statement that contains the GOTO statement are closed, except cursors that are used to return result sets.

Examples

*Example 1:* In the following procedure, the GOTO statement branches outside of the current compound statement to a higher level:

```sql
CREATE PROCEDURE TESTGOTOS ( )
BEGIN
    DECLARE I ,A INTEGER;
    SET I = 1;
    LAB1: SET A = I;
    BEGIN
        LAB2: SET A = 2;
        BEGIN
            SET I = 1+1;
            IF I<3 THEN GOTO LAB1;
        END
    END
END
```
Example 2: In the following example, cursors are declared at multiple levels. The GOTO statement that specified TarLabel as the target label, results in the closing of cursors C1, C2, and C3. This is because cursors C1, C2, and C3 are all declared directly or indirectly in the compound statement with the label L1. The GOTO statement causes control to transfer out of the compound statement with label L1, so the cursors that are defined within that compound statement (at any level) are closed.

L0: BEGIN
    DECLARE CURSOR C0 ...
    ...
    TARGLABEL: ...
    ...
L1: BEGIN
    DECLARE CURSOR C1 ...
    ...
L2: BEGIN
    DECLARE CURSOR C2 ...
    ...
    GOTO TARGLABEL;
    ...
L3: BEGIN
    DECLARE CURSOR C3 ...
    ...
END L3;
END L2;
END L1;
END L0
**IF statement**

The IF statement executes different sets of SQL statements based on the result of search conditions.

**Syntax**

```
IF search-condition
THEN
  label:
  SQL-procedure-statement;
ELSEIF search-condition
THEN
  SQL-procedure-statement;
ELSE
  SQL-procedure-statement;
END IF
```

**Description**

- **label**
  Specifies the label for the IF statement. The label name cannot be the same as the name of the SQL routine or another label name within the same scope. For additional information, see "References to labels" on page 2031.

- **search-condition**
  Specifies the search-condition for which an SQL statement should be executed. If the condition is unknown or false, processing continues to the next search condition, until either a condition is true or processing reaches the ELSE clause.

- **SQL-procedure-statement**
  Specifies an SQL statement to be executed if the preceding search-condition is true. See "SQL-procedure-statement" on page 2034.

**Examples**

Assign a value to the SQL variable `new_salary` based on the value of SQL variable `rating`.

```
IF rating = 1
 THEN SET new_salary =
         new_salary + (new_salary * .10);
ELSEIF rating = 2
 THEN SET new_salary =
         new_salary + (new_salary * .05);
ELSE SET new_salary =
         new_salary + (new_salary * .02);
END IF
```
ITERATE statement

The ITERATE statement causes the flow of control to return to the beginning of a labeled loop.

Syntax

```
ITERATE target-label
```

Description

**label**

Specifies the label for the ITERATE statement. The label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 2031.

**target-label**

Specifies the label of the FOR, LOOP, REPEAT, or WHILE statement to which the flow of control is passed. target-label must be defined as a label for a FOR, LOOP, REPEAT, or WHILE statement. The ITERATE statement must be in that FOR, LOOP, REPEAT, or WHILE statement, or in the block of code that is directly or indirectly nested within that statement, subject to the following restrictions:

- If the ITERATE statement is in a condition handler, target-label must be defined in that condition handler.
- If the ITERATE statement is not in a condition handler, target-label must not be defined in a condition handler.

Examples

**Example 1:** This example uses a cursor to return information for a new department. If the not_found condition handler is invoked, the flow of control passes out of the loop. If the value of v_dept is 'D11', an ITERATE statement causes the flow of control to be passed back to the top of the LOOP statement. Otherwise, a new row is inserted into the table.

```
CREATE PROCEDURE ITERATOR ()
    LANGUAGE SQL
    MODIFIES SQL DATA
BEGIN
    DECLARE v_dept CHAR(3);
    DECLARE v_deptname VARCHAR(29);
    DECLARE v_admdept CHAR(3);
    DECLARE at_end INTEGER DEFAULT 0;
    DECLARE not_found CONDITION FOR SQLSTATE '02000';
    DECLARE c1 CURSOR FOR
        SELECT deptno,deptname,admrdept
        FROM department
        ORDER BY deptno;
    DECLARE CONTINUE HANDLER FOR not_found
        SET at_end = 1;
    OPEN c1;
    ins_loop:
    LOOP
        FETCH c1 INTO v_dept, v_deptname, v_admdept;
        IF at_end = 1 THEN
```
LEAVE ins_loop;
ELSEIF v_dept = 'D11' THEN
    ITERATE ins_loop;
END IF;
INSERT INTO department (deptno,deptname,admrddept)
    VALUES('NEW', v_deptname, v_admdept);
END LOOP;
CLOSE c1;
END

Example 2: An ITERATE statement can be issued from a nested block to cause that
flow of control to return to the beginning of a loop at a higher level. In the
following example, the ITERATE statement within the LAB2 compound statement
causes the flow of control to return to the beginning of the LAB1 LOOP statement:

LAB1: LOOP
    SET A = 0;
    LAB2: BEGIN
        ...
        LAB3: BEGIN
            ...
            ITERATE LAB1; -- Multilevel ITERATE
            ...
            END LAB3;
        ...
        ITERATE LAB1; -- Multilevel ITERATE
        ...
        END LAB2;
    END LOOP;
END
**LEAVE statement**

The LEAVE statement transfers program control out of a FOR, LOOP, REPEAT, WHILE, or compound statement.

**Syntax**

```
LEAVE target-label
```

**Description**

- **label**
  Specifies the label for the LEAVE statement. The label name cannot be the same as the name of the SQL routine or the same as another label that is within the same scope. For additional information, see "References to labels" on page 2031.

- **target-label**
  Specifies the label of the compound, FOR, LOOP, REPEAT, or WHILE statement to exit. `target-label` must be defined as a label for a compound, FOR, LOOP, REPEAT, or WHILE statement, or in a block of code that is directly or indirectly nested within that statement, subject to the following rules:
  - If the LEAVE statement is in a condition handler, `target-label` must be defined in that condition handler.
  - If the LEAVE statement is not in a condition handler, `target-label` must not be defined in a condition handler.

**Notes**

*Effect on open cursors:* When a LEAVE statement transfers control out of a compound statement, all open cursors in the compound statement, except cursors that are used to return result sets, are closed.

**Examples**

*Example 1:* The example contains a loop that fetches data for cursor `c1`. If the value of SQL variable `at_end` is not zero, the LEAVE statement transfers control out of the loop.

```sql
CREATE PROCEDURE LEAVE_LOOP (OUT COUNTER INTEGER)
  LANGUAGE SQL
BEGIN
  DECLARE v_counter INTEGER;
  DECLARE vFirstname VARCHAR(12);
  DECLARE vMidinit CHAR(1);
  DECLARE vLastname VARCHAR(15);
  DECLARE at_end SMALLINT DEFAULT 0;
  DECLARE not_found CONDITION FOR SQLSTATE '02000';
  DECLARE c1 CURSOR FOR
    SELECT firstname, midinit, lastname
    FROM employee;
  DECLARE CONTINUE HANDLER FOR not_found
    SET at_end = 1;
  SET v_counter = 0;
  OPEN c1;
```

2060 SQL Reference
Example 2: A LEAVE statement can be issued from a nested block to leave a statement at a higher level. In the following example, the LEAVE statement within the LAB2 compound statement causes the LAB1 LOOP statement to terminate:

LAB1: LOOP

... 
LAB2: BEGIN
  SET A = 0;
...
LAB3: BEGIN
  ...
  LEAVE LAB1;  -- Multilevel LEAVE
  ...
  END LAB3;
...
  LEAVE LAB1;  -- Multilevel LEAVE
  ...
  END LAB2;
END LOOP;
### LOOP statement

The LOOP statement executes a statement or group of statements multiple times.

#### Syntax

```
label:
  LOOP
  SQL-procedure-statement
  ;
END LOOP
```

#### Description

**label**

Specifies the label for the LOOP statement. If the ending label is specified, a matching beginning label must be specified. A label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see “References to labels” on page 2031.

**SQL-procedure-statement**

Specifies an SQL statement to be executed in the loop. The statement must be one of the statements listed under “SQL-procedure-statement” on page 2034.

#### Notes

**Considerations for the diagnostics area:** At the beginning of the first iteration of the LOOP statement, and with every subsequent iteration, the diagnostics area is cleared.

**Considerations for the SQLSTATE and SQLCODE SQL variables:** Prior to executing the first SQL-procedure-statement within that LOOP statement, the SQLSTATE and SQLCODE values reflect the last values that were set prior to the LOOP statement. If the loop is terminated with a GOTO or a LEAVE statement, the SQLSTATE and SQLCODE values reflect successful completion of that statement. When the LOOP statement iterates, the SQLSTATE and SQLCODE values reflect the result of the last SQL statement that is executed within the LOOP statement.

#### Examples

This procedure uses a LOOP statement to fetch values from the employee table. Each time the loop iterates, the OUT parameter counter is incremented and the value of `v_midinit` is checked to ensure that the value is not a single space (' '). If `v_midinit` is a single space, the LEAVE statement passes the flow of control outside of the loop.

```sql
CREATE PROCEDURE LOOP_UNTIL_SPACE(OUT counter INTEGER)
  LANGUAGE SQL
  BEGIN
    DECLARE v_counter INTEGER DEFAULT 0;
    DECLARE v_firstname VARCHAR(12);
    DECLARE v_midinit CHAR(1);
    DECLARE v_lastname VARCHAR(15);
    DECLARE c1 CURSOR FOR
      SELECT firstname, midinit, lastname
      FROM employee;
    DECLARE EXIT HANDLER FOR NOT FOUND
    EXIT;
    DECLARE EXIT HANDLER FOR SINGLE_SPACE
    LEAVE;
    DECLARE EXIT HANDLER FOR NOT FOUND
    Reset counter;
    DECLARE EXIT HANDLER FOR NOT FOUND
    GOTO label;
    label:
    BEGIN
      DECLARE EXIT HANDLER FOR NOT FOUND
      LEAVE;
      DECLARE EXIT HANDLER FOR NOT FOUND
      GOTO label;
    END;
    DECLARE EXIT HANDLER FOR NOT FOUND
    GOTO label;
  END;
```
SET counter = -1;
OPEN c1;
fetch_loop:
LOOP
FETCH c1 INTO v_firstnme, v_midinit, v_lastname;
IF v_midinit = '' THEN
  LEAVE fetch_loop;
END IF;
SET v_counter = v_counter + 1;
END LOOP fetch_loop;
SET counter = v_counter;
CLOSE c1;
END
**REPEAT statement**

The REPEAT statement executes a statement or group of statements until a search condition is true.

**Syntax**

```
label:
REPEAT SQL-procedure-statement; UNTIL search-condition END REPEAT
```

**Description**

*label*

Specifies the label for the REPEAT statement. If an ending label is specified, a matching beginning label must be specified. A label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 2031.

*SQL-procedure-statement*

Specifies an SQL statement to be executed within the REPEAT loop. The statement must be one of the statements listed under "SQL-procedure-statement" on page 2034.

*search-condition*

Specifies a condition that is evaluated after each execution of the REPEAT loop. If the condition is true, the REPEAT loop will exit. If the condition is unknown or false, the looping continues.

**Notes**

*Considerations for the diagnostics area:* At the beginning of the first iteration of the REPEAT statement, and with every subsequent iteration, the diagnostics area is cleared.

*Considerations for the SQLSTATE and SQLCODE SQL variables:* At the beginning of the first iteration of the REPEAT statement, the SQLSTATE and SQLCODE values reflect the values that were set prior to the REPEAT statement. At the beginning of iterations 2 through *n* of the REPEAT statement, the SQLSTATE and SQLCODE SQL values reflect the result of evaluating the search condition in the UNTIL clause of that REPEAT. If the loop is terminated with a GOTO, ITERATE, or LEAVE statement, the SQLSTATE and SQLCODE values reflect the successful completion of that statement. Otherwise, after the END REPEAT of the REPEAT statement completes, the SQLSTATE and SQLCODE reflect the result of evaluating the search condition in the UNTIL clause of that REPEAT statement.
Examples

Use a REPEAT statement to fetch rows from a table.

fetch_loop:
REPEAT
    FETCH c1 INTO
    v_firstnme, v_midinit, v_lastname;
UNTIL
    SQLCODE <> 0
END REPEAT fetch_loop
**RESIGNAL statement**

The RESIGNAL statement is used within a condition handler to resignal the condition that activated the handler, or to raise an alternate condition so that it can be processed at a higher level. It causes an exception, warning, or not found condition to be returned along with optional message text.

**Syntax**

```sql
label: RESIGNAL

-SQLSTATE VALUE

-sqlstate-string-constant SQL-variable-name signal-information

-SQL-condition-name SQL-parameter-name

-SET MESSAGE_TEXT = diagnostic-string-expression
```

**Description**

`label`

Specifies the label for the RESIGNAL statement. A label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see “References to labels” on page 2031.

**SQLSTATE VALUE**

Specifies the SQLSTATE that will be returned. Any valid SQLSTATE value can be used. It must be a character string constant with exactly five characters that follow the rules for SQLSTATE values:

- Each character must be from the set of digits ('0' through '9') or non-accented upper case letter ('A' through 'Z').
- The SQLSTATE class (the first two characters) cannot be '00' because it represents successful completion.

If the SQLSTATE does not conform to these rules, an error occurs.

`sqlstate-string-constant`

A character string constant with an actual length of five bytes that is a valid SQLSTATE value.

`SQL-variable-name` or `SQL-parameter-name`

Specifies an SQL variable or SQL parameter that is defined for the routine.

`SQL-variable-name`

Specifies an SQL variable that is declared within the `compound-statement` that contains the RESIGNAL statement or within a compound statement in which that compound statement is nested.
**SQL-variable-name** must be defined as CHAR or VARCHAR data type with an actual length of five bytes, must not be null, and must contain a valid SQLSTATE value.

**SQL-parameter-name**
Specifies an SQL parameter that is defined for the routine that contains the SQLSTATE value. The SQL parameter must be defined as CHAR or VARCHAR data type with an actual length of five bytes, must not be null, and must contain a valid SQLSTATE value.

**SQL-condition-name**
Specifies the name of the condition that will be returned. **SQL-condition-name** must be declared within the compound-statement that contains the RESIGNAL statement, or within a compound statement in which that compound statement is nested.

**SET MESSAGE_TEXT**
Specifies a string that describes the error or warning. The string is returned in the SQLERRMC field of the SQLCA or with the GET DIAGNOSTICS statement.

**diagnostic-string-expression**
An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see "GET DIAGNOSTICS" on page 1744.

**Notes**
While any valid SQLSTATE value can be used in the RESIGNAL statement, programmers should define new SQLSTATEs based on ranges reserved for applications. This practice prevents the unintentional use of an SQLSTATE value that might be defined by the database manager in a future release.

If the SQLSTATE or condition indicates that an exception is signaled (SQLSTATE class other than '01' or '02'):

- If a condition handler exists in the same compound statement as the RESIGNAL statement, and the compound statement contains a condition handler for SQLEXCEPTION or the specified SQLSTATE or condition, the exception is handled and control is transferred to that condition handler.
- If the compound statement is nested and an outer level compound statement has a condition handler for SQLEXCEPTION or the specified SQLSTATE or condition, the exception is handled and control is transferred to that condition handler.
- Otherwise, the exception is not handled and control is immediately returned to the end of the compound statement.

If an SQLSTATE or a condition indicates that a warning or a not found condition is signaled:

- If a condition handler exists in the same compound statement as the RESIGNAL statement, and the compound statement contains a condition handler for SQLWARNING, NOT FOUND, or the specified SQLSTATE or condition, the warning or not found condition is handled and control is transferred to that condition handler.
- If the compound statement is nested and an outer level compound statement contains a condition handler for SQLWARNING, NOT FOUND, or the specified
SQLSTATE or condition, the warning or not found condition is handled and
control is returned to that condition handler.

- Otherwise, the warning is not handled and processing continues with the next
  statement.

Considerations for the diagnostics area: The RESIGNAL statement might modify
the contents of the current diagnostics area. If an SQLSTATE or condition-name
is specified as part of the RESIGNAL statement, the RESIGNAL statement starts with
a clear diagnostics area and sets the RETURNED_SQLSTATE to reflect the specified
SQLSTATE or condition-name. If message text is specified, the MESSAGE_TEXT
item of the condition area is assigned the specified value.
DB2_RETURNED_SQLCODE is set to +438 or -438 corresponding to the specified
SQLSTATE or condition-name.

Processing a RESIGNAL statement: If the RESIGNAL statement is specified
without an SQLSTATE clause or a condition-name, the SQL routine resinals the
identical condition that invoked the handler and the SQLCODE is not changed.

When a RESIGNAL statement is issued and an SQLSTATE or condition-name is
specified, the SQLCODE is based on the SQLSTATE value as follows:

- If the specified SQLSTATE class is either '01' or '02', a warning or not found is
  signaled and the SQLCODE is set to +438.
- Otherwise, an exception is returned and the SQLCODE is set to -438.

Examples

The following example detects a division by zero error. The IF statement uses a
SIGNAL statement to invoke the overflow condition handler. The condition
handler uses a RESIGNAL statement to return a different SQLSTATE to the client
application.

```sql
CREATE PROCEDURE divide (IN numerator INTEGER,
    IN denominator INTEGER,
    OUT divide_result INTEGER)
    LANGUAGE SQL
    CONTAINS SQL
    BEGIN
    DECLARE overflow CONDITION FOR SQLSTATE '22003';
    DECLARE CONTINUE HANDLER FOR overflow
        RESIGNAL SQLSTATE '22375';
    IF denominator = 0 THEN
        SIGNAL overflow;
    ELSE
        SET divide_result = numerator / denominator;
    END IF;
END
```

```sql
2068  SQL Reference
```
RETURN statement

The RETURN statement is used to return from the routine.

• For an SQL scalar function, the scalar result of the function is returned. The body of an SQL scalar function must contain at least one RETURN statement and a RETURN statement must be executed when the function is invoked.
• For an SQL table function, the result table of the function is returned. A RETURN statement must be specified in the body of an SQL table function.
• For an SQL procedure, the RETURNS statement optionally returns an integer status value.

Syntax

```
labe1: RETURN expression [null] [fullselect] 
       WITH common-table-expression
```

Description

`label`

Specifies the label for the RETURN statement. A label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see “References to labels” on page 2031.

`expression`

Specifies a value that is returned from the routine.

• If the routine is a scalar function, the data type of the result must be assignable to the data type that is defined for the function result, using the storage assignment rules as described in “Assignment and comparison” on page 123. The RETURN statement must not contain a period specification.

• The body of any SQL function must not contain a reference to an aggregate function, or a reference to a user-defined function that is sourced on an aggregate function, or an OLAP specification.

• In the body of an inlined SQL function, the RETURN statement must not contain a scalar fullselect. If the expression does not conform to this rule, DB2 attempts to define a compiled function.

• If the routine is a table function, a scalar expression (other than a scalar fullselect) cannot be specified. The data type of the result column of the fullselect must be assignable to the data type that is defined for the function result, using the storage assignment rules as described in “Assignment and comparison” on page 123. The RETURN statement must not contain a period specification.

• If the routine is a procedure, the data type of `expression` must be INTEGER.

`null`

The null value is returned from the SQL routine.

• If the routine is a scalar function, the null value is returned.
• If the routine is a table function, NULL must not be specified.
• If the routine is a procedure, NULL must not be specified.

**WITH common-table-expression**
Specifies one or more common table expressions that are to be used in the fullselect.

**fullselect**
Specifies the row or rows that are returned from the routine.

• If the routine is a scalar function, the function is a compiled function and the fullselect must return one column and, at most, one row. The data type of the result column must be assignable to the data type that is defined for the function result, using the storage assignment rules as described in "Assignment and comparison" on page 123.
• If the routine is a table function, the fullselect can return zero or more rows with one or more columns. The number of columns in the fullselect must match the number of columns in the function result. In addition, the data types of the result table columns of the fullselect must be assignable to the data types of the columns that are defined for the function result, using the storage assignment rules as described in "Assignment and comparison" on page 123.
• If the routine is a procedure, fullselect must not be specified.

**Notes**

**Considerations for SQL functions:** A RETURN statement in an SQL function must specify expression, NULL, or fullselect. Only a single RETURN statement can be specified in the routine body of an SQL table function. The execution of an SQL function must end with a RETURN statement.

A data change table reference is not allowed in a RETURN statement in an SQL function.

**Considerations for SQL procedures:**

• **When a RETURN statement is used within an SQL procedure:** If a RETURN statement with a specified return value was used to return from a procedure, the SQLCODE, SQLSTATE, and message length in the SQLCA are initialized to zeros and the message text is set to blanks. An error is not returned to the caller.

• **When a RETURN statement is not used within an SQL procedure or when no value is specified:** If a RETURN statement was not used to return from a procedure or if a value is not specified on the RETURN statement, one of the following values is set:
  – If the procedure returns with an SQLCODE that is greater or equal to zero, the specified target for DB2_RETURN_STATUS in a GET DIAGNOSTICS statement will be set to a value of zero.
  – If the procedure returns with an SQLCODE that is less than zero, the specified target for DB2_RETURN_STATUS in a GET DIAGNOSTICS statement will be set to a value of '-1'.

• **When the value is returned from an SQL procedure:** When a value is returned from a procedure, the caller may access the value using one of the following methods:
  – The GET DIAGNOSTICS statement to retrieve the RETURN_STATUS when the SQL procedure was called from another SQL procedure.
The parameter bound for the return value parameter marker in the escape clause CALL syntax (?=CALL...) in a CLI application.

- Directly from the SQLCA returned from processing the CALL of an SQL procedure by retrieving the value of sqlerrd[0]. When the SQLCODE is less than zero, the sqlerrd[0] value is not set. The application should assume a return status value of '-1'.

Examples

Example 1: Use a RETURN statement to return from an SQL procedure with a status value of zero if successful or '-200' if not successful.
BEGIN
  . .
  GOTO FAIL;
  . .
  SUCCESS: RETURN 0;
  FAIL: RETURN -200;
END

Example 2: Define a scalar function that returns the tangent of a value using the existing sine and cosine functions:

CREATE FUNCTION TAN (X DOUBLE)
  RETURNS DOUBLE
  LANGUAGE SQL CONTAINS SQL NO EXTERNAL ACTION
  DETERMINISTIC
  RETURN SIN(x)/COS(x)
**SIGNAL statement**

The SIGNAL statement is used to return an exception or warning condition. It causes an error or warning to be returned with the specified SQLSTATE, along with optional message text. The SIGNAL statement places the specified condition information in the cleared diagnostics area.

**Syntax**

```
label: SIGNAL SQLSTATE VALUE sqlstate-string-constant SQL-variable-name SQL-parameter-name SQL-condition-name
```

**signal-information:**

```
SET MESSAGE_TEXT = diagnostic-string-expression (1)
```

**Notes:**

1. `(diagnostic-string-expression)` must only be specified within a trigger body.

**Description**

**label**

Specifies the label for the SIGNAL statement. A label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 2031.

**SQLSTATE VALUE**

Specifies the SQLSTATE that will be returned. Any valid SQLSTATE value can be used. It must be a character string constant with exactly five characters that follow the rules for SQLSTATEs:

- Each character must be from the set of digits ('0' through '9') or non-accented upper case letter ('A' through 'Z').
- The SQLSTATE class (the first two characters) cannot be '00' because it represents successful completion.

If the SQLSTATE does not conform to these rules, an error occurs.

**sqlstate-string-constant**

A character string constant with an actual length of five bytes that is a valid SQLSTATE value.
**SQL-variable-name** or **SQL-parameter-name**
Specifies an SQL variable or SQL parameter that contains a valid SQLSTATE value.

**SQL-variable-name**
Specifies an SQL variable that is declared within the compound-statement that contains the SIGNAL statement, or within a compound statement in which that compound statement is nested. **SQL-variable-name** must be defined as a CHAR or VARCHAR data type with an actual length of five bytes, must not be null, and must contain a valid SQLSTATE value.

**SQL-parameter-name**
Specifies an SQL parameter that is defined for the routine and contains the SQLSTATE value. The SQL parameter must be defined as a CHAR or VARCHAR data type with an actual length of five bytes, must not be null, and must contain a valid SQLSTATE value.

**SQL-condition-name**
Specifies the name of the condition that will be returned. The **SQL-condition-name** must be declared within the compound statement that contains the SIGNAL statement, or within a compound statement in which that compound statement is nested.

**SET MESSAGE_TEXT**
Specifies a string that describes the error or warning. The string is returned in the SQLERRMC field of the SQLCA or with the GET DIAGNOSTICS statement.

**diagnostic-string-expression**
An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see "GET DIAGNOSTICS" on page 1744.

**(diagnostic-string-expression)**
An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see "GET DIAGNOSTICS" on page 1744.

This syntax variation is only provided within the scope of a CREATE TRIGGER statement for compatibility with previous versions of DB2. To conform with the ANS and ISO standards, this form should not be used.

**Notes**

While any valid SQLSTATE value can be used in the SIGNAL statement, programmers should define new SQLSTATEs based on ranges reserved for applications. This practice prevents the unintentional use of an SQLSTATE value that might be defined by the database manager in a future release.

If the SQLSTATE or condition indicates that an exception is signaled:
- If a condition handler exists in the same compound statement as the SIGNAL statement, and the compound statement contains a condition handler for SQLEXCEPTION or the specified SQLSTATE or condition, the exception is handled and control is transferred to that condition handler.
If the compound statement is nested and the outer level compound statement has a condition handler for SQLSTATE exception or the specified SQLSTATE or condition, the exception is handled and control is transferred to that condition handler.

Otherwise, the exception is not handled and control is immediately returned to the end of the compound statement.

If the SQLSTATE or condition indicates that a warning or not found condition is signaled:

- If a condition handler exists in the same compound statement as the SIGNAL statement, and the compound statement contains a condition handler for SQLWARNING, NOT FOUND, or the specified SQLSTATE or condition, the warning or not found condition is handled and control is transferred to that condition handler.
- If the compound statement is nested and an outer level compound statement contains a condition handler for SQLWARNING, NOT FOUND, or the specified SQLSTATE or condition, the warning or not found condition is handled and control is transferred to that condition handler.
- Otherwise, the warning or not found condition is not handled and processing continues with the next statement.

Considerations for the diagnostics area: The SIGNAL statement starts with a clear diagnostics area and sets the RETURNED_SQLSTATE to reflect the specified SQLSTATE or condition-name. If message text is specified, the MESSAGE_TEXT item of the condition area is assigned the specified value. DB2_RETURNED_SQLCODE is set to +438 or -438 corresponding to the specified SQLSTATE or condition-name.

Examples

Example 1: The following example shows an SQL procedure for an order system that signals an application error when a customer number is not known to the application. The ORDERS table includes a foreign key to the CUSTOMER table, requiring that the CUSTNO exist before an order can be inserted.

```
CREATE PROCEDURE SUBMIT_ORDER
(IN ONUM INTEGER, IN CNUM INTEGER,
 IN PNUM INTEGER, IN QNUM INTEGER)
LANGUAGE SQL
SPECIFIC SUBMIT_ORDER
MODIFIES SQL DATA
BEGIN
  DECLARE EXIT HANDLER FOR SQLSTATE '23503'
  SIGNAL SQLSTATE '75002'
  SET MESSAGE_TEXT = 'Customer number is not known';
  INSERT INTO ORDERS (ORDERNO, CUSTNO, PARTNO, QUANTITY)
  VALUES (ONUM, CNUM, PNUM, QNUM);
END
```

Example 2: The following example shows a trigger for an order system that allows orders to be recorded in an ORDERS table (ORDERNO, CUSTNO, PARTNO, QUANTITY) only if there is sufficient stock in the PARTS tables. When there is insufficient stock for an order, SQLSTATE '75001' is returned along with an appropriate error description.

```
CREATE TRIGGER CK_AVAIL
NO CASCADE BEFORE INSERT ON ORDERS
REFERENCING NEW AS NEW_ORDER
FOR EACH ROW MODE DB2SQL
```
WHEN (NEW_ORDER.QUANTITY > (SELECT ON_HAND FROM PARTS
    WHERE NEW_ORDER.PARTNO = PARTS.PARTNO))
BEGIN ATOMIC
    SIGNAL SQLSTATE '75001' ('Insufficient stock for order');
END
WHILE statement

The WHILE statement repeats the execution of a statement or group of statements while a specified condition is true.

Syntax

```
label: WHILE search-condition DO SQL-procedure-statement END WHILE
```

Description

`label`

Specifies the label for the WHILE statement. If the ending label is specified, it must be the same as the beginning label. A label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 2031.

`search-condition`

Specifies a condition that is evaluated before each execution of the loop. If the condition is true, the SQL procedure statements in the loop are executed.

`SQL-procedure-statement`

Specifies a statement to be run within the WHILE loop. The statement must be one of the statements listed under "SQL-procedure-statement" on page 2034.

Notes

Considerations for the diagnostics area: At the beginning of the first iteration of the WHILE statement, and with every subsequent iteration, the diagnostics area is cleared.

Considerations for the SQLSTATE and SQLCODE SQL variables: With each iteration of the WHILE statement, when the first SQL-procedure-statement is executed, the SQLSTATE and SQLCODE SQL variables reflect the result of evaluating the search condition of that WHILE statement. If the loop is terminated with a GOTO, ITERATE, or LEAVE statement, the SQLSTATE and SQLCODE values reflect the successful completion of that statement. Otherwise, after the END WHILE of the WHILE statement completes, the SQLSTATE and SQLCODE reflect the result of evaluating that search condition of that WHILE statement.

Examples

Use a WHILE statement to fetch rows from a table while SQL variable `at_end`, which indicates whether the end of the table has been reached, is 0.

```
WHILE at_end = 0 DO
  FETCH c1 INTO
    v_firstnme, v_midinit,
    v_lastname, v_edlevel, v_salary;
  IF SQLCODE=100 THEN SET at_end=1;
  END IF;
END WHILE;
```
Appendix. Additional information for DB2 SQL

These topics contain additional information for DB2 SQL.
Limits in DB2 for z/OS

DB2 for z/OS has system limits, object and SQL limits, length limits for identifiers and strings, and limits for certain data type values.

System storage limits might preclude the limits specified in this section. The limit for items not that are not specified below is limited by system storage.

The following table shows the length limits for identifiers.

Table 159. Identifier length limits. The term byte(s) in this table means the number of bytes for the UTF-8 representation unless noted otherwise.

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>External-java-routine-name</td>
<td>1305 bytes</td>
</tr>
<tr>
<td>Name of an alias 1, auxiliary table, collection, clone table,</td>
<td>128 bytes</td>
</tr>
<tr>
<td>constraint, correlation, cursor (except for DECLARE CURSOR WITH</td>
<td></td>
</tr>
<tr>
<td>RETURN or the EXEC SQL utility), distinct type (both parts of two-</td>
<td></td>
</tr>
<tr>
<td>part name), function (both parts of two-part name), host identifier,</td>
<td></td>
</tr>
<tr>
<td>index, JARs, parameter, procedure, role, schema, sequence, specific,</td>
<td></td>
</tr>
<tr>
<td>statement, storage group, savepoint, SQL condition, SQL label, SQL</td>
<td></td>
</tr>
<tr>
<td>parameter, SQL variable, synonym, table, trigger, view, XML attribute</td>
<td></td>
</tr>
<tr>
<td>name, XML element name</td>
<td></td>
</tr>
<tr>
<td>Name of an authorization ID or name of a security label</td>
<td>8 bytes</td>
</tr>
<tr>
<td>Routine version identifier</td>
<td>64 EBCDIC bytes, and the UTF-8 representation of the name must not exceed 122 bytes.</td>
</tr>
<tr>
<td>Name of a column</td>
<td>30 bytes 1</td>
</tr>
<tr>
<td>Name of cursor that is created with DECLARE CURSOR WITH RETURN</td>
<td>30 bytes</td>
</tr>
<tr>
<td>Name of cursor that is created with the EXEC SQL utility</td>
<td>8 bytes</td>
</tr>
<tr>
<td>Name of a location</td>
<td>16 bytes</td>
</tr>
<tr>
<td>Name of buffer pool name, catalog, database, plan, program, table</td>
<td>8 bytes</td>
</tr>
<tr>
<td>space</td>
<td></td>
</tr>
<tr>
<td>Name of package</td>
<td>8 bytes (Only 8 EBCDIC characters are used for packages that are created with the BIND PACKAGE command. 128 bytes can be used for packages that are created as a result of the CREATE FUNCTION (SQL scalar) statement, the CREATE PROCEDURE (SQL - native) statement, the CREATE TRIGGER statement, or a BIND command that specifies a zFS file as DBRM library.)</td>
</tr>
<tr>
<td>Name of a profile that is created with CREATE TRUSTED CONTEXT or</td>
<td>127 bytes</td>
</tr>
<tr>
<td>ALTER TRUSTED CONTEXT</td>
<td></td>
</tr>
</tbody>
</table>

Notes:
1. If the column name length or the distinct type schema or name length is greater than 30 Unicode bytes, truncation occurs in the sqlname field of the SQLDA when those objects are described in an application.

Table 160 shows the minimum and maximum limits for numeric values.

<td>Coefficient length for DECFLOAT values</td>
<td>DECFLOAT(16) is 16 digits; DECFLOAT(34) is 34 digits</td>
</tr>
<tr>
<td>Maximum Exponent (E_max) for DECFLOAT values</td>
<td>DECFLOAT(16) is 384; DECFLOAT(34) is 6144</td>
</tr>
<tr>
<td>Minimum Exponent (E_min) for DECFLOAT values</td>
<td>DECFLOAT(16) is -383; DECFLOAT(34) is -6143</td>
</tr>
<tr>
<td>Bias for DECFLOAT values</td>
<td>DECFLOAT(16) is 398; DECFLOAT(34) is 6176</td>
</tr>
</tbody>
</table>

Note:
1. These are the limits for normal numbers in DECFLOAT. DECFLOAT also contains special values such as NaN and Infinity that are also valid. DECFLOAT also supports subnormal numbers that are outside of the documented range.

The following table shows the length limits for strings.

Table 161. String length limits

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum length of CHAR</td>
<td>255 bytes</td>
</tr>
<tr>
<td>Maximum length of GRAPHIC</td>
<td>127 double-byte characters</td>
</tr>
<tr>
<td>Maximum length of BINARY</td>
<td>255 bytes</td>
</tr>
</tbody>
</table>
### Table 161. String length limits (continued)

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
</table>
| Maximum length\(^1\) of VARCHAR                  | • 4046 bytes for a column in a table in a table space with 4 KB pages \(\text{v}\)  
  • 8128 bytes for a column in a table in a table space with 8 KB pages \(\text{v}\)  
  • 16320 bytes for a column in a table in a table space with 16 KB pages \(\text{v}\)  
  • 32704 bytes for a column in a table in a table space with 32 KB pages \(\text{v}\)  
  Otherwise, 32704 bytes                                                                   |
| Maximum length of VARCHAR that can be indexed by an XML index | 1000 bytes after conversion to UTF-8                                 |
| Maximum length\(^1\) of VARGRAPHIC               | • 2023 double-byte characters for a column in a table in a table space with 4 KB pages \(\text{v}\)  
  • 4064 double-byte characters for a column in a table in a table space with 8 KB pages \(\text{v}\)  
  • 8160 double-byte characters for a column in a table in a table space with 16 KB pages \(\text{v}\)  
  • 16352 double-byte characters for a column in a table in a table space with 32 KB pages \(\text{v}\)  
  Otherwise, 16352 double-byte characters                                                       |
| Maximum length of VARBINARY                      | 32704 bytes                                                           |
| Maximum length of CLOB                          | 2 147 483 647 bytes (2 GB - 1 byte)                                   |
| Maximum length of DBCLOB                        | 1 073 741 823 double-byte characters                                   |
| Maximum length of BLOB                          | 2 147 483 647 bytes (2 GB - 1 byte)                                   |
| Maximum length of a character constant          | 32704 UTF-8 bytes                                                    |
| Maximum length of a hexadecimal character constant | 32704 hexadecimal digits                                           |
| Maximum length of a graphic string constant    | 16352 double-byte characters (32704 bytes when expressed in UTF-8)   |
| Maximum length of a hexadecimal graphic string constant | 32704 hexadecimal digits                                           |
| Maximum length of a text string used for a scalar expression | 4000 UTF-8 bytes                                                    |
| Maximum length of a concatenated character string | 2 147 483 647 bytes (2 GB - 1 byte)                                   |
| Maximum length of a concatenated graphic string | 1 073 741 824 double-byte characters                                   |
| Maximum length of a concatenated binary string  | 2 147 483 647 bytes (2 GB - 1 byte)                                   |
| Maximum length of XML pattern text              | 4000 bytes after conversion to UTF-8                                   |
| Maximum length of an XML element or attribute name in an XML document | 1000 bytes                                                            |
| Maximum length of a namespace uri               | 1000 bytes                                                           |
| Maximum length of a namespace prefix            | 998 bytes                                                            |
| Largest depth of an internal XML tree            | 128 levels                                                           |

**Note:**
1. The maximum length can be achieved only if the column is the only column in the table. Otherwise, the maximum length depends on the amount of space remaining on a page.
The following table shows the minimum and maximum limits for datetime values.

**Table 162. Datetime limits**

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Smallest DATE value (shown in ISO format)</td>
<td>0001-01-01</td>
</tr>
<tr>
<td>Largest DATE value (shown in ISO format)</td>
<td>9999-12-31</td>
</tr>
<tr>
<td>Smallest TIME value (shown in ISO format)</td>
<td>00.00.00</td>
</tr>
<tr>
<td>Largest TIME value (shown in ISO format)</td>
<td>24.00.00</td>
</tr>
<tr>
<td>Smallest TIMESTAMP WITHOUT TIME ZONE value</td>
<td>0001-01-01-00.00.00.00.000000000000</td>
</tr>
<tr>
<td>Largest TIMESTAMP WITHOUT TIME ZONE value</td>
<td>9999-12-31-24.00.00.00.000000000000 1</td>
</tr>
<tr>
<td>Smallest TIMESTAMP WITH TIME ZONE value</td>
<td>0001-01-01-00.00.00.000000000000 +00:00</td>
</tr>
<tr>
<td>Largest TIMESTAMP WITH TIME ZONE value</td>
<td>9999-12-31-24.00.00.00.000000000000 +00:00 1</td>
</tr>
<tr>
<td>TIMESTAMP precision range</td>
<td>0 to 12</td>
</tr>
<tr>
<td>TIME ZONE hour range</td>
<td>-12 to 14</td>
</tr>
<tr>
<td>TIME ZONE minute range</td>
<td>0 to 59</td>
</tr>
</tbody>
</table>

**Note:**
1. The maximum value is stated as a UTC value. When a timestamp without a time zone is compared to a timestamp with time zone, a necessary adjustment is made using the implicit time zone. During that adjustment, the timestamp without time zone could be converted to a value that is greater than the maximum value for a timestamp with time zone value (this could occur on operations such as comparison and assignment). This situation can be avoided by using ‘9999-12-30-00.00.00.000000000000’ as the maximum value for timestamp without time zone and ‘9999-12-30-00.00.00.000000000000 +00:00’ as the maximum value for timestamp with time zone columns.

The following table shows the DB2 limits on SQL statements.

**Table 163. DB2 limits on SQL statements**

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of columns that are in a table or view (the value depends on the complexity of the CREATE VIEW statement) or columns returned by a table function.</td>
<td>750 or fewer (including hidden columns) 749 if the table is a dependent</td>
</tr>
<tr>
<td>Maximum number of base tables in a view, SELECT, UPDATE, INSERT, MERGE, or DELETE</td>
<td>225</td>
</tr>
<tr>
<td>Maximum number of rows that can be inserted with a single INSERT or MERGE statement</td>
<td>32767</td>
</tr>
<tr>
<td>Maximum row and record sizes for a table</td>
<td>See the maximum record size table under CREATE TABLE.</td>
</tr>
<tr>
<td>Maximum number of volume IDs in a storage group</td>
<td>133</td>
</tr>
<tr>
<td>Maximum number of partitions in a partitioned table space or partitioned index</td>
<td>64 for table spaces that are not defined with LARGE or a DSSIZE greater than 2 GB. 4096, depending on what is specified for DSSIZE or LARGE and the page size.</td>
</tr>
<tr>
<td>Maximum sum of the lengths of limit key values of a partition boundary</td>
<td>765 UTF-8 bytes</td>
</tr>
<tr>
<td>Item</td>
<td>Limit</td>
</tr>
<tr>
<td>-----------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Maximum size of a partition (table space or index)       | For table spaces that are not defined with LARGE or a DSSIZE greater than 2 GB:  
                                                                                                                   4 GB, for 1 to 16 partitions  
                                                                                                                   2 GB, for 17 to 32 partitions  
                                                                                                                   1 GB, for 33 to 64 partitions  
                                                                                                                   For table spaces that are defined with LARGE or a DSSIZE of 4 GB:  
                                                                                                                   4 GB, for 1 to 4096 partitions  
                                                                                                                   For table spaces that are defined with a DSSIZE greater than 4 GB:  
                                                                                                                   256 GB, depending on the page size (for 1 to 64 partitions for 4 KB pages, for 1 to 128 partitions for 8 KB pages, for 1 to 256 partitions for 16 KB pages, and 1 to 512 partitions for 32 KB pages) |
| Maximum size of a non-partitioned index for a partitioned table space | For 5-byte EA table spaces:  
                                                                                                                   16 TB for 4 KB pages  
                                                                                                                   32 TB for 8 KB pages  
                                                                                                                   64 TB for 16 KB pages  
                                                                                                                   128 TB for 32 KB pages  
                                                                                                                   For table spaces that are defined with LARGE:  
                                                                                                                   16 TB                                                                                                                                                                                                       |
| Maximum length of an index key                           | Partitioning index: 255-n  
                                                                                                                   Nonpartitioning index that is padded: 2000-n  
                                                                                                                   Nonpartitioning index that is not padded: 2000-n-2m  
                                                                                                                   Where n is the number of columns in the key that allow nulls and m is the number of varying-length columns in the key                                                                                                                                 |
| Maximum number of bytes used in the partitioning of a partitioned index | 255 (This maximum limit is subject to additional limitations, depending on the number of partitions in the table space. The number of partitions * (106 + limit key size) must be less than 65394.)                                                                                       |
| Maximum number of columns in an index key                | 64                                                                                                                                                                                                                                                                 |
| Maximum number of expressions in an index key            | 64                                                                                                                                                                                                                                                                 |
| Maximum number of tables in a FROM clause               | 225 or fewer, depending on the complexity of the statement                                                                                                                                                                                                                                                                 |
| Maximum number of subqueries in a statement             | 224                                                                                                                                                                                                                                                                 |
| Maximum total length of host and indicator variables pointed to in an SQLDA | 32767 bytes  
                                                                                                                   2 147 483 647 bytes (2 GB - 1 byte) for a LOB, subject to the limitations that are imposed by the application environment and host language                                                                                                                                 |
| Maximum size of application SQLDA for any statement that references host variables or parameter markers | 99016 bytes                                                                                                                                                                                                                                                                 |
| Maximum length of host variable used for insert or update operation | 32704 bytes for a non-LOB  
                                                                                                                   2 147 483 647 bytes (2 GB - 1 byte) for a LOB, subject to the limitations that are imposed by the application environment and host language                                                                                                                                 |
| Maximum length of an SQL statement                       | 2 097 152 bytes                                                                                                                                                                                                                                                                 |

Table 163. DB2 limits on SQL statements (continued)
### Table 163. DB2 limits on SQL statements (continued)

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of elements in a select list</td>
<td>750 or fewer, depending on whether the select list is for the result table of static scrollable cursor&lt;sup&gt;1&lt;/sup&gt;</td>
</tr>
<tr>
<td>Maximum number of predicates in a WHERE or HAVING clause</td>
<td>Limited by storage</td>
</tr>
<tr>
<td>Maximum total length of columns of a query operation requiring a sort key (SELECT DISTINCT, ORDER BY, UNION, EXCEPT, and INTERSECT, without the ALL keyword, and the DISTINCT keyword for aggregate functions)</td>
<td>4032 bytes</td>
</tr>
<tr>
<td>Maximum total length of columns of a query operation requiring sort and evaluating column functions (MULTIPLE DISTINCT and GROUP BY)</td>
<td>65529 bytes</td>
</tr>
<tr>
<td>Maximum length of a sort key</td>
<td>16000 bytes</td>
</tr>
<tr>
<td>Maximum length of a check constraint</td>
<td>3800 bytes</td>
</tr>
</tbody>
</table>
| Maximum number of bytes that can be passed in a single parameter of an SQL CALL statement | 32765 bytes for a non-LOB  
2 147 483 647 bytes (2 GB - 1 byte) for a LOB, subject to the limitations imposed by the application environment and host language |
| Maximum number of stored procedures, triggers, and user-defined functions that an SQL statement can implicitly or explicitly reference | 64 nesting levels                                                                         |
| Maximum length of the SQL path                                       | 2048 bytes                                                                                 |
| Maximum length of a WLM environment name in a CREATE PROCEDURE, CREATE FUNCTION, ALTER PROCEDURE, or ALTER FUNCTION statement. | 32 bytes                                                                                  |
| Maximum number of XPath level in the XMLPATTERN clause of the CREATE INDEX statement. | 50 nesting levels                                                                         |

**Note:**
1. If the scrollable cursor is read-only, the maximum number is 749 less the number of columns in the ORDER BY that are not in the select list. If the scrollable cursor is not read-only, the maximum number is 747.

