If the ON ROLLBACK PRESERVE ROWS option was specified for the table, insert, update, and delete activity is not logged. During a ROLLBACK or ROLLBACK TO SAVEPOINT operation, all rows in the table are preserved regardless of any updates to the table since the last COMMIT statement. Any open cursors for the table do not have positions. If the declaration of the declared global temporary table was not committed, the declaration of the table is rolled back.

Effect of rollback operations on global variables: Global variables are not controlled at the transaction level. Issuing a ROLLBACK statement does not effect the contents of a global variable.

Examples

Example 1: Roll back all DB2 database changes made since the unit of recovery was started.

```
ROLLBACK WORK;
```

Example 2: After a unit of recovery started, assume that three savepoints A, B, and C were set and that C was released:

```
...
SAVEPOINT A ON ROLLBACK RETAIN CURSORS;
...
SAVEPOINT B ON ROLLBACK RETAIN CURSORS;
...
SAVEPOINT C ON ROLLBACK RETAIN CURSORS;
...
RELEASE SAVEPOINT C;
...
```

Roll back all DB2 database changes only to savepoint A:

```
ROLLBACK WORK TO SAVEPOINT A;
```

If a savepoint name was not specified (that is, ROLLBACK WORK TO SAVEPOINT), the rollback would be to the last active savepoint that was set, which is B.

SAVEPOINT

The SAVEPOINT statement sets a savepoint within a unit of recovery to identify a point in time within the unit of recovery to which relational database changes can be rolled back.

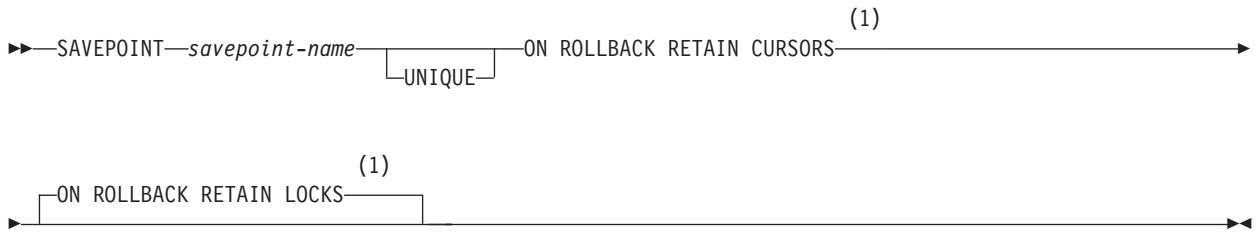
Invocation

This statement can be imbedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax



Notes:

1 These clauses can be specified in either order.

Description

savepoint-name
Names the savepoint. *savepoint-name* must not begin with 'SYS'.

UNIQUE
Specifies that the application program cannot reuse the savepoint name within the unit of recovery. An error occurs if a savepoint with the same name as *savepoint-name* already exists within the unit of recovery.

Omitting UNIQUE indicates that the application can reuse the savepoint name within the unit of recovery. If *svpt-name* identifies a savepoint that already exists within the unit of recovery and the savepoint was not created with the UNIQUE option, the existing savepoint is destroyed and a new savepoint is created. Destroying a savepoint to reuse its name for another savepoint is not the same as releasing the savepoint. Reusing a savepoint name destroys only one savepoint. Releasing a savepoint with the RELEASE SAVEPOINT statement releases the savepoint and all savepoints that have been subsequently set.

ON ROLLBACK RETAIN CURSORS
Specifies that any cursors that are opened after the savepoint is set are not tracked, and thus, are not closed upon rollback to the savepoint. Although these cursors remain open after rollback to the savepoint, they might not be usable. For example, if rolling back to the savepoint causes the insertion of a

row on which the cursor is positioned to be rolled back, using the cursor to update or delete the row results in an error.