The following table shows the DB2 system limits.

### Table 164. DB2 system limits

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of concurrent DB2 or application agents</td>
<td>Limited by the EDM pool size, buffer pool size, and the amount of storage that is used by each DB2 or application agent</td>
</tr>
<tr>
<td>Maximum number of concurrently active audit policies</td>
<td>32</td>
</tr>
<tr>
<td>Maximum size of a non-LOB table or table space</td>
<td>128 terabytes (TB)</td>
</tr>
<tr>
<td>Maximum size of a simple or segmented table space</td>
<td>64 GB</td>
</tr>
</tbody>
</table>
| Maximum size of a log space                                         | 6-byte format: 2<sup>4</sup> bytes  
10-byte format: 2<sup>10</sup> bytes                                 |
| Maximum size of an active log data set                              | 4 GB minus 1 byte                                                                          |
| Maximum size of an archive log data set                             | 4 GB minus 1 byte                                                                          |
| Maximum number of active log copies                                 | 2                                                                                          |
### Table 164. DB2 system limits (continued)

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of archive log copies</td>
<td>2</td>
</tr>
<tr>
<td>Maximum number of active log data sets (each copy)</td>
<td>93</td>
</tr>
<tr>
<td>Maximum number of archive log volumes (each copy)</td>
<td>10000</td>
</tr>
<tr>
<td>Maximum number of databases accessible to an application or user</td>
<td>Limited by system storage and EDM pool size</td>
</tr>
<tr>
<td>Maximum number of databases</td>
<td>65217</td>
</tr>
<tr>
<td>Maximum number of implicitly created databases</td>
<td>Maximum value of the sequence SYSIBM.DSNSEQ_IMPLICITDB, with a default of 10000</td>
</tr>
<tr>
<td>Maximum number of internal objects for each database</td>
<td>32767</td>
</tr>
<tr>
<td>Maximum number of indexes on declared global temporary tables</td>
<td>10000</td>
</tr>
<tr>
<td>Maximum size of an EDM pool</td>
<td>The installation parameter maximum depends on available space</td>
</tr>
<tr>
<td>Maximum number of rows per page</td>
<td>255 for all table spaces except catalog and directory tables spaces, which have a maximum of 127</td>
</tr>
<tr>
<td>Maximum simple or segmented data set size</td>
<td>2 GB</td>
</tr>
<tr>
<td>Maximum partitioned data set size</td>
<td>See item “maximum size of a partition” in Table 163 on page 2081</td>
</tr>
<tr>
<td>Maximum LOB data set size</td>
<td>256 GB</td>
</tr>
<tr>
<td>Maximum number of table spaces that can be defined in a work file database</td>
<td>500</td>
</tr>
<tr>
<td>Maximum number of tables and triggers that can be defined in a work file database</td>
<td>11767</td>
</tr>
</tbody>
</table>

**Note:**

1. The number of internal object descriptors (OBDs) for external objects are as follows:
   - Table space: 2
   - Table: 1
   - Index: 2
   - Check constraint: 1
   - Referential integrity relationship: 2
   - Auxiliary relationship for each LOB column: 1
   - XML relationship for each XML column: 1
   - Trigger: 1
   - View that has an INSTEAD OF trigger: 1
Reserved schema names and reserved words

Restrictions exist on the use of certain names that are used by DB2. In some cases, names are reserved and cannot be used by application programs. In other cases, certain names are not recommended for use by application programs though not prevented by the database manager.
Reserved schema names

In general, for certain objects, schema names that begin with the prefix SYS are reserved. The schema name for these objects cannot begin with SYS except for certain exceptions.

The schema name for the objects listed in the following table must follow the restrictions listed in the table.

**Recommendations:**
- Do not to use SESSION as a schema name.
- Do not use SYSPUBLIC as a schema name for a table or view.

**Table 165. Objects with schema name restrictions and exceptions.**

<table>

</tbody>
</table>

**Notes:**
1. If the user who executes the CREATE statement has the SYSADM or SYSCTRL privilege.
2. For external user-defined scalar functions or external user-defined table functions if the user who executes the CREATE statement has the SYSADM or SYSCTRL privilege.
Reserved words

Certain words cannot be used as ordinary identifiers in some contexts because those words might be interpreted as SQL keywords. For example, ALL cannot be a column name in a SELECT statement. Each word, however, can be used as a delimited identifier in contexts where it otherwise cannot be used as an ordinary identifier. For example, if the quotation mark (" is the escape character that begins and ends delimited identifiers, “ALL” can appear as a column name in a SELECT statement.

Certain keywords might be interpreted as ordinary identifiers in some contexts rather than as keywords. For example, in the statement SELECT * FROM SYSIBM.SYSTABLES WHERE, WHERE is interpreted as an ordinary identifier specified as a correlation name, rather than as the beginning of an incomplete WHERE clause.

New reserved words for this version of DB2 for z/OS are identified with notes in this topic. In addition, some topics in this information might indicate words that cannot be used in the specific context that is being described.

IBM SQL has additional reserved words that DB2 for z/OS does not enforce. Therefore, you should not use these additional reserved words as ordinary identifiers in names that have a continuing use. See IBM DB2 SQL Reference for Cross-Platform Development for a list of the words.

Characteristics of SQL statements in DB2 for z/OS

DB2 allows specific actions on each SQL statement, and only certain SQL statements are allowed in external routines and SQL procedures.
### Actions allowed on SQL statements

Specific DB2 statements can be executed, prepared interactively or dynamically, or processed by the requester, the server, or the precompiler or coprocessor.

The following table shows whether a specific DB2 statement can be executed, prepared interactively or dynamically, or processed by the requester, the server, or the precompiler or coprocessor. The letter \( Y \) means yes.

**Table 166. Actions allowed on SQL statements in DB2 for z/OS**

</tbody>
</table>

Note:
1. The statement can be dynamically prepared. It cannot be issued dynamically.
2. The statement can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.
3. The statement can be dynamically prepared, but only from an ODBC or CLI driver that supports dynamic CALL statements.
4. The requesting system processes the PREPARE statement when the statement being prepared is ALLOCATE CURSOR or ASSOCIATE LOCATORS.
5. The value to which special register CURRENT SQLID is set is used as the SQL authorization ID for dynamic SQL statements only when DYNAMICRULES run behavior is in effect. The CURRENT SQLID value is ignored for the other DYNAMICRULES behaviors.
6. This statement can be used only in the triggered action of a trigger.
7. Local special registers can be referenced in a VALUES INTO statement if it results in the assignment of a single host-variable, not if it results in setting more than one value.
8. Some processing also occurs at the requester.
**SQL statements allowed in functions and stored procedures**

Certain SQL statements can be executed in a stored procedure or in a user-defined function. Whether the statements can be executed depends on the level of SQL data access with which the stored procedure or function is defined.

The following table shows which SQL statements in a stored procedure or in a user-defined function can execute. The letter **Y** means yes.

In general, if an executable SQL statement is encountered in a stored procedure or function defined as NO SQL, SQLSTATE 38001 is returned. If the routine is defined to allow some level of SQL access, SQL statements that are not supported in any context return SQLSTATE 38003. SQL statements not allowed for routines defined as CONTAINS SQL return SQLSTATE 38004, and SQL statements not allowed for READS SQL DATA return SQLSTATE 38002.

</tr>
<tr>
<td></td>
<td>MODIFIES SQL DATA</td>
</tr>
</tbody>
</table>

Notes:
1. Although the SQL option implies that no SQL statements can be specified, non-executable statements are not restricted.
2. The stored procedure that is called must have the same or more restrictive level of SQL data access than the current level in effect. For example, a routine defined as MODIFIES SQL DATA can call a stored procedure defined as MODIFIES SQL DATA, READS SQL DATA, CONTAINS SQL, or NO SQL. A routine defined as CONTAINS SQL can call a procedure defined as CONTAINS SQL or NO SQL.
3. The COMMIT statement cannot be executed in a user-defined function. The COMMIT statement cannot be executed in a stored procedure if the procedure is in the calling chain of a user-defined function or trigger.
4. The statement specified for the EXECUTE statement must be a statement that is allowed for the particular level of SQL data access in effect. For example, if the level in effect is READS SQL DATA, the statement must not be an INSERT, UPDATE, MERGE, or DELETE statement.
5. The statement is supported only if it does not contain a subquery or query-expression.
6. RELEASE SAVEPOINT, SAVEPOINT, and ROLLBACK (with the TO SAVEPOINT clause) cannot be executed from a user-defined function.
7. If the ROLLBACK statement (without the TO SAVEPOINT clause) is executed in a user-defined function, an error is returned to the calling program, and the application is placed in a must rollback state.
8. The ROLLBACK statement (without the TO SAVEPOINT clause) cannot be executed in a stored procedure if the procedure is in the calling chain of a user-defined function or trigger.

SQL control statements for external SQL procedures

SQL control statements for external SQL procedures can be used only with SQL procedures that are created with the FENCED or EXTERNAL clause. SQL control statements provide the capability to control the logic flow, declare and set variables, and handle warnings and exceptions. Some SQL control statements include other nested SQL statements.

SQL-control-statement:

- assignment-statement
- CALL statement
- CASE statement
- compound-statement
- GET DIAGNOSTICS statement
- GOTO statement
- IF statement
- ITERATE statement
- LEAVE statement
- LOOP statement
- REPEAT statement
- RESIGNAL statement
- RETURN statement
- SIGNAL statement
- WHILE statement
Control statements are supported in SQL procedures. External SQL procedures are created by specifying either FENCED or EXTERNAL, LANGUAGE SQL, and an SQL routine body on the CREATE PROCEDURE (SQL - external) statement. The SQL routine body must be a single SQL statement which may be an SQL control statement.

The remainder of this chapter contains a description of the control statements that are supported for external SQL procedures, and includes syntax diagrams, semantic descriptions, usage notes, and examples of the use of the statements that constitute the SQL routine body. In addition, you can find information about referencing SQL parameters and variables in References to SQL parameters and SQL variables.

The two common elements that are used in describing specific SQL control statements are:

- SQL control statements as described above
- "SQL-procedure-statement" on page 2100

## References to SQL parameters and SQL variables

SQL parameters and SQL variables can be referenced anywhere in the statement where an expression or a host variable can be specified. Host variables can be specified in SQL routines. SQL parameters and SQL variables can be referenced anywhere in the compound statement in which they are declared and can be qualified with the label name that is specified at the beginning of the compound statement.

All SQL parameters and SQL variables are considered nullable. The name of an SQL parameter or SQL variable in an SQL routine can be the same as the name of a column in a table or view that the SQL routine references. Names that are the same should be explicitly qualified. Qualifying a name clearly indicates whether the name refers to a column, SQL variable, or SQL parameter.

If the name is not qualified, the following rules describe whether the name refers to the column, the SQL variable, or the SQL parameter:

- The name is checked first as an SQL variable name and then as an SQL parameter name.
- If an SQL variable or SQL parameter by that name is not found, the name is assumed to be a column name.

The name of an SQL variable or SQL parameter in an SQL routine can be the name of an identifier that is used in certain SQL statements. If the name is not qualified, the following rules describe whether the name refers to the identifier, the SQL variable, or the SQL parameter:

- In the SET PATH and SET SCHEMA statements, the name is checked as an SQL variable name or an SQL parameter name. If an SQL variable or SQL parameter by that name is not found, the name is assumed to be an identifier.
- In the ASSOCIATE LOCATORS, CONNECT statement, the SET CONNECTION statement, and the RELEASE (connection) statement the name is used as an identifier.
An SQL control statement may allow multiple SQL statements to be specified within the SQL control statement. These statements are defined as SQL procedure statements.

**Syntax**

```
SQL-label:  SQL-control-statement  SQL-statement
```

**Description**

**SQL-label**
Specifies a label for the statement. **SQL-label** must not be a delimited identifier that includes lowercase letters or special characters. The label must be unique within the procedure.

**SQL-control-statement**
Specifies an SQL statement that provides the capability to control logic flow, declare and set variables, and handle warnings and exceptions, as defined in this section. Control statements are supported in SQL procedures.

**SQL-statement**
Specifies an SQL statement. These statements are described in Chapter 6, "Statements," on page 865.

**Notes**

**Comments:** Comments can be included within the body of an SQL procedure. In addition to the double-dash form of comments (--), a comment can begin with /* and end with */. The following rules apply to this form of comment:
- The beginning characters /* must be adjacent and on the same line.
- The ending characters */ must be adjacent and on the same line.
- Comments can be started wherever a space is valid.
- Comments can be continued to the next line.

**Handling errors and warnings:** Conditions can be detected within an SQL procedure by using the following methods:
- Test the special SQL variables SQLSTATE and SQLCODE.
- Issue a GET DIAGNOSTICS statement to request the condition information. See "GET DIAGNOSTICS" on page 1744.
- Define condition handlers to detect and process conditions. See "compound-statement" on page 2108 for information about defining condition handlers.
assignment-statement (SQL control statements for external routines)

The assignment statement assigns a value to an SQL parameter or to an SQL variable.

Syntax

```
SET SQL-parameter-name = CURRENT SERVER
SQL-variable-name CURRENT PACKAGESET
CURRENT PACKAGE PATH
expression
NULL
```

Description

**SQL-parameter-name**

Identifies the parameter that is the assignment target. The parameter must be specified in parameter-declaration in the CREATE PROCEDURE statement and must be defined as OUT or INOUT.

**SQL-variable-name**

Identifies the SQL variable that is the assignment target. SQL variables can be declared in a compound-statement and must be declared before it is used. For information on declaring SQL variables, see "compound-statement" on page 2108.

**expression or NULL**

Specifies the expression or value that is the assignment source. The expression can be any expression of the type described in "Expressions" on page 243 except it cannot contain a reference to local special registers (CURRENT SERVER, CURRENT PACKAGESET, or CURRENT PACKAGE PATH).

Notes

**Assignment rules**: Assignment statements in SQL procedures must conform to the SQL assignment rules. For example, the data type of the target and source must be compatible. See "Assignment and comparison" on page 123 for assignment rules.

When a string is assigned to a fixed-length variable and the length of the string is less than the length attribute of the target, the string is padded on the right with the necessary number of single-byte or double-byte blanks. When a string is assigned to a variable and the string is longer than the length attribute of the variable, the value is truncated and a warning is returned.

The ENCODING bind option is not used during processing of assignments to string variables. For example, assume that the system does not use mixed or DBCS, and the system EBCDIC SBCS CCSID is 37. Character conversion will not occur on assignment even if CCSID 500 is specified for the ENCODING bind parameter for the package for the procedure.

If truncation of the whole part of a number occurs on assignment to a numeric variable, the value is truncated and a warning is returned.
Assignments involving SQL parameters:

- An IN parameter can appear on the left side of an assignment statement. When control returns to the caller, the original value of an IN parameter is passed to the caller.
- An OUT parameter can appear on the left or right side of an assignment statement. When control returns to the caller, the last value that is assigned to an OUT parameter is returned to the caller.
- An INOUT parameter can appear on the left or right side of an assignment statement. The first value of the parameter is determined by the caller, and the last value that is assigned to the parameter is returned to the caller.
- A LOB parameter can not be used as an output value in an SQL statement in an SQL procedure when connected to a remote site. To circumvent the restriction, use a LOB SQL variable instead of a LOB parameter.

Considerations for SQLSTATE and SQLCODE SQL variables: Assignment to these variables is not prohibited. However, it is not recommended as assignment does not affect the diagnostic area or result in the activation of condition handlers. Furthermore, processing an assignment to these SQL variables causes the specified values for the assignment to be overlayed with the SQL return codes returned from executing the statement that does the assignment.

Examples

Increase the SQL variable `p_salary` by 10 percent.

```
SET p_salary = p_salary + (p_salary * .10)
```

Set SQL variable `p_salary` to the null value.

```
SET p_salary = NULL
```

Set SQL variable `midinit` to the first character of SQL variable `midname`.

```
SET midinit = SUBSTR(midname,1,1)
```
CALL statement

The CALL statement invokes a stored procedure.

Syntax

```
CALL procedure-name argument-list
```

**Description**

**procedure-name**

Identifies the stored procedure to call. The procedure name must identify a stored procedure that exists at the current server.

**argument-list**

Identifies a list of values to be passed as parameters to the stored procedure. The number of parameters must be the same as the number of parameters defined for the stored procedure. See “CALL” on page 1163 for more information.

Control is passed to the stored procedure according to the calling conventions for SQL procedures. When execution of the stored procedure is complete, the value of each parameter of the stored procedure is assigned to the corresponding parameter of the CALL statement defined as OUT or INOUT.

**SQL-variable-name**

Specifies an SQL variable as an argument to the stored procedure. For an explanation of references to SQL variables, see “References to SQL parameters and SQL variables” on page 2099.

**SQL-parameter-name**

Specifies an SQL parameter as an argument to the stored procedure. For an explanation of references to SQL parameters, see “References to SQL parameters and SQL variables” on page 2099.

**expression**

The parameter is the result of the specified expression, which is evaluated before the stored procedure is invoked. If expression is a single SQL-parameter-name or SQL-variable-name, the corresponding parameter of the procedure can be defined as IN, INOUT, or OUT. Otherwise, the corresponding parameter of the procedure must be defined as IN. If the result of the expression can be the null value, either the description of the
procedure must allow for null parameters or the corresponding parameter of the stored procedure must be defined as OUT.

The following additional rules apply depending on how the corresponding parameter was defined in the CREATE PROCEDURE statement for the procedure:

- **IN expression** can contain references to multiple SQL parameters or variables. In addition to the rules stated in "Expressions" on page 243 for expression, expression cannot include a column name, an aggregate function, or a user-defined function that is sourced on an aggregate function.
- **INOUT or OUT expression** can only be a single SQL parameter or variable.

**NULL**

The parameter is a null value. The corresponding parameter of the procedure must be defined as IN and the description of the procedure must allow for null parameters.

**Notes**

See "CALL" on page 1163 for more information on the SQL CALL statement.

**Examples**

Call stored procedure proc1 and pass SQL variables as parameters.

```sql
CALL proc1(v_empno, v_salary)
```
**CASE statement**

The CASE statement selects an execution path based on the evaluation of one or more conditions. A CASE statement operates in the same way as a CASE expression.

**Syntax**

```
CASE
  simple-when-clause
  searched-when-clause
  ELSE
    SQL-procedure-statement
END CASE
```

**simple-when-clause:**

```
expression
  WHEN
    expression
    THEN
    SQL-procedure-statement
```

**searched-when-clause:**

```
WHEN
  search-condition
  THEN
    SQL-procedure-statement
```

**Description**

**CASE**

Begins a case-expression.

**simple-when-clause**

Specifies the expression prior to the first WHEN keyword that is tested for equality with the value of each expression that follows the WHEN keyword, and the result to be executed when those expressions are equal. If the comparison is true, the THEN statement is executed. If the result is unknown or false, processing continues to the next expression or the ELSE statement.

The data type of the expression prior to the first WHEN keyword must be comparable to the data types of each expression that follows the WHEN keywords.

**searched-when-clause**

Specifies the search-condition that is applied to each row or group of table data presented for evaluation, and the result when that condition is true. search-condition cannot contain a fullselect. If the search condition is true, the
THEN statement is executed. If the condition is unknown or false, processing continues to the next search condition or the ELSE statement.

**SQL-procedure-statement**

Specifies a statement that follows the THEN and ELSE keyword. The statement specifies the result of a searched-when-clause or a simple-when-clause that is true, or the result if no case is true. The statement must be one of the statements listed under “SQL-procedure-statement” on page 2100.

**search-condition**

Specifies a condition that is true, false, or unknown about a row or group of table data.

**ELSE SQL-procedure-statement**

If none of the conditions specified in the simple-when-clause or searched-when-clause are true, the statements in the else-clause are executed.

If none of the conditions specified in the WHEN clause are true and an ELSE clause is not specified, an error is returned at run time, and the execution of the CASE statement is terminated.

**END CASE**

Ends a case-statement.

**Notes**

If none of the conditions specified in the WHEN clause are true and an ELSE clause is not specified, an error is returned at run time, and the execution of the CASE statement is terminated.

CASE statements that use a simple case statement WHEN clause can be nested up to three levels. CASE statements that use a searched statement WHEN clause have no limit to the number of nesting levels.

**Considerations for the SQLSTATE and SQLCODE SQL variables:** When the first SQL-procedure-statement in the CASE statement is executed, the SQLSTATE and SQLCODE SQL variables reflect the result of evaluating the expression or search conditions of that CASE statement. If a CASE statement does not include an ELSE clause and none of the search conditions evaluate to true, an error is returned.

**Examples**

*Example 1:* Use a simple case statement WHEN clause to update column DEPTNAME in table DEPT, depending on the value of SQL variable v_workdept.

```sql
CASE v_workdept
  WHEN 'A00'
    THEN UPDATE DEPT SET DEPTNAME = 'DATA ACCESS 1';
  WHEN 'B01'
    THEN UPDATE DEPT SET DEPTNAME = 'DATA ACCESS 2';
  ELSE UPDATE DEPT SET DEPTNAME = 'DATA ACCESS 3';
END CASE
```

*Example 2:* Use a searched case statement WHEN clause to update column DEPTNAME in table DEPT, depending on the value of SQL variable v_workdept.

```sql
CASE
  WHEN v_workdept < 'B01'
    THEN UPDATE DEPT SET
```

2106 SQL Reference
DEPTNAME = 'DATA ACCESS 1';
WHEN v_workdept < 'C01'
    THEN UPDATE DEPT SET
        DEPTNAME = 'DATA ACCESS 2';
ELSE UPDATE DEPT SET
    DEPTNAME = 'DATA ACCESS 3';
END CASE
**compound-statement**

A compound statement contains a group of statements and declarations for SQL variables, cursors, and condition handlers.

**Syntax**

```
BEGIN NOT_ATOMIC
label:
  SQL-variable-declaration;
  SQL-condition-declaration;
  return-codes-declaration;
  DECLARE-CURSOR-statement;
  handler-declaration;
  SQL-procedure-statement;
END
label
```

**Notes:**

1. Only one `label:` can be specified for each `SQL-procedure-statement`. If an ending label is specified for this beginning label, the labels must be the same.

**SQL-variable-declaration:**

```
DECLARE SQL-variable-name data-type DEFAULT NULL
  DEFAULT constant
RESULT_SET_LOCATOR VARYING
```

**SQL-condition-declaration:**

```
DECLARE SQL-condition-name CONDITION FOR SQLSTATE string-constant
```

**return-codes-declaration:**
**Description**

**label**
 Defines the label for the code block. If the beginning label is specified, it can be used to qualify SQL variables declared in the compound statement and can also be specified on a LEAVE statement. If the ending label is specified, it must be the same as the beginning label.

**NOT ATOMIC**
 NOT ATOMIC indicates that an error within the compound statement does not cause the compound statement to be rolled back.

**SQL-variable-declaration**
 Declares a variable that is local to the compound statement.

**SQL-variable-name**
 A qualified or unqualified name that designates a variable in an SQL procedure body. The unqualified form of SQL-variable-name is an SQL identifier and must not be a delimited identifier that contains lowercase letters or special characters. The qualified form is an SQL procedure statement label followed by a period (.) and an SQL identifier.
DB2 folds all SBCS SQL variable names to uppercase. SQL variable names should not be the same as column names. If an SQL statement contains an SQL variable or parameter and a column reference with the same name, DB2 interprets the name as an SQL variable or parameter name. To refer to the column, qualify the column name with the table name. Further, to avoid ambiguous variable references and to ensure compatibility with other DB2 platforms, qualify the SQL variable or parameter name with the label of the SQL procedure statement.

**data-type**
Specifies the data type and length of the variable. SQL variables follow the same rules for default lengths and maximum lengths as SQL procedure parameters. See "CREATE PROCEDURE (SQL - external)" on page 1393 for a description of SQL data types and lengths.

**DEFAULT constant or NULL**
Defines the default for the SQL variable. The variable is initialized when the SQL procedure is called. If a default value is not specified, the variable is initialized to NULL.

**RESULT_SET_LOCATOR VARYING**
Specifies the data type for a result set locator variable.

**SQL-condition-declaration**
Declares a condition name and corresponding SQLSTATE value.

**SQL-condition-name**
Specifies the name of the condition. The condition name is an SQL identifier and must not be a delimited identifier that includes lowercase letters or special characters. **SQL-condition-name** must be unique within the procedure body and can be referenced only within the compound statement in which it is declared.

**FOR SQLSTATE string-constant**
Specifies the SQLSTATE that is associated with the condition. The string must be specified as five characters enclosed in single quotes, and cannot be '00000'.

**return-codes-declaration**
Declares special variables called SQLSTATE and SQLCODE that are set automatically to the value returned after processing an SQL statement. Both the SQLSTATE and SQLCODE variables can be declared only in the outermost compound statement of the SQL procedure. Assignment to these variables is not prohibited; however, assignment is ignored by exception handlers, and processing the next SQL statement replaces the assigned value.

**DECLARE-CURSOR-statement**
Declares a cursor. Each cursor in the procedure body must have a unique name. An OPEN statement must be specified to open the cursor, and a FETCH statement can be specified to read rows. The cursor can be referenced only from within the compound statement. For more information on declaring a cursor, see "DECLARE CURSOR" on page 1598.

**handler-declaration**
Specifies a set of statements to execute when an exception or completion condition occurs in the compound statement. **SQL-procedure-statement** is the set of statements that execute when the handler receives control. See "SQL-procedure-statement" on page 2100 for information on SQL-procedure-statement.
A handler is active only within the compound statement in which it is declared.

The actions that a handler can perform are:

**CONTINUE**
Specifies that after the condition handler is activated and completes successfully, control is returned to the SQL statement that follows the statement that raised the condition. However, if the condition is an error condition and it was encountered while evaluating a search condition, as in a CASE, IF, REPEAT or WHILE statement, control returns to the statement that follows the corresponding END CASE, END IF, END REPEAT, or END WHILE.

**EXIT**
After the handler is invoked successfully, control is returned to the end of the compound statement.

The conditions that can cause the handler to gain control are:

**SQLSTATE** *string-constant*
Specifies an SQLSTATE for which the handler is invoked. The SQLSTATE cannot be '00000'.

**SQL-condition-name**
Specifies a condition name for which the handler is invoked. The condition name must be previously defined in a condition declaration.

**SQLEXCEPTION**
Specifies that the handler is invoked when an SQLEXCEPTION occurs. An SQLEXCEPTION is an SQLSTATE in which the class code is a value other than '00', '01', or '02'. For more information on SQLSTATE values, see *DB2 Codes*.

**SQLWARNING**
Specifies that the handler is invoked when an SQLWARNING occurs. An SQLWARNING is an SQLSTATE value with a class code of '01'.

**NOT FOUND**
Specifies that the handler is invoked when a NOT FOUND condition occurs. NOT FOUND corresponds to an SQLSTATE value with a class code of '02'.

**Notes**

The order of statements in a compound statement must be:
1. SQL variable, condition declarations, and return codes declarations
2. Cursor declarations
3. Handler declarations
4. SQL procedure statements

Compound statements cannot be nested.

Unlike host variables, SQL variables are not preceded by colons when they are used in SQL statements.

The following rules apply to handlers:
- A handler declaration that contains SQLEXCEPTION, SQLWARNING, or NOT FOUND cannot contain additional SQLSTATE or condition names.
• Handler declarations within the same compound statement cannot contain duplicate conditions.

• A handler declaration cannot contain the same condition code or SQLSTATE value more than once, and cannot contain an SQLSTATE value and a condition name that represent the same SQLSTATE value.

• A handler is activated when it is the most appropriate handler for an exception or completion condition.

• If there is no handler for an SQL error, the error is passed to the caller in the SQLCA.

• A handler cannot be activated by an assignment statement that assigns a value to SQLSTATE.

The following rules and recommendations apply to the SQLCODE and SQLSTATE SQL variables:

• A null value cannot be assigned to SQLSTATE or SQLCODE.

• The SQLSTATE and SQLCODE variable values should be saved immediately to temporary variables if there is any intention to use the values. If a handler exists for SQLSTATE, this assignment must be done as the first statement to be processed in the handler to avoid having the value replaced by the next SQL procedure statement. If the condition raised by the SQL statement is handled, the value is changed by the first SQL statement contained in the handler.

*Considerations for the SQLSTATE and SQLCODE SQL variables:* The compound statement itself does not affect the SQLSTATE and SQLCODE SQL variables. However, SQL statements contained within the compound statement can affect the SQLSTATE and SQLCODE SQL variables. At the end of the compound statement, the SQLSTATE and SQLCODE SQL variables reflect the result of the last SQL statement executed within the compound statement that caused a change to the SQLSTATE and SQLCODE SQL variables. If the SQLSTATE and SQLCODE SQL variables were not changed within the compound statement, they contain the same values as when the compound statement was entered.

**Examples**

Create a procedure body with a compound statement that performs the following actions:

• Declares SQL variables, a condition for SQLSTATE '02000', a handler for the condition, and a cursor

• Opens the cursor, fetches a row, and closes the cursor

```
CREATE PROCEDURE PROC1(OUT NOROWS INT) LANGUAGE SQL
BEGIN
    DECLARE v_firstnme VARCHAR(12);
    DECLARE v_midinit CHAR(1);
    DECLARE v_lastname VARCHAR(15);
    DECLARE v_edlevel SMALLINT;
    DECLARE v_salary DECIMAL(9,2);
    DECLARE at_end INT DEFAULT 0;
    DECLARE not_found
        CONDITION FOR '02000';
    DECLARE c1 CURSOR FOR
        SELECT FIRSTNME, MIDINIT, LASTNAME,
        EDLEVEL, SALARY
        FROM EMP;
    DECLARE CONTINUE HANDLER FOR not_found SET NOROWS=1;
```
OPEN c1;
FETCH c1 INTO v_firstnme, v_midinit,
v_lastname, v_edlevel, v_salary;
END
GET DIAGNOSTICS statement

The GET DIAGNOSTICS statement obtains information about the previous SQL statement that was executed.

See “GET DIAGNOSTICS” on page 1744.

When you need to specify a variable in a GET DIAGNOSTICS statement that is used within an SQL procedure, you would use either SQL-variable-name or SQL-parameter-name. In an embedded GET DIAGNOSTICS statement, you would use a host-variable. You can replace the instances of host-variable in the description of “GET DIAGNOSTICS” on page 1744 with SQL-variable-name or SQL-parameter-name.
GOTO statement

The GOTO statement is used to branch to a user-defined label within an SQL procedure.

Syntax

```sql
GOTO label
```

Description

`label`

Specifies a labeled statement at which processing is to continue.

The labeled statement and the GOTO statement must be in the same scope. The following rules apply to the scope:

- If the GOTO statement is defined in a compound statement, `label` must be defined inside the same compound statement.
- If the GOTO statement is defined in a handler, `label` must be defined in the same handler and follow the other scope rules.
- If the GOTO statement is defined outside of a handler, `label` must not be defined within a handler.

If `label` is not defined within a scope that the GOTO statement can reach, an error is returned.

A label name cannot be the same as the name of the SQL procedure in which the label is used.

Notes

Use the GOTO statement sparingly. Because the GOTO statement interferes with the normal sequence of processing, it makes an SQL procedure more difficult to read and maintain. Before using a GOTO statement, determine whether some other statement, such as an IF statement or LEAVE statement, can be used instead.

Examples

Use a GOTO statement to transfer control to the end of a compound statement if the value of an SQL variable is less than 600.

```sql
BEGIN
  DECLARE new_salary DECIMAL(9,2);
  DECLARE service DECIMAL(8,2);
  SELECT SALARY, CURRENT_DATE - HIREDATE
    INTO new_salary, service
  FROM EMP
  WHERE EMPNO = v_empno;
  IF service < 600
    THEN GOTO EXIT;
  END IF;
  IF rating = 1
    THEN SET new_salary =
      new_salary + (new_salary * .10);
  ELSEIF rating = 2
    THEN SET new_salary =
      new_salary + (new_salary * .05);
```
END IF;
UPDATE EMP
SET SALARY = new_salary
WHERE EMPNO = v_empno;
EXIT: SET return_parm = service;
END
**IF statement**

The IF statement selects an execution path based on the evaluation of a condition.

**Syntax**

```
IF search-condition THEN SQL-procedure-statement ;
ELSEIF search-condition THEN SQL-procedure-statement ;
ELSE SQL-procedure-statement ;
END IF
```

**Description**

- **search-condition**
  Specifies the condition for which an SQL statement should be invoked. If the condition is unknown or false, processing continues to the next search condition until either a condition is true or processing reaches the ELSE clause.

- **SQL-procedure-statement**
  Specifies the statement to be invoked if the preceding search-condition is true. If no search-condition evaluates to true, then the SQL-procedure-statement following the ELSE keyword is invoked. The statement must be one of the statements listed under “SQL-procedure-statement” on page 2100.

**Notes**

*Considerations for the SQLSTATE and SQLCODE SQL variables*: When the first SQL-procedure-statement in the IF statement is executed, the SQLSTATE and SQLCODE SQL variables reflect the result of evaluating the search conditions of that IF statement. If an IF statement does not include an ELSE clause and none of the search conditions evaluate to true, then when the statement that follows that IF statement is executed, the SQLSTATE and SQLCODE SQL variables reflect the result of evaluating the search conditions of that IF statement.

**Examples**

Assign a value to the SQL variable new_salary based on the value of SQL variable rating.

```
IF rating = 1
THEN SET new_salary =
    new_salary = (new_salary * .10);
ELSEIF rating = 2
```
THEN SET new_salary =
    new_salary + (new_salary * .05);
ELSE SET new_salary =
    new_salary + (new_salary * .02);
END IF
ITERATE statement

The ITERATE statement causes the flow of control to return to the beginning of a labeled loop.

Syntax

```
迭代label
```

Description

*label*

Specifies the label of the LOOP, REPEAT, or WHILE statement to which the flow of control is passed.

Examples

This example uses a cursor to return information for a new department. If the not_found condition handler is invoked, the flow of control passes out of the loop. If the value of `v_dept` is 'D11', an ITERATE statement causes the flow of control to be passed back to the top of the LOOP statement. Otherwise, a new row is inserted into the table.

```
CREATE PROCEDURE ITERATOR ()
  LANGUAGE SQL
  MODIFIES SQL DATA
  BEGIN
    DECLARE v_dept CHAR(3);
    DECLARE v_deptname VARCHAR(29);
    DECLARE v_admdept CHAR(3);
    DECLARE at_end INTEGER DEFAULT 0;
    DECLARE not_found CONDITION FOR SQLSTATE '02000';
    DECLARE c1 CURSOR FOR
      SELECT deptno,deptname,admdept
      FROM department
      ORDER BY deptno;
    DECLARE CONTINUE HANDLER FOR not_found
      SET at_end = 1;
    OPEN c1;
    ins_loop:
      LOOP
        FETCH c1 INTO v_dept, v_deptname, v_admdept;
        IF at_end = 1 THEN
          LEAVE ins_loop;
        ELSEIF v_dept = 'D11' THEN
          ITERATE ins_loop;
        END IF;
        INSERT INTO department (deptno,deptname,admdept)
          VALUES('NEW', v_deptname, v_admdept);
      END LOOP;
    CLOSE c1;
  END
```
LEAVE statement

The LEAVE statement transfers program control out of a loop or a compound statement.

Syntax

```
LEAVE label
```

Description

`label`

Specifies the label of the compound statement or loop to exit.

A label name cannot be the same as the name of the SQL procedure in which the label is used.

Notes

When a LEAVE statement transfers control out of a compound statement, all open cursors in the compound statement, except cursors that are used to return result sets, are closed.

Examples

Use a LEAVE statement to transfer control out of a LOOP statement when a negative SQLCODE occurs.

```
ftch_loop: LOOP
  FETCH c1 INTO
  v_firstname, v_midinit,
  v_lastname, v_edlevel, v_salary;
  IF SQLCODE=100 THEN LEAVE ftch_loop;
  END IF;
  END LOOP
```
LOOP statement

The LOOP statement executes a statement or group of statements multiple times.

Syntax

```
(1) label:
LOOP
  SQL-procedure-statement;
END LOOP
label
```

Notes:

1. Only one `label:` can be specified for each `SQL-procedure-statement`.

Description

`label`

Specifies the label for the LOOP statement. If the ending label is specified, the beginning label must be specified, and the two must match.

A label name cannot be the same as the name of the SQL procedure in which the label is used.

`SQL-procedure-statement`

Specifies the statements to be executed in the loop. The statement must be one of the statements listed under “SQL-procedure-statement” on page 2100.

Examples

This procedure uses a LOOP statement to fetch values from the employee table. Each time the loop iterates, the OUT parameter counter is incremented and the value of `v_midinit` is checked to ensure that the value is not a single space (' '). If `v_midinit` is a single space, the LEAVE statement passes the flow of control outside of the loop.

```sql
CREATE PROCEDURE LOOP_UNTIL_SPACE(OUT counter INTEGER)
  LANGUAGE SQL
BEGIN
  DECLARE v_counter INTEGER DEFAULT 0;
  DECLARE v_firstnme VARCHAR(12);
  DECLARE v_midinit CHAR(1);
  DECLARE v_lastname VARCHAR(15);
  DECLARE c1 CURSOR FOR
    SELECT firstnme, midinit, lastname
    FROM employee;
  DECLARE EXIT HANDLER FOR NOT FOUND
    SET counter = -1;
  OPEN c1;
  fetch_loop:
  LOOP
    FETCH c1 INTO v_firstnme, v_midinit, v_lastname;
    IF v_midinit = ' ' THEN
      LEAVE fetch_loop;
    END IF;
    SET v_counter = v_counter + 1;
```

Appendix. Additional information for DB2 SQL 2121
END LOOP fetch_loop;
SET counter = _counter;
CLOSE c1;
END
**REPEAT statement**

The REPEAT statement executes a statement or group of statements until a search condition is true.

**Syntax**

```
label: REPEAT SQL-procedure-statement ; UNTIL search-condition END REPEAT
```

**Notes:**

1. Only one `label` can be specified for each `SQL-procedure-statement`.

**Description**

- `label`
  - Specifies the label for the REPEAT statement. If the ending label is specified, the beginning label must be specified, and the two must match.
  
  A label name cannot be the same as the name of the SQL procedure in which the label is used.

- `SQL-procedure-statement`
  - Specifies the statements to be executed. The statement must be one of the statements listed under “SQL-procedure-statement” on page 2100.

- `search-condition`
  - Specifies a condition that is evaluated after each execution of the REPEAT statement. If the condition is true, the REPEAT loop will exit. If the condition is unknown or false, the REPEAT loop continues.

**Examples**

Use a REPEAT statement to fetch rows from a table.

```sql
fetch_loop:
REPEAT
  FETCH c1 INTO
    v_firstnme, v_midinit, v_lastname;
UNTIL
  SQLCODE <> 0
END REPEAT fetch_loop
```
**RESIGNAL statement**

The RESIGNAL statement is used within a condition handler to re-raise the current condition, or to raise an alternate condition so that it can be processed at a higher level. It causes an exception, warning, or not found condition to be returned along with optional message text.

Issuing the RESIGNAL statement without an operand causes the current condition to be passed upwards.

**Syntax**

```
RESIGNAL SQLSTATE VALUE sqlstate-string-constant
  SQL-variable-name signal-information
```

**Description**

**SQLSTATE VALUE**

Specifies the SQLSTATE that will be returned. Any valid SQLSTATE value can be used. It must be a character string constant with exactly five characters that follow the rules for SQLSTATE values:

- Each character must be from the set of digits ('0' through '9') or non-accented upper case letter ('A' through 'Z').
- The SQLSTATE class (the first two characters) cannot be '00' because it represents successful completion.

If the SQLSTATE does not conform to these rules, an error occurs.

**sqlstate-string-constant**

A character string constant with a length of five bytes that is a valid SQLSTATE value.

**SQL-variable-name or SQL-parameter-name**

Specifies an SQL variable or SQL parameter that is defined for the procedure.

**SQL-variable-name**

Specifies an SQL variable that is declared within the compound-statement that contains the RESIGNAL statement. SQL-variable-name must be defined as CHAR or VARCHAR data type with a length of five bytes, must not be null, and must contain a valid SQLSTATE value.

**SQL-parameter-name**

Specifies an SQL parameter that is defined for the procedure that contains the SQLSTATE value. The SQL parameter must be defined as
a CHAR or VARCHAR value and have a length of five bytes and must not be null. The SQL parameter must contain a valid SQLSTATE value.

**SQL-condition-name**

Specifies the name of the condition that will be returned. *condition-name* must be declared within the *compound-statement*.

**SET MESSAGE_TEXT**

Specifies a string that describes the error or warning. The string is returned in the SQLERRMC field of the SQLCA or with the GET DIAGNOSTICS statement.

**diagnostic-string-expression**

An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see "GET DIAGNOSTICS" on page 1744.

**Notes**

While any valid SQLSTATE value can be used in the RESIGNAL statement, programmers should define new SQLSTATE values based on ranges reserved for applications. This practice prevents the unintentional use of an SQLSTATE value that might be defined by the database manager in a future release.

If the RESIGNAL statement is issued without an SQLSTATE clause or a *condition-name*, the RESIGNAL statement must be in a handler and the identical condition that activated the handler is returned. The SQLSTATE, SQLCODE, and the SQLCA associated with the condition are unchanged.

If an SQLSTATE clause or a *condition-name* was specified, the SQLCODE returned is based on the SQLSTATE value as follows:

- If the specified SQLSTATE class is either '01' or '02', a warning or not-found message is returned, and the SQLCODE is set to +438.
- Otherwise, an exception is returned and the SQLCODE is set to -438.

The other fields of the SQLCA are set as follows:

- SQLERRDx fields are set to zero.
- SQLWARNx fields are set to blank.
- SQLERRMC is set to the first 70 bytes of MESSAGE_TEXT.
- SQLERRML is set to the length of SQLERRMC.
- SQLERRP is set to ROUTINE.

When the SQLSTATE or condition indicates that an exception is returned (an SQLSTATE class other than '01' or '02'), the exception is not handled, and control is immediately returned to the end of the compound statement.

When the SQLSTATE or condition indicates that a warning (SQLSTATE class '02') is returned, the warning is not handled, and processing continues with the next statement.

When the SQLSTATE or condition indicates that a not-found condition (SQLSTATE class '02') is returned, the not-found condition is not handled, and processing continues with the next statement.
Examples

The following example detects a division by zero error. The IF statement uses a SIGNAL statement to invoke the overflow condition handler. The condition handler uses a RESIGNAL statement to return a different SQLSTATE to the client application.

```sql
CREATE PROCEDURE divide ( IN numerator INTEGER,
                          IN denominator INTEGER,
                          OUT divide_result INTEGER)
    LANGUAGE SQL
    CONTAINS SQL
    BEGIN
      DECLARE overflow CONDITION for SQLSTATE '22003';
      DECLARE CONTINUE HANDLER FOR overflow
        RESIGNAL SQLSTATE '22375';
      IF denominator = 0 THEN
        SIGNAL overflow;
      ELSE
        SET divide_result = numerator / denominator;
      END IF;
    END
```

SQL Reference
**RETURN statement**

The RETURN statement is used to return from the routine. For SQL functions, it returns the result of the function. For an SQL procedure, it optionally returns an integer status value.

**Syntax**

```
RETURN expression
```

**Description**

*expression*

Specifies a value that is returned from the routine.

- If the routine is a function, *expression* must be specified and the value of *expression* must conform to the SQL assignment rules as described in ["Assignment and comparison" on page 123](#). If the value is being assigned to a string variable, storage assignment rules apply.
- If the routine is a procedure, the data type of *expression* must be INTEGER. If *expression* evaluates to the null value, a value of 0 is returned.

The *expression* cannot include a column name or a host variable. See ["Expressions" on page 243](#) for information on expressions. The *expression* cannot contain a scalar fullselect.

**NULL**

The null value is returned from the SQL function. **NULL** is not allowed in SQL procedures.

**Notes**

**When a RETURN statement is not used within an SQL procedure or when no value is specified:** If a RETURN statement was not used to return from a procedure or if a value is not specified on the RETURN statement, one of the following values is set:

- If the procedure returns with an SQLCODE that is greater or equal to zero, the return status is set to a value of 0.
- If the procedure returns with an SQLCODE that is less than zero, the return status is set to a value of -1.

**When a RETURN statement is used within an SQL procedure:** If a RETURN statement with a specified return value was used to return from a procedure, the SQLCODE, SQLSTATE, and message length in the SQLCA are initialized to zeros and the message text is set to blanks. An error is not returned to the caller.

**When the value is returned:** When a value is returned from a procedure, the caller may access the value using one of the following methods:

- The GET DIAGNOSTICS statement to retrieve the RETURN_STATUS when the SQL procedure was called from another SQL procedure.
- The parameter bound for the return value parameter marker in the escape clause CALL syntax (=CALL...) in a CLI application.

Appendix. Additional information for DB2 SQL 2127
• Directly from the SQLCA returned from processing the CALL of an SQL procedure by retrieving the value of sqlerrd[0]. When the SQLCODE is less than zero, the sqlerrd[0] value is not set. The application should assume a return status value of '-1'.

Examples

Use a RETURN statement to return from an SQL procedure with a status value of zero if successful or '-200' if not successful.

BEGIN
  .
  GOTO FAIL;
  .
  SUCCESS: RETURN 0;
  FAIL: RETURN -200;
END
**SIGNAL statement**

The SIGNAL statement is used to return an error or warning condition. It causes an error or warning to be returned with the specified SQLSTATE, along with optional message text.

**Syntax**

```
SIGNAL SQLSTATE value
```

1. **value**
   - A character string constant with a length of five bytes that is a valid SQLSTATE value.

**Notes:**

1. The **SQLSTATE** variation must be used within a trigger body.
2. **SQL-condition-name** must not be specified within a trigger body.
3. **signal-information** must be specified within a trigger body.

**signal-information:**

```
SET MESSAGE_TEXT = diagnostic-string-expression
```

1. **diagnostic-string-expression**
   - A character string constant with a length of five bytes that is a valid SQLSTATE value.

**Notes:**

1. **(diagnostic-string-expression)** must only be specified within a trigger body.

**Description**

**SQLSTATE VALUE**

Specifies the SQLSTATE that will be returned. Any valid SQLSTATE value can be used. It must be a character string constant with exactly five characters that follow the rules for SQLSTATEs:

- Each character must be from the set of digits ('0' through '9') or non-accented upper case letter ('A' through 'Z').
- The SQLSTATE class (the first two characters) cannot be '00' because it represents successful completion.

If the SQLSTATE does not conform to these rules, an error occurs.

**sqlstate-string-constant**

A character string constant with a length of five bytes that is a valid SQLSTATE value.
**SQL-variable-name or SQL-parameter-name**

Specifies an SQL variable or SQL parameter that contains a valid SQLSTATE value.

**SQL-variable-name**

Specifies an SQL variable that is declared within the compound-statement. **SQL-variable-name** must be defined as a CHAR or VARCHAR data type, have a length of five bytes, must not be null, and must contain a valid SQLSTATE value.

**SQL-parameter-name**

Specifies an SQL parameter that is defined for the procedure and contains the SQLSTATE value. The SQL parameter must be defined as a CHAR or VARCHAR value, have a length of five bytes, must not be null, and must contain a valid SQLSTATE value.

**SQL-condition-name**

Specifies the name of the condition that will be returned. **condition-name** must be declared within the compound-statement.

**SET MESSAGE_TEXT**

Specifies a string that describes the error or warning. The string is returned in the SQLERRMC field of the SQLCA or with the GET DIAGNOSTICS statement.

**diagnostic-string-expression**

An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see "GET DIAGNOSTICS" on page 1744.

**diagnostic-string-expression**

An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see "GET DIAGNOSTICS" on page 1744.

This syntax variation is only provided within the scope of a CREATE TRIGGER statement for compatibility with previous versions of DB2. To conform with the ANS and ISO standards, this form should not be used.

**Notes**

While any valid SQLSTATE value can be used in the SIGNAL statement, programmers should define new SQLSTATEs based on ranges reserved for applications. This practice prevents the unintentional use of an SQLSTATE value that might be defined by the database manager in a future release.

If a SIGNAL statement is issued, the SQLCODE that is returned is based on the SQLSTATE as follows:
- If the specified SQLSTATE class is either '01' or '02', a warning or not-found message is returned, and the SQLCODE is set to +438.
- Otherwise, an exception is returned and the SQLCODE is set to -438.

The other fields of the SQLCA are set as follows:
- SQLERRDx fields are set to zero.
- SQLWARNx fields are set to blank.
- SQLERRMC is set to the first 70 bytes of MESSAGE_TEXT.
• SQLERRML is set to the length of SQLERRMC.
• SQLERRP is set to ROUTINE.

When the SQLSTATE or condition indicates that an exception (an SQLSTATE class other than '01' or '02') is returned, one of the following actions occurs:
• If a handler exists for the specified SQLSTATE, condition, or SQLEXCEPTION, the exception is handled, and control is transferred to that handler.
• Otherwise, the exception is not handled, and control is immediately returned to the end of the compound statement.

When the SQLSTATE or condition indicates that a warning (SQLSTATE class '01') is returned, one of the following actions occurs:
• If an active handler exists for the specified SQLSTATE, condition, or SQLWARNING, the warning is handled, and control is transferred to that handler.
• Otherwise, the warning is not handled, and processing continues with the next statement.

When the SQLSTATE or condition indicates that a not-found condition (SQLSTATE class '02') is returned, one of the following actions occurs:
• If an active handler exists for the specified SQLSTATE, condition, or not-found condition, the not-found condition is handled, and control is transferred to that handler.
• Otherwise, the not-found condition is not handled, and processing continues with the next statement.

When the SIGNAL statement is issued in a handler, no active handler exists.

**Using a SIGNAL statement in the body of a trigger:** Within the triggered action of a CREATE TRIGGER statement, the message text can be specified using only these variations:

```
SIGNAL SQLSTATE sqlstate-string-constant
SET MESSAGE_TEXT = diagnostic-string-expression
```

```sql
SIGNAL SQLSTATE sqlstate-string-constant
(diagnostic-string-expression)
```

**Examples**

**Example 1:** The following example shows an SQL procedure for an order system that signals an application error when a customer number is not known to the application. The ORDERS table includes a foreign key to the CUSTOMER table, requiring that the CUSTNO exist before an order can be inserted.

```
CREATE PROCEDURE SUBMIT_ORDER
  (IN ONUM INTEGER, IN CNUM INTEGER,
   IN PNUM INTEGER, IN QNUM INTEGER)
  LANGUAGE SQL
  SPECIFIC SUBMIT_ORDER
  MODIFIES SQL DATA
BEGIN
  DECLARE EXIT HANDLER FOR SQLSTATE VALUE '23503'
  SIGNAL SQLSTATE '75002'
  SET MESSAGE_TEXT = 'Customer number is not known';
  INSERT INTO ORDERS (ORDERNO, CUSTNO, PARTNO, QUANTITY)
  VALUES (ONUM, CNUM, PNUM, QNUM);
END
```
Example 2: The following example shows a trigger for an order system that allows orders to be recorded in an ORDERS table (ORDERNO, CUSTNO, PARTNO, QUANTITY) only if there is sufficient stock in the PARTS tables. When there is insufficient stock for an order, SQLSTATE '75001' is returned along with an appropriate error description.

```sql
CREATE TRIGGER CK_AVAIL
    NO CASCADE BEFORE INSERT ON ORDERS
    REFERENCING NEW AS NEW_ORDER
    FOR EACH ROW MODE DB2SQL
    WHEN (NEW_ORDER.QUANTITY > (SELECT ON_HAND FROM PARTS
        WHERE NEW_ORDER.PARTNO = PARTS.PARTNO))
    BEGIN ATOMIC
        SIGNAL SQLSTATE '75001' ('Insufficient stock for order');
    END
```
**WHILE statement**

The WHILE statement repeats the execution of a statement or group of statements while a specified condition is true.

### Syntax

```
(1) label: WHILE search-condition DO SQL-procedure-statement ; END WHILE
```

### Notes:

1. Only one label can be specified for each SQL-procedure-statement. If an ending label is specified for this beginning label, the labels must be the same.

### Description

**label**

Specifies the label for the WHILE statement. If the ending label is specified, it must be the same as the beginning label.

A label name cannot be the same as the name of the SQL procedure in which the label is used.

**search-condition**

Specifies a condition that is evaluated before each execution of the loop. If the condition is true, the SQL procedure statement in the loop is executed.

**SQL-procedure-statement**

Specifies the statements to be executed in the loop. The statement must be one of the statements listed under "SQL-procedure-statement" on page 2100.

### Examples

Use a WHILE statement to fetch rows from a table while SQL variable at_end, which indicates whether the end of the table has been reached, is 0.

```
WHILE at_end = 0 DO
    FETCH cI INTO
        vFirstname, vMidinit,
        vLastName, vEdlevel, vSalary;
    IF SQLCODE=100 THEN SET at_end=1;
    END IF;
END WHILE
```
SQL communication area (SQLCA)

An SQLCA is a structure or collection of variables that is updated after each SQL statement executes. An application program that contains executable SQL statements must provide exactly one SQLCA, with a few exceptions.

The following exceptions exist:
- A program that is precompiled with the STDSQL(YES) option must not provide an SQLCA.
- In some cases a Fortran program must provide more than one SQLCA.

In all host languages except REXX, the SQL INCLUDE statement can be used to provide the declaration of the SQLCA.

**In COBOL and assembler:**
- The name of the storage area must be SQLCA.

**In PL/I and C:**
- The name of the structure must be SQLCA. Every executable SQL statement must be within the scope of its declaration.
- Unless noted otherwise, C is used to represent C/370™ and C/C++ programming languages.

**In Fortran:**
- The name of the COMMON area for the INTEGER variables of the SQLCA must be SQLCA1; the name of the COMMON area for the CHARACTER variables must be SQLCA2. An SQLCA definition is required for every subprogram that contains SQL statements. One is also needed for the main program if it contains SQL statements.

**In Java:**
- The DB2Sqlca class, which is an encapsulation of the SQLCA, should be used.

**In REXX:**
- DB2 generates the SQLCA automatically. A REXX procedure cannot use the INCLUDE statement. The REXX SQLCA has a somewhat different format from SQLCAs for the other languages.

Related reference:
- [DB2Sqlca class (DB2 Application Programming for Java)]
- “The REXX SQLCA” on page 2142
**Description of SQLCA fields**

For the most part, COBOL, C, PL/I, and assembler use the same names for the SQLCA fields, and Fortran uses different names. However, there is one instance where C, PL/I, and assembler names differ from COBOL.

The names in the following table are those provided by the SQL INCLUDE statement.

<table>
<thead>
<tr>
<th>assembler, COBOL, or PL/I Name</th>
<th>C Name</th>
<th>Fortran Name</th>
<th>Data Type</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQLCAID</td>
<td>sqlcaid</td>
<td>Not used.</td>
<td>CHAR(8)</td>
<td>An “eye catcher” for storage dumps, containing the text 'SQLCA'. The sixth byte is 'L' if line number information is returned from parsing a dynamic statement or a native SQL procedure. The sixth byte is not set when processing an external SQL procedure.</td>
</tr>
<tr>
<td>SQLCABC</td>
<td>sqlcabc</td>
<td>Not used.</td>
<td>INTEGER</td>
<td>Contains the length of the SQLCA: 136.</td>
</tr>
<tr>
<td>SQLCODE (See note 1)</td>
<td>SQLCODE</td>
<td>SQLCOD</td>
<td>INTEGER</td>
<td>Contains the SQL return code. (See note 2)</td>
</tr>
<tr>
<td>SQLERRML (See note 3)</td>
<td>sqlerrml</td>
<td>SQLTXL</td>
<td>SMALLINT</td>
<td>Length indicator for SQLERRMC, in the range 0 through 70. 0 means that the value of SQLERRMC is not pertinent.</td>
</tr>
<tr>
<td>SQLERRMC (See note 3)</td>
<td>sqlerrmc</td>
<td>SQLTXT</td>
<td>VARCHAR(70)</td>
<td>Contains one or more tokens, separated by X’FF’, that are substituted for variables in the descriptions of error conditions. It may contain truncated tokens. A message length of 70 bytes indicates a possible truncation.</td>
</tr>
<tr>
<td>SQLERRP</td>
<td>sqlerrp</td>
<td>SQLERP</td>
<td>CHAR(8)</td>
<td>Provides a product signature and, in the case of an error, diagnostic information such as the name of the module that detected the error. In all cases, the first three characters are ‘DSN’ for DB2 for z/OS.</td>
</tr>
<tr>
<td>SQLERRD(1)</td>
<td>sqlerrd[0]</td>
<td>SQLERR(1)</td>
<td>INTEGER</td>
<td>For a sensitive static cursor, contains the number of rows in a result table when the cursor position is after the last row (that is, when SQLCODE is equal to +100). On successful return from an SQL procedure, contains the return status value from the SQL procedure. SQLERRD(1) can also contain an internal error code.</td>
</tr>
<tr>
<td>assembler, COBOL, or PL/I Name</td>
<td>C Name</td>
<td>Fortran Name</td>
<td>Data type</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------</td>
<td>--------------</td>
<td>-----------</td>
<td>---------</td>
</tr>
<tr>
<td>SQLERRD(2)</td>
<td>sqlerrd[1]</td>
<td>SQLERR(2)</td>
<td>INTEGER</td>
<td>For a sensitive static cursor, contains the number of rows in a result table when the cursor position is after the last row (that is, when SQLCODE is equal to +100). SQLERRD(2) can also contain an internal error code.</td>
</tr>
</tbody>
</table>
### Table 168. Fields of SQLCA (continued)

<table>
<thead>
<tr>
<th>assembler, COBOL, or PL/I Name</th>
<th>C Name</th>
<th>Fortran Name</th>
<th>Data type</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQLERRD(3)</td>
<td>sqlerrd[2]</td>
<td>SQLERR(3)</td>
<td>INTEGER</td>
<td>Contains the number of rows that qualified to be deleted, inserted, or updated after a DELETE, INSERT, UPDATE, or MERGE statement. The number excludes rows affected by triggers, referential integrity constraints, or inserted rows that are the result of processing a FOR PORTION OF clause for a BUSINESS_TIME period. For the OPEN of a cursor for a SELECT with a data change statement or for a SELECT INTO, SQLERRD(3) contains the number of rows affected by the embedded data change statement. The value is 0 if the SQL statement fails, indicating that all changes made in executing the statement canceled. For a DELETE statement the value will be -1 if the operation is a mass delete from a table in a segmented table space and the DELETE statement did not include selection criteria. If the delete was against a view, neither the DELETE statement nor the definition of the view included selection criteria. For a TRUNCATE statement, the value will be -1. For a PREPARE statement, contains the estimated number of rows selected. If the number of rows is greater than 2 147 483 647, a value of 2 147 483 647 is returned. For a REFRESH TABLE statement, SQLERRD(3) contains the number of rows inserted into the materialized query table. For a rowset-oriented FETCH, contains the number of rows fetched. For SQLCODES -911 and -913, SQLERRD(3) contains the reason code for the timeout or deadlock. When an error is encountered in parsing a dynamic statement, or when parsing, binding, or executing a native SQL procedure, SQLERRD(3) will contain the line number where the error was encountered. The sixth byte of SQLCAID must be ‘L’ for this to be a valid line number. This value will be meaningful only if the statement source contains new line control characters. This information is not returned for an external SQL procedure.</td>
</tr>
</tbody>
</table>

Appendix. Additional information for DB2 SQL 2137
### Table 168. Fields of SQLCA (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>C Name</th>
<th>Fortran Name</th>
<th>Data type</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQLERRD(4)</td>
<td>sqlerrd[3]</td>
<td>SQLERR(4)</td>
<td>INTEGER</td>
<td>Generally, contains timerons, a short floating-point value that indicates a rough relative estimate of resources required (See note 4). It does not reflect an estimate of the time required. When preparing a dynamically defined SQL statement, you can use this field as an indicator of the relative cost of the prepared SQL statement. For a particular statement, this number can vary with changes to the statistics in the catalog. It is also subject to change between releases of DB2 for z/OS.</td>
</tr>
<tr>
<td>SQLERRD(5)</td>
<td>sqlerrd[4]</td>
<td>SQLERR(5)</td>
<td>INTEGER</td>
<td>Contains the position or column of a syntax error for a PREPARE or EXECUTE IMMEDIATE statement.</td>
</tr>
<tr>
<td>SQLWARN0</td>
<td>SQLWARN0</td>
<td>SQLWRN(0)</td>
<td>CHAR(1)</td>
<td>Contains a blank if no other indicator is set to a warning condition (that is, no other indicator contains a W or Z). Contains a W if at least one other indicator contains a W or Z.</td>
</tr>
<tr>
<td>SQLWARN1</td>
<td>SQLWARN1</td>
<td>SQLWRN(1)</td>
<td>CHAR(1)</td>

<td>SQLSTATE</td>
<td>sqlstate</td>
<td>SQLSTT</td>
<td>CHAR(5)</td>
<td>Contains a return code for the outcome of the most recent execution of an SQL statement (See note 5).</td>
</tr>
</tbody>
</table>

**Notes:**

1. With the precompiler option STDSQL(YES) in effect, SQLCODE is replaced by SQLCADE in SQLCA.
2. For the specific meanings of SQL return codes, see *DB2 Codes*.
3. In COBOL, SQLERRM includes SQLERRML and SQLERRMC. In PL/I and C, the varying-length string SQLERRM is equivalent to SQLERRML prefixed to SQLERRMC. In assembler, the storage area SQLERRM is equivalent to SQLERRML and SQLERRMC. See the examples for the various host languages in “The included SQLCA” on page 2140.
4. The use of timerons may require special handling because they are floating-point values in an INTEGER array. In PL/I, for example, you could first copy the value into a BIN FIXED(31) based variable that coincides with a BIN FLOAT(24) variable.
5. For a description of SQLSTATE values, see *DB2 Codes*.
The included SQLCA

The description of the SQLCA that is given by INCLUDE SQLCA is shown for each of the host languages.

The REXX SQLCA

The REXX SQLCA consists of a set of variables, rather than a structure. DB2 makes the SQLCA available to your application automatically.

The following table lists the variables in a REXX SQLCA.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQLCODE</td>
<td>Contains the SQL return code.</td>
</tr>
<tr>
<td>SQLERRMC</td>
<td>Contains one or more tokens, separated by X'FF', that are substituted for variables in the descriptions of error conditions. It might contain truncated tokens. A message length of 70 bytes indicates a possible truncation.</td>
</tr>
<tr>
<td>SQLERRP</td>
<td>Provides a product signature and, in the case of an error, diagnostic information such as the name of the module that detected the error. For DB2 for z/OS, the product signature is 'DSN'.</td>
</tr>
<tr>
<td>SQLERRD.1</td>
<td>For a sensitive static cursor, contains the number of rows in a result table when the cursor position is after the last row (that is, when SQLCODE is equal to +100). SQLERRD(1) can also contain an internal error code.</td>
</tr>
<tr>
<td>SQLERRD.2</td>
<td>For a sensitive static cursor, contains the number of rows in a result table when the cursor position is after the last row (that is, when SQLCODE is equal to +100). SQLERRD(2) can also contain an internal error code.</td>
</tr>
<tr>
<td>SQLERRD.3</td>
<td>Contains the number of rows that qualified for the operation after an SQL data change statement (but not rows deleted as a result of CASCADE delete). For the OPEN of a cursor for a SELECT with an SQL data change statement or for a SELECT INTO, SQLERRD(3) contains the number of rows affected by the embedded data change statement. Set to 0 if the SQL statement fails, indicating that all changes made in executing the statement were canceled. Set to -1 for a mass delete from a table in a segmented table space, for a truncate operation, or a delete from a view when neither the DELETE statement nor the definition of the view included selection criteria. For rowset-oriented FETCH statements, contains the number of rows returned in the rowset. For SQLCODES -911 and -913, SQLERRD(3) contains the reason code for the timeout or deadlock. After successful execution of the REFRESH TABLE statement, SQLERRD(3) contains the number of rows inserted into the materialized query table. When an error is encountered in parsing a dynamic statement, or when parsing, binding, or executing a native SQL procedure, SQLERRD(3) will contain the line number where the error was encountered. The sixth byte of SQLCAID must be 'L' for this to be a valid line number. This value will be meaningful only if the statement source contains new line control characters. This information is not returned for an external SQL procedure.</td>
</tr>
<tr>
<td>SQLERRD.4</td>
<td>Generally, contains timerons, a short floating-point value that indicates a rough relative estimate of resources required. This value does not reflect an estimate of the time required to execute the SQL statement. After you prepare an SQL statement, you can use this field as an indicator of the relative cost of the prepared SQL statement. For a particular statement, this number can vary with changes to the statistics in the catalog. This value is subject to change between releases of DB2 for z/OS.</td>
</tr>
<tr>
<td>SQLERRD.5</td>
<td>Contains the position or column of a syntax error for a PREPARE or EXECUTE IMMEDIATE statement.</td>
</tr>
<tr>
<td>SQLERRD.6</td>
<td>Contains an internal error code.</td>

</table>
SQL descriptor area (SQLDA)

An SQLDA is a collection of variables that is required for execution of the SQL DESCRIBE statement, and can be optionally used by the PREPARE, OPEN, FETCH, EXECUTE, and CALL statements. An SQLDA can be used in a DESCRIBE or PREPARE INTO statement, modified with the addresses of host variables, and then reused in a FETCH statement.

The meaning of the information in an SQLDA depends on the context in which it is used. For DESCRIBE and PREPARE INTO, DB2 sets the fields in the SQLDA to provide information to the application program. For OPEN, EXECUTE, FETCH, and CALL, the application program sets the fields in the SQLDA to provide DB2 with information:

DESCRIBE statement-name or PREPARE INTO
With the exception of SQLN, DB2 sets fields of the SQLDA to provide information to an application program about a prepared statement. Each SQLVAR occurrence describes a column of the result table.

DESCRIBE TABLE
With the exception of SQLN, DB2 sets fields of the SQLDA to provide information to an application program about the columns of a table or view. Each SQLVAR occurrence describes a column of the specified table or view.

DESCRIBE CURSOR
With the exception of SQLN, DB2 sets fields of the SQLDA to provide information to an application program about the result set that is associated with the specified cursor. Each SQLVAR occurrence describes a column of the result set.

DESCRIBE INPUT
With the exception of SQLN, DB2 sets fields of the SQLDA to provide information to an application program about the input parameter markers of a prepared statement. Each SQLVAR occurrence describes an input parameter marker.

DESCRIBE PROCEDURE
With the exception of SQLN, DB2 sets fields of the SQLDA to provide information to an application program about the result sets returned by the specified stored procedure. Each SQLVAR occurrence describes a returned result set.

OPEN, EXECUTE, FETCH, and CALL
The application program sets fields of the SQLDA to provide information about host variables or output buffers in the application program to DB2. Each SQLVAR occurrence describes a host variable or output buffer.

- For OPEN and EXECUTE, each SQLVAR occurrence describes an input value that is substituted for a parameter marker in the associated SQL statement that was previously prepared.
- For FETCH, each SQLVAR occurrence describes a host variable or buffer in the application program that is to be used to contain an output value from a row of the result.
- For CALL, each SQLVAR occurrence describes a host variable that corresponds to a parameter in the parameter list for the stored procedure.
For information on the way to use the SQLDA, see DB2 Application Programming and SQL Guide.
Description of SQLDA fields

An SQLDA consists of four variables, a header, and an arbitrary number of occurrences of a sequence of variables collectively named SQLVAR.

In DESCRIBE and PREPARE INTO, each occurrence of the SQLVAR describes the column of a table. In FETCH, OPEN, EXECUTE, and CALL, each occurrence describes a host variable.

The order of the SQLVAR entries matches the order of the columns in the table or the order of the parameter markers in the SQL statement.

The SQLDA Header

The fields in the SQLDA header have different usage depending on whether the SQLDA is being used in a DESCRIBE or PREPARE INTO statement or the SQLDA is being used in a FETCH, INSERT, OPEN, EXECUTE, or CALL statement.

The following table describes the fields in the SQLDA header.

<table>
<thead>
<tr>
<th>C name</th>
<th>Data type</th>
<th>Usage in DESCRIBE and PREPARE INTO</th>
<th>Usage in FETCH, INSERT, OPEN, EXECUTE, and CALL</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqldaid</td>
<td>CHAR(8)</td>
<td>An “eye catcher” for storage dumps, containing the text ‘SQLDA ’.</td>
<td>A plus sign (+) in the 6th byte indicates that SQLNAME contains an overriding CCSID.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The 7th byte of the field is a flag that can be used to determine if more than one SQLVAR entry is needed for each column. For details, see “Determining how many SQLVAR occurrences are needed” on page 2149.</td>
<td>A ‘2’ in the 7th byte indicates the two SQLVAR entries were allocated for each column or parameter.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For DESCRIBE CURSOR, the field is set to ‘SQLRS’. If the cursor is declared WITH HOLD in a stored procedure, the high-order bit of the 8th byte is set to 1.</td>
<td>A ‘3’ in the 7th byte indicates that three SQLVAR entries were allocated for each column or parameter.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For DESCRIBE PROCEDURE, it is set to ‘SQLPR’.</td>
<td>Although three entries are never needed on input to DB2, an SQLDA with three entries might be used when the SQLDA was initialized by a DESCRIBE or PREPARE INTO with a USING BOTH clause.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Otherwise, SQLDAID is not used.</td>
<td></td>
</tr>
<tr>
<td>sqldabc</td>
<td>INTEGER</td>
<td>Length of the SQLDA, equal to SQLNx * 44+16.</td>
<td>Length of the SQLDA, greater than or equal to SQLNx * 44+16.</td>
</tr>
</tbody>
</table>
Table 170. Fields of the SQLDA header (continued)

<table>
<thead>
<tr>
<th>C name assembler, COBOL or PL/I name</th>
<th>Data type</th>
<th>Usage in DESCRIBE and PREPARE INTO</th>
<th>Usage in FETCH, INSERT, OPEN, EXECUTE, and CALL</th>
</tr>
</thead>
</table>
| sqln                                 | SMALLINT  | Unchanged by DB2. The field must be set to a value greater than or equal to zero before the statement is executed. The field indicates the total number of occurrences of SQLVAR. At the very least, the number should be:  
  • For DESCRIBE INPUT, the number of parameter markers to be described.  
  • For other DESCRIBE or PREPARE INTO: the number of columns of the result, or a multiple of the columns of the result when there are multiple sets of SQLVAR entries because column labels are returned in addition to column names. | Total number of occurrences of SQLVAR provided in the SQLDA. SQLN must be set to a value greater than or equal to zero. |
| sqld                                 | SMALLINT  | The number of columns described by occurrences of SQLVAR. Double that number if USING BOTH appears in the DESCRIBE or PREPARE INTO statement. Contains a 0 if the statement string is not a query. For DESCRIBE PROCEDURE, the number of result sets returned by the stored procedure. Contains a 0 if no result sets are returned. | The number of host variables described by occurrences of SQLVAR. |

Note:
1. The third column of this table represents several forms of the DESCRIBE statement:
   • For DESCRIBE output and PREPARE INTO, the column pertains to columns of the result table.
   • For DESCRIBE CURSOR, the column pertains to a result set associated with a cursor.
   • For DESCRIBE INPUT, the column pertains to parameter markers.
   • For DESCRIBE PROCEDURE, the column pertains to the result sets returned by the stored procedure.

SQLVAR entries
For each column or host variable described by the SQLDA, there are both base SQLVAR entries and extended SQLVAR entries.

Base SQLVAR entry
The base SQLVAR entry is always present. The fields of this entry contain the base information about the column or host variable such as data type code, length attribute (except for LOBs), column name (or label), host variable address, and indicator variable address.

Extended SQLVAR entry
The extended SQLVAR entry is needed (for each column) if the result
includes any LOB or distinct type\textsuperscript{42} columns. For distinct types, the extended SQLVAR contains the distinct type name. For LOBs, the extended SQLVAR contains the length attribute of the host variable and a pointer to the buffer that contains the actual length. If locators are used to represent LOBs, an extended SQLVAR is not necessary.

The extended SQLVAR entry is also needed for each column when the USING BOTH clause was specified, which indicates that both column names and labels are returned. (\texttt{DESCRIBE output} is the only statement with the USING BOTH clause).

The fields in the extended SQLVAR that return LOB and distinct type information do not overlap, and the fields that return LOB and label information do not overlap. Depending on the combination of labels, LOBs and distinct types, more than one extended SQLVAR entry per column may be required to return the information. See “Determining how many SQLVAR occurrences are needed” on page 2149.

The following table shows how to map the base and extended SQLVAR entries. For an SQLDA that contains both base and extended SQLVAR entries, the base SQLVAR entries are in the first block, followed by a block of extended SQLVAR entries, which if necessary, are followed by a second block of extended SQLVAR entries. In each block, the number of occurrences of the SQLVAR entry is equal to the value in SQLD\textsuperscript{43} even though many of the extended SQLVAR entries might be unused.

</tbody>
</table>

\textsuperscript{42} DESCRIBE INPUT does not return information about distinct types.

\textsuperscript{43} When an extended SQLVAR entry is present for each column for \texttt{labels} (and there are no LOB or distinct type columns in the result).
### Table 171. Contents of SQLVAR arrays (continued)

<table>
<thead>
<tr>
<th>LOBs</th>
<th>Distinct types(^1)</th>
<th>7th byte of SQLDAID</th>
<th>SQLD</th>
<th>Minimum for SQLN(^2)</th>
<th>First set (Base)</th>
<th>Second set (Extended)</th>
<th>Third set (Extended)</th>
</tr>
</thead>
</table>

**Notes:**
1. DESCRIBE INPUT does not return information about distinct types.
2. The number of columns or host variables that the SQLDA describes.
3. Either LOBs, distinct types, or both are present.
4. Here, the 7th byte is set to a space and SQLD is set to two times the number of columns in the result. For all other values of the 7th byte for USING BOTH, SQLD is set to the number of columns in the result, and the 7th byte can be used to determine how many SQLVAR entries are needed for each column of the result.

---

**Determining how many SQLVAR occurrences are needed:**

The number of SQLVAR occurrences needed depends on the statement that the SQLDA was provided for and the data types of the columns or parameters being described.

If the USING BOTH clause was not specified for the statement and neither LOBs nor distinct types are present in the result, only one SQLVAR entry (a base entry) is needed for each column. The 7th byte of SQLDAID is set to a space. The SQLD is set to the number of columns in the result and represents the number of SQLVAR occurrences needed. If an insufficient number of SQLVAR occurrences were provided, DB2 returns a +236 warning in SQLCODE if the standards option was set. Otherwise, SQLCODE is zero.

If USING BOTH is specified and neither LOBs nor distinct types are present in the result, an extended SQLVAR entry per column is needed for the labels in addition to the base SQLVAR entry. The 7th byte of the SQLDAID is set to space. SQLD is set to the twice the number of columns in the result and represents the combined number of base and extended SQLVAR occurrences needed.

If LOBs, distinct types, or both are present in the results, one extended SQLVAR entry is needed per column in addition to the base SQLVAR entry with one exception. The exception is that when the USING BOTH clause is specified and distinct types are present in the results, two extended SQLVAR entries per column are needed. When a sufficient number of SQLVAR entries are provided in the SQLDA for both the base and extended SQLVARs, information for the LOBs and distinct types is returned. The 7th byte of SQLDAID is set to the number of SQLVAR entries that were used for each column:

- 2 Two SQLVAR entries per column (a base and an extended)
- 3 Three SQLVAR entries per column (a base and two extended)

SQLD is set to the number of columns in the result. Therefore, the value of the 7th byte of SQLDAID multiplied by the value of SQLD is the total number SQLVAR entries that were provided.

Otherwise, when an insufficient number of SQLVAR entries have been provided when LOBs or distinct types are present, DB2 indicates that by returning one of the following warnings in SQLCODE. DB2 also sets the 7th byte of SQLDAID to indicate how many SQLVAR entries are needed for each column of the result.

- +237 There are insufficient SQLVAR entries to describe the data, and the data
includes distinct types. In this case, there were enough base SQLVAR entries to describe the data, so the base SQLVAR entries are set. However, sufficient extended SQLVAR entries were not provided so the distinct type names are not returned.

+238  There are insufficient SQLVAR entries to describe the data, and the data includes LOBs. In this case no information is returned in the SQLVAR entries.

+239  There are insufficient SQLVAR entries to describe the data, and the data includes distinct types. There weren't even enough base SQLVAR entries. In this case no information is returned in the SQLVAR entries.

Field descriptions of an occurrence of a base SQLVAR:

The fields of a base SQLVAR have different uses depending on the SQL statement.

The following table describes the contents of the fields of a base SQLVAR.

Table 172. Fields in an occurrence of a base SQLVAR

<table>
<thead>
<tr>
<th>C name</th>
<th>Data type</th>
<th>Usage in DESCRIBE¹ and PREPARE INTO</th>
<th>Usage in FETCH, OPEN, EXECUTE, and CALL</th>
</tr>
</thead>
<tbody>
<tr>
<td>assembler</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>COBOL, or PL/I name</td>
<td>SMALLINT</td>
<td>Indicates the data type of the column or parameter and whether it can contain null values. For a description of the type codes, see Table 174 on page 2155. For a distinct type, the data type on which the distinct type was based is placed in this field. The base SQLVAR provides no indication that this is part of the description of a distinct type.</td>
<td>Indicates the data type of the host variable and whether an indicator variable is provided. Host variables for datetime values must be character string variables. For FETCH, a datetime type code means a fixed-length character string. For a description of the type codes, see “SQLTYPE and SQLLEN” on page 2155.</td>
</tr>
<tr>
<td>sqltype</td>
<td>SQLTYPE</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For a Unicode column (defined with CCSID 1208) that is in an EBCDIC table, SQLTYPE reflects VARCHAR, even though the column is recorded in the catalog as VARBINARY with CCSID 1208.

For a Unicode column (defined with CCSID 1200) that is in an EBCDIC table, SQLTYPE reflects VARGRAPHIC, even though the column is recorded in the catalog as VARBINARY with CCSID 1200.

<th>Usage in FETCH, OPEN, EXECUTE, and CALL</th>
</tr>
</thead>
</table>
| sqlname                            | VARCHAR(30) | Contains the unqualified name or label of the column, or a string of length zero if the name or label does not exist. If the name is longer than 30 bytes, it is truncated at a byte boundary. For more information about column names, see Names of result columns. For DESCRIBE PROCEDURE, SQLNAME contains the cursor name used by the stored procedure to return the result set. The values for SQLNAME appear in the order the cursors were opened by the stored procedure. For DESCRIBE INPUT, SQLNAME is not used. | Can contain CCSID and/or host-variable-array dimension information. DB2 interprets the third and fourth byte of the data portion of SQLNAME as the CCSID of the host variable if all of the following are true and the third and fourth byte are not X'0000':  
  • The 6th byte of SQLDAID is '+' (x'4E')  
  • SQLTYPE indicates the host variable is a string variable  
  • The length of SQLNAME is 8  
  • The first two bytes of the data portion of SQLNAME are X'0000'. If the third and fourth byte of the data portion of SQLNAME are X'0000', DB2 uses the appropriate default CCSID. For FETCH, OPEN, INSERT, and EXECUTE, if the length of SQLNAME is 8, and the first two bytes of the data portion of SQLNAME are X'0000', DB2 interprets the fifth through eighth bytes of the data portion of the SQLNAME field as follows: |
<table>
<thead>
<tr>
<th>C name</th>
<th>assembler</th>
<th>Data type</th>
<th>Usage in DESCRIBE¹ and PREPARE INTO</th>
<th>Usage in FETCH, OPEN, EXECUTE, and CALL</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlname</td>
<td>SQLNAME</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(cont.)

- **fifth and sixth bytes**: a flag field that indicates the type of host variable that is being described by the current SQLDA entry. The values of this field are as follows:
  - X'0000' - host variable
  - X'0100' - XML host variable (XML AS BLOB, XML AS CLOB, XML AS DBCLOB)
  - X'0001' - host variable array
  - X'0101' - XML host variable array
  - X'0002' - special host variable that represents the value for ‘n’ in a multiple-row INSERT statement.

- **seventh and eighth bytes**: if the sixth byte is X'01', a binary small integer (halfword) that represents the dimension of the host-variable-array, and the corresponding indicator-array if one is specified.

Notes:

1. The third column of this table represents several forms of the DESCRIBE statement.
   - For DESCRIBE output and PREPARE INTO, the column pertains to columns of the result table.
   - For DESCRIBE CURSOR, the column pertains to a result set associated with a cursor.
   - For DESCRIBE INPUT, the column pertains to parameter markers.
   - For DESCRIBE PROCEDURE, the column pertains to the result sets returned by the stored procedure.

Field descriptions of an occurrence of an extended SQLVAR:

The fields of an extended SQLVAR have different uses depending on the SQL statement.

The following table describes the contents of the fields of an extended SQLVAR entry.
Table 173. Fields in an occurrence of an extended SQLVAR

<table>
<thead>
<tr>
<th>Field name</th>
<th>Data type</th>
<th>Usage in DESCRIBE1 and PREPARE INTO</th>
<th>Usage in FETCH, OPEN, EXECUTE, and CALL</th>
</tr>
</thead>
<tbody>
<tr>
<td>len.sqllonglen</td>
<td>INTEGER</td>
<td>The length attribute of a LOB (BLOB, CLOB, or DBCLOB) column.</td>
<td>The length attribute of a LOB (BLOB, CLOB, or DBCLOB) host variable. DB2 ignores the SQLLEN field in the base SQLVAR for these data types. The length attribute indicates the number of bytes for a BLOB or CLOB, and the number of characters for a DBCLOB.</td>
</tr>
<tr>
<td>SQLLONGL</td>
<td>pointer</td>
<td>Not used.</td>
<td>Used only for LOB (BLOB, CLOB, and DBCLOB) host variables. If the value of the field is null, the actual length of the LOB is stored in the 4 bytes immediately before the start of the data, and SQLDATA points to the first byte of the field length. The actual length indicates the number of bytes for a BLOB or CLOB, and the number of characters for a DBCLOB. If the value of the field is not null, the field contains a pointer to a 4-byte long buffer that contains the actual length in bytes (even for DBCLOBs) of the data in the buffer pointed to from the SQLDATA field in the matching base SQLVAR. Regardless of whether this field is used, field SQLLONGLEN must be set.</td>
</tr>
<tr>
<td>SQLLONGLEN</td>
<td>pointer</td>
<td>Reserved.</td>
<td>Reserved.</td>
</tr>
</tbody>
</table>

* INTEGER Reserved.
Table 173. Fields in an occurrence of an extended SQLVAR (continued)

<table>
<thead>
<tr>
<th>C name assembler, COBOL, or PL/I name</th>
<th>Data type</th>
<th>Usage in DESCRIBE(^1) and PREPARE INTO</th>
<th>Usage in FETCH, OPEN, EXECUTE, and CALL</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqldatatype_name SQLTNAME SQLDATATYPE-NAME</td>
<td>VARCHAR(30)</td>
<td>A SQLTNAME field of the extended SQLVAR is set to one of the following:</td>
<td>Not used.</td>
</tr>
</tbody>
</table>

- For a distinct type column, the database manager sets this field to the fully qualified distinct type name. If the qualified name is longer than 30 bytes, it is truncated.
- For a label, the database manager sets this field to label.

In the case that both a distinct type name and a label need to be returned in extended SQLVAR entries (USING BOTH has been specified), the distinct type name is returned in the first extended SQLVAR entry and the label in the second extended SQLVAR entry.

Note:
1. The third column of this table represents several forms of the DESCRIBE statement:
   - For DESCRIBE output and PREPARE INTO, the column pertains to columns of the result table.
   - For DESCRIBE CURSOR, the column pertains to a result set associated with a cursor.
   - For DESCRIBE INPUT, the column pertains to parameter markers.
   - For DESCRIBE PROCEDURE, the column pertains to the result sets returned by the stored procedure.

SQLTYPE and SQLLEN:

The contents of the SQLTYPE and SQLLEN fields of the SQLDA depends on the SQL statement that is returning the value.

The following table shows the values that can appear in the SQLTYPE and SQLLEN fields of the SQLDA. In DESCRIBE and PREPARE INTO, an even value of SQLTYPE means the column does not allow nulls, and an odd value means the column does allow nulls. In DESCRIBE INPUT statements, only odd values are returned for SQLTYPE. In FETCH, OPEN, EXECUTE, and CALL, an even value of SQLTYPE means no indicator variable is provided, and an odd value means that SQLIND contains the address of an indicator variable.

Table 174. SQLTYPE and SQLLEN values for DESCRIBE, PREPARE INTO, FETCH, OPEN, EXECUTE, and CALL

<td>varying-length character string representation of a timestamp with time zone</td>
<td>length attribute of the host variable</td>
</tr>
</tbody>
</table>

**Note:**
1. SQLLEN might be different if a date installation exit is specified.
2. SQLLEN might be different if a time installation exit is specified.
3. Field SQLLONGLEN in the extended SQLVAR contains the length attribute of the column.
4. BIGINT is supported by other DB2 platforms.
5. p is the timestamp precision.

**SQLDATA:**

Depending on the data type of the string column that the SQLVAR is describing, the SQLDATA field can contain different CCSID values.

The following table identifies the CCSID values that appear in the SQLDATA field when the SQLVAR element describes a string column.
Table 175. CCSID values for SQLDATA

<table>
<thead>
<tr>
<th>Data type</th>
<th>Subtype</th>
<th>Bytes 1 and 2</th>
<th>Bytes 3 and 4</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>Any other data type</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
</tr>
</tbody>
</table>
Unrecognized and unsupported SQLTYPES

The values that appear in the SQLTYPE field of the SQLDA are dependent on the level of data type support available at the sender as well as at the receiver of the data. This support is particularly important as new data types are added to the product.