ON ROLLBACK RETAIN LOCKS
Specifies that any locks that are acquired after the savepoint is set are not tracked, and thus, are not released on rollback to the savepoint. ON ROLLBACK RETAIN LOCKS is the default behavior.

Example

Assume that you want to set three savepoints at various points in a unit of recovery. Name the first savepoint A and allow the savepoint name to be reused. Name the second savepoint B and do not allow the name to be reused. Because you no longer need savepoint A when you are ready to set the third savepoint, reuse A as the name of the savepoint.

```
SAVEPOINT A ON ROLLBACK RETAIN CURSORS;

⋮

SAVEPOINT B UNIQUE ON ROLLBACK RETAIN CURSORS;

⋮

SAVEPOINT A ON ROLLBACK RETAIN CURSORS;
```

SELECT

The *select-statement* is the form of a query that can be directly specified in a DECLARE CURSOR statement, or prepared and then referenced in a DECLARE CURSOR statement. It can also be issued interactively using SPUFI or the command line processor which causes a result table to be displayed at your terminal. In any case, the table specified by *select-statement* is the result of the fullselect.

For a description of the SELECT statement, see “select-statement” on page 819.

SELECT INTO

The SELECT INTO statement produces a result table that contains at most one row. The statement assigns the values in that row to variables. If the table is empty, the statement does not assign values to the host variables or global variables.

Invocation

This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared.

Authorization

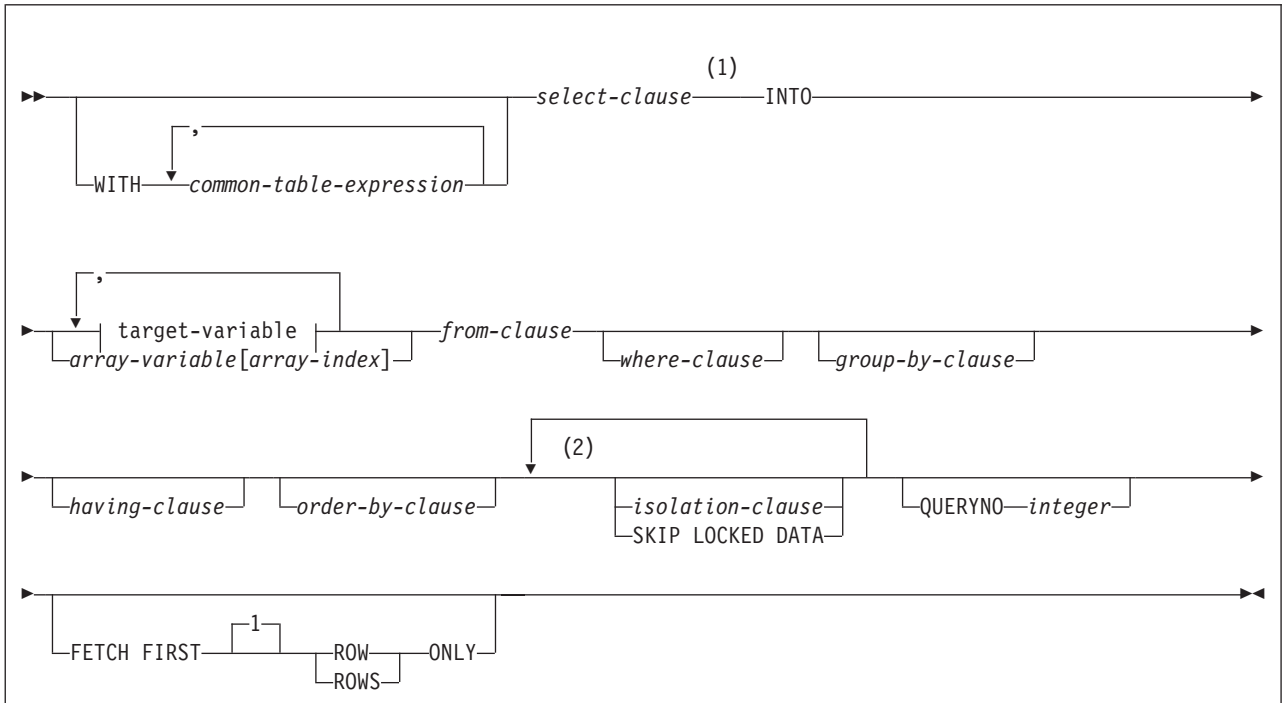
The privilege set that is defined below must include at least one of the following:

- The SELECT privilege on every table and view identified in the statement
- Ownership of every table and view identified in the statement
- READ and WRITE privileges on any global variables that are identified in the statement
- Ownership of any global variables that are identified in the statement
- DBADM authority for the database (tables only)
- DATAACCESS authority
- SYSADM authority
- SYSCTRL authority (catalog tables only)

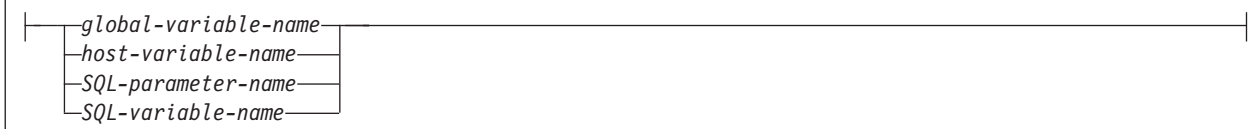
If the SELECT INTO statement includes an SQL data change statement, the privilege set must also include at least the privileges (INSERT, UPDATE, or DELETE) that are associated with that SQL data change statement on the table or view.

Privilege set: If the statement is embedded in an application program, the privilege set is the set of privileges that are held by the owner of the package.

Syntax



target-variable:



Notes:

1 The *select-clause* cannot reference both a system-period temporal table and an archive-enabled table.

2 The same clause must not be specified more than once.

Description

The table is derived by evaluating the *isolation-clause*, *from-clause*, *where-clause*, *group-by-clause*, *having-clause*, *order-by-clause*, and the *select-clause*, in this order. See Chapter 4, "Queries," on page 761 for a description of these clauses.

The tables or views identified in the statement can exist at the current server or at any DB2 subsystem with which the current server can establish a connection.

WITH *common-table-expression*
Refer to "common-table-expression" on page 820 for information about specifying a *common-table-expression*.

INTO *target-variable* **or** *array-variable*[*array-index*]
Identifies one or more targets for the assignment of output values. The number

of targets in the INTO clause must equal the number of values that are to be assigned. The first value in the result row is assigned to the first target in the list, the second value to the second target, and so on. A target variable must not be specified more than once in the INTO clause. Each assignment to a target is made in sequence through the list, according to the rules described in "Assignment and comparison" on page 121.

The value 'W' is assigned to the SQLWARN3 field of the SQLCA if the number of targets is less than the number of result column values.

If an error occurs on any assignment, the value is not assigned to the target, and no more values are assigned to the specified targets. Any values that have already been assigned remain assigned.

global-variable-name
Identifies the global variable that is the assignment target.

host-variable-name
Identifies the host variable that is the assignment target. For LOB output values, the target can be a regular host variable (if it is large enough), a LOB locator variable, or a LOB file reference variable.

SQL-parameter-name
Identifies the parameter that is the assignment target.

SQL-variable-name
Identifies the SQL variable that is the assignment target. SQL variables must be declared before they are used.

array-variable **[***array-index***]**
Specifies an array element that is the target of the assignment.

An array element must not be specified as the target for an assignment if *common-table-expression* is also specified in the statement.

[*array-index***]**
An expression that specifies which element in the array is the target of the assignment.

For an ordinary array, the array index expression must be castable to INTEGER, and must not be the null value. The index value must be between 1 and the maximum cardinality that is defined for the array.