New data types might not be supported by the sender or receiver of the data and might not be recognized by the sender or receiver of the data. Depending on the situation, the new data type might be returned, a compatible data type that is agreed to by both the sender and the receiver of the data might be returned, or an error might occur.

When the sender and receiver agree to use a compatible data type, the following table indicates the mapping that takes place. This mapping takes place when at least one of the sender or receiver does not support the data type provided. The unsupported data type can be provided by either the application or the database manager.

Table 176. Compatible data types for unsupported data types

<table>
<thead>
<tr>
<th>Data type</th>
<th>Compatible data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROWID</td>
<td>VARCHAR(40) FOR BIT DATA</td>
</tr>
</tbody>
</table>

No indication is given in the SQLDA that the data type is substituted.
The included SQLDA

Only assembler, C, C++, COBOL, and PL/I are supported for the SQLDA that is given by INCLUDE SQLDA.

**assembler:**

```assembly
SQLTRIPL EQU C'3'
SQLDOUBL EQU C'2'
SQLSINGL EQU C'1'
*
   SQLSECT SAVE
*
SQLDA DSECT
SQLDAID DS CL8 ID
SQLDABC DS F BYTE COUNT
SQLN DS H COUNT SQLVAR/SQLVAR2 ENTRIES
SQLD DS H COUNT VARS (TWICE IF USING BOTH)
*
SQLVAR DS OF BEGIN VARS
SQLVARN DSECT , NTH VARIABLE
SQLTYPE DS H DATA TYPE CODE
SQLLEN DS 0H LENGTH
SQLPRECN DS X DEC PRECISION
SQLSCALE DS X DEC SCALE
SQLDATA DS A ADDR OF VAR
SQLIND DS A ADDR OF IND
SQLNAME DS H,CL30 DESCRIBE NAME
SQLVSIZE EQU *-SQLDATA
SQLVSIZ EQU *-SQLVARN
*
SQLDA DSECT
SQLVAR2 DS OF BEGIN EXTENDED FIELDS OF VARS
SQLVAR2N DSECT , EXTENDED FIELDS OF NTH VARIABLE
SQLLONGL DS F LENGTH
SQLRSDLK DS F RESERVED
SQLDATAL DS A ADDR OF LENGTH IN BYTES
SQLNAME DS H,CL30 DESCRIBE NAME
*
   SQLSECT RESTORE
```

In the above declaration, SQLSECT SAVE is a macro invocation that remembers the current CSECT name. SQLSECT RESTORE is a macro invocation that continues that CSECT.

**C and C++:**

```c
#ifndef SQLDASIZE
#else
def SQLDASIZE /* Permit duplicate Includes */
#endif

/**/

struct sqlvar

Identifying an SQLDA in C or C++

A descriptor-name can be specified in the CALL, DESCRIBE, EXECUTE, FETCH, and OPEN statements. When the host application is written in C or C++, descriptor-name can be a pointer variable with pointer notation.

For example, descriptor-name could be declared as

```c
sqlda *outsqlda;
```

Afterwords, it could be used in a statement like the following:

```sql
EXEC SQL DESCRIBE STMT1 INTO DESCRIPTOR :*outsqlda;
```
The REXX SQLDA

A REXX SQLDA consists of a set of REXX variables with a common stem. The stem must be a REXX variable name that contains no periods and is the same as the value of descriptor-name that you specify when you use the SQLDA in an SQL statement. DB2 does not support the INCLUDE SQLDA statement in REXX.

The following table shows the variable names in a REXX SQLDA. The values in the second column of the table are values that DB2 inserts into the SQLDA when the statement executes. Except where noted otherwise, the values in the third column of the table are values that the application must put in the SQLDA before the statement executes.

Table 177. Fields of a REXX SQLDA

<table>
<thead>
<tr>
<th>Variable name</th>
<th>Usage in DESCRIBE and PREPARE INTO</th>
<th>Usage in FETCH, OPEN, EXECUTE, and CALL</th>
</tr>
</thead>
<tbody>
<tr>
<td>stem.SQLD</td>
<td>The number of columns that are described in the SQLDA. Double that number if USING BOTH appears in the DESCRIBE or PREPARE INTO statement. Contains a 0 if the statement string is not a query. For DESCRIBE PROCEDURE, the number of result sets returned by the stored procedure. Contains a 0 if no result sets are returned.</td>
<td>The number of host variables that are used by the SQL statement.</td>
</tr>
<tr>
<td>stem.n.SQLTYPE</td>
<td>Indicates the data type of the column or parameter and whether it can contain null values. For a description of the type codes, see “SQLTYPE and SQLLEN” on page 2155. For a distinct type, the data type on which the distinct type was based is placed in this field. The base SQLVAR provides no indication that this is part of the description of a distinct type.</td>
<td>Indicates the data type of the host variable and whether an indicator variable is provided. Host variables for datetime values must be character string variables. For FETCH, a datetime type code means a fixed-length character string. For a description of the type codes, see “SQLTYPE and SQLLEN” on page 2155.</td>
</tr>
<tr>
<td>stem.n.SQLLEN</td>
<td>For a column other than a DECIMAL or NUMERIC column, the length attribute of the column or parameter. For datetime data, the length of the string representation of the value. See “SQLTYPE and SQLLEN” on page 2155 for a description of allowable values.</td>
<td>For a host variable that does not have a decimal data type, the length attribute of the host variable. See “SQLTYPE and SQLLEN” on page 2155 for a description of allowable values.</td>
</tr>
<tr>
<td>stem.n.SQLLEN.SQLPRECISION</td>
<td>For a DECIMAL or NUMERIC column, the precision of the column or parameter.</td>
<td>For a host variable with a decimal data type, the precision of the host variable.</td>
</tr>
<tr>
<td>stem.n.SQLLEN.SQLSCALE</td>
<td>For a DECIMAL or NUMERIC column, the scale of the column or parameter.</td>
<td>For a host variable with a decimal data type, the scale of the host variable.</td>
</tr>
</tbody>
</table>

Each SQLDA contains stem.SQLD of the following variables. Therefore, 1<=n<=stem.SQLD. There is one occurrence of each variable for each column of the result table or host variable that is described by the SQLDA. This set of variables is equivalent to the SQLVAR structure in the SQLDA for other languages.
<table>
<thead>
<tr>
<th>Variable name</th>
<th>Usage in DESCRIBE and PREPARE INTO</th>
<th>Usage in FETCH, OPEN, EXECUTE, and CALL</th>
</tr>
</thead>
<tbody>
<tr>
<td>stem.n.SQLCCSID</td>
<td>For a string column or parameter, the CCSID of the column or parameter.</td>
<td>For a string host variable, the CCSID of the host variable.</td>
</tr>
<tr>
<td>stem.n.SQLUSECCSID</td>
<td>Not used.</td>
<td>Set to a new CCSID. If set, REXX will change the CCSID of the SQLDATA.</td>
</tr>
<tr>
<td>stem.n.SQLLOCATOR</td>
<td>For DESCRIBE PROCEDURE, the value of a result set locator.</td>
<td>Not used.</td>
</tr>
<tr>
<td>stem.n.SQLDATA</td>
<td>Not used.</td>
<td>Before EXECUTE or OPEN, contains the value of an input host variable. The application must supply this value. After FETCH, contains the values of an output host variable.</td>
</tr>
<tr>
<td>stem.n.SQLIND</td>
<td>Not used.</td>
<td>Before EXECUTE or OPEN, contains a negative number to indicate that the input host variable in stem.n.SQLDATA is null. The application must supply this value. After FETCH, contains a negative number if the value of the output host variable in stem.n.SQLDATA is null.</td>
</tr>
<tr>
<td>stem.n.SQLNAME</td>
<td>The name of the nth column in the result table. For DESCRIBE PROCEDURE, contains the cursor name that is used by the stored procedure to return the result set. The values for SQLNAME appear in the order that the cursors were opened by the stored procedure.</td>
<td>Not used.</td>
</tr>
</tbody>
</table>
DB2 catalog tables

DB2 for z/OS maintains a set of tables (in database DSND06) called the DB2 catalog.

About these topics

These topics describe that catalog by describing the columns of each catalog table.

The catalog tables describe such things as table spaces, tables, columns, indexes, privileges, application plans, and packages. Authorized users can query the catalog; however, it is primarily intended for use by DB2 and is therefore subject to change. All catalog tables are qualified by SYSIBM. Do not use this qualifier for user-defined tables.

The catalog tables are updated by DB2 during normal operations in response to certain SQL statements, commands, and utilities.

Additional information

Release dependency indicators: Some objects depend on functions in particular releases of DB2. If you are running on a release of DB2 and fall back to a previous release, an object that depends on the more recent release becomes frozen. The object is marked with a release dependency indicator and is unavailable until remigration.

The release dependency indicator, which is listed in the IBMREQD, RELCREATED, and RELBOUND columns of the catalog tables, shows the release of DB2 upon which the objects depend.

Important: The IBMREQD column is not a reliable indicator for indicating release dependencies. Where possible, the RELCREATED and RELBOUND columns should be used instead.

Release dependency indicators in IBMREQD, RELCREATED, and RELBOUND are defined by the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>Version 1R3 dependency indicator, not from the machine-readable material (MRM) tape</td>
</tr>
<tr>
<td>C</td>
<td>Version 2R1 dependency indicator, not from MRM tape</td>
</tr>
<tr>
<td>D</td>
<td>Version 2R2 dependency indicator, not from MRM tape</td>
</tr>
<tr>
<td>E</td>
<td>Version 2R3 dependency indicator, not from MRM tape</td>
</tr>
<tr>
<td>F</td>
<td>Version 3R1 dependency indicator, not from MRM tape</td>
</tr>
<tr>
<td>G</td>
<td>Version 4 dependency indicator, not from MRM tape</td>
</tr>
<tr>
<td>H</td>
<td>Version 5 dependency indicator, not from MRM tape</td>
</tr>
<tr>
<td>I</td>
<td>Version 6 dependency indicator, not from MRM tape</td>
</tr>
<tr>
<td>J</td>
<td>Version 6 dependency indicator, not from MRM tape</td>
</tr>
<tr>
<td>K</td>
<td>Version 7 dependency indicator, not from MRM tape</td>
</tr>
<tr>
<td>L</td>
<td>Version 8 dependency indicator, not from MRM tape</td>
</tr>
</tbody>
</table>
**Programming interface information**

Not all catalog table columns are part of the general-use programming interface. Whether a column is part of this interface is indicated in a column labeled “Use” in the table that describes the column. The values that “Use” can assume are as follows:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>G</td>
<td>Column is part of the general-use programming interface</td>
</tr>
<tr>
<td>S</td>
<td>Column is part of the product-sensitive interface</td>
</tr>
<tr>
<td>I</td>
<td>Column is for internal use only</td>
</tr>
<tr>
<td>N</td>
<td>Column is not used</td>
</tr>
</tbody>
</table>

For columns for which “Use” is N or I, the name of the column and its description do not appear in the explanation of the column.
### Table spaces and indexes

DB2 catalog tables are contained in certain table spaces and have indexes.

The following tables list the table space and indexes for each catalog table and lists the index fields for each index. The indexes are in ascending order, except where noted.

**Table 178. Table spaces and indexes for the catalog tables**

</table>

**Note:** 1. Index field is in descending order
**SQL statements allowed on the catalog**

Certain SQL statements can be used to change the value of certain options for existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables.

<table>
<thead>
<tr>
<th>SQL statement</th>
<th>Index</th>
<th>Allowable clauses and usage notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER INDEX</td>
<td>IBM-defined</td>
<td>Only these clauses are allowed: close, copy, freepage, gbpcache, not padded, padded, pctfree, piecesize. You cannot alter the GBPCACHE value for indexes DSNDXX01, DSNDXX02, and DSNDXX03, which are on catalog table SYSIBM.SYSINDEXES.</td>
</tr>
<tr>
<td>ALTER INDEX</td>
<td>User-created</td>
<td>All clauses are allowed, except for the following: bufferpool, regenerate, compress yes. Any partitioning clause</td>
</tr>
<tr>
<td>ALTER SEQUENCE</td>
<td></td>
<td>The only clause allowed is MAXVALUE.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can only change the MAXVALUE value of the catalog sequence DSNSEQ_IMPLICITDB. The only value specific must be an integer between 1 and 60000, inclusive.</td>
</tr>
<tr>
<td>ALTER TABLE</td>
<td></td>
<td>The only clause allowed is DATA CAPTURE CHANGES.</td>
</tr>
</tbody>
</table>
Table 179. SQL statements that can be used to change existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables (continued)

<table>
<thead>
<tr>
<th>SQL statement</th>
<th>Index</th>
<th>Allowable clauses and usage notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER TABLESPACE</td>
<td>Only these clauses are allowed:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>CLOSE</td>
<td></td>
</tr>
<tr>
<td></td>
<td>FREEPAGE</td>
<td></td>
</tr>
<tr>
<td></td>
<td>GBPCACHE</td>
<td></td>
</tr>
<tr>
<td></td>
<td>LOCKMAX</td>
<td></td>
</tr>
<tr>
<td></td>
<td>MAXROWS</td>
<td></td>
</tr>
<tr>
<td></td>
<td>PCTFREE</td>
<td></td>
</tr>
<tr>
<td></td>
<td>TRACKMOD</td>
<td></td>
</tr>
</tbody>
</table>

You cannot alter the GBPCACHE or MAXROWS value of some catalog table spaces. Do not specify GBPCACHE for the following table spaces:
- DSNDB06.SYSTSCOL
- DSNDB06.SYSTSDBA
- DSNDB06.SYSTSDBR
- DSNDB06.SYSTSDBU
- DSNDB06.SYSTSFAU
- DSNDB06.SYSTSFLD
- DSNDB06.SYSTSFOR
- DSNDB06.SYSTSIPT
- DSNDB06.SYSTSIXR
- DSNDB06.SYSTSIXS
- DSNDB06.SYSTSIXT
- DSNDB06.SYSTSKEY
- DSNDB06.SYSTSPKA
- DSNDB06.SYSTSPKD
- DSNDB06.SYSTSPKG
- DSNDB06.SYSTSPKL
- DSNDB06.SYSTSPKS
- DSNDB06.SYSTSPKX
- DSNDB06.SYSTSPKY
- DSNDB06.SYSTSPLA
- DSNDB06.SYSTSPLD
- DSNDB06.SYSTSPLN
- DSNDB06.SYSTSPLY
- DSNDB06.SYSTSPVR
- DSNDB06.SYSTSREL
- DSNDB06.SYSTSSTM
- DSNDB06.SYSTSSYN
- DSNDB06.SYSTSTAB
- DSNDB06.SYSTSTAU
- DSNDB06.SYSTSTPT
- DSNDB06.SYSTSTSP

For DSNDB06.SYSSEQ, MAXROW can be specified only with a value of 1.

You can specify the LOCKSIZE keyword on the ALTER TABLESPACE statement for any catalog table spaces that are not LOB table spaces.
Table 179. SQL statements that can be used to change existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables (continued)

<table>

</tr>
<tr>
<td>DROP INDEX</td>
<td>User-created</td>
<td>The statement has no clauses.</td>
</tr>
</tbody>
</table>

Reorganizing the catalog

The REORG TABLESPACE utility can be run on all the table spaces in the catalog database (DSNDB06) to reclaim unused or wasted space, which can affect performance.

The utility observes the PCTFREE and FREEPAGE values specified in the ALTER INDEX statement for all the catalog indexes and the following table spaces:

- DSNDB06.SYSDDF
- DSNDB06.SYSGPATH
- DSNDB06.SYSGRTNS
- DSNDB06.SYSHIST
- DSNDB06.SYSJAVA
- DSNDB06.SYSJAUXS
- DSNDB06.SYSJAUXB
- DSNDB06.SYSEQ
- DSNDB06.SYSEQ2
- DSNDB06.SYSTSTATS
- DSNDB06.SYSTSCHX
- DSNDB06.SYSTSCKD
- DSNDB06.SYSTSCKS
- DSNDB06.SYSTSCPY
- DSNDB06.SYSTSSRG
- DSNDB06.SYSTUSR
- DSNDB01.SCT02
- DSNDB01.SPT01

For details on running REORG TABLESPACE, see DB2 Utility Guide and Reference.
New and changed catalog tables

This release of DB2 for z/OS includes many new catalog tables as well as many catalog tables that have new or changed content.

Descriptions of the following catalog tables have been added:

<table>
<thead>
<tr>
<th>Catalog table name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;SYSIBM.SYSINDEXCLEANUP table&quot; on page 2276</td>
<td>The rows in the SYSIBM.SYSINDEXCLEANUP table specify time windows to control index cleanup processing. Each row specifies a time window to enable or disable the cleanup of pseudo-deleted index entries for specific database objects.</td>
</tr>
<tr>
<td>&quot;SYSIBM.SYSQUERYPREDICATE table&quot; on page 2398</td>
<td>The SYSIBM.SYSQUERYPREDICATE table contains information about predicates for queries in the SYSIBM.SYSQUERY table that have been identified for extended optimization. It correlates to the SYSIBM.SYSQUERY table by the QUERYID column.</td>
</tr>
<tr>
<td>&quot;SYSIBM.SYSQUERYSEL table&quot; on page 2403</td>
<td>The SYSIBM.SYSQUERYSEL table contains information about the selectivity of predicates for queries in the SYSIBM.SYSQUERY table that have been identified for extended optimization. It correlates to the SYSIBM.SYSQUERY table by the QUERYID column.</td>
</tr>
<tr>
<td>&quot;SYSIBM.SYSTATFEEDBACK table&quot; on page 2437</td>
<td>The SYSIBM.SYSTATFEEDBACK table contains information about missing or conflicting catalog statistics for SQL statements.</td>
</tr>
<tr>
<td>&quot;SYSIBM.SYSVARIABLEAUTH table&quot; on page 2500</td>
<td>The SYSIBM.SYSVARIABLEAUTH table contains one row for each privilege of each authorization ID that has privileges on a global variable.</td>
</tr>
<tr>
<td>&quot;SYSIBM.SYSVARIABLES_DESC table&quot; on page 2502</td>
<td>The SYSIBM.SYSVARIABLES_DESC table is an auxiliary table for the SYSIBM.SYSVARIABLES table.</td>
</tr>
<tr>
<td>&quot;SYSIBM.SYSVARIABLES table&quot; on page 2497</td>
<td>The SYSIBM.SYSVARIABLES table contains one row for each global variable that is created.</td>
</tr>
<tr>
<td>&quot;SYSIBM.SYSVARIABLES_TEXT table&quot; on page 2503</td>
<td>The SYSIBM.SYSVARIABLES_TEXT table is an auxiliary table for the DEFAULTTEXT column of the SYSIBM.SYSVARIABLES table.</td>
</tr>
</tbody>
</table>

The catalog tables that are listed in the following table have new or revised columns, column values, or column descriptions to support the new function in this release of DB2 for z/OS.

<table>

**SYSIBM.IPLIST table**

The SYSIBM.IPLIST table allows multiple IP addresses to be specified for a given LOCATION.

Insert rows into this table when you want to define a remote DB2 data sharing group. The same value for the IPADDR column cannot appear in both the SYSIBM IPNAMES table and the SYSIBM.IPLIST table. Rows in this table can be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>LINKNAME</td>
<td>VARCHAR(24)</td>
<td>This column is associated with the value specified in the LINKNAME column in the SYSIBM.LOCATIONS table and the SYSIBM.IPNAMES table. The values of the other columns in the SYSIBM.IPNAMES table apply to the server identified by the LINKNAME column in this row.</td>
<td>G</td>
</tr>
</tbody>
</table>
| IPADDR      | VARCHAR(254)  | This column contains an IPv4 or IPv6 address, or domain name of a remote TCP/IP host of the server. If WLM Domain Name Server workload balancing is used, this column must contain the member specific domain name. If Dynamic VIPA workload balancing is used, this column must contain the member specific Dynamic VIPA address. The IPADDR column must be specified as follows:
• An IPv4 address must be left justified and is represented as a dotted decimal address. For example, '123.456.78.912' would be interpreted as an IPv4 address.
• An IPv6 address must be left justified and is represented as a colon hexadecimal address. An example of an IPv6 address is '2001:0DB8:0000:0000:0008:0800:200C:417A', which can also be expressed in compressed form as '2001:DB8::8:800:200C:417A'.
• A domain name is converted to an IP address by the domain name server where a resulting IPv4 or IPv6 address is determined. An example of a domain name is 'stlmvs1.svl.ibm.com'. | G     |
| IBMREQD     | CHAR(1)       | A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. | G     |
**SYSIBM.IPNAMES table**

The SYSIBM.IPNAMES table defines the remote DRDA servers DB2 can access using TCP/IP.

Rows in this table can be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>

<td>NOT NULL WITH DEFAULT 'A'</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **A** The option is “already verified”. Outbound connection requests contain an authorization ID and no password. The authorization ID used for an outbound request is either the DB2 user’s authorization ID or a translated ID, depending upon the value of the USERNAMES column.
  
  The authorization ID is not encrypted when it is sent to the partner. For encryption, refer to ‘D’.

- **D** The option is “userid and security-sensitive data encryption”. Outbound connection requests contain an authorization ID and no password. The authorization ID used for an outbound request is either the DB2 user’s authorization ID or a translated ID, depending upon the value of the USERNAMES column.
  
  This option indicates that the userid and security-sensitive data are to be encrypted. For non-encryption, refer to ‘A’.

- **E** The option is “userid, password, and security-sensitive data encryption”. Outbound connection requests contain an authorization ID and a password. The password is obtained from the SYSIBM.USERNAMES table. The USERNAMES column must specify ‘O’.
  
  This option indicates that the userid, password, and security-sensitive data are to be encrypted. For non-security-sensitive data encryption, refer to ‘P’.

  If the applications connect to any remote server as trusted, the USERNAMES column must specify ‘O’ or ‘S’.

SYSIBM.SYSCOLDIST table

The SYSIBM.SYSCOLDIST table contains one or more rows for the cardinality, frequency, and histogram statistics for a single column or a column group.

Rows in this table can be inserted, updated, and deleted.

Important: Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

SYSIBM.SYSCOLSTATS table

The SYSIBM.SYSCOLSTATS table contains partition statistics for selected columns. For each column, a row exists for each partition in the table.

Rows are inserted when RUNSTATS collects either indexed column statistics or non-indexed column statistics for a partitioned table space. No row is inserted if the table space is nonpartitioned. Rows in this table can be inserted, updated, and deleted.

**Important:** Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

Default indicator:

A  The column is defined as a ROWID with the GENERATED ALWAYS attribute.
B  The column is defined as a built-in data type with a default value that depends on the data type of the column.
D  The column is defined as a ROWID with the GENERATED BY DEFAULT attribute.
E  The column is defined with the FOR EACH ROW ON UPDATE and GENERATED ALWAYS attributes.
F  The column is defined with the FOR EACH ROW ON UPDATE and GENERATED BY DEFAULT attributes.
I  The column is defined with the AS IDENTITY and GENERATED ALWAYS attributes.
J  The column is defined with the AS IDENTITY and GENERATED BY DEFAULT attributes.
K  The column is defined for the implicit DOCID column for a base table that contains XML data.
L  The column is defined with the AS SECURITY LABEL attribute.
N  The column has no default value.
Q  The column is defined with the AS ROW BEGIN attribute.
R  The column is defined with the AS ROW END attribute.

| DEFAULT (continued) | CHAR(1) NOT NULL | Default indicator:  
6 The column has a default value that is the UX string found in the DEFAULTVALUE column of this table row.  
7 The column has a graphic data type and has a default value that is the character string constant found in the DEFAULTVALUE column of this table row.  
8 The column has a character data type and has a default value that is the graphic string constant found in the DEFAULTVALUE column of this table row.  
9 The column has a default value that is the DECFLOAT constant found in the DEFAULTVALUE column of this table row.  
a The column is defined with an expression that specifies a special register. The default value is the value of the special register.  
b The column is defined with an expression that specifies a built-in session variable. The default value is the value of the built-in session variable.  
d The column is defined with the DATA CHANGE OPERATION clause. The default value is an I, U, or D character indicating which data change operation the row represents. |
| KEYSEQ | SMALLINT NOT NULL | The numeric position of the column within the primary key of the table. The value is 0 if it is not part of a primary key. |
| FOREIGNKEY | CHAR(1) NOT NULL | Applies to character or CLOB columns, where it indicates the subtype of the data:  
B BIT data  
M MIXED data  
S SBCS data  
blank Indicates one of the following subtypes:  
• MIXED data if the encoding scheme is UNICODE, or if the encoding scheme is not UNICODE and the value of MIXED DATA on installation panel DSNTIPS is YES  
• SBCS data if the encoding scheme is not UNICODE and the value of MIXED DATA on the installation panel DSNTIPS is NO.  
For views defined prior to Version 7, subtype information is not available and the default (MIXED or SBCS) is used. |
| FLDPROC | CHAR(1) NOT NULL | Whether the column has a field procedure:  
N No  
Y Yes  
blank The column is for a view defined prior to Version 7. Views defined after Version 7 contain Y or N. |
<table>

**SYSIBM.SYSCOLUMNS_HIST table**

The SYSIBM.SYSCOLUMNS_HIST table contains rows from SYSCOLUMNS.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

</table>

When ICTYPE=A, the values are:

- A: A partition was added to a table.
- B: The MEMBER CLUSTER value was changed.
- C: A column was added to a table and an index in different commit scopes, or a column was dropped from a table.
- D: Either the DSSIZE attribute of the table space was altered or the default value of a column of a table was altered.
- E: The data set numbers of a base table and its associated clone table are exchanged.
- F: The page size attribute of the table space or index was altered.
- G: An index was regenerated
- H: The table was altered to hash organization, the size of the hash space was changed, or the hash organization was dropped. The value of the TTYPE column indicates the action taken.
- I: The inline length attribute of the LOB column was altered by REORG.
- L: The logging attribute of the table space was altered to LOGGED.
- M: The MAXPARTITIONS attribute of the table space was altered.
- N: An index was altered to not padded
- O: The logging attribute of the table space was altered to NOT LOGGED.
- P: An index was altered to padded
- R: A table was altered to rotate partitions.
- S: The SEGSIZE attribute of the table space was altered.
- V: A column in a table was altered for a numeric data type change and the column is in an index.
- X: A REORG dropped one or more empty partitions from the related table space.
- Y: An index was altered to COPY YES
- Z: A column that is in the key of an index that was versioned prior to DB2 Version 8 was altered.

When ICTYPE=C, the values are:

- L: The logging attribute of the table space was LOGGED.
- O: The logging attribute of the table space was NOT LOGGED.

When ICTYPE=E, the values are:

- B: RECOVER utility with the BACKOUT keyword.
- blank: RECOVER utility without the BACKOUT keyword.

When ICTYPE=F, the values are:

- C: DFSMS concurrent copy ("I" instance of the table space)
- J: DFSMS concurrent copy ("J" instance of the table space)
- N: A FlashCopy copy is not consistent.
- Q: Sequential copy is consistent
- R: LOAD REPLACE(YES)

Values for STYPE continue on next page.

When ICTYPE=L, the value is:
- M: Mass DELETE, TRUNCATE TABLE, DROP TABLE, or ALTER TABLE ROTATE PARTITION. The LOWDSNUM column contains the table OBID of the affected table.

The MERGECOPY utility, when used to merge an embedded copy with subsequent incremental copies, also produces a record that contains ICTYPE=F and the STYPE of the original image copy (R, S, W, or X).

When ICTYPE=M and the MODIFY RECOVERY utility was executed to delete SYSCOPY and/or SYSLGRNX records, the value is R.

When ICTYPE=O, the values are:
- B: A table space or partition that was in reordered row format was recovered to a point in time when it was in basic row format.
- R: A table space or partition was converted to reordered row format as a result of REORG or LOAD REPLACE.

When ICTYPE=P, the values are:
- B: Recover to a point in time with the BACKOUT YES option was run.
- C: Recover to a point in time without using logonly with consistency.
- L: Recover to a point in time using logonly without consistency.
- M: Recover to a point in time using logonly with consistency.
- blank: Recover to a point in time without using logonly without consistency.

When ICTYPE=Q and option WRITE(YES) is in effect when the quiesce point is taken, the value is W.

When ICTYPE=R or S, the values are:
- A: Resetting REORG pending status
- T: First materializing the default value for a row change timestamp column

When ICTYPE=T, this field indicates which COPY utility was terminated by the TERM UTILITY command or the START DATABASE command with the ACCESS(Force) option. The values are:
- F: COPY FULL YES
- I: COPY FULL NO

</table>
**SYSIBM.SYSDUMMY1 table**

The SYSIBM.SYSDUMMY1 table contains one row. The table is used for SQL statements in which a table reference is required, but the contents of the table are not important.

Unlike the other catalog tables, which reside in Unicode table spaces, SYSIBM.SYSDUMMY1 resides in table space SYSEBCDC, which is an EBCDIC table space.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td>The value in this field is not a reliable indicator of release dependencies.</td>
<td></td>
</tr>
</tbody>
</table>
SYSIBM.SYSDUMMYA table

The SYSIBM.SYSDUMMYA table contains one row. The table is used for SQL statements in which a table reference is required, but the contents of the table are not important.

SYSIBM.SYSDUMMYA resides in table space SYSTSASC, which is an ASCII table space.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators.</td>
<td>G</td>
</tr>
</tbody>
</table>

The value in this field is not a reliable indicator of release dependencies.
SYSIBM.SYSDUMMYE table

The SYSIBM.SYSDUMMYE table contains one row. The table is used for SQL statements in which a table reference is required, but the contents of the table are not important.

SYSIBM.SYSDUMMYE resides in table space SYSEBCDC, which is an EBCDIC table space.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td>The value in this field is not a reliable indicator of release dependencies.</td>
<td></td>
</tr>
</tbody>
</table>
SYSIBM.SYSDUMMYU table

The SYSIBM.SYSDUMMYU table contains one row. The table is used for SQL statements in which a table reference is required, but the contents of the table are not important.

SYSIBM.SYSDUMMYU resides in table space SYSTSUNI, which is a UNICODE table space.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>IBMREQD</td>
<td>CHAR(1) NOT NULL</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators</td>
<td>G</td>
</tr>
</tbody>
</table>

The value in this field is not a reliable indicator of release dependencies.
## SYSIBM.SYSENVIRONMENT table

The SYSIBM.SYSENVIRONMENT table records the environment variables when an object is created.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENVID</td>
<td>INTEGER NOT NULL</td>

## SYSIBM.SYSFOREIGNKEYS table

The SYSIBM.SYSFOREIGNKEYS table contains one row for every column of every foreign key.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATOR</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Schema or qualifier of the table that contains the column.</td>
<td>G</td>
</tr>
<tr>
<td>TBNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Name of the table that contains the column.</td>
<td>G</td>
</tr>
<tr>
<td>RELNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Constraint name for the constraint for which the column is part of the foreign key.</td>
<td>G</td>
</tr>
<tr>
<td>COLNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Name of the column.</td>
<td>G</td>
</tr>
<tr>
<td>COLNO</td>
<td>SMALLINT NOT NULL</td>
<td>Numeric place of the column in its table.</td>
<td>G</td>
</tr>
<tr>
<td>COLSEQ</td>
<td>SMALLINT NOT NULL</td>
<td>Numeric place of the column in the foreign key.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1) NOT NULL</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see <a href="#">Release dependency indicators</a>.</td>
<td>G</td>
</tr>
</tbody>
</table>

The value in this field is not a reliable indicator of release dependencies.
SYSIBM.SYSINDEXCLEANUP table

The rows in the SYSIBM.SYSINDEXCLEANUP table specify time windows to control index cleanup processing. Each row specifies a time window to enable or disable the cleanup of pseudo-deleted index entries for specific database objects.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBNAME</td>
<td>VARCHAR(24)</td>
<td>The name of the database that contains the index space.</td>
<td>G</td>
</tr>
<tr>
<td>INDEXSPACE</td>
<td>VARCHAR(24)</td>
<td>The name of the index space.</td>
<td>G</td>
</tr>
<tr>
<td>ENABLE_DISABLE</td>
<td>CHAR(1) NOT NULL</td>
<td>Specifies whether the row enables or disables cleanup for the specified index space.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'E' Enabled</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>'D' Disabled</td>
<td></td>
</tr>
<tr>
<td>MONTH_WEEK</td>
<td>CHAR(1) NOT NULL</td>
<td>Indicates the meaning of the value of the DAY column:</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'M' The value indicates the day of the month.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>'W' The value indicates a day of the week.</td>
<td></td>
</tr>
<tr>
<td>MONTH</td>
<td>SMALLINT</td>
<td>The month in which the time window applies. For example, a 1 value indicates January and a 12 value indicates December. If this column contains NULL, the time window applies to all months. If the value of the MONTH_WEEK column is 'W', this value must be NULL.</td>
<td>G</td>
</tr>
<tr>
<td>DAY</td>
<td>SMALLINT</td>
<td>The day of the month or the day of the week for which the time window applies, as specified by the value of the MONTH_WEEK column. For example, if MONTH_WEEK='W', a 1 value indicates Monday and 7 indicates Sunday. If the value of this column is NULL, the time window applies to every day of the month or every day of the week.</td>
<td>G</td>
</tr>
<tr>
<td>START_TIME</td>
<td>TIME</td>
<td>The local time at the beginning of the time window specified by the row. When this column contains a null value, the row applies at all times on the specified days. This column must contain NULL if the END_TIME column contains NULL.</td>
<td>G</td>
</tr>
<tr>
<td>END_TIME</td>
<td>TIME</td>
<td>The local time at the end of the time window specified by the row. When this column contains a null value, the row applies at all times on the specified days. This column must contain NULL if the START_TIME column contains NULL.</td>
<td>G</td>
</tr>
</tbody>
</table>

**SYSIBM.SYSINDEXSPACESTATS table**

The SYSIBM.SYSINDEXSPACESTATS table contains real time statistics for index spaces.

Rows in this table can be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>UPDATESTATSTIME</td>
<td>TIMESTAMP</td>
<td>The timestamp that the row in the SYSINDEXSPACESTATS table is inserted or last updated.</td>
<td>G</td>
</tr>
<tr>
<td>NLEVELS</td>
<td>SMALLINT</td>
<td>The number of levels in the index tree.</td>
<td>G</td>
</tr>
<tr>
<td>NPAGES</td>
<td>INTEGER</td>
<td>The number of pages in the index tree that contain only pseudo-deleted index entries. This is an updatable column.</td>
<td>G</td>
</tr>
<tr>
<td>NLEAF</td>
<td>INTEGER</td>
<td>The number of leaf pages in the index. This is an updatable column.</td>
<td>G</td>
</tr>
<tr>
<td>NACTIVE</td>
<td>INTEGER</td>
<td>The number of active pages in the index space or partition. This value is equivalent to the number of pre-formatted pages.</td>
<td>G</td>
</tr>
<tr>
<td>SPACE</td>
<td>INTEGER</td>
<td>The amount of space, in KB, that is allocated to the index space or partition. For multi-piece, linear page sets, this value is the amount of space in all data sets. A null value indicates the amount of space is unknown.</td>
<td>G</td>
</tr>
<tr>
<td>EXTENTS</td>
<td>SMALLINT</td>
<td>The number of extents in the index space or partition. For multi-piece index spaces, this value is the number of extents for the last data sets. For a data set that is stripped across multiple volumes, the value is the number of logical extents. A null value indicates the number of extents is unknown.</td>

In data sharing environments, the values in SYSIBM.SYSINDEXSPACESTATS can be negative for short periods of time for certain situations.

**Related concepts:**

[How DB2 maintains in-memory statistics in data sharing (DB2 Data Sharing Planning and Administration)]
**SYSIBM.SYSINDEXSTATS table**

The SYSIBM.SYSINDEXSTATS table contains one row for each partition of a partitioning index or a data-partitioned secondary index.

Rows in this table can be inserted, updated, and deleted.

**Important:** Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

<td>The value in this field is not a reliable indicator of release dependencies.</td>
<td></td>
</tr>
</tbody>
</table>
## SYSIBM.SYSKEYCOLUSE table

The SYSIBM.SYSKEYCOLUSE table contains a row for every column in a unique constraint (primary key or unique key) from the SYSIBM.SYSTABCONST table.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONSTNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Name of the constraint.</td>
<td>G</td>
</tr>
<tr>
<td>TBCREATOR</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Schema or qualifier of the table on which the constraint is defined.</td>
<td>G</td>
</tr>
<tr>
<td>TBNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Name of the table on which the constraint is defined.</td>
<td>G</td>
</tr>
<tr>
<td>COLNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Name of the column</td>
<td>G</td>
</tr>
<tr>
<td>COLSEQ</td>
<td>SMALLINT NOT NULL</td>
<td>Numeric position of the column in the key (the first position in the key is 1).</td>
<td>G</td>
</tr>
<tr>
<td>COLNO</td>
<td>SMALLINT NOT NULL</td>
<td>Numeric position of the column in the table on which the constraint is defined.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1) NOT NULL WITH DEFAULT 'N'</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators.</td>
<td>G</td>
</tr>
</tbody>
</table>

The value in this field is not a reliable indicator of release dependencies.

<table>
<thead>
<tr>
<th>PERIOD</th>
<th>CHAR(1) NOT NULL WITH DEFAULT</th>
<th>Indicates whether the column is the start or end column for the BUSINESS_TIME period:</th>
<th>G</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>

</tbody>
</table>
SYSIBM.SYSKEYTARGETSTATS table

The SYSIBM.SYSKEYTARGETSTATS table contains partition statistics for selected key-targets. For each key-target, a row exists for each partition in the table.

Rows are inserted when RUNSTATS collects indexed key statistics or non-indexed key statistics for a partitioned table space. No row is inserted if the table space is nonpartitioned. Rows in this table can be inserted, updated, and deleted.

**Important:** Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

</table>
**SYSIBM.SYSKEYTGTDIST table**

The SYSIBM.SYSKEYTGTDIST table contains one or more rows for the first key-target of an extended index key.

Rows in this table can be inserted, updated, and deleted.

**Important:** Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

**SYSIBM.SYSKEYTGTDISTSTATS table**

The SYSIBM.SYSKEYTGTDISTSTATS table contains zero or more rows per partition for the first key-target of a data-partitioned secondary index.

Rows are inserted when RUNSTATS scans a data-partitioned secondary index. No row is inserted if the index is a secondary index. Rows in this table can be inserted, updated, and deleted.

**Important:** Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

<td>VARCHAR(128) NOT NULL</td>
<td>Name of the package</td>
<td>G</td>
</tr>
</tbody>
</table>
| CONTOKEN    | CHAR(8) NOT NULL FOR BIT DATA | Consistency token for the package. For a package derived from a DB2 DBRM, this is either:  
• The “level” as specified by the LEVEL option when the package's program was precompiled  
• The timestamp indicating when the package's program was precompiled, in an internal format. | S   |
| OWNER       | VARCHAR(128) NOT NULL       | Authorization ID of the package owner. For a trigger package, the value is the authorization ID of the owner of the trigger, which is set to the current authorization ID (the plan or package owner for static CREATE TRIGGER statement; the CURRENT SQLID for a dynamic CREATE TRIGGER statement). | G   |
| CREATOR     | VARCHAR(128) NOT NULL       | Authorization ID of the owner of the creator of the package version. For a trigger package, the value is determined differently. For dynamic SQL, it is the primary authorization ID of the user who issued the CREATE TRIGGER statement. For static SQL, it is the authorization ID of the plan or package owner. | G   |
| TIMESTAMP   | TIMESTAMP NOT NULL          | Timestamp indicating when the package was created.                          | G   |
| BINDTIME    | TIMESTAMP NOT NULL          | Timestamp indicating when the package was last bound.                       | G   |
| QUALIFIER   | VARCHAR(128) NOT NULL       | Implicit qualifier for the unqualified table, view, index, and alias names in the static SQL statements of the package. | G   |
| PKSIZE      | INTEGER NOT NULL            | Size of the base section\(^4\) of the package, in bytes.                    | G   |
| AVGSIZE     | INTEGER NOT NULL            | Average size, in bytes, of those sections\(^4\) of the plan that contain SQL statements processed at bind time. | G   |
| SYSENTRIES  | SMALLINT NOT NULL           | Number of enabled or disabled entries for this package in SYSIBM.SYSPKSYSTEM. A value of 0 if all types of connections are enabled. | G   |

---

\(^4\) Packages are divided into sections. The base section of the package must be in the EDM pool during the entire time the package is executing. Other sections of the package, corresponding roughly to sets of related SQL statements, are brought into the pool as needed.

---

## SYSIBM.SYSPACKCOPY table

The SYSIBM.SYSPACKCOPY table contains one row for the previous version of each package and one row for the original version of each package.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCATION</td>
<td>VARCHAR(128)</td>
<td>Always contains blanks</td>
<td>S</td>
</tr>
<tr>
<td>COLLID</td>
<td>VARCHAR(128)</td>
<td>Name of the package collection. For a trigger package, it is the schema name of the trigger.</td>
<td>G</td>
</tr>
<tr>
<td>NAME</td>
<td>VARCHAR(128)</td>
<td>Name of the package.</td>
<td>G</td>
</tr>
<tr>
<td>CONTOKEN</td>
<td>CHAR(8)</td>
<td>Consistency token for the package. For a package derived from a DB2 DBRM, this is either:</td>
<td>S</td>
</tr>
<tr>
<td></td>
<td>NOT NULL WITH DEFAULT FOR BIT DATA</td>
<td>• The “level” as specified by the LEVEL option when the package's program was precompiled</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The timestamp indicating when the package's program was precompiled, in an internal format.</td>
<td></td>
</tr>
<tr>
<td>OWNER</td>
<td>VARCHAR(128)</td>
<td>Authorization ID of the package owner. For a trigger package, the value is the authorization ID of the owner of the trigger, which is set to the current authorization ID (the plan or package owner for static CREATE TRIGGER statement; the CURRENT SQLID for a dynamic CREATE TRIGGER statement).</td>
<td>G</td>
</tr>
<tr>
<td>CREATOR</td>
<td>VARCHAR(128)</td>
<td>Authorization ID of the owner of the creator of the package version. For a trigger package, the value is determined differently. For dynamic SQL, it is the primary authorization ID of the user who issued the CREATE TRIGGER statement. For static SQL, it is the authorization ID of the plan or package owner.</td>
<td>G</td>
</tr>
<tr>
<td>TIMESTAMP</td>
<td>TIMESTAMP</td>
<td>Timestamp indicating when the package was created.</td>
<td>G</td>
</tr>
<tr>
<td>BINDTIME</td>
<td>TIMESTAMP</td>
<td>Timestamp indicating when the package was last bound.</td>
<td>G</td>
</tr>
<tr>
<td>QUALIFIER</td>
<td>VARCHAR(128)</td>
<td>Implicit qualifier for the unqualified table, view, index, and alias names in the static SQL statements of the package.</td>
<td>G</td>
</tr>
<tr>
<td>PKSIZE</td>
<td>INTEGER</td>
<td>Size of the base section of the package, in bytes.</td>
<td>G</td>
</tr>
<tr>
<td>AVGSIZE</td>
<td>INTEGER</td>
<td>Average size, in bytes, of those sections of the plan that contain SQL statements processed at bind time.</td>
<td>G</td>
</tr>
</tbody>
</table>

45. Packages are divided into sections. The base section of the package must be in the EDM pool during the entire time the package is executing. Other sections of the package, corresponding roughly to sets of related SQL statements, are brought into the pool as needed.

| REOPTVAR    | CHAR(1) NOT NULL WITH DEFAULT 'N' | Whether the access path is determined again at execution time using input variable values:  
A Bind option REOPT(AUTO) indicates that the access path is determined multiple times at execution time depending on the parameter value.  
N Bind option REOPT(NONE) indicates that the access path is determined at bind time.  
Y Bind option REOPT(ALWAYS) indicates that the access path is determined at execution time for SQL statements with variable values.  
1 Bind option REOPT(ONCE) indicates that the access path is determined only once at execution time, using the first set of input variable values, regardless of how many times the same statement is executed. | G   |
| DEFERPREPARE | CHAR(1) NOT NULL WITH DEFAULT | Whether PREPARE processing is deferred until OPEN is executed:  
N Bind option NODEFER(PREPARE) indicates that PREPARE processing is not deferred until OPEN is executed.  
Y Bind option DEFER(PREPARE) indicates that PREPARE processing is deferred until OPEN is executed.  
blank Bind option not specified for the package. It is inherited from the plan. | G   |
| KEEPDYNAMIC | CHAR(1) NOT NULL WITH DEFAULT 'N' | Whether prepared dynamic statements are to be purged at each commit point:  
N The bind option is KEEPDYNAMIC(NO). Prepared dynamic SQL statements are destroyed at commit.  
Y The bind option is KEEPDYNAMIC(YES). Prepared dynamic SQL statements are kept past commit. | G   |
<p>| PATHSCHEMAS | VARCHAR(2048) NOT NULL WITH DEFAULT | SQL path specified on the BIND or REBIND command that bound the package. The path is used to resolve unqualified data type, function, and stored procedure names used in certain contexts. If the PATH bind option was not specified, the value in the column is a zero length string; however, DB2 uses the default SQL path. | G   |</p>
<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
</table>
| TYPE        | CHAR(1)        | Type of package. Identifies how the package is created:  
- **F**: CREATE FUNCTION or ALTER FUNCTION statement, or a BIND PACKAGE DEPLOY command created the package, and this package is a non-inline SQL scalar function package.  
- **N**: CREATE PROCEDURE or ALTER PROCEDURE statement, or BIND PACKAGE DEPLOY command created the package, and this package is a native SQL routine package.  
- **R**: CREATE TRIGGER or ALTER TRIGGER statement created the package, and the package is a trigger package that has been created or regenerated in Version 11 New Function Mode or later.  
- **T**: CREATE TRIGGER statement prior to Version 11 New Function Mode has created the package, and the package is a trigger package.  
- **blank**: BIND PACKAGE command created the package. | G   |
| DBPROTOCOL  | CHAR(1)        | Whether remote access for SQL is implemented with DRDA access or DRDA access with the capability for package-based continuous block fetch:  
- **D**: DRDA  
- **C**: DRDA access with the capability for package-based continuous block fetch. | G   |
| FUNCTIONTS  | TIMESTAMP      | Timestamp when the function was resolved. Set by the BIND and REBIND commands, but not by AUTOBIND. | G   |
| OPTHINT     | VARCHAR(128)   | Value of the OPTHINT bind option. Identifies rows in owner.PLAN_TABLE that are to be used as input to DB2. Refer to the ACCESSPATH column in the "SYSIBM.SYSPACKSTMT table" on page 2356 for information about which statements are using the specified hints. | G   |
| ENCODING_CCSID | INTEGER   | The CCSID corresponding to the encoding scheme or CCSID as specified for the bind option ENCODING. The Encoding Scheme specified on the bind command:  
- **ccsid**: The specified or derived CCSID.  
- **0**: The default CCSID as specified on panel DSNTIPF at installation time. Used when the package was bound prior to Version 7. | G   |
| IMMEDWRITE  | CHAR(1)        | Indicates when writes of updated group buffer pool dependent pages are to be done. This option is only applicable for data sharing environments.  
- **N**: Bind option IMMEDWRITE(NO) indicates normal write activity is done.  
- **Y**: Bind option IMMEDWRITE(YES) indicates that immediate writes are done for updated group buffer pool dependent pages.  
- **1**: Bind option IMMEDWRITE(PH1) indicates that updated group buffer pool dependent pages are written at or before phase 1 commit.  
- **blank**: A migrated package. | G   |

### SYSIBM.SYSPACKDEP table

The SYSIBM.SYSPACKDEP table records the dependencies of packages on local tables, views, synonyms, table spaces, indexes, aliases, functions, and stored procedures.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>BNAME</td>
<td>VARCHAR(128)</td>
<td>The name of an object that a package depends on.</td>

**SYSIBM.SYSPACKLIST table**

The SYSIBM.SYSPACKLIST table contains one or more rows for every local application plan bound with a package list. Each row represents a unique entry in the plan's package list.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PLANNAME</td>
<td>VARCHAR(24)</td>
<td>Name of the application plan.</td>
</tr>
<tr>
<td>SEQNO</td>
<td>SMALLINT</td>
<td>Sequence number of the entry in the package list.</td>
</tr>
<tr>
<td>LOCATION</td>
<td>VARCHAR(128)</td>
<td>Location of the package. Blank if this is local. An asterisk (*) indicates</td>
</tr>
<tr>
<td>COLLID</td>
<td>VARCHAR(128)</td>
<td>Collection name for the package. An asterisk (*) indicates</td>
</tr>
<tr>
<td>NAME</td>
<td>VARCHAR(128)</td>
<td>Name of the package. An asterisk (*) indicates an entire</td>
</tr>
<tr>
<td>TIMESTAMP</td>
<td>TIMESTAMP</td>
<td>Timestamp indicating when the row was created.</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic</td>
</tr>
</tbody>
</table>

The value in this field is not a reliable indicator of release dependencies.
### SYSIBM.SYSPACKSTMT table

The SYSIBM.SYSPACKSTMT table contains one or more rows for each statement in a package.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCATION</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Always contains blanks</td>
<td>S</td>
</tr>
<tr>
<td>COLLID</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Name of the package collection.</td>
<td>G</td>
</tr>
<tr>
<td>NAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Name of the package.</td>
<td>G</td>
</tr>
</tbody>
</table>
| CONTOKEN    | CHAR(8) NOT NULL FOR BIT DATA | Consistency token for the package. This is either:  
- The “level” as specified by the LEVEL option when the package's program was precompiled  
- The timestamp indicating when the package’s program was precompiled, in an internal format | S |
| SEQNO       | INTEGER NOT NULL | Not used. | G |
| STMTNO      | SMALLINT NOT NULL | The statement number of the statement in the source program. A statement number greater than 32767 is stored as zero⁴⁷ or as a negative number. If the value is zero, see STMTNOI for the statement number. | G |
| SECTNO      | SMALLINT NOT NULL | The section number of the statement.⁴⁸ | G |
| BINDERROR   | CHAR(1) NOT NULL | Whether an SQL error was detected at bind time:  
N No  
Y Yes | G |
| IBMREQD     | CHAR(1) NOT NULL | A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators.  
The value in this field is not a reliable indicator of release dependencies. | G |
| VERSION     | VARCHAR(122) NOT NULL | Version identifier for the package. | G |
|             | VARCHAR(3500) NOT NULL WITH DEFAULT FOR BIT DATA | Internal use only. | I |

---

⁴⁷ Rows in which the value of SEQNO, STMTNO, and SECTNO are zero are for internal use.

⁴⁸ To convert a negative STMTNO to a meaningful statement number that corresponds to your precompile output, add 65536 to it. For example, -26472 is equivalent to +39064 (-26472 + 65536).
<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISOLATION</td>
<td>CHAR(1)</td>
<td>Isolation level for the SQL statement:</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL WITH DEFAULT</td>
<td>R RR (repeatable read)</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>T RS (read stability)</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>S CS (cursor stability)</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>U UR (uncommitted read)</td>

**SYSIBM.SYSQUERYPLAN table**

The SYSIBM.SYSQUERYPLAN table contains the plan hint information for the queries in the SYSIBM.SYSQUERY table. It correlates to the SYSIBM.SYSQUERY table by the QUERYID column. For a query, there can be up to 3 copies of plan hints stored in the SYSIBM.SYSQUERYPLAN table, distinguished by the value of the COPYID column.

<table>

### SYSIBM.SYSQUERYPREDICATE table

The SYSIBM.SYSQUERYPREDICATE table contains information about predicates for queries in the SYSIBM.SYSQUERY table that have been identified for extended optimization. It correlates to the SYSIBM.SYSQUERY table by the QUERYID column.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYID</td>
<td>BIGINT</td>
<td>Identifier of the query.</td>

## SYSIBM.SYSQUERYSEL table

The SYSIBM.SYSQUERYSEL table contains information about the selectivity of predicates for queries in the SYSIBM.SYSQUERY table that have been identified for extended optimization. It correlates to the SYSIBM.SYSQUERY table by the QUERYID column.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYID</td>
<td>BIGINT</td>
<td>The identifier of the query.</td>
<td>S</td>
</tr>
<tr>
<td>QUERYNO</td>
<td>INTEGER</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
<td>S</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows produced by EXPLAIN statements</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows not produced by EXPLAIN statements</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>DB2 assigns a number that is based on the line number of the SQL statement in the source program.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.</td>
<td></td>
</tr>
<tr>
<td>QBLOCKNO</td>
<td>SMALLINT</td>
<td>A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.</td>
<td>S</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>

</tbody>
</table>
| LANGUAGE    | VARCHAR(24) NOT NULL | Implementation language of the routine:  
• ASSEMBLE  
• C  
• COBOL  
• COMPJAVA  
• JAVA  
• PLI  
• REXX  
• SQL  
The value is blank if ROUTINETYPE = 'F' and ORIGIN is not 'E' or not 'Q'. | G |
| COLLID      | VARCHAR(128) NOT NULL | Name of the package collection to be used when the routine is executed. A blank value indicates the package collection is the same as the package collection of the program that invoked the routine. | G |
| SOURCESCHEMA | VARCHAR(128) NOT NULL | If ORIGIN is 'U' and ROUTINETYPE is 'F', the schema of the source user-defined function ('SYSIBM' for a source built-in function). Otherwise, the value is blank. | G |
| SOURCESPECIFIC | VARCHAR(128) NOT NULL | If ORIGIN is 'U' and ROUTINETYPE is 'F', the specific name of the source user-defined function or source built-in function name. Otherwise, the value is blank. | G |
| DETERMINISTIC | CHAR(1) NOT NULL | The deterministic option of an external function or a stored procedure:  
\N Indeterminate (results might differ with a given set of input values).  
\Y Deterministic (results are consistent).  
blank ROUTINETYPE='F' and ORIGIN is not 'E' or not 'Q' (the routine is a function, but not an external function or an SQL function). | G |
| EXTERNAL_ACTION | CHAR(1) NOT NULL | The external action option of an external function or SQL function:  
\N Function has no side effects.  
\E Function has external side effects so that the number of invocations is important.  
blank ORIGIN is not 'E' or 'Q' for the function (ROUTINETYPE='F'), or it is a stored procedure (ROUTINETYPE='P'). | G |
| NULL_CALL | CHAR(1) NOT NULL | The CALLED ON NOT NULL INPUT option of an external function or stored procedure:  
\N The routine is not called if any parameter has a NULL value.  
\Y The routine is called if any parameter has a NULL value.  
blank ROUTINETYPE='F' and ORIGIN is not 'E' (the routine is a function, but not an external function). | G |
| CAST_FUNCTION | CHAR(1) NOT NULL | Whether the routine is a cast function:  
\N The routine is not a cast function.  
\Y The routine is a cast function.  
blank ORIGIN is not 'E' for the function (ROUTINETYPE='F'), or it is a stored procedure (ROUTINETYPE='P').  
A cast function is generated by DB2 for a CREATE TYPE statement. | G |

### SYSIBM.SYSROUTINESTEXT table

The SYSIBM.SYSROUTINESTEXT is an auxiliary table for the TEXT column of SYSIBM.SYSROUTINES and is required to hold the LOB data.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>TEXT</td>
<td>CLOB(2M)</td>
<td>The source text of the CREATE PROCEDURE statement for the routine. TEXT can also hold the source text of the ALTER PROCEDURE statement for the routine if the routine is a native SQL procedure and the SQL procedure body is included in the ALTER PROCEDURE statement.</td>
<td>G</td>
</tr>
</tbody>
</table>
SYSIBM.SYSROUTINES_OPTS table

The SYSIBM.SYSROUTINES_OPTS table contains a row for each generated routine, such as one created by DB2 for z/OS Procedure Processor DSNTPSMP, that records the build options for the routine.

Rows in this table can be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMA</td>
<td>VARCHAR(128)</td>
<td>Schema of the routine.</td>
<td>G</td>
</tr>
<tr>
<td>ROutiname</td>
<td>VARCHAR(128)</td>
<td>Name of the routine.</td>
<td>G</td>
</tr>
<tr>
<td>BUILDDATE</td>
<td>DATE</td>
<td>Date the routine was built.</td>
<td>G</td>
</tr>
<tr>
<td>BUILDTIME</td>
<td>TIME</td>
<td>Time the routine was built.</td>
<td>G</td>
</tr>
<tr>
<td>BUILDSTATUS</td>
<td>CHAR(1)</td>
<td>Whether this version of the routine's options is the current version.</td>
<td>G</td>
</tr>
<tr>
<td>BUILDSCHEMA</td>
<td>VARCHAR(128)</td>
<td>Schema name for BUILDNAME.</td>
<td>G</td>
</tr>
<tr>
<td>BUILDNAME</td>
<td>VARCHAR(128)</td>
<td>Procedure used to create the routine.</td>
<td>G</td>
</tr>
<tr>
<td>BUILDOWNER</td>
<td>VARCHAR(128)</td>
<td>Authorization ID used to create the routine.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.</td>
<td>G</td>
</tr>
<tr>
<td>PRECOMPILE_OPTS</td>
<td>VARCHAR(765)</td>
<td>SQL processing (precompiler or coprocessor) options used to build the routine.</td>
<td>G</td>
</tr>
<tr>
<td>COMPILE_OPTS</td>
<td>VARCHAR(765)</td>
<td>Compiler options used to build the routine.</td>
<td>G</td>
</tr>
<tr>
<td>PRELINK_OPTS</td>
<td>VARCHAR(765)</td>
<td>Prelink-edit options used to build the routine.</td>
<td>G</td>
</tr>
<tr>
<td>Column name</td>

<td>Description</td>
<td>Use</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------</td>
<td>-------------</td>
<td>-----</td>
</tr>
<tr>
<td>LINK_OPTS</td>
<td>VARCHAR(765) NOT NULL WITH DEFAULT</td>
<td>Link-edit options used to build the routine.</td>
<td>G</td>
</tr>
<tr>
<td>BIND_OPTS</td>
<td>VARCHAR(3072) NOT NULL WITH DEFAULT</td>
<td>Bind options used to build the routine.</td>
<td>G</td>
</tr>
<tr>
<td>SOURCEDSN</td>
<td>VARCHAR(765) NOT NULL WITH DEFAULT</td>
<td>Name of the source data set.</td>
<td>G</td>
</tr>
<tr>
<td>DEBUG_MODE</td>
<td>CHAR(1) NOT NULL</td>
<td>Debugging is on or off for this object.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>0</td>
<td>Debugging is off. Default and value on migration are both 0.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Debugging is on.</td>
<td></td>
</tr>
</tbody>
</table>
**SYSIBM.SYSROUTINES_TREE table**

The SYSIBM.SYSROUTINES_TREE table is an auxiliary table for the PTREE column of the SYSIBM.SYSROUTINES table.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>PTREE</td>
<td>BLOB(1G)</td>
<td>Internal use only.</td>
<td>I</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>WITH DEFAULT</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**SYSIBM.SYSROUTINES_SRC table**

The SYSIBM.SYSROUTINES_SRC table contains source for generated routines, such as those created by DB2 for z/OS Procedure Processor DSNTPSMP.

Rows in this table can be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMA</td>
<td>VARCHAR(128)</td>
<td>Schema of the routine.</td>
<td>G</td>
</tr>
<tr>
<td>ROUTINENAME</td>
<td>VARCHAR(128)</td>
<td>Name of the routine.</td>
<td>G</td>
</tr>
<tr>
<td>BUILDDATE</td>
<td>DATE</td>
<td>Date the routine was built.</td>
<td>G</td>
</tr>
<tr>
<td>BUILDTIME</td>
<td>TIME</td>
<td>Time the routine was built.</td>
<td>G</td>
</tr>
<tr>
<td>BUILDSTATUS</td>
<td>CHAR(1)</td>
<td>Whether this version of the routine's source is the current version.</td>
<td>G</td>
</tr>
<tr>
<td>SEQNO</td>
<td>INTEGER</td>
<td>Number of the source statement piece in CREATESTMT.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td></td>
<td>material (MRM) tape. For all other values, see <strong>Release dependency indicators</strong>.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The value in this field is not a reliable indicator of release dependencies.</td>
<td></td>
</tr>
<tr>
<td>CREATESTMT</td>
<td>VARCHAR(7500)</td>
<td>Routine source statement.</td>
<td>G</td>
</tr>
</tbody>
</table>

**Release dependency indicators**

- **Y**: Indicate that the row came from the basic machine-readable material (MRM) tape.
- **N**: For all other values, see release dependency indicators.
- **C**: Whether this version of the routine's source is the current version.
- **G**: Rows in this table can be inserted, updated, and deleted.
SYSIBM.SYSSCHEMMAUTH table
The SYSIBM.SYSSCHEMMAUTH table contains one or more rows for each user that is granted a privilege on a particular schema in the database.

<table>
<thead>
<tr>
<th>Column name</th>

SYSIBM.SYSSTATFEEDBACK table

The SYSIBM.SYSSTATFEEDBACK table contains information about missing or conflicting catalog statistics for SQL statements.

The following values control the collection of statistics feedback data in the SYSIBM.SYSSTATFEEDBACK catalog table:

- The STATFDBK_SCOPE subsystem parameter controls whether the data is collected, and whether it is collected only for static SQL statements, only for dynamic SQL statements, or for both.
- The STATSINT subsystem parameter controls when and how frequently the data is externalized.
- The STATS_FEEDBACK column of the SYSIBM.SYSTABLES catalog table controls whether the data is collected for a particular table.

The RUSNTATS utility removes data from the SYSIBM.SYSSTATFEEDBACK catalog table when the recommended statistics are collected.

</table>
SYSIBM.SYSSTRINGS table

The SYSIBM.SYSSTRINGS table contains information about character conversion. Each row describes a conversion from one coded character set to another.

Also refer to z/OS C/C++ Programming Guide for information on the additional conversions that are supported.

Each row in the table must have a unique combination of values for its INCCSID, OUTCCSID, and IBMREQD columns. Rows for which the value of IBMREQD is N can be deleted, inserted, and updated subject to this uniqueness constraint and to the constraints imposed by a VALIDPROC defined on the table. An inserted row could have values for the INCCSID and OUTCCSID columns that match those of a row for which the value of IBMREQD is Y. DB2 then uses the information in the inserted row instead of the information in the IBM-supplied row. Rows for which the value of IBMREQD is Y cannot be deleted, inserted, or updated. For information about the use of inserted rows for character conversion, see DB2 Installation Guide.

DB2 has two methods for character conversions and applies them in the following order:
1. Conversions specified by the various combinations of the INCCSID and OUTCCSID columns in the SYSIBM.SYSSTRINGS catalog table.
2. Conversions provided by z/OS support for Unicode. For more information, see z/OS Support for Unicode: Using Conversion Services.

If neither of these methods can be used for a particular character conversion, DB2 returns an error.

Appendix. Additional information for DB2 SQL   2459
SYSIBM.SYSTABLEPART_HIST table

The SYSIBM.SYSTABLEPART_HIST table contains rows from SYSTABLEPART.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

<table>

</tr>
<tr>
<td>CREATOR</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The schema of the table, view, or alias.</td>
<td>G</td>
</tr>
</tbody>
</table>
| TYPE        | CHAR(1) NOT NULL | Type of object:  
A  Alias  
C  Clone table  
G  Created global temporary table  
H  History table  
M  Materialized query table  
P  Table that was implicitly created for XML columns  
R  Archive table  
T  Table  
V  View  
X  Auxiliary table | G   |
| DBNAME      | VARCHAR(24) NOT NULL | For a table, or a view of tables, the name of the database that contains the table space that is named in TSNAME. For a created temporary table, an alias, or a view of a view, the value is DSNDB06. | G   |
| TSNAME      | VARCHAR(24) NOT NULL | For a table, or a view of one table, the name of the table space that contains the table. For a view of more than one table, the name of a table space that contains one of the tables. For a created temporary table, a view of a view, or an alias, it is SYSTSTAB. | G   |
| DBID        | SMALLINT NOT NULL | Internal identifier of the database; 0 if the row describes a view, alias, or created temporary table. Non-zero if the view has an INSTEAD OF trigger defined. | S   |
| OBID        | SMALLINT NOT NULL | Internal identifier of the table; 0 if the row describes a view, an alias, or a created temporary table. Non-zero if the view has an INSTEAD OF trigger defined. | S   |
| COLCOUNT    | SMALLINT NOT NULL | Number of columns in the table or view. The value is 0 if the row describes an alias. | G   |
| EDPROC      | VARCHAR(24) NOT NULL | Name of the edit procedure; blank if the row describes a view or alias or a table without an edit procedure. | G   |
| VALPROC     | VARCHAR(24) NOT NULL | Name of the validation procedure; blank if the row describes a view or alias or a table without a validation procedure. | G   |
| CLUSTERTYPE | CHAR(1) NOT NULL | Whether RESTRICT ON DROP applies:  
blank  No  
Y  Yes. You cannot drop the table or any table space or database that contains the table. | G   |
| CLUSTERID   | INTEGER NOT NULL | The table is a system-period temporal table with versioning, and the table is defined with the ON DELETE ADD EXTRA ROW clause.  
0  All other tables. | N   |

<tr>
<td>STATSTIME</td>
<td>TIMESTAMP</td>
<td>If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column. For a created temporary table, the value of STATSTIME is always the default value.</td>
<td>G</td>
</tr>
</tbody>
</table>
| CHECKS      | SMALLINT      | Number of check constraints that are defined on the table. The value is 0 if either of the following conditions are true:  
  - The row describes a view, an alias, a created temporary table, or a materialized query table.  
  - No constraints are defined on the table. | G   |
<p>| CARDF       | FLOAT         | Total number of rows in the table or total number of LOBs in an auxiliary table. The value is -1 if statistics have not been gathered or the row describes a view, alias, or created temporary table. This column can be updated. | S   |</p>
<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
</table>
| CHECKRID5B          | CHAR(5)     | RID of the first row of the table space partition that can violate referential constraints, check constraints, or both. The value of X'0000000000' indicates that any row can violate referential constraints. The value is blank if any of the following conditions are true:  
  - The table or partition is not in CHECK-pending status (CHECKFLAG is blank)  
  - The table space is not partitioned  
  - The table is a created temporary table                                                                                                                                                                                                                                                                                                                                                       | S   |
| ENCODING_SCHEME     | CHAR(1)     | Encoding scheme for a table, view, or the table or view that is referred to by a local alias:  
  E EBCDIC. This value is 'E' even if the table contains a Unicode column.  
  A ASCII  
  M Multiple CCSID set or multiple encoding schemes  
  U Unicode  
  blank For remote aliases  
  The value is 'E' for tables in non-work file databases. The value is blank for tables in work file databases that were created before Version 5 or in the default database, DSNDB04. This column is not applicable for objects that were created before DB2 for z/OS Version 5.                                                                                          | G   |
| TABLESTATUS         | VARCHAR(30) | Indicates the reason for an incomplete table definition:  
  L Definition is incomplete because an auxiliary table or auxiliary index has not been defined for a LOB column.  
  P Definition is incomplete because the table lacks a primary index.  
  R Definition is incomplete because the table lacks a required index on a row ID.  
  U Definition is incomplete because the table lacks a required index on a unique key.  
  V An error occurred when an attempt was made to regenerate the internal representation of the view.  
  blank Definition is complete.                                                                                                                                                                                                                                                                                                                                                          | G   |
<p>| NPAGESF             | FLOAT(8)    | Number of pages that are used by the table. The value is -1 if statistics have not been gathered or the table is an auxiliary table. This column can be updated.                                                                                                                                                                                                                                                                                                                                                     | G   |
| SPACEF              | FLOAT(8)    | Kilobytes of DASD storage. The value is -1 if statistics have not been gathered. The value might be non-zero for an auxiliary table in the LOB table space. This column can be updated.                                                                                                                                                                                                                                                                                                                                                           | G   |
| AVGROWLEN           | INTEGER     | Average length of rows for the tables in the table space. If the table space is compressed, the value is the compressed row length. If the table space is not compressed, the value is the uncompressed row length. The value is -1 if statistics have not been gathered.                                                                                                                                                                                                                                                | G   |</p>

SYSIBM.SYSTABLESPACESTATS table

The SYSIBM.SYSTABLESPACESTATS table contains real time statistics for table spaces.

Rows in this table can be inserted, updated, and deleted.

**Important:** Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>UPDATESTATSTIME</td>
<td>TIMESTAMP</td>
<td>The timestamp that the row in the SYSTABLESPACESTATS table is inserted or updated.</td>
<td>G</td>
</tr>
<tr>
<td>NACTIVE</td>
<td>INTEGER</td>
<td>The number of active pages in the table space or partition.</td>
<td>G</td>
</tr>
<tr>
<td>NPAGES</td>
<td>INTEGER</td>
<td>The number of distinct pages with active rows in the partition or table space. This is an updatable column.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This column can be used to calculate an estimate of the size of LOB data in a table space. To produce an estimate, use the following formula: value of NPAGES * page size = approximate size of LOB data</td>
<td></td>
</tr>
<tr>
<td>EXTENTS</td>
<td>SMALLINT</td>
<td>The number of extents in the table space. For multi-piece table spaces, this value is the number of extents for the last data set. For a data set that is striped across multiple volumes, the value is the number of logical extents. A null value indicates the number of extents is unknown.</td>
<td>G</td>
</tr>
<tr>
<td>LOADRLASTTIME</td>
<td>TIMESTAMP</td>
<td>The timestamp that the LOAD REPLACE utility was last run on the table space or partition.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td></td>
<td>A null value indicates that the LOAD REPLACE utility has never been run on the table space or partition or that the timestamp is unknown.</td>
<td></td>
</tr>
<tr>
<td>REORGLASTTIME</td>
<td>TIMESTAMP</td>
<td>The timestamp the REORG utility was last run on the table space or partition, or when the REORG utility has not been run, the time when the table space or partition was created. A null value indicates that the timestamp is unknown.</td>
<td>G</td>
</tr>
<tr>
<td>REORGINserts</td>
<td>INTEGER</td>
<td>The number of rows or LOBs that have been inserted into the table space or partition or loaded into the table space or partition using the LOAD utility specified without the REPLACE option since the last time the REORG or LOAD REPLACE utilities were run, or since the object was created.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td></td>
<td>A null value indicates that the number of inserted rows or LOBs is unknown.</td>

<tr>
<td>REORGDELETES</td>
<td>INTEGER</td>
<td>The number of rows or LOBs that have been deleted from the table space or partition since the last time the REORG or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of deleted rows or LOBs is unknown.</td>
<td>G</td>
</tr>
<tr>
<td>REORGUPDATES</td>
<td>INTEGER</td>
<td>The number of rows that have been updated in the table space or partition since the last time the REORG or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of updated rows is unknown.</td>
<td>G</td>
</tr>
<tr>
<td>REORGUNCLUSTINS</td>
<td>INTEGER</td>
<td>The number of rows that were inserted that are not well-clustered with respect to the clustering index since the last REORG or LOAD REPLACE, or since the object was created. A record is well-clustered if the record is inserted into a page that is within 16 pages of the ideal candidate page. The clustering index determines the ideal candidate page. A null value indicates that the number of not well clustered pages is unknown.</td>
<td>G</td>
</tr>
<tr>
<td>REORGDISORGLOB</td>
<td>INTEGER</td>
<td>The number of LOBs that were inserted that are not perfectly chunked since the last REORG or LOAD REPLACE, or since the object was created. A LOB is perfectly chunked if the allocated pages are in the minimum number of chunks. A null value indicates that the number of not perfectly chunked LOBs is unknown.</td>
<td>G</td>
</tr>
<tr>
<td>REORGMASSDELETE</td>
<td>INTEGER</td>
<td>The number of mass deletes from a segmented or LOB table space, or the number of dropped tables from a segmented table space since the last time the REORG or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of mass deletes is unknown.</td>
<td>G</td>
</tr>
<tr>
<td>REORGNEARINDREF</td>
<td>INTEGER</td>
<td>The number of overflow rows that are created and relocated near the pointer record since the last time the REORG and LOAD REPLACE utilities were run, or since the object was created. For non-segmented table spaces, a page is near the present page if the two page numbers differ by 16 or less. For segmented table spaces, a page is near the present page if the two page numbers differ by SEGSIZE(^2) or less. A null value indicates that the number of overflow rows that are near the pointer record is unknown.</td>

</tbody>
</table>
| DRIVETYPE             | CHAR(3) NOT NULL WITH DEFAULT | The drive type on which the table space or table space partition data set is defined.  
  **HDD** Hard Disk Drive  
  **SSD** Solid State Drive  
  For multi-volume data sets, the drive type is set to SSD if any volume is SSD. For multi-piece linear page sets, the drive type of the first data set is used. This is an updatable column. | G   |
| LPFACILITY            | CHAR(1)   | Whether the disk control unit has the high performance list prefetch facility.  
  **N** No  
  **Y** Yes  
  A NULL value indicates that it is unknown whether the disk control unit has the high performance list prefetch facility. This is an updatable column. | G   |
| UPDATESIZE            | BIGINT    | The net number of bytes that were added or removed by UPDATE operations since the object was created, or since the last REORG or LOAD REPLACE operation. | G   |
## LASTDATACHANGE

**Data type**: TIMESTAMP

**Description**: The last time that this row was updated because data was modified in the table space or partition. The timestamp reflects the time at which the real-time statistics table was updated, and not the time at which the data in the table space or partition was modified. Physical data changes such as reorganization of data are not reflected in this column.

In data sharing environments, the values in `SYSIBM.SYSTABLESPACESTATS` can be negative for short periods of time for certain situations.

SYSIBM.SYSTABLES_HIST table

The SYSIBM.SYSTABLES_HIST table contains rows from SYSTABLES.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

The value in this field is not a reliable indicator of release dependencies.
**SYSIBM.SYSTABLES_PROFILES table**

The SYSIBM.SYSTABLES_PROFILES table contains one row for each profile that is associated with a table in SYSIBM.SYSTABLES.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMA</td>
<td>VARCHAR(128)</td>
<td>The schema (qualifier) for the table.</td>
<td>G</td>
</tr>
<tr>

**Related tasks:**

- Automating statistics maintenance (DB2 Performance)
SYSIBM.SYSTABLES_PROFILE_TEXT table

The SYSIBM.SYSTABLES_PROFILE_TEXT table is an auxiliary table for the PROFILE_TEXT column of the SYSIBM.SYSTABLES_PROFILES table and is required to hold LOB data.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROFILE_TEXT</td>
<td>CLOB(2M)</td>
<td>The complete text for the profile that the row represents.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>WITH DEFAULT</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**SYSIBM.SYSTABSTATS table**

The SYSIBM.SYSTABSTATS table contains one row for each partition of a partitioned table space.

Rows in this table can be inserted, updated, and deleted.

**Important:** Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>CARD</td>
<td>INTEGER NOT NULL</td>
<td>Total number of rows in the partition.</td>
<td>S</td>
</tr>
<tr>
<td>NPAGES</td>
<td>INTEGER NOT NULL</td>
<td>Total number of pages on which rows of the partition appear.</td>
<td>S</td>
</tr>
<tr>
<td>PCTPAGES</td>
<td>SMALLINT NOT NULL</td>
<td>Percentage of total active pages in the partition that contain rows of the table.</td>
<td>S</td>
</tr>
<tr>
<td>NACTIVE</td>
<td>INTEGER NOT NULL</td>
<td>Number of active pages in the partition.</td>
<td>S</td>
</tr>
<tr>
<td>PCTROWCOMP</td>
<td>SMALLINT NOT NULL</td>
<td>Percentage of rows compressed within the total number of active rows in the partition. This includes any row in a table space that is defined with COMPRESS YES.</td>
<td>S</td>
</tr>
<tr>
<td>STATTIME</td>
<td>TIMESTAMP NOT NULL</td>
<td>If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics. The default value is '0001-01-01-00:00:00:000000'. The default value indicates that statistics were not collected. This is an updatable column.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1) NOT NULL</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see <a href="#">Release dependency indicators</a>. The value in this field is not a reliable indicator of release dependencies.</td>
<td>G</td>
</tr>
<tr>

<td>S</td>
</tr>
</tbody>
</table>
### SYSIBM.SYSTABSTATS_HIST table

The SYSIBM.SYSTABSTATS_HIST table contains rows from SYSTABSTATS.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>NPAGES</td>
<td>INTEGER</td>
<td>Total number of pages on which rows of the partition appear.</td>
<td>S</td>
</tr>
<tr>
<td>STATTIME</td>
<td>TIMESTAMP</td>
<td>If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.</td>
<td>G</td>
</tr>
<tr>

<td>G</td>
</tr>
</tbody>
</table>
## SYSIBM.SYSTRIGGERS table

The SYSIBM.SYSTRIGGERS table contains one row for each trigger.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Name of the trigger and trigger package.</td>
<td>G</td>
</tr>
<tr>
<td>SCHEMA</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Schema of the trigger. This implicit or explicit qualifier for the trigger name is also used for the collection ID of the trigger package.</td>
<td>G</td>
</tr>
<tr>
<td>SMALLINT</td>
<td>NOT NULL</td>
<td>Not used.</td>
<td>N</td>
</tr>
<tr>
<td>DBID</td>
<td>SMALLINT NOT NULL</td>
<td>Internal identifier of the database for the trigger.</td>
<td>G</td>
</tr>
<tr>
<td>OBID</td>
<td>SMALLINT NOT NULL</td>
<td>Internal identifier of the trigger.</td>
<td>G</td>
</tr>
<tr>
<td>OWNER</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Owner of the trigger.</td>
<td>G</td>
</tr>
<tr>
<td>CREATEDBY</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Primary authorization ID of the user who created the trigger.</td>
<td>G</td>
</tr>
<tr>
<td>TBNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Name of the table or view.</td>
<td>G</td>
</tr>
<tr>
<td>TBOWNER</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Qualifier of the name of the table or view to which this trigger applies.</td>
<td>G</td>
</tr>
<tr>
<td>TRIGTIME</td>
<td>CHAR(1) NOT NULL</td>
<td>Time when triggered actions are applied to the base table, relative to the event that activated the trigger: A Trigger is applied after the event. B Trigger is applied before the event. I Trigger is applied instead of the event</td>
<td>G</td>
</tr>
<tr>
<td>TRIGEVENT</td>
<td>CHAR(1) NOT NULL</td>
<td>Operation that activates the trigger: I Insert D Delete U Update</td>

<td>G</td>
</tr>
<tr>
<td>Trigname</td>
<td>VARCHAR(128)</td>
<td>Unused</td>
<td>G</td>
</tr>
<tr>
<td>OwnerType</td>
<td>CHAR(1)</td>
<td>Indicates the type of creator:</td>
<td>G</td>
</tr>
<tr>
<td>Envid</td>
<td>INTEGER</td>
<td>Internal environment identifier.</td>
<td>G</td>
</tr>
<tr>
<td>Relcreated</td>
<td>CHAR(1)</td>
<td>The release of DB2 that is used to create the object. Blank if created prior</td>
<td>G</td>
</tr>
<tr>
<td>Secure</td>
<td>CHAR(1)</td>
<td>Indicates if the trigger is secured:</td>
<td>G</td>
</tr>
<tr>
<td>Alteredts</td>
<td>TIMESTAMP</td>
<td>Time when the last ALTER statement was executed for this trigger.</td>
<td>G</td>
</tr>
<tr>
<td>Rowid</td>
<td>ROWID</td>
<td>ROWID column, created for the lob columns in this table.</td>
<td>G</td>
</tr>
<tr>
<td>Statement</td>
<td>CLOB(2M)</td>
<td>The text of the entire CREATE TRIGGER statement that was used to</td>
<td>G</td>
</tr>
</tbody>
</table>

Appendix. Additional information for DB2 SQL 2491
### SYSIBM.SYSTRIGGERS_STMT table

The SYSIBM.SYSTRIGGERS_STMT table is an auxiliary table for the STATEMENT column of the SYSIBM.SYSTRIGGERS table and is required to hold LOB data.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATEMENT</td>
<td>CLOB(2M) NOT NULL WITH DEFAULT</td>
<td>The text of the entire CREATE TRIGGER statement that was used to create the object.</td>

<td>G</td>
</tr>
</tbody>
</table>

This column can contain one of the following values:

- **N**: The global variable does not have a default value.
- **S**: The default value is the value of the SQL authorization ID of the process at the time that a default value is used.
- **1**: The default value is a string constant.
- **2**: The default value is a floating-point constant.
- **3**: The default value is a decimal constant.
- **4**: The default value is an integer constant.
- **5**: The default value is a hexadecimal character string.
- **6**: The default value is a UX string.
- **7**: The global variable has a graphic data type and has a default value that is a character string constant.
- **8**: The global variable has a character data type and has a default value that is a character string constant.
- **9**: The default value is a DECFLOAT constant.

If this column contains one of the following values, the default value of the global variable is the value of the indicated special register at the time that a default value is used:

- **AES**: CURRENT APPLICATION ENCODING SCHEM
- **ACT**: CURRENT CLIENT ACCTNG
- **APN**: CURRENT CLIENT_APPLNAME
- **CID**: CURRENT CLIENT_USERID
- **WSN**: CURRENT_CLIENT_WRKSTNNAME
- **DAT**: CURRENT_DATE
- **DBG**: CURRENT DEBUG MODE
- **DEC**: CURRENT DECFLOAT ROUNDING MODE
- **DEG**: CURRENT DEGREE
- **EXP**: CURRENT EXPLAIN MODE
- **LCT**: CURRENT Locale LC_CTYPE
- **MTT**: CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION
- **MEM**: CURRENT MEMBER
- **HNT**: CURRENT OPTIMIZATION HINT
- **CPP**: CURRENT PACKAGE PATH
- **CPS**: CURRENT PACKAGESET
- **PTH**: CURRENT PATH
- **PRC**: CURRENT PRECISION
- **RFA**: CURRENT REFRESH AGE
- **RVS**: CURRENT ROUTINE VERSION
- **RUL**: CURRENT RULES
- **SCH**: CURRENT SCHEMA
- **SVR**: CURRENT SERVER
- **TIM**: CURRENT TIME
- **TST**: CURRENT TIMESTAMP
- **STZ**: SESSION TIME_ZONE
- **U**: SESSION_USER

</tbody>
</table>
### SYSIBM.SYXMLSTRINGS table

Each row of the SYSIBM.SYXMLSTRINGS table contains a single string and its unique ID that are used to condense XML data. The string can be an element name, attribute name, name space prefix, or a namespace URI.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRINGID</td>
<td>INTEGER</td>
<td>Unique ID for the string.</td>
<td>G</td>
</tr>
<tr>
<td>STRING</td>
<td>VARCHAR(1000)</td>
<td>The string data.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators.</td>
<td>G</td>
</tr>
</tbody>
</table>

The value in this field is not a reliable indicator of release dependencies.
**SYSIBM.USERNAMES table**

Each row in the SYSIBM.USERNAMES table is used to carry out one outbound ID translation or inbound ID translation and “come from” checking.

Rows in this table can be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TYPE</strong></td>
<td>CHAR(1)</td>
<td>How the row is to be used:</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td></td>
<td>I</td>
<td>For inbound translation and “come from” checking.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>O</td>
<td>For outbound translation.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>S</td>
<td>For outbound system AUTHID to establish a trusted connection.</td>
</tr>
<tr>
<td><strong>AUTHID</strong></td>
<td>VARCHAR(128)</td>
<td>Authorization ID to be translated. Applies to any authorization ID if blank.</td>
<td>G</td>
</tr>
<tr>
<td><strong>LINKNAME</strong></td>
<td>VARCHAR(24)</td>
<td>Identifies the VTAM or TCP/IP network locations associated with this row. A blank value in this column indicates this name translation rule applies to any TCP/IP or SNA partner.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If a non-blank LINKNAME is specified, one or both of the following statements must be true:</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• A row exists in SYSIBM.LUNAMES whose LUNAME matches the value specified in the SYSIBM.USERNAMES LINKNAME column. This row specifies the VTAM site associated with this name translation rule.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• A row exists in SYSIBM.IPNAMES whose LINKNAME matches the value specified in the SYSIBM.USERNAMES LINKNAME column. This row specifies the TCP/IP host associated with this name translation rule.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Inbound name translation and “come from” checking are not performed for TCP/IP clients.</td>
<td></td>
</tr>
<tr>
<td><strong>NEWAUTHID</strong></td>
<td>VARCHAR(128)</td>
<td>Translated value of AUTHID. Blank specifies no translation. NEWAUTHID can be stored as encrypted data by calling the DSNLEUSR stored procedure. To send the encrypted value of AUTHID across a network, one of the encryption security options in the SYSIBM.IPNAMES table should be specified.</td>
<td>G</td>
</tr>
<tr>
<td><strong>PASSWORD</strong></td>
<td>VARCHAR(255)</td>
<td>Password to accompany an outbound request, if passwords are not encrypted by RACF. If passwords are encrypted, or the row is for inbound requests, the column is not used. PASSWORD can be stored as encrypted data by calling the DSNLEUSR stored procedure. To send the encrypted value of PASSWORD across a network, one of the encryption security options in the SYSIBM.IPNAMES table should be specified.</td>
<td>G</td>
</tr>
<tr>
<td><strong>IBMREQD</strong></td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see <a href="#">Release dependency indicators</a>.</td>
<td>G</td>
</tr>
</tbody>
</table>

The value in this field is not a reliable indicator of release dependencies.
**SYSIBM.SYSXMLTYPMOD table**

The SYSIBM.SYSXMLTYPMOD table contains rows about the XML type modifiers of XML columns. Rows in this table can be inserted, updated and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>XML_TYPEMOD_ID</td>
<td>INTEGER</td>
<td>An id generated for the XML type modifier, it is an identity column and primary key.</td>

<td>TIMESTAMP</td>
<td>The timestamp when this type modifier is created.</td>
<td>G</td>
</tr>
<tr>
<td>ALTEREDTS</td>
<td>TIMESTAMP</td>
<td>The timestamp when this type modifier is altered</td>
<td>G</td>
</tr>
<tr>
<td>RELCREATED</td>
<td>CHAR(1)</td>
<td>The release of DB2 that is used to create the object. See Release dependency indicators for the values.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.</td>
<td>G</td>
</tr>
<tr>
<td>CREATEDBY</td>
<td>VARCHAR(128)</td>
<td>Primary authorization ID of the user who created the database.</td>
<td>G</td>
</tr>
</tbody>
</table>
### SYSIBM.SYSXMLTYPMSCHEMA table

The SYSIBM.SYSXMLTYPMSCHEMA table contains the XML schema information for an XML type modifier. It contains one row per XML schema for an XML type modifier.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>XML_TYPEMOD_ID</td>
<td>INTEGER</td>
<td>The id for the XML type modifier.</td>
<td>G</td>
</tr>
<tr>
<td>XSROBJECTID</td>
<td>INTEGER</td>
<td>The id for an XML schema registered in XSR.</td>
<td>G</td>
</tr>
<tr>
<td>ELEMENT_NAMESPACE</td>
<td>INTEGER</td>
<td>String id for the namespace name of the root element node. By default, it is the TARGETNAMESPACE of the XML schema. It would be 0 if it is NO NAMESPACE.</td>
<td>G</td>
</tr>
<tr>
<td>ELEMENT_NAME</td>
<td>INTEGER</td>
<td>String id for the local name of the root element node. It would be 0 if it is not specified.</td>
<td>G</td>
</tr>
<tr>
<td>CREATEDTS</td>
<td>TIMESTAMP</td>
<td>The timestamp when this type modifier is created.</td>
<td>G</td>
</tr>
<tr>
<td>ALTEREDTS</td>
<td>TIMESTAMP</td>
<td>The timestamp when this type modifier is altered</td>
<td>G</td>
</tr>
<tr>
<td>RELCREATED</td>
<td>CHAR(1)</td>
<td>The release of DB2 that is used to create the object. See Release dependency indicators for the values.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators.</td>
<td>G</td>
</tr>
</tbody>
</table>

The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.
DB2 directory tables

DB2 for z/OS maintains a set of tables (in database DSNDB01) called the DB2 directory. Authorized users can query the directory; however, it is primarily intended for use by DB2 and is therefore subject to change.

About these topics

These topics describe the directory tables that allow SELECT operations by describing the columns of those tables.

Users must have one of the following privileges to execute SELECT statements on the directory tables:
- Installation SYSADM
- SYSADM
- SYSCTRL
- ACCESSCTRL
- DATAACCESS
- SECADM
- SQLADM
- System DBADM
- DBADM on DSNDB01
- The SELECT privilege on a specific table

All directory tables are qualified by SYSIBM. Do not use this qualifier for user-defined tables.

The directory tables are not, in most cases, updated as part of DB2 operations.

Programming interface information