For an associative array, the array index expression must be castable to the index data type of the associative array, and must not be the null value.

array-index must not be:

- An expression that references the CURRENT DATE, CURRENT TIME, or CURRENT TIMESTAMP special register
- A nondeterministic function
- A function that is defined with EXTERNAL ACTION
- A function that is defined with MODIFIES SQL DATA
- A sequence expression

The data type of a variable must be compatible with the value assigned to it. If the value is numeric, the variable must have the capacity to represent the integral part of the value. For a date or time value, the variable must be a character string variable of a minimum length as defined in "Assignment and comparison" on page 121.

Each assignment to a variable is made according to the rules described in "Assignment and comparison" on page 121. Assignments are made in sequence through the list.

If an error occurs as the result of an arithmetic expression in the SELECT list of a SELECT INTO statement (division by zero or overflow) or a numeric conversion error occurs, the result is the null value. As in any other case of a null value, an indicator variable must be provided and the main variable is unchanged. In this case, however, the indicator variable is set to -2. Processing of the statement continues as if the error had not occurred. (However, this error causes a positive SQLCODE.) If you do not provide an indicator variable, a negative value is returned in the SQLCODE field of the SQLCA. Processing of the statement terminates when the error is encountered.

If an error occurs, no value is assigned to the variable or to later variables, though any values that have already been assigned to variables remain assigned.

If an error occurs because the result table has more than one row, values might be assigned to the variables. If values are assigned to the variables, the row that is the source of the values is undefined and not predictable.

isolation-clause
Specifies the isolation level at which the statement is executed and, optionally, the type of locks that are acquired.

SKIP LOCKED DATA
Specifies that rows are skipped when incompatible locks are held on the row by other transactions. These rows can belong to any accessed table that is specified in the statement. SKIP LOCKED DATA can be used only when isolation CS or RS is in effect and applies only to row level or page level locks.

SKIP LOCKED DATA is ignored if it is specified when the isolation level that is in effect is repeatable read (WITH RR) or uncommitted read (WITH UR).

QUERYNO *integer*
Specifies the number to be used for this SQL statement in EXPLAIN output and trace records. The number is used for the QUERYNO columns of the plan tables for the rows that contain information about this SQL statement. This number is also used in the QUERYNO column of the SYSIBM.SYSSTMT and SYSIBM.SYSPACKSTMT catalog tables.

If the clause is omitted, the number associated with the SQL statement is the statement number assigned during precompilation. Thus, if the application program is changed and then precompiled, that statement number might change.

Using the QUERYNO clause to assign unique numbers to the SQL statements in a program is helpful:
- For simplifying the use of optimization hints for access path selection
- For correlating SQL statement text with EXPLAIN output in the plan table

For information on using optimization hints, such as enabling the system for optimization hints and setting valid hint values, and for information on accessing the plan table, see *DB2 Performance Monitoring and Tuning Guide*.

FETCH FIRST ROW ONLY *integer*
The FETCH FIRST ROW ONLY clause can be used in the SELECT INTO statement when the query can result in more than a single row. The clause

indicates that only one row should be retrieved regardless of how many rows might be in the result table. When a number is explicitly specified, it must be 1.

Using the FETCH FIRST ROW ONLY clause to explicitly limit the result table to a single row provides a way for the SELECT INTO statement to be used with a query that returns more than a single row. Using the clause helps you to avoid using a cursor when you know that you want to retrieve only one row. To influence which row is returned, you can use the *order-by-clause*. When you specify *order-by-clause*, the rows of the result are ordered and then the first row is returned. If the FETCH FIRST ROW ONLY clause is not specified and the result table contains more than a single row, an error occurs.

Notes

Assignment to targets:

The *n*th target identified by the INTO clause or described in the SQLDA corresponds to the *n*th column of the result table of the cursor. The data type of target must be compatible with its corresponding value. If the value is numeric, the target must have the capacity to represent the whole part of the value. For a datetime value, the target must be a character string variable of a minimum length as defined in "String representations of datetime values" on page 101. When the target is a host variable, if the value is null, an indicator variable must be specified.