None of the directory table columns are part of the general-use programming interface. The column labeled “Use” in the table that describes the column indicates whether the column is part of the product-sensitive interface or is for internal, IBM use, only. The values that “Use” can assume are as follows:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>S</td>
<td>Column is part of the product-sensitive interface</td>
</tr>
<tr>
<td>I</td>
<td>Column is for internal use only</td>
</tr>
</tbody>
</table>

For columns for which “Use” is I, the name of the column and its description do not appear in the explanation of the column.
**Directory table spaces and indexes**

DB2 directory tables are contained in certain table spaces and have indexes.

The following table lists the table space and indexes for each directory table and lists the index fields for each index. The indexes are in ascending order.

The directory table space, tables, and indexes are primarily intended for use by DB2 and are therefore subject to change.

*Table 182. Table spaces and indexes for the directory tables*

<table>
<thead>
<tr>
<th>TABLE SPACE</th>
<th>TABLE</th>
<th>INDEX</th>
<th>INDEX FIELDS</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSNDB01</td>

<td></td>
<td></td>
<td>UTILID.SEQNO</td>
</tr>
</tbody>
</table>
**SYSIBM.DBDR table**

The DBDR table stores one row for each DBD section.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTEGER</td>
<td>Not used</td>
<td>S</td>
<td>S</td>
</tr>
<tr>
<td>DBID</td>
<td>SMALLINT</td>
<td>DBID of the database</td>
<td>S</td>
</tr>
<tr>
<td>SECTION</td>
<td>SMALLINT</td>
<td>DBD section number</td>
<td>S</td>
</tr>
<tr>
<td>DBD_ROWID</td>
<td>ROWID</td>
<td>ID that is used to support the DBD_DATA column</td>
<td>S</td>
</tr>
<tr>
<td>DBD_DATA</td>
<td>BLOB(2G)</td>
<td>DBD data for the section</td>
<td>I</td>
</tr>
</tbody>
</table>
SYSIBM.SYSDBD_DATA table

The SYSIBM.SYSDBD_DATA table is an auxiliary table for the SYSIBM.DBDR table.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBD_DATA</td>
<td>BLOB(2G)</td>
<td>Contents of the DBD section.</td>
<td>I</td>
</tr>
</tbody>
</table>
### SYSIBM.SCTR table

The SYSIBM.SCTR table stores Skeleton Cursor Tables (SKCT) information.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCTLL</td>
<td>CHAR (4) FOR BIT DATA</td>
<td>The length of the record.</td>
<td>S</td>
</tr>
<tr>
<td>SCTNAME</td>
<td>CHAR (14) FOR BIT DATA</td>
<td>The plan name, section number, and sequence number.</td>
<td>S</td>
</tr>
<tr>
<td>SCDAT</td>
<td>VARCHAR(4028)</td>
<td>SKCT data.</td>
<td>I</td>
</tr>
</tbody>
</table>
### SYSIBM.SPTR table
The SYSIBM.SPTR table stores Skeleton Package Table (SKPT) information

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPTLL</td>
<td>INTEGER</td>
<td>The length of the record.</td>
<td>S</td>
</tr>
<tr>
<td>SPTLOCID</td>
<td>VARCHAR(128)</td>
<td>Package location.</td>
<td>S</td>
</tr>
<tr>
<td>SPTCOLID</td>
<td>VARCHAR(128)</td>
<td>Package collection ID.</td>
<td>S</td>
</tr>
<tr>
<td>SPTNAME</td>
<td>VARCHAR(128)</td>
<td>Package name.</td>
<td>S</td>
</tr>
<tr>
<td>SPTCONID</td>
<td>CHAR(8) FOR BIT DATA</td>
<td>Package consistency token.</td>
<td>S</td>
</tr>
<tr>
<td>SPTRESV</td>
<td>CHAR(2) FOR BIT DATA</td>
<td>Internal use only.</td>
<td>I</td>
</tr>
<tr>
<td>SPTSEC</td>
<td>CHAR(4) FOR BIT DATA</td>
<td>Section number.</td>
<td>S</td>
</tr>
<tr>
<td>SPTSEQ</td>
<td>CHAR(2) FOR BIT DATA</td>
<td>Sequence number within the section.</td>
<td>S</td>
</tr>
<tr>
<td>SPTBODY</td>
<td>VARCHAR(1)</td>
<td>Reserved.</td>
<td>I</td>
</tr>
<tr>
<td>SPTVER</td>
<td>VARCHAR(64)</td>
<td>Package version.</td>
<td>S</td>
</tr>
<tr>
<td>SPT_ROWID</td>
<td>ROWID</td>
<td>ROWID that DB2 creates for the LOB columns in this table.</td>
<td>S</td>
</tr>
<tr>
<td>SPT_DATA</td>
<td>BLOB(2G)</td>
<td>Internal use only.</td>
<td>I</td>
</tr>
<tr>
<td>SPT_EXPLAIN</td>
<td>BLOB(2G)</td>
<td>Internal use only.</td>
<td>I</td>
</tr>
</tbody>
</table>
SYSIBM.SYSSPTSEC_DATA table

The SYSIBM.SYSSPTSEC_DATA table is an auxiliary table that contains package data for the SYSIBM.SPTR table.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPT_DATA</td>
<td>BLOB(2G)</td>
<td>Contents of the SKPT section</td>
<td>I</td>
</tr>
</tbody>
</table>
**SYSIBM.SYSSPTSEC_EXPL table**

The SYSIBM.SYSSPTSEC_EXPL table is an auxiliary table that contains static package explain data for the SYSIBM.SPTR table.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPT_EXPLAIN</td>
<td>BLOB(2G)</td>
<td>Contents of the SKPT section explain block</td>
<td>I</td>
</tr>
</tbody>
</table>
## SYSIBM.SYSLGRNX table

The SYSLGRNX table stores recovery log ranges that record the time an index space defined with COPY YES or a table space was open for updates. This provides an efficient way for DB2 to access the appropriate log records for recovery, rather than having to scan every record in the recovery log for a particular table.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>LGRDBID</td>
<td>CHAR(2)</td>
<td>DBID of the modified object</td>
<td>S</td>
</tr>
<tr>
<td>LGRPSID</td>
<td>CHAR(2)</td>
<td>OBID of the modified object</td>
<td>S</td>
</tr>
<tr>
<td>LGRUCDT</td>
<td>CHAR(6)</td>
<td>Modification date in the form <code>mm/dd/yy</code></td>
<td>S</td>
</tr>
<tr>
<td>LGRUCTM</td>
<td>CHAR(8)</td>
<td>Modification time in the form <code>hh:mm:ss.th</code></td>
<td>S</td>
</tr>
<tr>
<td>LGRSRBA1</td>
<td>CHAR(10)</td>
<td>Starting RBA</td>
<td>S</td>
</tr>
<tr>
<td>LGRSPBA1</td>
<td>CHAR(10)</td>
<td>Stopping RBA</td>
<td>S</td>
</tr>
<tr>
<td>LGRPART</td>
<td>SMALLINT</td>
<td>Partition number in the table space or index space</td>
<td>S</td>
</tr>
<tr>
<td>LGRSLRSN1</td>
<td>CHAR(10)</td>
<td>Starting LRSN of update log records for data sharing. Otherwise, the system clock value that corresponds to the first update log record.</td>
<td>S</td>
</tr>
<tr>
<td>LGRELRSN1</td>
<td>CHAR(10)</td>
<td>Ending LRSN of update log records for data sharing. Otherwise, the system clock value that corresponds to the last update log record.</td>
<td>S</td>
</tr>
<tr>
<td>LGRMEMB</td>
<td>CHAR(2)</td>
<td>Data sharing member ID of the modifying DB subsystem. <code>X'0000'</code> for a non-data-sharing environment.</td>
<td>S</td>
</tr>
</tbody>
</table>

### Note:

1. A SELECT from SYSIBM.SYSLGRNX displays this column in either 6-byte or 10-byte format. Before CATENFM of SYSLGRNX the data and the display are in 6-byte format. After CATENFM of SYSLGRNX the data and the display are in 10-byte format.
The SYSUTIL table stores status information about DB2 utilities that are active or stopped. Each record is uniquely identified by the utility identifier. Each row of the table contains the information for one utility execution step. When the utility completes, the corresponding entries in the SYSUTIL table are deleted.

<table>
<thead>
<tr>

</tbody>
</table>

**Performance information for SQL application programming**

Efficient applications are an important first step to good system and application performance. As you code applications that access data in DB2, consider performance objectives in your application design.

The following topics can help you understand how application programmers can consider performance as they write applications that access data in DB2 for z/OS.

**Concurrency and programming**

The goal is to program and prepare applications in a way that:
- Protects the integrity of the data that is being read or updated from being changed by other applications.
- Minimizes the length of time that other access to the data is prevented.

For more information about DB2 concurrency and recommendations for improving concurrency in your application programs, see the following topics:

- Concurrency recommendations for application designers (Introduction to DB2 for z/OS)
- Concurrency and locks (DB2 Performance)
- Improving concurrency (DB2 Performance)
- Improving concurrency in data sharing environments (DB2 Data Sharing Planning and Administration)

**Writing efficient queries**

The predicates, subqueries, and other structures in SQL statements affect the access paths that DB2 uses to access the data.

For information about how to write SQL statements that access data efficiently, see the following topics:

- Ways to improve query performance (Introduction to DB2 for z/OS)
- Writing efficient SQL queries (DB2 Performance)
Analyzing access paths

By analyzing the access path that DB2 uses to access the data for an SQL statement, you can discover potential problems. You can use this information to modify your statement to perform better.

For information about how you can use EXPLAIN tables, and SQL optimization tools such as IBM Data Studio, to analyze the access paths for your SQL statements, see the following topics:

- Investigating access path problems (DB2 Performance)
- Using EXPLAIN to understand the access path (Introduction to DB2 for z/OS)
- Investigating SQL performance by using EXPLAIN (DB2 Performance)
- Interpreting data access by using EXPLAIN (DB2 Performance)
- EXPLAIN tables (DB2 Performance)
- “EXPLAIN” on page 1706
- Tuning SQL with Optim Query Tuner, Part 1: Understanding access paths (IBM developerWorks)
- Generating visual representations of access plans (IBM Data Studio)

Distributed data access performance

The goal is to reduce the amount of network traffic that is required to access the distributed data, and to manage the use of system resources such as distributed database access threads and connections.

For information about improving the performance of applications that access distributed data, see the following topics:

- Ways to reduce network traffic (Introduction to DB2 for z/OS)
- Managing DB2 threads (DB2 Performance)
- Improving performance for applications that access distributed data (DB2 Performance)
- Improving performance for SQL statements in distributed applications (DB2 Performance)

Stored procedures performance

For information about stored procedures and DB2 performance, see the following topics:

- Implementing DB2 stored procedures (DB2 Administration Guide)
- Improving the performance of stored procedures and user-defined functions (DB2 Performance)

Related concepts:

- SQL: the language of DB2 (Introduction to DB2 for z/OS)
- Application programming for DB2 (Introduction to DB2 for z/OS)

Related tasks:

- Programming applications for performance (DB2 Performance)
- Planning for and designing DB2 applications (DB2 Application programming and SQL)
DB2 XML schema repository tables

The DB2 for z/OS XML schema repository (XSR) is a set of DB2 tables where you can store XML schemas.

DB2 creates the XSR tables during installation or migration. After you add XML schemas to the DB2 XSR, you can use them to validate XML documents before you store them in XML columns.

An XML schema consists of a set of XML schema documents. To add an XML schema to the DB2 XSR, you register XML schema documents to DB2. The XML schema documents must be in the Unicode encoding scheme.

Programming interface information

Not all XSR table columns are part of the general-use programming interface. Whether a column is part of this interface is indicated in a column labeled “Use” in the row that describes the table column. The meaning of the values for the “Use” column is indicated in the following table.

Table 183. Meaning of values in the “Use” column if table descriptions

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>G</td>
<td>Column is part of the general-use programming interface</td>
</tr>
<tr>
<td>S</td>
<td>Column is part of the product-sensitive interface</td>
</tr>
<tr>
<td>I</td>
<td>Column is for IBM use only</td>
</tr>
<tr>
<td>N</td>
<td>Column is not used</td>
</tr>
</tbody>
</table>

For columns for which “Use” is N or I, the name of the column and its description do not appear in the explanation of the column.

**XML schema repository (XSR) table spaces and indexes**

DB2 XSR tables are contained in certain table spaces and have indexes.

The following tables list the table space and indexes for each XRS table and lists the index fields for each index. The indexes are in ascending order, except where noted.

Table 184. Table spaces and indexes for the DSNXSR database tables

<table>
<thead>
<tr>
<th>Table space DSNXSR. ...</th>
<th>Table SYSIBM. ...</th>
<th>Index SYSIBM. ...</th>
<th>Index fields</th>
</tr>
</thead>
<tbody>

<td>BLOB(5M)</td>
<td>Contents of the additional property information of the XML schema document.</td>
<td>G</td>
</tr>
</tbody>
</table>
EXPLAIN tables

EXPLAIN tables contain information about SQL statements and functions that run on DB2 for z/OS.

You can create and maintain a set of EXPLAIN tables to capture and analyze information about the performance of SQL statements and functions that run on DB2 for z/OS. Each row in an EXPLAIN table describes some aspect of a step in the execution of a query or subquery in an explainable statement. The column values for the row identify, among other things, the query or subquery, the tables and other objects involved, the methods used to carry out each step, and cost information about those methods. DB2 creates EXPLAIN output and populates EXPLAIN tables in the following situations:

- When an EXPLAIN statement is executed.
- At BIND or REBIND with the EXPLAIN(YES) or (ONLY) bind options. Rows are added for every explainable statement in the plan or package being bound. For a plan, these do not include statements in the packages that can be used with the plan. For either a package or plan, they do not include explainable statements within EXPLAIN statements nor do they include explainable statements that refer to declared temporary tables, which are incrementally bound at run time.
- When an explainable dynamic statement is executed and the value of the CURRENT EXPLAIN MODE special register is set to YES or EXPLAIN.

Important: It is best to convert EXPLAIN tables to Version 11 format during migration, or soon after migration. In Version 11, the EXPLAIN function supports tables in Version 11 or Version 10 formats only. However, Version 10 format EXPLAIN tables are deprecated. If you invoke EXPLAIN and Version 10 tables are used, DB2 issues SQL code +20520. If tables of an unsupported format are found, DB2 issues SQL code -20008 and the EXPLAIN operation fails. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current DB2 release, or complete other maintenance tasks.

Related tasks:

- Migration step 24: Convert EXPLAIN tables to the current format (DB2 Installation and Migration)

Related reference:

- BIND and REBIND options for packages and plans (DB2 Commands)
- Interpreting data access by using EXPLAIN (DB2 Performance)

- Creating EXPLAIN tables (DB2 Performance)
- ADMIN_EXPLAIN_MAINT stored procedure (DB2 Performance)
PLAN_TABLE

The plan table, PLAN_TABLE, contains information about access paths that is collected from the results of EXPLAIN statements.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM

One instance of this table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use the table and the data that it contains. The table is created when you run job DSNTIJSG when you install or migrate DB2.

userID

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current DB2 release, or complete other maintenance tasks.

Optional PLAN_TABLE formats

A PLAN_TABLE instance can have a format with fewer columns than those shown in the sample CREATE TABLE statement. However instances of PLAN_TABLE must have one of the following formats:

Version 11 format

All columns shown in the sample CREATE TABLE statement, up to and including the EXPANSION_REASON column (COLCOUNT=66).

Version 10 format

All columns shown in the sample CREATE TABLE statement, up to and including the MERGN column (COLCOUNT=64). This format is deprecated in Version 11.

Important: If the EXPLAIN tables have any format older than the Version 10 format, DB2 returns an error for any operation that tries to insert rows in the
EXPLAIN tables. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current DB2 release, or complete other maintenance tasks.

**Column descriptions**

Your subsystem or data sharing group can contain more than one of these tables, including a table with the qualifier SYSIBM, a table with the qualifier DB2OSCA, and additional tables that are qualified by user IDs.

The following table shows the descriptions of the columns in PLAN_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
</tr>
</tbody>
</table>
|             |                   | **For rows produced by EXPLAIN statements**  
The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.            |
|             |                   | **For rows not produced by EXPLAIN statements**  
DB2 assigns a number that is based on the line number of the SQL statement in the source program.                                                                                                         |
|             |                   | When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.                                      |
|             |                   | When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure. |
| QBLOCKNO    | SMALLINT NOT NULL | A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.                                                       |
| APPLNAME    | VARCHAR(24) NOT NULL | The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. |
|             |                   | When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.                                                                                  |

<td>CHAR(1)</td>
<td>For index access, the direction of the index scan:</td>
</tr>
<tr>
<td></td>
<td>F</td>
<td>Forward</td>
</tr>
<tr>
<td></td>
<td>R</td>
<td>Reverse</td>
</tr>
<tr>
<td></td>
<td>blank</td>
<td>Index scan is not used</td>
</tr>
<tr>
<td>Column name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>EXPANSION_REASON</td>
<td>CHAR(2) NOT NULL WITH DEFAULT</td>
<td>This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: A The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. B The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. S The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. SB The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.</td>
</tr>
</tbody>
</table>

**Notes:**
1. For PLAN_TABLE rows in which ACCESSTYPE='A' and QBLOCK_TYPE='SELECT', the values of all other columns except QUERYNO, APPLNAME, and PROGNAME are the default values for those columns.
2. In rows that are used for optimization hints, NULL values in the following columns indicate a hint for no parallelism:
• PARALLELISM_MODE
• ACCESS_PGROUP_ID
• JOIN_PGROUP_ID

3. In rows that are used for optimization hints, NULL values in the following columns indicate a hint for no parallel sort:
• SORTN_PGROUP_ID
• SORTC_PGROUP_ID

4. The ACCESSTYPE column contains the following values:
   A    The query is sent to an accelerator server.
   DI   By an intersection of multiple DOCID lists to return the final DOCID list
   DU   By a union of multiple DOCID lists to return the final DOCID list
   DX   By an XML index scan on the index that is named in ACCESSNAME to return a DOCID list
   E    By direct row access using a row change timestamp column.
   H    By hash access. If an overflow condition occurs, the hash overflow index that is identified by ACCESSCREATOR and ACCESSNAME is used.
   HN   By hash access using an IN predicate, or an IN predicate that DB2 generates. If a hash overflow condition occurs, the hash overflow index that is identified in ACCESSCREATOR and ACCESSNAME is used.
   I    By an index (identified in ACCESSCREATOR and ACCESSNAME)
   IN   By an index scan when the matching predicate contains an IN predicate and the IN-list is accessed through an in-memory table.
   I1   By a one-fetch index scan
   M    By a multiple index scan. A row that contains this value might be followed by a row that contains one of the following values:
   • DI
   • DU
   • MH
   • MI
   • MU
   • MX
   MH   By the hash overflow index named in ACCESSNAME. A row that contains this value always follows a row that contains M.
   MI   By an intersection of multiple indexes. A row that contains this value always follows a row that contains M.
   MU   By a union of multiple indexes. A row that contains this value always follows a row that contains M.
   MX   By an index scan on the index named in ACCESSNAME. When the access method MX follows the access method DX, DI, or DU, the table is accessed by the DOCID index by using the DOCID list that is returned by DX, DI, or DU. A row that contains this value always follows a row that contains M.
   N    One of the following types:
   • By an index scan when the matching predicate contains the IN keyword
   • By an index scan when DB2 rewrites a query using the IN keyword
   O    By a work file scan, as a result of a subquery.
   NR   Range list access.
   P    By a dynamic pair-wise index scan
   R    By a table space scan
   RW   By a work file scan of the result of a materialized user-defined table function
   V    By buffers for an INSERT statement within a SELECT
5. The QBLOCK_TYPE column contains the following values:

- **SELECT**
- **INSERT**
- **UPDATE**
- **MERGE**
- **DELETE**
- **SELUPD**
- **DELCUR**
- **UPDCUR**
- **CORSUB**
- **TRUNCA**
- **NCOSUB**
- **TABLEX**
- **TRIGGR**
- **UNION**
- **UNIONA**
- **INTERS**
- **INTERA**
- **EXCEPT**
- **EXCEPTA**
- **PRUNED**

DB2 does not generate an access path for the query because the query is guaranteed to qualify zero rows, such as the case of an always-false WHERE clause. For example: WHERE 0=1
6. DB2 inserts a value into the REMARKS column at bind or rebind when the EXPLAIN(ONLY) option is specified and reuse or comparison fails for an access path. The value might include the following information:
   - A reason code that corresponds to the reason codes in SQLCODE +395 when reuse fails
   - The name of the unmatched PLAN_TABLE column for which comparison failed
   - A string that identifies that unmatched rows were found

7. DB2 inserts a value into the REMARKS column when selectivity overrides cannot be used for a statement. The value contains a reason code that indicates why the selectivity override was not used. The value might also contain additional diagnostic information.

   The reason code values correspond to SQLCODE +395 reason codes:
   - '1'-'41' Indicate that an optimization hint that was generated as part of the extended optimization process cannot be applied. Use only a single selectivity instance.
   - '42' Indicates that the structure of the selectivity override is not valid. Generate the selectivity override again.
   - '43' The selectivity override cannot be applied because of an unexpected error. If the problem persists, you might need to contact IBM Software Support.
   - '44'-'99' Indicate that an optimization hint that was generated as part of the extended optimization process cannot be applied. Use only a single selectivity instance.

The PLAN_TABLE_HINT_IX index

The PLAN_TABLE_HINT_IX index improves prepare performance when access path hints are used. This index is required for statement-level access paths and optimization parameters. The PLAN_TABLE_HINT_IX index is optional, although strongly recommended, for PLAN_TABLE access path hints.

The statement that creates the PLAN_TABLE_HINT_IX index is included as part of the DSNTESC member of the SDSNSAMP library.

Related concepts:
- Interpreting data access by using EXPLAIN (DB2 Performance)

Related tasks:
- Preparing to influence access paths (DB2 Performance)
- Generating visual representations of access plans (IBM Data Studio)

Related reference:
- “EXPLAIN” on page 1706

Support Portal: DB2 Analytics Accelerator for z/OS
- EXPLAIN table changes in Version 11 (DB2 for z/OS What's New?)
The column distribution table contains non-uniform column group statistics that are obtained dynamically by DB2 from non-index leaf pages.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Qualifiers**

Your subsystem or data sharing group can contain more than one of these tables:

**SYSIBM**

One instance of this table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use the table and the data that it contains. The table is created when you run job DSNTIJSG when you install or migrate DB2.

**userID**

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current DB2 release, or complete other maintenance tasks.

**Column descriptions**

The following table shows the descriptions of the columns in the DSN_COLDIST_TABLE table.
### Table 186. Descriptions of columns in DSN_COLDIST_TABLE

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows not produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>DB2 assigns a number that is based on the line number of the SQL statement in the source program.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td>PROGNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.</td>

</tbody>
</table>
| TYPE        | CHAR(1) NOT NULL | The type of statistics:  
C  Cardinality  
F  Frequent value  
H  Histogram  
T  Real-time table cardinality  
L  Real-time column cardinality (unique index only)  
P  real-time partition cardinality |
| CARDF       | FLOAT NOT NULL | For TYPE='C', the number of distinct values for the column group. For TYPE='H', the number of distinct values for the column group in a quantile indicated by the value of the QUANTILENO column.  
For TYPE='T', a value related to real-time statistics table values that are determined by the COLVALUE column.  
For TYPE='L', a value related to a real-time statistics column value that is determined by the COLVALUE column. The QUANTILENO column contains the column number. The NAME column contains the column name.  
For TYPE='P' a value related to real-time statistics partition value that is determined by the COLVALUE column. The QUANTILENO column contains the partition number. |
| COLGROUPCOLNO | VARCHAR(254) NOT NULL FOR BIT DATA | The identity of the set of columns associated with the statistics. If the statistics are only associated with a single column, the field contains a zero length. Otherwise, the field is an array of SMALLINT column numbers with a dimension equal to the value in the NUMCOLUMNS column. This is an updatable column. |
| NUMCOLUMNS  | SMALLINT NOT NULL | Identifies the number of columns associated with the statistics. |
| FREQUENCYF  | FLOAT NOT NULL | The percentage of rows in the table with the value that is specified in the COLVALUE column when the number is multiplied by 100. For example, a value of '1' indicates 100%. A value of '.153' indicates 15.3%. |
| QUANTILENO  | SMALLINT NOT NULL | The ordinary sequence number of a quantile in the whole consecutive value range, from low to high. This column is not updatable.  
For TYPE= 'L', this column contains the column number.  
For TYPE= 'P', the column contains the partition number. |
| LOWVALUE    | VARCHAR(2000) NOT NULL FOR BIT DATA | For TYPE='H', this is the lower bound for the quantile indicated by the value of the QUANTILENO column. Not used if the value of the TYPE column is not 'H'. This column is not updatable. |
### Table 186. Descriptions of columns in DSN_COLDIST_TABLE (continued)

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HIGHVALUE</td>
<td>VARCHAR(2000) NOT NULL FOR BIT DATA</td>
<td>For TYPE='H', this is the higher bound for the quantile indicated by the value of the QUANTILENO column. This column is not updatable.</td>
</tr>
<tr>
<td>EXPANSION_REASON</td>
<td>CHAR(2) NOT NULL WITH DEFAULT</td>
<td>This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank.</td>
</tr>
</tbody>
</table>

Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options.

DB2 implicitly adds certain syntax to the query if one of the following conditions are true:
- The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES
- The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES
- The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES

This column can have one of the following values:
- **A**: The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable.
- **B**: The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register.
- **S**: The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register.
- **SB**: The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register.
- **blank**: The query does not contain implicit query transformation.
Related concepts:

Dynamic collection of index filtering estimates (DB2 Performance)
DSN_DETCOST_TABLE

The detailed cost table, DSN_DETCOST_TABLE, contains information about
detailed cost estimation of the mini-plans in a query.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN
tables, and use care when deleting obsolete EXPLAIN table data. The data is
intended to be manipulated only by the DB2 EXPLAIN function and optimization
tools. Certain optimization tools depend on instances of the various EXPLAIN
tables. Be careful not to delete data from or drop instances EXPLAIN tables that
are created for these tools.

**Qualifiers**

Your subsystem or data sharing group can contain more than one of these tables:

**SYSIBM**

One instance of this table can be created with the SYSIBM qualifier. DB2
and SQL optimization tools might use the table and the data that it
contains. The table is created when you run job DSNTIJSG when you
install or migrate DB2.

**userID**

You can create additional instances of EXPLAIN tables that are qualified by
user ID. These tables are populated with statement cost information when
you issue the EXPLAIN statement or bind. They are also populated when
you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND
command. SQL optimization tools might also create EXPLAIN tables that
are qualified by a user ID. You can find the SQL statement for creating an
instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in
member DSNTESC of the SDSNSAMP library. You can call the
ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade
them to the format for the current DB2 release, or complete other maintenance
tasks.
### Column descriptions

The following table describes the columns of DSN_DETCOST_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
</table>
| QUERYNO      | INTEGER NOT NULL | A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:  
**For rows produced by EXPLAIN statements**  
The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.  
**For rows not produced by EXPLAIN statements**  
DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.  
When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure. |
| QBLOCKNO     | SMALLINT NOT NULL | A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive. |
| APPLNAME     | VARCHAR(24) NOT NULL | The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.  
When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank. |
| PROGNAME     | VARCHAR(128) NOT NULL | The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.  
When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. |
<p>| PLANNO       | SMALLINT NOT NULL | The plan number, a number used to identify each mini-plan with a query block. |
| OPENIO       | FLOAT(4) NOT NULL | The Do-at-open IO cost for non-correlated subquery. |
| OPENCPU      | FLOAT(4) NOT NULL | The Do-at-open CPU cost for non-correlated subquery. |
| OPENCOST     | FLOAT(4) NOT NULL | The Do-at-open total cost for non-correlated subquery. |
| DMIO         | FLOAT(4) NOT NULL | IBM internal use only. |</p>

### Table 187. DSN_DETCOST_TABLE description (continued)

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXPANSION_REASON</td>
<td>CHAR(2) NOT NULL WITH DEFAULT</td>
<td>This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true:  - The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES  - The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES  - The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES  This column can have one of the following values:  - <strong>A</strong>: The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable.  - <strong>B</strong>: The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register.  - <strong>S</strong>: The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register.  - <strong>SB</strong>: The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register.  - <strong>blank</strong>: The query does not contain implicit query transformation.</td>
</tr>
</tbody>
</table>

**Related reference:**

Support Portal: DB2 Analytics Accelerator for z/OS
DSN_FILTER_TABLE

The filter table, DSN_FILTER_TABLE, contains information about how predicates are used during query processing.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM

One instance of this table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use the table and the data that it contains. The table is created when you run job DSNTIJSG when you install or migrate DB2.

userID

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current DB2 release, or complete other maintenance tasks.
Column descriptions

The following table describes the columns of DSN_FILTER_TABLE.

Table 188. DSN_FILTER_TABLE description

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows not produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>DB2 assigns a number that is based on the line number of the SQL statement in the source program.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in</td>
</tr>
<tr>
<td></td>
<td></td>
<td>certain rare cases, the value is not guaranteed to be unique.</td>
</tr>
<tr>
<td>QBLOCKNO</td>
<td>SMALLINT NOT NULL</td>
<td>A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily</td>
</tr>
<tr>
<td></td>
<td></td>
<td>consecutive.</td>
</tr>
<tr>
<td>PLANNO</td>
<td>SMALLINT</td>
<td>The plan number, a number used to identify each miniplan with a query block.</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.</td>
</tr>
<tr>
<td>PROGNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.</td>

<tr>
<td></td>
<td></td>
<td>blank The predicate is not pushed down for evaluation.</td>
</tr>
<tr>
<td>Column name</td>
<td>Data type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| EXPANSION_REASON | CHAR(2) NOT NULL WITH DEFAULT | This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true:  
  • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES  
  • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES  
  • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES  
This column can have one of the following values:  
  A The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable.  
  B The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register.  
  S The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register.  
  SB The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register.  
  blank The query does not contain implicit query transformation. |
The function table, DSN_FUNCTION_TABLE, contains descriptions of functions that are used in specified SQL statements.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Qualifiers**

Your subsystem or data sharing group can contain more than one of these tables:

**SYSIBM**

One instance of this table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use the table and the data that it contains. The table is created when you run job DSNTIJSG when you install or migrate DB2.

**userID**

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current DB2 release, or complete other maintenance tasks.

**Column descriptions**

The following table describes the columns of DSN_FUNCTION_TABLE.
<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
</table>
| QUERYNO     | INTEGER NOT NULL WITH DEFAULT | A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:  
**For rows produced by EXPLAIN statements**  
The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.  
**For rows not produced by EXPLAIN statements**  
DB2 assigns a number that is based on the line number of the SQL statement in the source program.  
When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.  
When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure. |
| QBLOCKNO    | INTEGER NOT NULL WITH DEFAULT | A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive. |
| APPLNAME    | VARCHAR(24) NOT NULL WITH DEFAULT | The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.  
When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank. |
| PROGNAME    | VARCHAR(128) NOT NULL WITH DEFAULT | The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.  
When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. |
| COLLID      | VARCHAR(128) NOT NULL WITH DEFAULT | The collection ID:  
**DSNDYNAMICSQLCACHE**  
The row originates from the dynamic statement cache  
**DSNEXPLAINMODEYES**  
The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register.  
**DSNEXPLAINMODEEXPLAIN**  
The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register.  
When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure. |
Table 189. Descriptions of columns in DSN_FUNCTION_TABLE (continued)

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GROUP_MEMBER</td>
<td>VARCHAR(24) NOT NULL WITH DEFAULT</td>
<td>The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.</td>
</tr>
</tbody>
</table>
| EXPLAIN_TIME       | TIMESTAMP NOT NULL WITH DEFAULT | The time when the EXPLAIN information was captured:  
  **All cached statements**  
  When the statement entered the cache, in the form of a full-precision timestamp value.  
  **Non-cached static statements**  
  When the statement was bound, in the form of a full precision timestamp value.  
  **Non-cached dynamic statements**  
  When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros. |
| SCHEMA_NAME        | VARCHAR(128) NOT NULL WITH DEFAULT | The schema name of the function invoked in the explained statement. |
| FUNCTION_NAME      | VARCHAR(128) NOT NULL WITH DEFAULT | The name of the function invoked in the explained statement. |
| SPEC_FUNC_NAME     | VARCHAR(128) NOT NULL WITH DEFAULT | The specific name of the function invoked in the explained statement. |
| FUNCTION_TYPE      | CHAR(2) NOT NULL WITH DEFAULT | The type of function invoked in the explained statement. Possible values are:  
  **CU** Column function  
  **SU** Scalar function  
  **TU** Table function |
| VIEW_CREATOR       | VARCHAR(128) NOT NULL WITH DEFAULT | If the function specified in the FUNCTION_NAME column is referenced in a view definition, the creator of the view. Otherwise, blank. |
| VIEW_NAME          | VARCHAR(128) NOT NULL WITH DEFAULT | If the function specified in the FUNCTION_NAME column is referenced in a view definition, the name of the view. Otherwise, blank. |
| PATH               | VARCHAR(2048) NOT NULL WITH DEFAULT | The value of the SQL path that was used to resolve the schema name of the function. |
| FUNCTION_TEXT      | VARCHAR(1500) NOT NULL WITH DEFAULT | The text of the function reference (the function name and parameters). If the function reference is over 100 bytes, this column contains the first 100 bytes. For functions specified in infix notation, FUNCTION_TEXT contains only the function name. For example, for a function named /, which overloads the SQL divide operator, if the function reference is A/B, FUNCTION_TEXT contains only /. |
| FUNC_VERSION       | VARCHAR(122) NOT NULL WITH DEFAULT | For a version of a non-inline SQL scalar function, this column contains the version identifier. For all other cases, this column contains a zero length string. A version of a non-inline SQL scalar function is defined in the SYSIBM.SYSROUTINES table with ORIGIN='Q', FUNCTION_TYPE='S', INLINE='N', and VERSION column containing the version identifier. |

Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESSENSITIVE, SYSTIMESSENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESSENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESSENSITIVE bind option is set to YES This column can have one of the following values: A The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. B The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. S The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. SB The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.</td>
</tr>
</tbody>
</table>
**DSN_PGRANGE_TABLE**

The page range table, DSN_PGRANGE_TABLE, contains information about qualified partitions for all page range scans in a query.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Qualifiers**

Your subsystem or data sharing group can contain more than one of these tables:

**SYSIBM**

One instance of this table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use the table and the data that it contains. The table is created when you run job DSNTIJSG when you install or migrate DB2.

**userID**

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current DB2 release, or complete other maintenance tasks.

</tbody>
</table>
DSN_PREDICAT_TABLE

The predicate table, DSN_PREDICAT_TABLE, contains information about all of the predicates in a query. It is also used as input when you issue a BIND QUERY command to override predicate selectivities for matching SQL statements.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM

One instance of this table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use the table and the data that it contains. The table is created when you run job DSNTIJSG when you install or migrate DB2.

userID

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current DB2 release, or complete other maintenance tasks.
### Column descriptions

The following table describes the columns of the DSN_PREDICAT_TABLE

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
</table>
| QUERYNO     | INTEGER NOT NULL | A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:  

**For rows produced by EXPLAIN statements**  
The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.  

**For rows not produced by EXPLAIN statements**  
DB2 assigns a number that is based on the line number of the SQL statement in the source program.  

When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.  

When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.  

QBLOCKNO     | SMALLINT NOT NULL | A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.  

APPLNAME     | VARCHAR(24) NOT NULL | The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.  

When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.  

PROGNAME     | VARCHAR(128) NOT NULL | The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.  

When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.  

PREDNO       | INTEGER NOT NULL | The predicate number, a number used to identify a predicate within a query. |
<table>
<thead>

</tbody>
</table>

**Related concepts:**
- “Predicates” on page 299

**Related tasks:**
- Overriding predicate selectivities at the statement level (DB2 Performance)
**DSN_PREDICATE_SELECTIVITY table**

The predicate selectivity table contains information about the selectivity of predicates that are used for access path selection. It is used as an input table for the BIND QUERY command when selectivity overrides are specified.

When selectivity overrides are not specified, or specified selectivity overrides cannot not be used by DB2, the DSN_PREDICATE_SELECTIVITY table contains one row for each predicate in DSN_PREDICAT_TABLE that is used for access path selection. These rows contain ASSUMPTION='NORMAL' values.

DSN_PREDICATE_SELECTIVITY does not contain rows from DSN_PREDICAT_TABLE for predicates that are not used for access path selection.

When selectivity overrides are specified and used by DB2, this table also contains one row for each selectivity override that was used. These rows contain ASSUMPTION='OVERRIDE' values.

Additionally, if the sum of the weights for all specified selectivity override instances is less than one, this table contains one row for each predicate in DSN_PREDICAT_TABLE that is used for access path selection. These rows contain ASSUMPTION='NORMAL' values and WEIGHT values equal to one minus the sum of the specified override weight values.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Qualifiers**

Your subsystem or data sharing group can contain more than one of these tables:

**SYSIBM**

One instance of this table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use the table and the data that it contains. The table is created when you run job DSNTIJSG when you install or migrate DB2.

**userID**

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current DB2 release, or complete other maintenance tasks.
**Column descriptions**

Your subsystem or data sharing group can contain more than one of these tables, including a table with the qualifier SYSIBM, a table with the qualifier DB2OSCA, and additional tables that are qualified by user IDs.

The following table shows the descriptions of the columns in the DSN_PREDICATE_SELECTIVITY table.

<p>| Table 194. Descriptions of columns in the DSN_PREDICATE_SELECTIVITY table |</p>
<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>

<td>-------------</td>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>PROGNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.</td>
</tr>
<tr>
<td>SECTNOI</td>
<td>INTEGER NOT NULL WITH DEFAULT</td>
<td>The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.</td>
</tr>
</tbody>
</table>
| COLLID      | VARCHAR(128) NOT NULL | The collection ID:  

**DSNDYNAMICSQLCACHE**  
The row originates from the dynamic statement cache  

**DSNEXPLAINMODEYES**  
The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register.  

**DSNEXPLAINMODEEXPLAIN**  
The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register.  

When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure. |
<p>| VERSION     | VARCHAR(122) NOT NULL | The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the compiled SQL function or native SQL procedure. |
| PREDNO      | INTEGER NOT NULL    | The predicate number, a number used to identify a specific predicate within a query.                                                                                                                                                                                                                                                     |
| INSTANCE    | SMALLINT NOT NULL   | The selectivity instance. Used to group related selectivities.                                                                                                                                                                                                                                                                         |
| SELECTIVITY | FLOAT NOT NULL      | The selectivity estimate.                                                                                                                                                                                                                                                                                                              |</p>
<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WEIGHT</td>
<td>FLOAT(4)</td>
<td>The percentage of executions that have the specified selectivity. For example, a value of 0.25 means that 25% of the time when query is executed it has this selectivity.</td>
</tr>
</tbody>
</table>
| ASSUMPTION  | VARCHAR(128) | Indicates how the selectivity was estimated, or is used. One of the following values:  
|             |           | 'NORMAL' Selectivity is estimated by using the normal selectivity assumptions.  
|             |           | 'OVERRIDE' Selectivity is based on an override. |
| INSERT_TIME | TIMESTAMP | The time when the row was inserted or updated. Generated always for each row on update as row change timestamp. |
| EXPLAIN_TIME| TIMESTAMP | The time when the EXPLAIN information was captured:  
|             |           | All cached statements  
|             |           | When the statement entered the cache, in the form of a full-precision timestamp value.  
|             |           | Non-cached static statements  
|             |           | When the statement was bound, in the form of a full precision timestamp value.  
|             |           | Non-cached dynamic statements  
|             |           | When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros. |
| REMARKS     | VARCHAR(762) | IBM internal use only. |
Table 194. Descriptions of columns in the DSN_PREDICATE_SELECTIVITY table (continued)

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| EXPANSION_REASON      | CHAR(2) NOT NULL WITH DEFAULT | This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true:  
  • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES  
  • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES  
  • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES  
This column can have one of the following values:  
  A  The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable.  
  B  The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register.  
  S  The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register.  
  SB  The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register.  
  blank  The query does not contain implicit query transformation.
DSN_PTASK_TABLE

The parallel tasks table, DSN_PTASK_TABLE, contains information about all of the parallel tasks in a query.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM

One instance of this table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use the table and the data that it contains. The table is created when you run job DSNTIJSG when you install or migrate DB2.

userID

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current DB2 release, or complete other maintenance tasks.
## Column descriptions

The following table describes the columns of DSN_PTASK_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows not produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>DB2 assigns a number that is based on the line number of the SQL statement in the source program.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.</td>
</tr>
<tr>
<td>QBLOCKNO</td>
<td>SMALLINT NOT NULL</td>
<td>A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.</td>
</tr>
<tr>
<td>PGDNO</td>
<td>SMALLINT NOT NULL</td>
<td>The parallel group identifier within the current query block. This value corresponds to the value of the GROUPID column in DSN_PGROUP_TABLE table rows.</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.</td>
</tr>
<tr>

### Notes:

1. The name of these columns originally contained the # symbol as the last character in the names. However, the names that contain these characters are obsolete and are no longer supported.
DSN_QUERYINFO_TABLE

The query information table, DSN_QUERYINFO_TABLE, contains information about the eligibility of query blocks for automatic query rewrite, information about the materialized query tables that are considered for eligible query blocks, reasons why ineligible query blocks are not eligible, and information about acceleration of query blocks.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

userID You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind, or rebind, a plan or package with the EXPLAIN(YES) option. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current DB2 release, or complete other maintenance tasks.
### Column descriptions

*Table 196. Descriptions of columns in DSN_QUERYINFO_TABLE*

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
</tr>
</tbody>
</table>
|             |                       | **For rows produced by EXPLAIN statements**  
|             |                       | The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.                                                                                                                                                                                               |
|             |                       | **For rows not produced by EXPLAIN statements**  
|             |                       | DB2 assigns a number that is based on the line number of the SQL statement in the source program.                                                                                                                                                                                                                                |
|             |                       | When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.                                                                                                                                   |
|             |                       | When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.                                                                                   |
| QBLOCKNO    | SMALLINT NOT NULL     | A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.                                                                                                                                   |
| QINAME1     | VARCHAR(128) NOT NULL | When `TYPE='A'`:  
|             |                       | • When `REASON_CODE=0`, this value is the name of the accelerator server to which the query is sent.  
<p>|             |                       | • When <code>REASON_CODE&lt;&gt;0</code>, the query was not sent to an accelerator server. The <code>REASON_CODE</code> value indicates why the query was not sent to the accelerator server.                                                                                                                  |
|             |                       | When <code>TYPE='ACCELMDL'</code>, this statement used accelerator modeling.                                                                                                                                                                                                                                                                         |
| QINAME2     | VARCHAR(128) NOT NULL | When <code>TYPE='A'</code> and <code>REASON_CODE=0</code>, this value is the name of the location name of the accelerator server to which the query is sent.                                                                                                                                                                                                  |
| APPLNAME    | VARCHAR(24) NOT NULL  | The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.                                                                                                           |
|             |                       | When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.                                                                                                                                                                                                     |
| PROGNAME    | VARCHAR(128) NOT NULL | The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.                                                                                               |
|             |                       | When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.                                                                                                               |</p>

<th>Description</th>
</tr>
</thead>
</table>
| QI_DATA         | CLOB(2M) NOT NULL WITH DEFAULT | When TYPE='A':  
|                 |                            | • For REASON_CODE values other than 0, this value is the description of the REASON_CODE value.  
|                 |                            | • For a REASON_CODE value of 0, this value is the query text, after it is converted for processing by the accelerator. |
| SERVICE_INFO    | BLOB(2M) NOT NULL WITH DEFAULT | IBM internal use only. |
| QB_INFO_ROWID   | ROWID NOT NULL GENERATED ALWAYS | IBM internal use only. |
| EXPANSION_REASON | CHAR(2) NOT NULL WITH DEFAULT | This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank.  
|                 |                            | Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options.  
|                 |                            | DB2 implicitly adds certain syntax to the query if one of the following conditions are true:  
|                 |                            | • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES  
|                 |                            | • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES  
|                 |                            | • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES  
|                 |                            | This column can have one of the following values:  
|                 | A                          | The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. |
|                 | B                          | The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. |
|                 | S                          | The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. |
|                 | SB                         | The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. |
|                 | blank                      | The query does not contain implicit query transformation. |

Notes:
1. The REASON_CODE column has the following values:
   0 The query block qualifies for routing to an accelerator server. The values of QINAME1 and QINAME2 identify the accelerator server.
For example, for version 1 of the IBM DB2 Analytics Accelerator for z/OS, the associated data mart name is recorded in the QINAME2 column, with the following naming convention: data-mart-name@accelerator-name@digits.

No active accelerator server was found when EXPLAIN was executed.

Special register CURRENT QUERY ACCELERATION is set to NONE.

DB2 classified the query as a short-running query, or DB2 determined that sending the query to an accelerator server provided no performance advantage.

The query is not read-only.

The cursor is defined as a scrollable cursor.

The query references objects with multiple encoding schemes.

The FROM clause of the query specifies a data change table reference.

The query contains a table expression with one or more correlated references to other tables in the same FROM clause.

The query contains a reference to a recursive common table expression.

The query contains an unsupported expression. The text of the expression is in QI_DATA.

The query references a table that meets one of the following conditions:

• The table is not defined in the accelerator server.
• The table is defined in the accelerator server, but is not enabled for processing by an accelerator.

The accelerator server that contains the tables that are referenced by the query is not started.

A column that is referenced in the query was altered by DB2 after the data was loaded in the accelerator server.

The query uses functionality that is available only in DB2 for z/OS Version 10 new-function mode or later, and the functionality is not supported by the accelerator server.

The query is an INSERT statement, but the DB2 subsystem parameter DSN6SPRM.QUERY_ACCEL_OPTIONS does not specify option 2 to enable its acceleration.

The accelerator server is not at the correct level and does not support a function in the SQL statement. The QI_DATA column contains the function text or expression text that is using the unsupported function for the accelerator server.

The rowset cursor is declared WITH RETURN or runs remotely or under an SQL PL routine.

The query contains a correlated subquery that is not supported for acceleration.

For IBM internal use only.

Support Portal: DB2 Analytics Accelerator for z/OS
**DSN_QUERY_TABLE**

The query table, DSNQUERYTABLE, contains information about a SQL statement, and displays the statement before and after query transformation.

**PSPI**

Unlike other EXPLAIN tables, rows in DSN_QUERY_TABLE are not populated for static SQL statements at BIND or REBIND with the EXPLAIN(YES) option.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Qualifiers**

Your subsystem or data sharing group can contain more than one of these tables:

**SYSIBM**  
One instance of this table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use the table and the data that it contains. The table is created when you run job DSNTIJSG when you install or migrate DB2.

**userID**  
You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current DB2 release, or complete other maintenance tasks.
### Column descriptions

The following table describes the columns of DSN_QUERY_TABLE.

**Table 197. DSN_QUERY_TABLE description**

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
</table>
| QUERYNO       | INTEGER NOT NULL | A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:  

**For rows produced by EXPLAIN statements**  
The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.  

**For rows not produced by EXPLAIN statements**  
DB2 assigns a number that is based on the line number of the SQL statement in the source program.  

When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.  

When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure. |
<p>| TYPE          | CHAR(8) NOT NULL | The type of the data in the NODE_DATA column. |
| QUERY STAGE   | CHAR(8) NOT NULL WITH DEFAULT | The stage during query transformation when this row is populated. |
| SEQNO         | NOT NULL        | The sequence number for this row if NODE_DATA exceeds the size of its column. |
| NODE_DATA     | CLOB(2M)        | The XML data containing the SQL statement and its query block, table, and column information. |
| EXPLAIN_TIME  | TIMESTAMP       | The EXPLAIN timestamp. |
| QUERY_ROWID   | ROWID NOT NULL GENERATED ALWAYS | The ROWID of the statement. |
| GROUP MEMBER  | VARCHAR(24) NOT NULL | The member name of the DB2 subsystem that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed. |
| HASHKEY       | INTEGER NOT NULL | The hash value of the contents in NODE_DATA |
| HAS_PRED      | CHAR(1) NOT NULL | When NODE_DATA contains an SQL statement, this column indicates if the statement contains a parameter marker literal, non-parameter marker literal, or no predicates. |
| SECTNOI       | INTEGER NOT NULL WITH DEFAULT | The section number of the statement. The value is taken from the same column in SYSPACKSTM or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier. |</p>
<table>
<thead>
<tr>

</table>
Table 197. DSN_QUERY_TABLE description (continued)

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
</table>
| EXPANSION_REASON | CHAR(2) NOT NULL WITH DEFAULT | This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true:  
  • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES  
  • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES  
  • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES  
This column can have one of the following values:  
  A The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable.  
  B The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register.  
  S The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register.  
  SB The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register.  
  blank The query does not contain implicit query transformation. |
**DSN_SORTKEY_TABLE**

The sort key table, DSN_SORTKEY_TABLE, contains information about sort keys for all of the sorts required by a query.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Qualifiers**

Your subsystem or data sharing group can contain more than one of these tables:

**SYSIBM**

One instance of this table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use the table and the data that it contains. The table is created when you run job DSNTIJSG when you install or migrate DB2.

**userId**

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current DB2 release, or complete other maintenance tasks.
**Column descriptions**

</tbody>
</table>
DSN_SORT_TABLE

The sort table, DSN_SORT_TABLE, contains information about the sort operations required by a query.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM
One instance of this table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use the table and the data that it contains. The table is created when you run job DSNTIJSG when you install or migrate DB2.

userID You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current DB2 release, or complete other maintenance tasks.
## Column descriptions

The following table describes the columns of DSN_SORT_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
</table>
| QUERYNO     | INTEGER NOT NULL | A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:  
  **For rows produced by EXPLAIN statements**  
  The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.  
  **For rows not produced by EXPLAIN statements**  
  DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.  
  When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure. |
| QBLOCKNO    | SMALLINT NOT NULL | A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive. |
| PLANNO      | SMALLINT NOT NULL | The plan number, a number used to identify each miniplan with a query block. |
| APPLNAME    | VARCHAR(24) NOT NULL | The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank. |
| PROGNAME    | VARCHAR(128) NOT NULL | The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. |

</tbody>
</table>
| EXPANSION_REASON | CHAR(2) NOT NULL WITH DEFAULT | This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true:  
  - The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES  
  - The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES  
  - The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES  
This column can have one of the following values:  
  - A: The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable.  
  - B: The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register.  
  - S: The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register.  
  - SB: The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register.  
  - blank: The query does not contain implicit query transformation. |
DSN_STATEMENT_CACHE_TABLE

The statement cache table, DSN_STATEMENT_CACHE_TABLE, contains information about the SQL statements in the statement cache, information captured as the results of an EXPLAIN STATEMENT CACHE ALL statement.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Qualifiers**

Your subsystem or data sharing group can contain more than one of these tables:

- **user ID** You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Unlike other EXPLAIN tables, no instance of DSN_STATEMENT_CACHE_TABLE is created under the SYSIBM qualifier.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current DB2 release, or complete other maintenance tasks.

**Column descriptions**

The following table shows the descriptions of the columns in DSN_STATEMENT_CACHE_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STMT_ID</td>
<td>INTEGER NOT NULL</td>
<td>The statement ID; this value is the EDM unique token for the statement.</td>
</tr>
<tr>
<td>STMT_TOKEN</td>
<td>VARCHAR(240)</td>
<td>The statement token; you provide this value as an identification string.</td>
</tr>
</tbody>
</table>

<td>'A' REOPT(AUTO) or its equivalent</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'O' The current plan is deemed optimal and there is no need for REOPT(AUTO)</td>
</tr>
<tr>
<td>BIND_RA_TOT</td>
<td>INTEGER NOT NULL WITH DEFAULT</td>
<td>The total number of REBIND commands that have been issued for the dynamic statement because of the REOPT(AUTO) option.</td>
</tr>
<tr>
<td>GROUP_MEMBER</td>
<td>VARCHAR(24) NOT NULL WITH DEFAULT</td>
<td>The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.</td>
</tr>
<tr>
<td>STAT_EXECB</td>
<td>BIGINT NOT NULL WITH DEFAULT</td>
<td>The number of times this statement has been run. For a statement with a cursor, this is the number of OPENs.</td>
</tr>
<tr>
<td>STAT_GPAGB</td>
<td>BIGINT NOT NULL WITH DEFAULT</td>
<td>The number of getpage operations that are performed for the statement.</td>
</tr>
<tr>
<td>STAT_SYNRB</td>
<td>BIGINT NOT NULL WITH DEFAULT</td>
<td>The number of synchronous buffer reads that are performed for the statement.</td>
</tr>
<tr>
<td>STAT_WRITB</td>
<td>BIGINT NOT NULL WITH DEFAULT</td>
<td>The number of buffer write operations that are performed for the statement.</td>
</tr>
<tr>
<td>STAT_EROWB</td>
<td>BIGINT NOT NULL WITH DEFAULT</td>
<td>The number of rows that are examined for the statement.</td>
</tr>
<tr>
<td>STAT_PROWB</td>
<td>BIGINT NOT NULL WITH DEFAULT</td>
<td>The number of rows that are processed for the statement.</td>
</tr>
<tr>
<td>STAT_SORTB</td>
<td>BIGINT NOT NULL WITH DEFAULT</td>
<td>The number of sorts that are performed for the statement.</td>
</tr>
<tr>
<td>STAT_INDEXB</td>
<td>BIGINT NOT NULL WITH DEFAULT</td>
<td>The number of index scans that are performed for the statement.</td>
</tr>
<tr>
<td>STAT_RSCNB</td>
<td>BIGINT NOT NULL WITH DEFAULT</td>
<td>The number of table space scans that are performed for the statement.</td>
</tr>
<tr>
<td>STAT_PGRPB</td>
<td>BIGINT NOT NULL WITH DEFAULT</td>
<td>The number of parallel groups that are created for the statement.</td>
</tr>
</tbody>
</table>
Table 200. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STAT_RIDLIMTB</td>
<td>BIGINT NOT NULL WITH DEFAULT</td>
<td>The number of times a RID list was not used because the number of RIDs would have exceeded DB2 limits.2 on page 2642</td>
</tr>
<tr>
<td>STAT_RIDSTORB</td>
<td>BIGINT NOT NULL WITH DEFAULT</td>
<td>The number of times a RID list was not used because there is not enough storage available to hold the list of RIDs.2 on page 2642</td>
</tr>
<tr>
<td>LITERAL_REPL</td>
<td>CHAR(1) NOT NULL WITH DEFAULT</td>
<td>Identifies cached statements where the literal values are replaced by the ‘&amp;’ symbol.3 on page 2642</td>
</tr>
<tr>
<td></td>
<td></td>
<td>‘R’ The statement is prepared with CONCENTRATE STATEMENTS WITH LITERALS behavior and the literal constants in the statement have been replaced with ‘&amp;’.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>‘D’ This statement is a duplicate statement instance with different literal reusability criteria.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>blank Literal values are not replaced.</td>
</tr>
<tr>
<td>STAT_SUS_LATCH</td>
<td>FLOAT NOT NULL WITH DEFAULT</td>
<td>The accumulated wait time for latch requests for the statement.</td>
</tr>
<tr>
<td>STAT_SUS_PLATCH</td>
<td>FLOAT NOT NULL WITH DEFAULT</td>
<td>The accumulated wait time for page latch requests for the statement.</td>

<td>FLOAT NOT NULL WITH DEFAULT</td>
<td>The accumulated wait time for claim count requests for the statement.</td>
</tr>
<tr>
<td>STAT_SUS_LOG</td>
<td>FLOAT NOT NULL WITH DEFAULT</td>
<td>The accumulated wait time for log writer requests for the statement.</td>
</tr>
</tbody>
</table>
Table 200. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| EXPANSION_REASON  | CHAR(2) NOT NULL WITH DEFAULT | This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true:  
  - The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES  
  - The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES  
  - The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES  

This column can have one of the following values:  
A The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable.  
B The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register.  
S The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register.  
SB The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register.  
blank The query does not contain implicit query transformation.  

Notes:  
1. If the specified value exceeds 2147483647, the column contains the value 2147483647.  
2. Statistics are cumulative, across executions of the same statement, and across threads, if the value of COLLID is DSNDYNAMICSQCACHE. If the value of COLLID is DSNEXPLAINMODEYES, the values are for a single run of the statement only. If the value of COLLID is DSNEXPLAINMODE EXPLAIN, the values of all statistics columns are 0.  
3. The column is not applicable when the value of the COLLID column is 'DSNEXPLAINMODEYES' or 'DSNEXPLAINMODEEXPLAIN'
DSN_STATEMNT_TABLE

The statement table, DSN_STATEMNT_TABLE, contains information about the estimated cost of specified SQL statements.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM

One instance of this table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use the table and the data that it contains. The table is created when you run job DSNTIJSG when you install or migrate DB2.

userID

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current DB2 release, or complete other maintenance tasks.
## Column descriptions

The following table describes the content of each column in STATEMNT_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
</table>
| QUERYNO     | INTEGER NOT NULL WITH DEFAULT | A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:  
  **For rows produced by EXPLAIN statements**  
  The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.  
  **For rows not produced by EXPLAIN statements**  
  DB2 assigns a number that is based on the line number of the SQL statement in the source program.  
  When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.  
  When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure. |
| APPLNAME    | VARCHAR(24) NOT NULL WITH DEFAULT | The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.  
  When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank. |
| PROGNAME    | VARCHAR(128) NOT NULL WITH DEFAULT | The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.  
  When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. |
| COLLID      | VARCHAR(128) NOT NULL WITH DEFAULT | The collection ID:  
  **DSNDYNAMICSQLCACHE**  
  The row originates from the dynamic statement cache  
  **DSNEXPLAINMODEYES**  
  The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register.  
  **DSNEXPLAINMODEEXPLAIN**  
  The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register.  
  When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure. |
### Table 201. Descriptions of columns in DSN_STATEMNT_TABLE (continued)

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

Appendix. Additional information for DB2 SQL 2647
DSN_STAT_FEEDBACK

The DSN_STAT_FEEDBACK table contains recommendations for capturing missing or conflicting statistics that are defined during EXPLAIN. Collecting these statistics by the RUNSTATS utility might improve the performance of the query.

PSPI The values in this table are updated only at EXPLAIN time, and are not modified by the RUNSTATS utility.

Information is captured in this table only for EXPLAIN operations that use the access path selection process. The access path selection process is not used when you issue an EXPLAIN statement with the STMTCACHE or PACKAGE options.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM

One instance of this table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use the table and the data that it contains. The table is created when you run job DSNTIJSG when you install or migrate DB2.

userID You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library. You can call the ADMIN_EXPLAIN MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current DB2 release, or complete other maintenance tasks.

Column descriptions

The following table contains descriptions of the columns in the DSN_STAT_FEEDBACK table.
Table 202. Descriptions of columns in the DSN_STAT_FEEDBACK table

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows not produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>DB2 assigns a number that is based on the line number of the SQL statement in the source program.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>VARCHAR(24) NOT</td>
<td>The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td></td>
<td>NULL</td>
<td>When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.</td>
</tr>
<tr>
<td>PROGNAME</td>
<td>VARCHAR(128) NOT</td>
<td>The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td></td>
<td>NULL</td>
<td>When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.</td>
</tr>
<tr>
<td>COLLID</td>
<td>VARCHAR(128) NOT</td>
<td>The collection ID:</td>
</tr>
<tr>
<td></td>
<td>NULL WITH DEFAULT</td>
<td><strong>DSNDYNAMICSQLCACHE</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The row originates from the dynamic statement cache.</td>
</tr>
<tr>

<tr>
<td>COLNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the column.</td>
</tr>
<tr>
<td>NUMCOLUMNS</td>
<td>SMALLINT NOT NULL</td>
<td>The number of columns in the column group.</td>
</tr>
<tr>
<td>COLGROUPCOLNO</td>
<td>VARCHAR(254) NOT NULL FOR BIT DATA</td>
<td>A hex representation that identifies the set of columns associated with the statistics. If the statistics are only associated with a single column, the field contains a zero length. Otherwise, the field is an array of SMALLINT column numbers with a dimension equal to the value in NUMCOLUMNS.</td>
</tr>
<tr>
<td>Column name</td>
<td>Data Type</td>
<td>Descriptions</td>
</tr>
<tr>
<td>------------</td>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>TYPE</td>
<td>CHAR(1) NOT NULL</td>
<td>The type of statistic to collect:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'C'    Cardinality.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'F'    Frequency.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'H'    Histogram.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'I'    Index.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'T'    Table.</td>
</tr>
<tr>
<td>DBNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>The name of the database.</td>
</tr>
<tr>
<td>TSNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>The name of the table space.</td>
</tr>
<tr>
<td>REASON</td>
<td>CHAR(8) NOT NULL</td>
<td>The reason that the statistic was recommend:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'BASIC' A basic statistic value for a column, table, or index is missing.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>No statistics were collected for the identified object.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'KEYCARD' The cardinalities of index key columns are missing.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'LOWCARD' The cardinality of the column is a low value, which indicates that data might be skewed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'NULLABLE' Distribution statistics are not available for a nullable column, which indicates that data might be skewed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'DEFAULT' A predicate references a value that is probably a default value, which indicates that data might be skewed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'RANGEPRD' Histogram statistics are not available for a range predicate.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'PARALLEL' Parallelism could be improved by uniform partitioning of key ranges.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'CONFLICT' Another statistic contains a value that conflicts with the value of this statistic. Such conflicts usually occur because statistics were collected for related objects at different times.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'COMPFIX' Multi-column cardinality statistics are needed for an index compound filter factor.</td>
</tr>
<tr>
<td>REMARKS</td>
<td>VARCHAR(254) NOT NULL</td>
<td>Free form text for extensibility.</td>
</tr>

<tr>
<td></td>
<td></td>
<td><strong>For rows not produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>DB2 assigns a number that is based on the line number of the SQL statement in the source program.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.</td>
</tr>
<tr>
<td>QBLOCKNO</td>
<td>SMALLINT NOT NULL</td>
<td>A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td>PROGNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td>PARENT</td>
<td>SMALLINT NOT NULL</td>
<td>The parent query block number of the current query block in the structure of SQL text; this is the same as the PARENT_QBLOCKNO in PLAN_TABLE.</td>
</tr>
<tr>
<td>TIMES</td>
<td>FLOAT NOT NULL</td>
<td>The estimated number of rows returned by Data Manager; also the estimated number of times this query block is executed.</td>
</tr>
<tr>
<td>ROWCOUNT</td>
<td>INTEGER NOT NULL</td>
<td>The estimated number of rows returned by RDS (Query Cardinality).</td>
</tr>
<tr>
<td>ATOPEN</td>
<td>CHAR(1) NOT NULL</td>
<td>Whether the query block is moved up for do-at-open processing; 'Y' if done-at-open; 'N': otherwise.</td>
</tr>
</tbody>
</table>
### Table 203. DSN_STRUCT_TABLE description (continued)

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
</table>
| CONTEXT         | CHAR(10) NOT NULL  | This column indicates what the context of the current query block is. The possible values are:  
|                 |                    | • 'TOP LEVEL'  
|                 |                    | • 'UNION'  
|                 |                    | • 'UNION ALL'  
|                 |                    | • 'PREDICATE'  
|                 |                    | • 'TABLE EXP'  
|                 |                    | • 'UNKNOWN'  
| ORDERNO         | SMALLINT NOT NULL  | Not currently used.                                                          |
| DOATOPEN_PARENT | SMALLINT NOT NULL  | The parent query block number of the current query block; Do-at-open parent if the query block is done-at-open, this may be different from the PARENT_QBLOCKNO in PLAN_TABLE. |
| QBLOCK_TYPE     | CHAR(6) NOT NULL   | This column indicates the type of the current query block. The possible values are  
|                 | WITH DEFAULT       | • 'SELECT'  
|                 |                    | • 'INSERT'  
|                 |                    | • 'UPDATE'  
|                 |                    | • 'DELETE'  
|                 |                    | • 'SELUPD'  
|                 |                    | • 'DELCUR'  
|                 |                    | • 'UPDCUR'  
|                 |                    | • 'CORSUB'  
|                 |                    | • 'NCOSUB'  
|                 |                    | • 'TABLEX'  
|                 |                    | • 'TRIGGR'  
|                 |                    | • 'UNION'  
|                 |                    | • 'UNIONA'  
|                 |                    | • 'CTE'  
|                 |                    | It is equivalent to QBLOCK_TYPE column in PLAN_TABLE, except for CTE. |
| EXPLAIN_TIME    | TIMESTAMP NOT NULL | The time when the EXPLAIN information was captured:  
|                 |                    | **All cached statements**  
|                 |                    | When the statement entered the cache, in the form of a full-precision timestamp value. |
|                 |                    | **Non-cached static statements**  
|                 |                    | When the statement was bound, in the form of a full precision timestamp value. |
|                 |                    | **Non-cached dynamic statements**  
<p>|                 |                    | When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros. |
| QUERY_STAGE     | CHAR(8) NOT NULL   | IBM internal use only.                                                        |
| GROUP_MEMBER    | VARCHAR(24) NOT NULL | The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed. |</p>
<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORIGIN</td>
<td>CHAR(1) NOT NULL WITH DEFAULT</td>
<td>Indicates the origin of the query block: &lt;br&gt;Blank: Generated by DB2 &lt;br&gt;C: Column mask &lt;br&gt;R: Row permission &lt;br&gt;U: Specified by the user</td>
</tr>
<tr>
<td>SECTNOI</td>
<td>INTEGER NOT NULL WITH DEFAULT</td>
<td>The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.</td>
</tr>
<tr>
<td>COLLID</td>
<td>VARCHAR(128) NOT NULL WITH DEFAULT</td>
<td>The collection ID: &lt;br&gt;DSNDYNAMICSQLCACHE &lt;br&gt;The row originates from the dynamic statement cache &lt;br&gt;DSNEXPLAINMODEYES &lt;br&gt;The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. &lt;br&gt;DSNEXPLAINMODEEXPLAIN &lt;br&gt;The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register.</td>
</tr>
<tr>
<td>VERSION</td>
<td>VARCHAR(122) NOT NULL WITH DEFAULT</td>
<td>The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable.</td>
</tr>
</tbody>
</table>

When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the compiled SQL function or native SQL procedure.
Table 203.  DSN_STRUCT_TABLE description  (continued)

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXPANSION_REASON</td>
<td>CHAR(2) NOT NULL WITH DEFAULT</td>
<td>This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: - The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES - The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES - The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: A The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. B The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. S The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. SB The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.</td>
</tr>
</tbody>
</table>
The view reference table, DSN_VIEWREF_TABLE, contains information about all of the views and materialized query tables that are used to process a query.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Qualifiers**

Your subsystem or data sharing group can contain more than one of these tables:

**SYSIBM**

One instance of this table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use the table and the data that it contains. The table is created when you run job DSNTIJSG when you install or migrate DB2.

**userID**

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current DB2 release, or complete other maintenance tasks.
## Column descriptions

The following table describes the columns of DSN_VIEWREF_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
</table>
| QUERYNO     | INTEGER NOT NULL WITH DEFAULT | A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:.Session-produced by EXPLAIN statements: The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. Session-produced by EXPLAIN statements but not EXPLAIN statements: DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.  
When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure. |
| APPLNAME    | VARCHAR(24) NOT NULL WITH DEFAULT | The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.  
When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank. |
| PROGNAME    | VARCHAR(128) NOT NULL WITH DEFAULT | The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.  
When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. |
| VERSION     | VARCHAR(122) NOT NULL WITH DEFAULT | The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable.  
When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the compiled SQL function or native SQL procedure. |

</table>
| EXPANSION_REASON    | CHAR(2) NOT NULL  | This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true:  
  • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES  
  • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES  
  • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values:  
  A The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable.  
  B The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register.  
  S The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register.  
  SB The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register.  
  blank The query does not contain implicit query transformation. |
Tables that support query acceleration

To interact with accelerator servers, DB2 requires two tables that record characteristics of those accelerator servers: SYSACCELERATORS and SYSACCELERATEDTABLES. In addition, DB2 requires the SYSACCELERATEDPACKAGES table, which records the characteristics of packages that are bound with the QUERYACCELERATION and GETACCELARCHIVE bind options.

The following table lists the table space and indexes for these tables, and lists the index fields for each index. The indexes are in ascending order, except where noted.

| Table 205. Table spaces and indexes for the tables that support the acceleration of queries |
|---|---|---|---|
| TABLE SPACE DSNACCEL. ... | TABLE SYSACCEL. ... | INDEX SYSACCEL. ... | INDEX FIELDS |
| | | DSNACC01 | ACCELERATORNAME |
| | | DSNACT01 | CREATOR.NAME.ACCELERATORNAME |
| | | DSNACP01 | LOCATION, COLLID, NAME, VERSION |
| | | DSNACP02 | LOCATION, COLLID, NAME, CONTOKEN |
**SYSACCEL.SYSACCELERATORS table**

The SYSACCEL.SYSACCELERATORS table contains rows that describe the characteristics of each accelerator server.

Rows in this table can be inserted, updated, and deleted.

<table>
<thead>

**Using the catalog in database design**

Retrieving information from the catalog by using SQL statements, can be helpful in designing your relational database.

*DB2 SQL Reference* lists all the DB2 catalog tables and the information stored in them.

The information in the catalog is vital to normal DB2 operation. You can retrieve catalog information, but changing it can have serious consequences. Therefore you cannot execute insert or delete operations that affect the catalog, and only a limited number of columns exist that you can update. Exceptions to these restrictions are the SYSIBM.SYSTINGS, SYSIBM.SYSCOLDIST, and SYSIBM.SYSCOLDISTSTATS catalog tables, into which you can insert rows and proceed to update and delete rows.

To retrieve information from the catalog, you need at least the SELECT privilege on the appropriate catalog tables.

**Note:** Some catalog queries can result in long table space scans.
Retrieving catalog information about DB2 storage groups

The SYSIBM.SYSTOGROUP and SYSIBM.SYSVOLUMES tables contain information about DB2 storage groups and the volumes in those storage groups.

Procedure

To obtain information about DB2 storage groups and the volumes in those storage groups:

Query the SYSIBM.SYSTOGROUP and SYSIBM.SYSVOLUMES tables. The following query shows what volumes are in a DB2 storage group, how much space is used, and when that space was last calculated.

```
SELECT SGNAME, VOLID, SPACE, SPCDATE
FROM SYSIBM.SYSVOLUMES, SYSIBM.SYSTOGROUP
WHERE SGNAME = NAME
ORDER BY SGNAME;
```

Related reference:

- “SYSIBM.SYSTOGROUP table” on page 2444
- “SYSIBM.SYSVOLUMES table” on page 2509

Retrieving catalog information about a table

The SYSIBM.SYSTABLES table contains information about every table, view, and alias in your DB2 system.

About this task

- The SYSIBM.SYSTABLES table contains a row for every table, view, and alias in your DB2 system. Each row tells you whether the object is a table, a view, or an alias, its name, who created it, what database it belongs to, what table space it belongs to, and other information. The SYSTABLES table also has a REMARKS column in which you can store your own information about the table in question.

Procedure

To retrieve catalog information about a table:

Query the SYSIBM.SYSTABLES table. The following example query displays all the information for the project activity sample table:

```
SELECT *
FROM SYSIBM.SYSTABLES
WHERE NAME = 'PROJACT'
AND CREATOR = 'DSN8B10';
```

Related concepts:

- “Adding and retrieving comments” on page 2682

Related reference:
Retrieving catalog information about partition order

The LOGICAL_PART column in the SYSIBM.SYSTABLEPART table contains information for key order or logical partition order.

Procedure

To retrieve catalog information about partition order:

Query the SYSIBM.SYSTABLEPART table. The following statement displays information on partition order in ascending limit value order:

```
SELECT LIMITKEY, PARTITION
FROM SYSIBM.SYSTABLEPART
ORDER BY LOGICAL_PART;
```

Related reference:

“SYSIBM.SYSTABLEPART table” on page 2454

Retrieving catalog information about aliases

Query SYSIBM.SYSTABLES to obtain information about aliases.

About this task

You can use the SYSIBM.SYSTABLES table to find information about aliases by referencing the following three columns:

- LOCATION contains your subsystem's location name for the remote system, if the object on which the alias is defined resides at a remote subsystem.
- TBCREATOR contains the schema table or view.
- TBNAME contains the name of the table or the view.

You can also find information about aliases by using the following user-defined functions:

- TABLE_NAME returns the name of a table, view, or undefined object found after resolving aliases for a user-specified object.
- TABLE_SCHEMA returns the schema name of a table, view, or undefined object found after resolving aliases for a user-specified object.
- TABLE_LOCATION returns the location name of a table, view, or undefined object found after resolving aliases for a user-specified object.

The NAME and CREATOR columns of the SYSTABLES table contain the name and schema of the alias, and three other columns contain the following information for aliases:

- TYPE is A.
- DBNAME is DSNDB06.
- TSNAME is SYSTSTAB.
If similar tables at different locations have names with the same second and third parts, you can retrieve the aliases for them with a query like this one:

```sql
SELECT LOCATION, CREATOR, NAME
FROM SYSIBM.SYSTABLES
WHERE TBCREATOR='DSN8B10' AND TBNAME='EMP'
AND TYPE='A';
```

**Related reference:**
- “SYSIBM.SYSTABLES table” on page 2463
- “TABLE_NAME” on page 2710
- “TABLE_SCHEMA” on page 2712
- “TABLE_LOCATION” on page 2708

### Retrieving catalog information about columns

The SYSIBM.SYSCOLUMNS table has one row for each column of every table and view.

#### Procedure

To obtain information about the columns of a table or view:

Query the SYSIBM.SYSCOLUMNS table.

The following statement retrieves information about columns in the sample department table:

```sql
SELECT NAME, TBNAME, COLTYPE, LENGTH, NULLS, DEFAULT
FROM SYSIBM.SYSCOLUMNS
WHERE TBNAME='DEPT'
AND TBCREATOR = 'DSN8B10';
```

The result is shown below; for each column, the following information about each column is given:
- The column name
- The name of the table that contains it
- Its data type
- Its length attribute. For LOB columns, the LENGTH column shows the length of the pointer to the LOB.
- Whether it allows nulls
- Whether it allows default values

<table>
<thead>
<tr>
<th>NAME</th>
<th>TBNAME</th>
<th>COLTYPE</th>
<th>LENGTH</th>
<th>NULLS</th>
<th>DEFAULT</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEPTNO</td>
<td>DEPT</td>
<td>CHAR</td>
<td>3</td>
<td>N</td>
<td>N</td>
</tr>
<tr>
<td>DEPTNAME</td>
<td>DEPT</td>
<td>VARCHAR</td>
<td>36</td>
<td>N</td>
<td>N</td>
</tr>
<tr>
<td>MGRNO</td>
<td>DEPT</td>
<td>CHAR</td>
<td>6</td>
<td>Y</td>
<td>N</td>
</tr>
<tr>
<td>ADMRDEPT</td>
<td>DEPT</td>
<td>CHAR</td>
<td>3</td>
<td>N</td>
<td>N</td>
</tr>
</tbody>
</table>

**Related tasks:**
- “Retrieving catalog information about LOBs” on page 2680

**Related reference:**
- “SYSIBM.SYSCOLUMNS table” on page 2220
Retrieving catalog information about indexes

The SYSIBM.SYSINDEXES table contains a row for every index, including indexes on catalog tables.

Procedure

To obtain information about indexes:

Query the SYSIBM.SYSINDEXES table. For example, to retrieve a row about an index named XEMPL2:

```sql
SELECT *
FROM SYSIBM.SYSINDEXES
WHERE NAME = 'XEMPL2'
AND CREATOR = 'DSN8B10';
```

A table can have more than one index. To display information about all the indexes of a table:

```sql
SELECT *
FROM SYSIBM.SYSINDEXES
WHERE TBNAME = 'EMP'
AND TBCREATOR = 'DSN8B10';
```

Related reference:

“SYSIBM.SYSINDEXES table” on page 2277

Retrieving catalog information about views

For every view you create, DB2 stores descriptive information in several catalog tables. Query these catalog tables to obtain information about views in your database.

About this task

The following actions occur in the catalog after the execution of CREATE VIEW:

- A row is inserted into the SYSIBM.SYSTABLES table.
- A row is inserted into the SYSIBM.SYSTABAUTH table to record the owner’s privileges on the view.
- For each column of the view, a row is inserted into the SYSIBM.SYSCOLUMNS table.
- One or more rows are inserted into the SYSIBM.SYSVIEWS table to record the text of the CREATE VIEW statement.
- For each table or view on which the view is dependent, a row is inserted into the SYSIBM.SYSVIEWDEP table to record the dependency.
Procedure

To obtain information about views:

Query one or more catalog tables.

Related reference:
- “CREATE VIEW” on page 1590
- “SYSIBM.SYSTABLES table” on page 2463
- “SYSIBM.SYSTABAUTH table” on page 2450
- “SYSIBM.SYSCOLUMNS table” on page 2220
- “SYSIBM.SYSVIEWS table” on page 2505
- “SYSIBM.SYSVIEWDEP table” on page 2504

Retrieving catalog information about authorizations

The SYSIBM.SYSTABAUTH table contains information about who can access your data.

Procedure

To obtain information about who can access your data:

Query the SYSIBM.SYSTABAUTH table. The following query retrieves the names of all users who have been granted access to the DSN8B10.DEPT table.

```
SELECT GRANTEE
FROM SYSIBM.SYSTABAUTH
WHERE TTNAME = 'DEPT'
AND GRANTEETYPE <> 'P'
AND TCREATOR = 'DSN8B10';
```

GRANTEE is the name of the column that contains authorization IDs for users of tables. The TTNAME and TCREATOR columns specify the DSN8B10.DEPT table. The clause GRANTEETYPE <> 'P' ensures that you retrieve the names only of users (not application plans or packages) that have authority to access the table.

Related reference:
- “SYSIBM.SYSTABAUTH table” on page 2450

Retrieving catalog information about primary keys

The SYSIBM.SYSCOLUMNS table identifies columns of a primary key in column KEYSEQ; a nonzero value indicates the place of a column in the primary key.

Procedure

To obtain catalog information about primary keys:

Query the SYSIBM.SYSCOLUMNS table. To retrieve the creator, database, and names of the columns in the primary key of the sample project activity table using SQL statements, execute:
SELECT TBCREATOR, TBNAME, NAME, KEYSEQ
FROM SYSIBM.SYSCOLUMNS
WHERE TBCREATOR = 'DSN8B10'
AND TBNAME = 'PROJACT'
AND KEYSEQ > 0
ORDER BY KEYSEQ;

The SYSIBM.SYSINDEXES table identifies the primary index of a table by the
value P in column UNIQUERULE. To find the name, creator, database, and index
space of the primary index on the project activity table, execute:

SELECT TBCREATOR, TBNAME, NAME, CREATOR, DBNAME, INDEXSPACE
FROM SYSIBM.SYSINDEXES
WHERE TBCREATOR = 'DSN8B10'
AND TBNAME = 'PROJACT'
AND UNIQUERULE = 'P';

Retrieving catalog information about foreign keys

The SYSIBM.SYSRELS and SYSIBM.SYSFOREIGNKEYS tables contain information
about referential constraints and the columns of the foreign key that defines the
constraint.

About this task

The SYSIBM.SYSRELS table contains information about referential constraints, and
each constraint is uniquely identified by the schema and name of the dependent
table and the constraint name (RELNAME). The SYSIBM.SYSFOREIGNKEYS table
contains information about the columns of the foreign key that defines the
constraint.

Procedure

To obtain information about referential constraints and the columns of the foreign
key that defines the constraint:

Query the SYSIBM.SYSRELS table or the SYSIBM.SYSFOREIGNKEYS table. To
retrieve the constraint name, column names, and parent table names for every
relationship in which the project table is a dependent, execute:

SELECT A.CREATOR, A.TBNAME, A.RELNAME, B.COLNAME, B.COLSEQ,
       A.REFTBCREATOR, A.REFTBNAME
FROM SYSIBM.SYSRELS A, SYSIBM.SYSFOREIGNKEYS B
WHERE A.CREATOR = 'DSN8B10'
AND B.CREATOR = 'DSN8B10'
AND A.TBNAME = 'PROJ'
AND B.TBNAME = 'PROJ'
AND A.RELNAME = B.RELNAME
ORDER BY A.RELNAME, B.COLSEQ;

To find information about the foreign keys of tables to which the project table is a
parent:
SELECT A.RELNAME, A.CREATOR, A.TBNAME, B.COLNAME, B.COLNO
FROM SYSIBM.SYSRELS A, SYSIBM.SYSFOREIGNKEYS B
WHERE A.REFTBCREATOR = 'DSN8B10'
AND A.REFTBNAME = 'PROJ'
AND A.RELNAME = B.RELNAME
ORDER BY A.RELNAME, B.COLNO;

Related reference:
“SYSIBM.SYSRELS table” on page 2406

Retrieving catalog information about check pending

The SYSIBM.SYSTABLESPACE table contains information about table spaces that are in check-pending status.

About this task

The SYSIBM.SYSTABLESPACE table indicates that a table space is in check-pending status by a value in column STATUS: P if the entire table space has that status, S if the status has a scope of less than the entire space.

Procedure

To obtain information about table spaces that are in check-pending status:

Query the SYSIBM.SYSTABLESPACE table. To list all table spaces whose use is restricted for any reason, issue this command:
-DISPLAY DATABASE (+) SPACENAM(+) RESTRICT

To retrieve the names of table spaces in check-pending status only, with the names of the tables they contain, execute:
SELECT A.DBNAME, A.NAME, B.CREATOR, B.NAME
FROM SYSIBM.SYSTABLESPACE A, SYSIBM.SYSTABLES B
WHERE A.DBNAME = B.DBNAME
AND A.NAME = B.TSNAME
AND (A.STATUS = 'P' OR A.STATUS = 'S')
ORDER BY 1, 2, 3, 4;

Related reference:
“SYSIBM.SYSTABLESPACE table” on page 2471

Retrieving catalog information about check constraints

The SYSIBM.SYSCHECKS and SYSIBM.SYSCHECKDEP tables contain information about check constraints.
About this task

Information about check constraints is stored in the DB2 catalog in:
- SYSIBM.SYSCHECKS, which contains one row for each check constraint defined on a table
- SYSIBM.SYSCHECKDEP, which contains one row for each reference to a column in a check constraint

Procedure

To retrieve catalog information about check constraints:

Query the SYSIBM.SYSCHECKS and SYSIBM.SYSCHECKDEP tables. The following query shows all check constraints on all tables named SIMPDEPT and SIMPEMPL in order by column name within table schema. It shows the name, authorization ID of the creator, and text for each constraint. A constraint that uses more than one column name appears more than once in the result.

CREATE TABLE SIMPDEPT
(DEPTNO CHAR(3) NOT NULL,
DEPTNAME VARCHAR(12) CONSTRAINT CC1 CHECK (DEPTNAME IS NOT NULL),
MGRNO CHAR(6),
MGRNAME CHAR(6));

SELECT A.TBOWNER, A.TBNAME, B.COLNAME,
A.CHECKNAME, A.CREATOR, A.CHECKCONDITION
FROM SYSIBM.SYSCHECKS A, SYSIBM.SYSCHECKDEP B
WHERE A.TBOWNER = B.TBOWNER
AND A.TBNAME = B.TBNAME
AND B.TBNAME = 'SIMPDEPT'
AND A.CHECKNAME = B.CHECKNAME
ORDER BY TBOWNER, TBNAME, COLNAME;

Related reference:
“SYSIBM.SYSCHECKS table” on page 2206
“SYSIBM.SYSCHECKDEP table” on page 2207

Retrieving catalog information about LOBs

The SYSIBM.SYS Aux Xrels table contains information about the relationship between a base table and an auxiliary table.

Procedure

To retrieve catalog information about LOBs:

Query the SYSIBM.SYS Aux Xrels table. For example, this query returns information about the name of the LOB columns for the employee table and its associated auxiliary table schema and name:

SELECT COLNAME, PARTITION, AUXTBOWNER, AUXTBNNAME
FROM SYSIBM.SYS Aux Xrels
WHERE TBNAME = 'EMP' AND TBOWNER = 'DSN8B10';
Information about the length of a LOB is in the LENGTH2 column of the SYSCOLUMNS table. You can query information about the length of the column as it is returned to an application with the following query:

```
SELECT NAME, TBNAME, COLTYPE, LENGTH2, NULLS, DEFAULT
FROM SYSIBM.SYSCOLUMNS
WHERE TBNAME='DEPT'
AND TBCREATOR = 'DSN8B10';
```

Retrieving catalog information about user-defined functions and stored procedures

The SYSIBM.SYSROUTINES table contains information about routines.

**Procedure**

To retrieve information about user-defined functions and stored procedures:

```
Query the SYSIBM.SYSROUTINES table to obtain information about user-defined functions and stored procedures. You can use this example to find packages with stored procedures that were created prior to Version 6 and then migrated to the SYSIBM.SYSROUTINES table:

SELECT SCHEMA, NAME FROM SYSIBM.SYSROUTINES
WHERE ROUTINETYPE = 'P';
```

You can use this query to retrieve information about user-defined functions:

```
SELECT SCHEMA, NAME, FUNCTION_TYPE, PARM_COUNT FROM SYSIBM.SYSROUTINES
WHERE ROUTINETYPE='F';
```

**Related tasks:**

[Preparing a client program that calls a remote stored procedure (DB2 Application programming and SQL)]

**Related reference:**

“SYSIBM.SYSROUTINES table” on page 2413

Retrieving catalog information about triggers

The SYSIBM.SYSTIGGERS table contains information about triggers.

**Procedure**

To retrieve catalog information about triggers:

```
Query the SYSIBM.SYSTIGGERS table to obtain information about the triggers defined in your databases. You can issue this query to find all the triggers defined on a particular table, their characteristics, and to determine the order they are activated in:
```

```
```
SELECT DISTINCT SCHEMA, NAME, TRIGTIME, TRIGEVENT, GRANULARITY, CREATEDTS
FROM SYSIBM.SYSTRIGGERS
WHERE TBNAME = 'EMP' AND TBOWNER = 'DSN8B10';

Issue this query to retrieve the text of a particular trigger:
SELECT STATEMENT, CREATEDTS
FROM SYSIBM.SYSTRIGGERS
WHERE SCHEMA = schema_name
AND NAME = trigger_name
ORDER BY CREATEDTS;

Issue this query to determine triggers that must be rebound because they are
invalidated after objects are dropped or altered:
SELECT COLLID, NAME
FROM SYSIBM.SYSPACKAGE
WHERE TYPE = 'T'
AND (VALID = 'N' OR OPERATIVE = 'N');

Related reference:
“SYSIBM.SYSTRIGGERS table” on page 2490

Retrieving catalog information about sequences
The SYSIBM.SYSEQUENCES and SYSIBM.SYSEQUENCEAUTH tables contain
information about sequences.

Procedure

To obtain information about sequences:

Query the SYSIBM.SYSEQUENCES or SYSIBM.SYSEQUENCEAUTH table. To
retrieve the attributes of a sequence, issue this query:
SELECT *
FROM SYSIBM.SYSEQUENCES
WHERE NAME = 'MYSEQ' AND SCHEMA = 'USER1B';

Issue this query to determine the privileges that user USER1B has on sequences:
SELECT GRANTOR, NAME, DATEGRANTED, ALTERAUTH, USEAUTH
FROM SYSIBM.SEQUENCEAUTH
WHERE GRANTEE = 'USER1B';

Related reference:
“SYSIBM.SYSEQUENCES table” on page 2433
“SYSIBM.SYSEQUENCEAUTH table” on page 2431

Adding and retrieving comments
After you create an object, you can provide explanatory information about it for
future reference. For example, you can provide information about the purpose of
the object, who uses it, and anything unusual about it.
You can create comments about tables, views, indexes, aliases, packages, plans, distinct types, triggers, stored procedures, and user-defined functions. You can store a comment about the table or the view as a whole, and you can also include a comment for each column. A comment must not exceed 762 bytes.

A comment is especially useful if your names do not clearly indicate the contents of columns or tables. In that case, use a comment to describe the specific contents of the column or table.

Below are two examples of COMMENT:

```sql
COMMENT ON TABLE DSN8B10.EMP IS
  'Employee table. Each row in this table represents one employee of the company.';

COMMENT ON COLUMN DSN8B10.PROJ.PRSTDATE IS
  'Estimated project start date. The format is DATE.';
```

After you execute a COMMENT statement, your comments are stored in the REMARKS column of SYSIBM.SYSTABLES or SYSIBM.SYSCOLUMNS. (Any comment that is already present in the row is replaced by the new one.) The next two examples retrieve the comments that are added by the previous COMMENT statements.