Assignments are made in sequence through the list. Each assignment to a target is made according to the rules described in Chapter 2, "Language elements," on page 53. If the number of targets is less than the number of values in the row, the SQLWARN3 field of the SQLCA is set to 'W'. There is no warning if there are more targets than the number of result columns. If the target is a host variable and the value is null, an indicator variable must be provided. If an assignment error occurs, the value is not assigned to the target and no more values are assigned to targets. Any values that have already been assigned to targets remain assigned.

If more than one assignment is included in the same assignment statement, all expressions are evaluated before the assignments are performed. For example, a reference to a variable in an expression always uses the value of the variable prior to any assignment in the assignment statement.

Normally, you use LOB locators to assign and retrieve data from LOB columns. However, because of compatibility rules, you can also use LOB locators to assign data to targets with other data types. For more information on using locators, see Saving storage when manipulating LOBs by using LOB locators (DB2 Application programming and SQL).

A timestamp without time zone value must not be assigned to a timestamp with time zone target.

Default encoding scheme:

The default encoding scheme for the data is the value in the bind option ENCODING, which is the option for application encoding. If this statement is used with functions such as LENGTH or SUBSTRING that are operating on LOB locators, and the LOB data that is specifies by the locator is in a different encoding scheme from the ENCODING bind option, LOB materialization and character conversion occur. To avoid LOB materialization and character conversion, select the LOB data from the SYSIBM.SYSDUMMYA, SYSIBM.SYSDUMMYE, or SYSIBM.SYSDUMMYU sample table.

If the result table is empty:

If the table is empty, the statement assigns +100 to SQLCODE, '02000' to SQLSTATE, and does not assign values to the host variables or global variables.

Number of rows inserted:

If the SELECT INTO statement of the cursor contains an SQL data change statement, the SELECT INTO operation sets SQLERRD(3) to the number of rows inserted.

Examples

Example 1: Put the maximum salary in DSN8B10.EMP into the host variable MAXSALRY.

```
EXEC SQL SELECT MAX(SALARY)
  INTO :MAXSALRY
  FROM DSN8B10.EMP;
```

Example 2: Put the row for employee 528671, from DSN8B10.EMP, into the host structure EMPREC.

```
EXEC SQL SELECT * INTO :EMPREC
  FROM DSN8B10.EMP
  WHERE EMPNO = '528671'
END-EXEC.
```

Example 3: Put the row for employee 528671, from DSN8B10.EMP, into the host structure EMPREC. Assume that the row will be updated later and should be locked when the query executes.

```
EXEC SQL SELECT * INTO :EMPREC
  FROM DSN8B10.EMP
  WHERE EMPNO = '528671'
  WITH RS USE AND KEEP EXCLUSIVE LOCKS
END-EXEC.
```

Example 4: Using a SELECT INTO statement, retrieve the value of INTCOL1 from table T1 into an element in array MYINTARRAY1, which is indexed by the value of the expression INTCOL2+MYINTVAR+1.

```
SELECT INTCOL1 INTO MYINTARRAY1[INTCOL2+MYINTVAR+1]
 FROM T1
 WHERE INTCOL1 = MYINTARRAY1[INTCOL2] ;
```

SET CONNECTION

The SET CONNECTION statement establishes the database server of the process by identifying one of its existing connections.

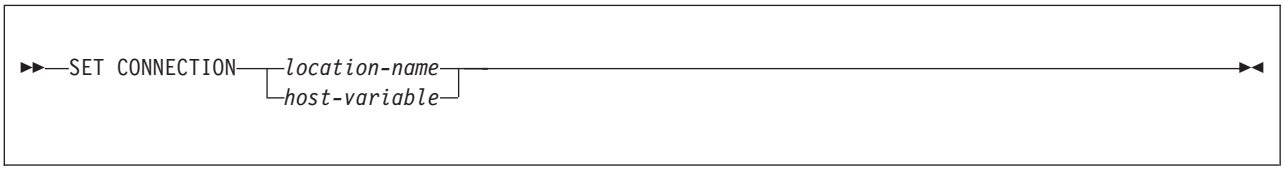
Invocation

This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared. It must not be specified in Java.