```sql
SELECT REMARKS
  FROM SYSIBM.SYSTABLES
  WHERE NAME = 'EMP'
  AND CREATOR = 'DSN8B10';

SELECT REMARKS
  FROM SYSIBM.SYSCOLUMNS
  WHERE NAME = 'PRSTDATE' AND TBNAME = 'PROJ'
  AND TBCREATOR = 'DSN8B10';
```

### Verifying the accuracy of the database definition

You can use the catalog to verify the accuracy of your database definition.

**Procedure**

To verify that you have created the objects in your database and check that no errors are in your CREATE statements:

Query the catalog tables to verify that your tables are in the correct table space, your table spaces are in the correct storage group, and so on.

**Related reference:**

“DB2 catalog tables” on page 2167

### Sample user-defined functions

Some sample user-defined functions are provided with DB2. You can use the functions in your applications just as you would use other user-defined functions, or as examples to help you define your own user-defined functions.
All REST functions are created by installation job DSNTIJRF or the createUDFZOS.sql script and can be used to allow applications to access REST-based services through SQL. For all other sample functions, the following points apply:

- To use these functions in your applications: Use the functions only if installation job DSNTIJ2U, which prepares the functions for use, has been run. Because the external programs that implement the logic of the sample functions are written in C and C++, the installation job requires that your site has IBM C/C++ for OS/390®. For information on installation job DSNTIJ2U, see DB2 Installation Guide.

- If you want to use these functions as examples to help you define and implement your own user-defined functions: Data set prefix.SDSNSAMP contains the code for the sample functions.

- The detailed descriptions of the functions include their external program names and specific names. The functions are in schema DSN8. The functions are defined to treat character or graphic string parameters, both input and output, as EBCDIC-encoded data.

Related concepts:

- [Job DSNTIJ2U (DB2 Installation and Migration)]

Related reference:

- [User-defined function samples that ship with DB2 (DB2 Application programming and SQL)]
The ALTDATE function returns the current date in the specified format or converts a user-specified date from one format to another.

\[
\text{ALTDATE}(\text{input-date, input-format, output-format})
\]

The schema is DSN8.

The ALTDATE function returns the current date in one of the following formats or converts a user-specified date from one format to another:

- D MONTH YY
- D MONTH YYYY
- DD MONTH YY
- DD MONTH YYYY
- D.M.YY
- D.M.YYYY
- DD.MM.YY
- DD.MM.YYYY
- D-M-YY
- D-M-YYYY
- DD-MM-YY
- DD-MM-YYYY
- D/M/YY
- D/M/YYYY
- DD/MM/YY
- DD/MM/YYYY
- M/D/YY
- M/D/YYYY
- MM/DD/YY
- MM/DD/YYYY
- YY/M/D
- YYYY/M/DD
- YY/MM/DD
- YYYY/MM/DD
- YYYY-M-D
- YYYY-MM-DD
- YYYY-D-XX
- YYYY-DD-XX
- YYYY-XX-D
- YYYY-DDD

where:

- D: Suppress leading zero if the day is less than 10
- DD: Retain leading zero if the day is less than 10
- M: Suppress leading zero if the month is less than 10
- MM: Retain leading zero if the month is less than 10
- MONTH: Use English-language name of month
- XX: Use a capital Roman numeral for month
- YY: Use a year format without century
- YYYY: Use a year format with century

The ALTDATE function demonstrates how you can create an overloaded function—a function name for which there are multiple function instances. Each instance supports a different parameter list enabling you to group related but distinct functions in a single user-defined function. The ALTDATE function has two forms.

**Form 1: ALTDATE(output-format)**
This form of the function converts the current date into the specified format.

output-format
A character string that matches one of the 34 date formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 13 bytes.

The result of the function is VARCHAR(17).

**Form 2: ALTDATE(input-date, input-format, output-format)**
This form of the function converts a date (input-date) in one user-specified format (input-format) into another format (output-format).

input-date
The argument must be a date or a character string representation of a date.
in the format specified by *input-format*. The character string must have a data type of VARCHAR and an actual length that is not greater than 17 bytes.

**input-format**

A character string that matches one of the 34 date formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 13 bytes.

**output-format**

A character string that matches one of the 34 date formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 13 bytes.

The result of the function is VARCHAR(17).

The following table shows the external and specific names for the two forms of the function, which are based on the input to the function.

<table>
<thead>
<tr>
<th>Conversion type</th>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current date</td>
<td><em>output-format</em> (VARCHAR)</td>
<td>DSN8DUAD</td>
<td>DSN8.DSN8DUADV</td>
</tr>
<tr>
<td>User-specified date</td>
<td><em>input-date</em> (VARCHAR)</td>
<td>DSN8DUCD</td>
<td>DSN8.DSN8DUCDVV</td>
</tr>
<tr>
<td></td>
<td><em>input-format</em> (VARCHAR)</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><em>output-format</em> (VARCHAR)</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><em>input-date</em> (DATE)</td>
<td>DSN8DUCD</td>
<td>DSN8.DSN8DUCDDVV</td>
</tr>
<tr>
<td></td>
<td><em>input-format</em> (VARCHAR)</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><em>output-format</em> (VARCHAR)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Example 1:** Convert the current date into format 'DD MONTH YY', a format that will include any leading zero for the month, the name of the month in English, and the year without the two digits for the century.

VALUES DSN8.ALTDATE( 'DD MONTH YY' );

**Example 2:** Convert the current date into format 'D.M.YYYY', a format that will suppress any leading zero for the day or month and include the year with the century.

VALUES DSN8.ALTDATE( 'D.M.YYYY' );

**Example 3:** Convert the current date into format 'YYYY-XX-DD', a format that will include the century, the month of the year as a roman numeral, and the day of the month with any leading zero.

VALUES DSN8.ALTDATE( 'YYYY-XX-DD' );

**Example 4:** Convert a date in the format of 'DD MONTH YYYY' to a date in the format of 'YYYY/MM/DD'.

VALUES DSN8.ALTDATE( '11 November 1918', 'DD MONTH YYYY', 'YYYY/MM/DD' );

The result of the above example is '1918/11/18'.
Example 5: Convert the date that employee 000130 was hired, a date in ISO format, into the format of 'D.M.YY'.

```sql
SELECT FIRSTNAME || ' ' || LASTNAME || ' was hired on ' || DSN8.ALTDATE(HIREDATE,
  'YYYY-MM-DD',
  'D.M.YY')
FROM EMP
WHERE EMPNO = '000130';
```

Assuming that the HIREDATE is '1971-07-28', the above example returns: 'DELORES QUINTANA was hired on 28.7.71'.

The ALTTIME function returns the current time in the specified format or converts a user-specified time from one format to another.

```
ALTTIME(input-time, input-format, output-format)
```

The schema is DSN8.

The ALTTIME function returns the current time in one of the following formats or converts a user-specified time from one of the formats to another:

- H:MM AM/PM
- HH:MM AM/PM
- HH:MM:SS AM/PM
- H.MM
- H.MM:SS
- H.MM:SS AM/PM
- H.MM:SS

where:
- H: Suppress leading zero if the hour is less than 10
- HH: Retain leading zero if the hour is less than 10
- M: Suppress leading zero if the minute is less than 10
- MM: Retain leading zero if the minute is less than 10
- AM/PM: Return time in 12-hour clock format, else 24-hour

The ALTTIME function demonstrates how you can create an overloaded function—a function name for which there are multiple function instances. Each instance supports a different parameter list enabling you to group related but distinct functions in a single user-defined function. The ALTTIME function has two forms.

**Form 1: ALTTIME(output-format)**

This form of the function converts the current time into the specified format.

- **output-format**
  A character string that matches one of the 8 time formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 14 bytes.

The result of the function is VARCHAR(11).

**Form 2: ALTTIME(input-time, input-format, output-format)**

This form of the function converts a time (input-date) in one user-specified format (input-format) into another format (output-format).

- **input-time**
  The argument must be a time or a character string representation of a time in the format specified by input-format. A character string argument must have a data type of VARCHAR and an actual length that is not greater than 11 bytes.

- **input-format**
  A character string that matches one of the 8 time formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 14 bytes.

- **output-format**
  A character string that matches one of the 8 time formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 14 bytes.
above. The character string must have a data type of VARCHAR and an actual length that is not greater than 14 bytes.

The result of the function is VARCHAR(11).

The following table shows the external program and specific names for the two forms of the function, which are based on the input to the function.

Table 208. External and specific names for ALTTIME

<table>
<thead>
<tr>
<th>Conversion type</th>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current time</td>
<td>output-format (VARCHAR)</td>
<td>DSN8DUAT</td>
<td>DSN8.DSN8DUATV</td>
</tr>
<tr>
<td>User-specified time</td>
<td>input-time (VARCHAR), input-format (VARCHAR), output-format (VARCHAR)</td>
<td>DSN8DUCT</td>
<td>DSN8.DSN8DUCTVVV</td>
</tr>
</tbody>
</table>

Example 1: Convert the current time into a 12-hour clock format without seconds, 'H:MM AM/PM'.

   VALUES DSN8.ALTTIME( 'H:MM AM/PM' );

Example 2: Convert the current time into a 24-hour clock format without seconds, 'HH.MM'.

   VALUES DSN8.ALTTIME( 'HH.MM' );

Example 3: Convert the current time into a 24-hour clock format with seconds, 'HH.MM.SS'.

   VALUES DSN8.ALTTIME( 'HH.MM.SS' );

Example 4: Convert '00:00:00', a time in 24-hour clock format with seconds, to a time in 12-hour clock format without seconds.

   VALUES DSN8.ALTTIME( '00:00:00','HH:MM:SS','HH:MM AM/PM' );

The function returns '12:00 AM'.

Example 5: Convert '00:00:00', a time in 24-hour clock format with seconds, to a time in 12-hour clock format without seconds and without any leading zero on the hour.

   VALUES DSN8.ALTTIME( '06.42.37','HH.MM.SS','H:MM AM/PM' );

The function returns '6:42 AM'.
**BASE64ENCODE and BASE64DECODE**

The BASE64ENCODE and BASE64DECODE helper REST functions complete Base64 encoding or decoding of the provided text or data.

```sql
BASE64ENCODE(text, encoding)
BASE64DECODE
```

The schema is DB2XML.

- **text**
  Specifies the text to encode or decode. For BASE64ENCODE, this argument is provided as a VARCHAR(2732) value and the function returns a Base64-encoded string. For BASE64DECODE, this argument is provided as a Base64-encoded VARCHAR(4096) value and the function returns the data as binary.

- **encoding**
  Specifies the character set that is to be used. It can be set to NULL where UTF-8 is used as the default.

**Related tasks:**

- Creating REST user-defined functions (DB2 Installation and Migration)
The CURRENCY function returns a value that is formatted as an amount with a user-specified currency symbol and, if specified, one of three symbols that indicate debit or credit.

The schema is DSN8.

**input-amount**
An expression that specifies the value to be formatted. The expression must be a floating-point value.

**currency-symbol**
A character string that specifies the currency symbol. The string must have a data type of VARCHAR and an actual length that is not greater than 2 bytes.

**credit/debit-indicator**
A character string that specifies the symbol that is included with the result to indicate whether the value is negative or positive. The string must have a data type of VARCHAR and an actual length that is not greater than 5 bytes. If credit/debit-indicator is not specified or is the value null, the result is formatted without an indicator symbol. You can specify the following symbols:

**CR/DB**
*Bank style.* Negative input values are appended with 'DB'; positive input values are appended with 'CR'.

**+-**
*Arithmetic style.* Negative input values are prefixed with a minus sign '-'; positive values are formatted without symbols.

**(/)**
*Accounting style.* Negative input values are enclosed in parentheses '(' ');' positive values are formatted without symbols.

The result of the function is VARCHAR(19).

The CURRENCY function uses the C language functions strftime to facilitate formatting of money amounts and setlocale to initialize strftime for local conventions. If setlocale fails, the CURRENCY function returns an error.

The following table shows the external program and specific names for CURRENCY. The specific names differ depending on the input to the function.

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>input-amount</strong>&lt;br&gt;<strong>currency-symbol</strong></td>
<td>DSN8DUCY</td>
<td>DSN8.DSN8DUCYFV</td>
</tr>
<tr>
<td><strong>input-amount</strong>&lt;br&gt;<strong>currency-symbol</strong>&lt;br&gt;<strong>credit/debit-indicator</strong></td>
<td>DSN8DUCY</td>
<td>DSN8.DSN8DUCYFVV</td>
</tr>
</tbody>
</table>
Example 1: Express \textsuperscript{\textregistered} '-1234.56' as an amount in US dollars, using the bank style debit/credit indicator to indicate whether the value is negative or positive.

\begin{verbatim}
VALUES DSN8.CURRENCY( -1234.56, '$', 'CR/DB' );
\end{verbatim}

The result of the function is '$1,234.56 DB$'.

Example 2: Express '-1234.56' as an amount in Deutsche marks, using the accounting style debit/credit indicator to indicate whether the value is negative or positive.

\begin{verbatim}
VALUES DSN8.CURRENCY( -1234.56, 'DM', '(' ) );
\end{verbatim}

The result of the function is '(DM 1,234.56)'.

Example 3: Express '-1234.56' as an amount in Canadian dollars, using the accounting style debit/credit indicator to indicate whether the value is negative or positive.

\begin{verbatim}
VALUES DSN8.CURRENCY( -1234.56, 'CD', '+' ) );
\end{verbatim}

The result of the function is '-CD 1,234.56'.

DAYNAME

The DAYNAME function returns the name of the weekday on which a given date falls. The name is returned in English.

\[ \text{DAYNAME}(\text{input-date}) \]

The schema is DSN8.

\textit{input-date}

A valid date or valid character string representation of a date. A character string representation The string must have a data type of VARCHAR and an actual length that is not greater than 10 bytes. The date must be in ISO format.

The result of the function is VARCHAR(9).

The DAYNAME function uses the IBM C++ classIDate.

The following table shows the external and specific names for DAYNAME. The specific names differ depending on the data type of the input argument.

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>\textit{input-date} (VARCHAR)</td>
<td>DSN8EUDN</td>
<td>DSN8.DSN8EUDNV</td>
</tr>
<tr>
<td>\textit{input-date} (DATE)</td>
<td>DSN8EUDN</td>
<td>DSN8.DSN8EUDND</td>
</tr>
</tbody>
</table>

Example 1: For the current date, find the day of the week.

\[ \text{VALUES DSN8.DAYNAME( CURRENT DATE );} \]

Example 2: Find the day of the week on which leap year falls in the year 2008.

\[ \text{VALUES DSN8.DAYNAME('2008-02-29');} \]

The result of the function is 'Friday'.

Example 3: Find the day of the week on which Delores Quintana, employee number 000130, was hired.

\[ \text{SELECT FIRSTNAME || ' ' || LASTNAME || ' was hired on ' \newline \text{DSN8.DAYNAME( HIREDATE ) || ' ', '} \newline \text{CHAR( HIREDATE )} \newline \text{FROM EMP} \newline \text{WHERE EMPNO = '000130';} \]

The result of the function is 'DELORES QUINTANA was hired on Wednesday, 1971-07-28'.

Appendix. Additional information for DB2 SQL 2693
HTTPBLOB

The HTTPBLOB REST function completes an HTTP request with the specified HTTP verb. Response messages from the server are returned as BLOB data.

```
HTTPBLOB(url, method, httpHeader, <input>)
```

The schema is DB2XML.

**url**

Specifies the URL at which to complete the request. This argument is defined as a VARCHAR(2048) value.

**method**

Specifies the HTTP verb to use. Valid values are GET, POST, PUT, and DELETE.

**httpHeader**

Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAttributeValue">
  <header name="name" value="value" />
</httpHeader>
```

**headerAttribute**

Specify any of the following optional attributes:

- **connectionTimeout**
  Specifies an integer value for the connection timeout threshold in milliseconds.

- **readTimeout**
  Specifies an integer value for the read timeout threshold in milliseconds.

- **followRedirects**
  Specifies whether redirects should be followed. This is a boolean value.

- **useCaches**
  Specifies whether caches should be used. This is a boolean value.

**headerAttributeValue**

Specifies a value for the `headerAttribute`. Separate `headerAttribute` and `headerAttributeValue` combinations with single spaces.

- **name**
  The header name.

- **value**
  The header value.

**<input>**

Specifies the data to update at the specified URL. This argument is defined as BLOB(5M).
Related tasks:

Creating REST user-defined functions (DB2 Installation and Migration)
HTTPCLOB

The HTTPCLOB REST function completes an HTTP request with the specified HTTP verb. Response messages from the server are returned as CLOB data. The character set is converted into the database code page if necessary.

```
HTTPCLOB(url, method, [httpHeader <input>])
```

The schema is DB2XML.

```
url
```

Specifies the URL at which to complete the request. This argument is defined as a VARCHAR(2048) value.

```
method
```

Specifies the HTTP verb to use. Valid values are GET, POST, PUT, and DELETE.

```
httpHeader
```

Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAttributeValue">
  <header name="name" value="value" />
</httpHeader>
```

```
headerAttribute
```

Specify any of the following optional attributes:

```
connectionTimeout
```

Specifies an integer value for the connection timeout threshold in milliseconds.

```
readTimeout
```

Specifies an integer value for the read timeout threshold in milliseconds.

```
followRedirects
```

Specifies whether redirects should be followed. This is a boolean value.

```
useCaches
```

Specifies whether caches should be used. This is a boolean value.

```
headerAttributeValue
```

Specifies a value for the `headerAttribute`. Separate `headerAttribute` and `headerAttributeValue` combinations with single spaces.

```
name
```

The header name.

```
value
```

The header value.
<input>
Specifies the data to update at the specified URL. This argument is defined as CLOB(5M).

Related tasks:

Creating REST user-defined functions (DB2 Installation and Migration)
HTTPDELETEBLOB and HTTPDELETECLOB

The HTTPDELETEBLOB and HTTPDELETECLOB REST functions delete a binary or text-based resource from the specified URL through an HTTP DELETE request. HTTPDELETEBLOB returns messages as BLOB data. HTTPDELETECLOB returns messages as CLOB data. The character set is converted into the database code page if necessary.

```
HTTPDELETEBLOB (url)
HTTPDELETECLOB (httpHeader)
```

The schema is DB2XML.

`url`
Specifies the URL of the resource being accessed. This parameter is defined as a VARCHAR(2048) value.

`httpHeader`
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```xml
<httpHeader headerAttribute="headerAttributeValue">
  <header name="name" value="value" />
</httpHeader>
```

`headerAttribute`
Specify any of the following optional attributes:

- `connectionTimeout`
  Specifies an integer value for the connection timeout threshold in milliseconds.

- `readTimeout`
  Specifies an integer value for the read timeout threshold in milliseconds.

- `followRedirects`
  Specifies whether redirects should be followed. This is a boolean value.

- `useCaches`
  Specifies whether caches should be used. This is a boolean value.

`headerAttributeValue`
Specifies a value for the `headerAttribute`. Separate `headerAttribute` and `headerAttributeValue` combinations with single spaces.

`name`
The header name.

`value`
The header value.

Related tasks:

[Creating REST user-defined functions (DB2 Installation and Migration)]
HTTPGETBLOB and HTTPGETCLOB

The HTTPGETBLOB and HTTPGETCLOB REST functions retrieve a binary or
text-based resource from the specified URL through an HTTP GET request.
HTTPGETBLOB returns the resource as BLOB(5M) data. HTTPGETCLOB returns
the resource as CLOB(5M) data. The character set is converted into the database
code page if necessary.

The schema is DB2XML.

url
Specifies the URL of the resource being accessed. This argument is defined as a
VARCHAR(2048) value.

httpHeader
Specifies an optional header XML document. This argument is defined as a
CLOB(10K) value.

The XML header document can provide additional HTTP header values in the
following format:
<httpHeader headerAttribute="headerAttributeValue">
  <header name="name" value="value" />
</httpHeader>

headerAttribute
Specify any of the following optional attributes:

connectionTimeout
  Specifies an integer value for the connection timeout threshold in
  milliseconds.

readTimeout
  Specifies an integer value for the read timeout threshold in
  milliseconds.

followRedirects
  Specifies whether redirects should be followed. This is a boolean value.

useCaches
  Specifies whether caches should be used. This is a boolean value.

headerAttributeValue
  Specifies a value for the headerAttribute. Separate headerAttribute and
  headerAttributeValue combinations with single spaces.

name
  The header name.

value
  The header value.

The following SQL statement retrieves country information from the GeoNames
database:
SELECT DB2XML.HTTPGETCLOB(
  CAST ('http://ws.geonames.org/countryInfo?lang=' ||
    DB2XML.URLENCODE('en','') ||
    '&country=' ||
    DB2XML.URLENCODE('us','') ||
    '&type=XML' AS VARCHAR(255)),
  CAST(NULL AS CLOB(1K)))
FROM SYSIBM.SYSDUMMY1;

Related tasks:

Creating REST user-defined functions (DB2 Installation and Migration)
HTTPGETBLOBFILE and HTTPGETCLOBFILE

The HTTPGETBLOBFILE and HTTPGETCLOBFILE REST functions retrieve a binary or text-based resource from the specified URL through an HTTP GET request. The resource is stored in a temporary file, and the path of the temporary file is returned as VARCHAR data. The character set is converted into the database code page if necessary.

```
HTTPGETBLOBFILE (url, httpHeader)
HTTPGETCLOBFILE (url, httpHeader)
```

The schema is DB2XML.

**url**
Specifies the URL of the resource that is being accessed. This argument is defined as a VARCHAR(2048) value.

**httpHeader**
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```xml
<httpHeader headerAttribute="headerAttributeValue">
  <header name="name" value="value" />
</httpHeader>
```

**headerAttribute**
Specify any of the following optional attributes:

- **connectionTimeout**
  Specifies an integer value for the connection timeout threshold in milliseconds.

- **readTimeout**
  Specifies an integer value for the read timeout threshold in milliseconds.

- **followRedirects**
  Specifies whether redirects should be followed. This is a boolean value.

- **useCaches**
  Specifies whether caches should be used. This is a boolean value.

**headerAttributeValue**
Specifies a value for the headerAttribute. Separate headerAttribute and headerAttributeValue combinations with single spaces.

**name**
The header name.

**value**
The header value.

Related tasks:

- Creating REST user-defined functions (DB2 Installation and Migration)
HTTPHEAD

The HTTPHEAD REST function verifies the HTTP header for the specified resource through an HTTP HEAD request. The HTTP header is returned as CLOB or XML data.

```
HTTPHEAD(url, httpHeader)
```

The schema is DB2XML.

**url**
Specifies the URL of the resource. This argument is defined as a VARCHAR(2048) value.

**httpHeader**
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:
```
<httpHeader headerAttribute="headerAttributeValue">
  <header name="name" value="value" />
</httpHeader>
```

**headerAttribute**
Specify any of the following optional attributes:

- **connectionTimeout**
  Specifies an integer value for the connection timeout threshold in milliseconds.

- **readTimeout**
  Specifies an integer value for the read timeout threshold in milliseconds.

- **followRedirects**
  Specifies whether redirects should be followed. This is a boolean value.

- **useCaches**
  Specifies whether caches should be used. This is a boolean value.

- **headerAttributeValue**
  Specifies a value for the headerAttribute. Separate headerAttribute and headerAttributeValue combinations with single spaces.

- **name**
  The header name.

- **value**
  The header value.

Related tasks:

[Creating REST user-defined functions (DB2 Installation and Migration)](http://www.example.com)
HTTPPOSTBLOB and HTTPPOSTCLOB

The HTTPPOSTBLOB and HTTPPOSTCLOB REST functions update a binary or text-based resource under the specified URL through an HTTP POST request. Response messages from the server are returned as BLOB for HTTPPOSTBLOB or as CLOB for HTTPPOSTCLOB. The character set is converted into the database code page if necessary.

The schema is DB2XML.

url
Specifies the URL at which to update the data. This argument is defined as a VARCHAR(2048) value.

httpHeader
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAttributeValue">
  <header name="name" value="value" />
</httpHeader>
```

headerAttribute
Specify any of the following optional attributes:

  **connectionTimeout**
  Specifies an integer value for the connection timeout threshold in milliseconds.

  **readTimeout**
  Specifies an integer value for the read timeout threshold in milliseconds.

  **followRedirects**
  Specifies whether redirects should be followed. This is a boolean value.

  **useCaches**
  Specifies whether caches should be used. This is a boolean value.

headerAttributeValue
Specifies a value for the headerAttribute. Separate headerAttribute and headerAttributeValue combinations with single spaces.

name
The header name.

value
The header value.

<input>
Specifies the data to update at the specified URL. This argument is defined as BLOB(5M) for HTTPPOSTBLOB or CLOB(5M) for HTTPPOSTCLOB.

Related tasks:
HTTPPUTBLOB and HTTPPUTCLOB

The HTTPPUTBLOB and HTTPPUTCLOB REST functions create or update a binary or text-based resource under the specified URL through an HTTP PUT request. Response messages from the server are returned as BLOB for HTTPPUTBLOB or as CLOB for HTTPPUTCLOB. The character set is converted into the database code page if necessary.

```
HTTPPUTBLOB (url,<input>), HTTPPUTCLOB (httpHeader)
```

The schema is DB2XML.

*url*

Specifies the URL at which to create or update the data. This argument is defined as a VARCHAR(2048) value.

*httpHeader*

Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAttributeValue">
  <header name="name" value="value" />
</httpHeader>
```

*headerAttribute*

Specify any of the following optional attributes:

- connectionTimeout
  - Specifies an integer value for the connection timeout threshold in milliseconds.

- readTimeout
  - Specifies an integer value for the read timeout threshold in milliseconds.

- followRedirects
  - Specifies whether redirects should be followed. This is a boolean value.

- useCaches
  - Specifies whether caches should be used. This is a boolean value.

*headerAttributeValue*

Specifies a value for the *headerAttribute*. Separate *headerAttribute* and *headerAttributeValue* combinations with single spaces.

*name*

The header name.

*value*

The header value.

*<input>*

Specifies the data to create or update at the specified URL. This argument is defined as BLOB(5M) for HTTPPUTBLOB or CLOB(5M) for HTTPPUTCLOB.

Related tasks:
Creating REST user-defined functions (DB2 Installation and Migration)
**MONTHNAME**

The MONTHNAME function returns the calendar name of the month in which a given date falls. The name is returned in English.

```
MONTHNAME(input-date)
```

The schema is DSN8.

**input-date**

A valid date or valid character string representation of a date. A character string representation must have a data type of VARCHAR and an actual length that is no greater than 10 bytes. The date must be in ISO format.

The result of the function is VARCHAR(9).

The MONTHNAME function uses the IBM C++ class IDate.

The following table shows the external and specific names for MONTHNAME. The specific names differ depending on the data type of the input argument.

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>input-date</td>
<td>DSN8EUMN</td>
<td>DSN8.DSN8EUMNV</td>
</tr>
<tr>
<td>input-date (VARCHAR)</td>
<td>DSN8EUMN</td>
<td>DSN8.DSN8EUMND</td>
</tr>
</tbody>
</table>

**Example 1:** For the current date, find the name of the month.

```
VALUES DSN8.MONTHNAME( CURRENT DATE );
```

**Example 2:** Find the month of the year in which Delores Quintana, employee number 000130, was hired.

```
SELECT FIRSTNAME || ' ' || LASTNAME || ' was hired in the month of ' || DSN8.MONTHNAME( HIREDATE ) || CHAR( HIREDATE )
FROM EMP
WHERE EMPNO = '000130';
```

The result of the function is 'DELORES QUINTANA was hired in the month of July'.
TABLE_LOCATION

The TABLE_LOCATION function searches for an object and returns the location name of the object after any alias chains have been resolved.

\[
\text{TABLE_LOCATION}(\text{object-name}, \text{object-schema}, \text{location-name})
\]

The schema is DSN8.

The starting point of the resolution is the object that is specified by object-name and, if specified, object-schema and location-name. If the starting point does not refer to an alias, the location name of the starting point is returned. The resulting name can be of a table, view, or undefined object. The function returns a blank if there is no location name.

**object-name**

A character expression that specifies the unqualified name to be resolved. The unqualified name is usually of an existing alias. object-name must have a data type of VARCHAR and an actual length that is no greater than 18 bytes.

**object-schema**

A character expression that represents the schema that is used to qualify the value specified in object-name before resolution. object-schema must have a data type of VARCHAR and an actual length that is no greater than 8 bytes.

If object-schema is not specified or is null, the default schema is used for the qualifier.

**location-name**

A character expression that represents the location that is used to qualify the value specified in object-name before resolution. location-name must have a data type of VARCHAR and an actual length that is no greater than 16 bytes.

If location-name is not specified or is null, the location name is equivalent to “any”.

The result of the function is VARCHAR(16). If object-name can be null, the result can be null; if object-name is null, the result is the null value.

The following table shows the external and specific names for TABLE_LOCATION. The specific names differ depending on the number of input arguments to the function.

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>object-name (VARCHAR)</td>
<td>DSN8DUTIL</td>
<td>DSN8.DSN8DUTILV</td>
</tr>
<tr>
<td>object-name (VARCHAR)</td>
<td>DSN8DUTIL</td>
<td>DSN8.DSN8DUTILV</td>
</tr>
<tr>
<td>object-schema (VARCHAR)</td>
<td>DSN8DUTIL</td>
<td>DSN8.DSN8DUTILV</td>
</tr>
<tr>
<td>object-schema (VARCHAR)</td>
<td>DSN8DUTIL</td>
<td>DSN8.DSN8DUTILV</td>
</tr>
</tbody>
</table>

Table 212. External and specific names for TABLE_LOCATION
Table 212. External and specific names for TABLE_LOCATION (continued)

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>object-name</code> (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTILVVV</td>
</tr>
<tr>
<td><code>object-schema</code> (VARCHAR)</td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>location-name</code> (VARCHAR)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Example: Assume that:
- DSN8.ALIAS_RS_SYSTABLES is an alias of SYSIBM.SYSTABLES at location name 'REMOTE_SITE'.
- The CURRENT SQLID is DSN8.

Use TABLE_LOCATION to find the location name where the base object for ALIAS_RS_SYSTABLES resides.
```sql
VALUES DSN8.TABLE_LOCATION( 'ALIAS_RS_SYSTABLES' );
```

The result of the function is 'REMOTE_SITE'.
The TABLE_NAME function searches for an object and returns the unqualified name of the object after any alias chains have been resolved.

\[
\text{TABLE_NAME}(\text{object-name[7, object-schema[7, location-name]}})
\]

The schema is DSN8.

The starting point of the resolution is the object that is specified by \textit{object-name} and, if specified, \textit{object-schema} and \textit{location name}. If the starting point does not refer to an alias, the unqualified name of the starting point is returned. The resulting name can be of a table, view, or undefined object.

\textit{object-name}

A character expression that specifies the unqualified name to be resolved. The unqualified name is usually of an existing alias. \textit{object-name} must have a data type of VARCHAR and an actual length that is no greater than 18 bytes.

\textit{object-schema}

A character expression that represents the schema that is used to qualify the value specified in \textit{object-name} before resolution. \textit{object-schema} must have a data type of VARCHAR and an actual length that is no greater than 8 bytes.

If \textit{object-schema} is not specified or is null, the default schema is used for the qualifier.

\textit{location-name}

A character expression that represents the location that is used to qualify the value specified in \textit{object-name} before resolution. \textit{location-name} must have a data type of VARCHAR and an actual length than is no greater than 16 bytes.

If \textit{location-name} is not specified or is null, the location name is equivalent to “any”.

The result of the function is VARCHAR(128). If \textit{object-name} can be null, the result can be null; if \textit{object-name} is null, the result is the null value.

The following table shows the external and specific names for TABLE_NAME. The specific names differ depending on the number of input arguments to the function.

\begin{table}
\begin{tabular}{|c|c|c|}
\hline
\textbf{Input arguments} & \textbf{External name} & \textbf{Specific name} \\
\hline
\textit{object-name} (VARCHAR) & DSN8DUTI & DSN8.DSN8DUTINV \\
\hline
\textit{object-name} (VARCHAR) & DSN8DUTI & DSN8.DSN8DUTINVV \\
\hline
\end{tabular}
\end{table}
Table 213. External and specific names for TABLE_NAME (continued)

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>object-name (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTINVVV</td>
</tr>
<tr>
<td>object-schema (VARCHAR)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>location-name (VARCHAR)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Example: Assume that:

- DSN8.VIEW_OF_SYSTABLES is a view of SYSIBM.SYSTABLES.
- DSN8 ALIAS_OF_VIEW is an alias of DSN8.VIEW_OF_SYSTABLES.
- The CURRENT SQLID is DSN8.

Use TABLE_NAME to find the name of the base object for ALIAS_OF_VIEW.

VALUES DSN8.TABLE_NAME( 'ALIAS_OF_VIEW' );

The result of the function is 'VIEW_OF_SYSTABLES'.
The `TABLE_SCHEMA` function searches for an object and returns the schema name of the object after any synonyms or alias chains have been resolved.

```
TABLE_SCHEMA(object-name, object-schema, location-name)
```

The schema is DSN8.

The starting point of the resolution is the object that is specified by `object-name` and `object-schema`. If the starting point does not refer to an alias or synonym, the schema name of the starting point is returned. The resulting schema name can be of a table, view, or undefined object.

**object-name**

A character expression that specifies the unqualified name to be resolved. The unqualified name is usually of an existing alias. `object-name` must have a data type of VARCHAR and an actual length that is no greater than 18 bytes.

**object-schema**

A character expression that represents the schema that is used to qualify the value specified in `object-name` before resolution. `object-schema` must have a data type of VARCHAR and an actual length that is no greater than 8 bytes.

If `object-schema` is not specified or is null, the default schema is used for the qualifier.

**location-name**

A character expression that represents the location that is used to qualify the value specified in `object-name` before resolution. `location-name` must have a data type of VARCHAR (and an actual length that is no greater than 16 bytes).

If `location-name` is not specified or is null, the location name is equivalent to “any”.

The result of the function is VARCHAR(128). If `object-name` can be null, the result can be null; if `object-name` is null, the result is the null value.

The following table shows the external and specific names for `TABLE_SCHEMA`. The specific names differ depending on the number of input arguments.

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>object-name</code> (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTISV</td>
</tr>
<tr>
<td><code>object-name</code> (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTISVV</td>
</tr>
<tr>
<td><code>object-schema</code> (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTISVV</td>
</tr>
</tbody>
</table>

The following table shows the external and specific names for `TABLE_SCHEMA`. The specific names differ depending on the number of input arguments.
Table 214. External and specific names for function TABLE_SCHEMA (continued)

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>object-name (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTISVVV</td>
</tr>
<tr>
<td>object-schema (VARCHAR)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>location-name (VARCHAR)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Example: Assume that:
- DSN8.ALIAS_OF_SYSTABLES is an alias of SYSIBM.SYSTABLES.
- The CURRENT SQLID is DSN8.

Find the name of the schema of the base table for ALIAS_OF_SYSTABLES.

```
VALUES DSN8.TABLE_SCHEMA( 'ALIAS_OF_SYSTABLES' );
```

The result of the function is 'SYSIBM'.
**URLENCODE and URLDECODE**

The URLENCODE and URLDECODE helper REST functions complete URL encoding or decoding of the provided text.

```
URLENCODE(text, encoding)
URLDECODE(text, encoding)
```

The schema is DB2XML.

**text**

Specifies the text to encode or decode. This argument is defined as a VARCHAR(2048) value.

**encoding**

Specifies the character set that is to be used. It can be set to NULL where UTF-8 is used as the default.

**Related tasks:**

[Creating REST user-defined functions (DB2 Installation and Migration)](link)
**WEATHER**

The WEATHER function returns information from a TSO data set as a DB2 table. The TSO data set contains sample weather statistics for various cities in the United States. The statistics are returned to the client with a row for each city and a column for each statistic. The WEATHER function is provided primarily to help you design and implement table functions.

```
WEATHER(input-data-set-name)RETURNS TABLE(
  name-of-city
  temperature-in-fahrenheit
  percent-humidity
  wind-direction
  wind-velocity
  barometer
  forecast
)
```

The schema is DSN8.

Unlike the other sample user-defined functions, which are scalar functions, WEATHER is a table function. WEATHER shows how to use a table function to make non-relational data available to a client for manipulation by SQL.

*input-data-set-name*

The name of the TSO data set that contains sample weather statistics. The name is a character string with a data type of VARCHAR and an actual length that is not greater than 44 bytes.

The result of the function is a DB2 table with the following columns. Each column can be null.

- **name-of-city**: VARCHAR(30)
- **temperature-in-fahrenheit**: INTEGER
- **percent-humidity**: INTEGER
- **wind-direction**: VARCHAR(5)
- **wind-velocity**: INTEGER
- **barometer**: FLOAT
- **forecast**: VARCHAR(25)

The external program name for the function is DSN8DUWF, and the specific name is DSN8.DSN8DUWF.

Example: Find the name of and the forecast for the cities that have a temperature less than 25 degrees.

```
SELECT CITY, FORECAST
FROM TABLE(DSN8.WEATHER('prefix.SDSNIVPD(DSN8LWC)')) AS W
WHERE TEMP_IN_F < 25
ORDER BY CITY;
```
This example returns:

<table>
<thead>
<tr>
<th>City</th>
<th>Weather</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bessemer, MI</td>
<td>Slight chance of snow</td>
</tr>
<tr>
<td>Cheyenne, WY</td>
<td>Continued cooling</td>
</tr>
<tr>
<td>Helena, MT</td>
<td>Heavy snow</td>
</tr>
<tr>
<td>Pierre, SD</td>
<td>Continued cold</td>
</tr>
</tbody>
</table>
Information resources for DB2 for z/OS and related products

Information about DB2 for z/OS and products that you might use in conjunction with DB2 for z/OS is available in online information centers or on library websites.

Obtaining DB2 for z/OS publications

The current DB2 for z/OS publications are available from the following website:

http://www-01.ibm.com/support/docview.wss?uid=swg27039165

Links to the information center version and the PDF version of each publication are provided.

DB2 for z/OS publications are also available for download from the IBM Publications Center [http://www.ibm.com/shop/publications/order].

In addition, books for DB2 for z/OS are available on a CD-ROM that is included with your product shipment:

• DB2 11 for z/OS Licensed Library Collection, LK5T-8882, in English. The CD-ROM contains the collection of books for DB2 11 for z/OS in PDF format. Periodically, IBM refreshes the books on subsequent editions of this CD-ROM.

Installable information center

You can download or order an installable version of the Information Management Software for z/OS Solutions Information Center, which includes information about DB2 for z/OS, QMF, IMS, and many DB2 and IMS Tools products. You can install this information center on a local system or on an intranet server. For more information, see [http://www-01.ibm.com/support/knowledgecenter/ SSEPEK_11.0.0/com.ibm.db2z11.doc/src/alltoc/installabledzic.html]

Programming interface information

This information is intended to help you to code SQL statements. This information primarily documents General-use Programming Interface and Associated Guidance Information provided by DB2 11 for z/OS. This information also documents Product-sensitive Programming Interface and Associated Guidance Information provided by DB2 11 for z/OS.

General-use Programming Interface and Associated Guidance Information

General-use Programming Interfaces allow the customer to write programs that obtain the services of DB2 11 for z/OS.

Product-sensitive Programming Interface and Associated Guidance Information

Product-sensitive Programming Interfaces allow the customer installation to perform tasks such as diagnosing, modifying, monitoring, repairing, tailoring, or tuning of this IBM software product. Use of such interfaces creates dependencies on the detailed design or implementation of the IBM software product.

Product-sensitive Programming Interfaces should be used only for these specialized purposes. Because of their dependencies on detailed design and implementation, it is to be expected that programs written to such interfaces may need to be changed in order to run with new product releases or versions, or as a result of service.

Product-sensitive Programming Interface and Associated Guidance Information is identified where it occurs by the following markings:

Trademarks

IBM, the IBM logo, and ibm.com® are trademarks or registered marks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies.

A current list of IBM trademarks is available on the web at http://www.ibm.com/legal/copytrade.shtml

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

Microsoft, Windows, Windows NT, and the Windows logo are trademarks of Microsoft Corporation in the United States, other countries, or both.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Privacy policy considerations

IBM Software products, including software as a service solutions, (“Software Offerings”) may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering’s use of cookies is set forth below.

This Software Offering does not use cookies or other technologies to collect personally identifiable information.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

Glossary

The glossary is available in the Information Management Software for z/OS Solutions Information Center.

See the Glossary topic for definitions of DB2 for z/OS terms.
Index

Special characters

_ (underscore character) as escape character 315
- (minus sign) 246
, (comma) as decimal point 331
: (colon)
    preceding a host variable 223
! (exclamation mark) as not sign 301
? (question mark) 1698
/ (divide sign) 246
. (period) as decimal point 331
* (asterisk)
    COUNT function 356
    COUNT_BIG function 356
    multiply sign 246
    use in subselect 786
% (percent sign) as escape character 315
| | (vertical bars) 253
+ (plus sign) 246
+ (plus sign) as escape character 315