Authorization

None required.

Syntax



Description

location-name **or** *host-variable*

Identifies the SQL connection by the specified location name or the location name contained in the host variable. If a host variable is specified:

- It must be a character string variable with a length attribute that is not greater than 16. (A C NUL-terminated character string can be up to 17 bytes.)
- It must not be followed by an indicator variable.
- The location name must be left-justified within the host variable and must conform to the rules for forming an ordinary location identifier.
- If the length of the location name is less than the length of the host variable, it must be padded on the right with blanks.

Let S denote the specified location name or the location name contained in the host variable. S must identify an existing SQL connection of the application process. If S identifies the current SQL connection, the state of S and all other connections of the application process are unchanged. The following rules apply when S identifies a dormant SQL connection.

If the SET CONNECTION statement is successful:

- SQL connection S is placed in the current state.
- S is placed in the CURRENT SERVER special register.
- Information about server S is placed in the SQLERRP field of the SQLCA. If the server is an IBM product, the information has the form *pppvvrrm*, where:
  - *ppp* is:
    ARI for DB2 Server for VSE & VM
    DSN for DB2 for z/OS
    QSQ for DB2 for i
    SQL for all other DB2 products
  - *vv* is a two-digit version identifier such as '11'.

– *rr* is a two-digit release identifier such as '01'.
– *m* is a one-digit modification level.
  - Values 0, 1, 2, 3, and 4 are reserved for modification levels in conversion and enabling-new-function mode from Version 10 (CM10, CM10*, ENFM10, and ENFM10*)
  - Values 5, 6, 7, 8, and 9 are for modification levels in new-function mode.

  For example, if the server is Version 9 of DB2 for z/OS in new-function mode with the latest maintenance, the value of SQLERRP is 'DSN09015'.

- Any previously current SQL connection is placed in the dormant state.

If the SET CONNECTION statement is unsuccessful, the connection state of the application process and the states of its SQL connections are unchanged.

Notes

SET CONNECTION after CONNECT (Type 1): The use of CONNECT (Type 1) statements does not prevent the use of SET CONNECTION, but the statement either fails or does nothing because dormant SQL connections do not exist. The SQLRULES(DB2) bind option does not prevent the use of SET CONNECTION, but the statement is unnecessary because CONNECT (Type 2) statements can be used instead. Use the SET CONNECTION statement to conform to the SQL standard.

Status of locks, cursors, and prepared statements: When an SQL connection is used, made dormant, and then restored to the current state in the same unit of work, the status of locks, cursors, and prepared statements for that SQL connection reflects its last use by the application process.

Host variables: If the SET CONNECTION statement contains host variables, the contents of the host variables are assumed to be in the encoding scheme that was specified in the ENCODING parameter when the package or plan that contains the statement was bound.

Restrictions on array types and array variables: In any SQL statement other than a CALL statement, array types and array variables must not be referenced after a connection at a remote server has been established. This restriction includes an SQL statement that executes at a remote server as a result of a three-part name or alias that resolves to an object at a remote server. An exception is that an array element can be the target of a FETCH, SELECT INTO, SET *assignment-statement*, or VALUES INTO statement in an SQL routine even when the statement is executed at a remote server.

Example

Execute SQL statements at TOROLAB1, execute SQL statements at TOROLAB2, and then execute more SQL statements at TOROLAB1.

```
EXEC SQL CONNECT TO TOROLAB1;

  -- execute statements referencing objects at TOROLAB1

EXEC SQL CONNECT TO TOROLAB2;

  -- execute statements referencing objects at TOROLAB2

EXEC SQL SET CONNECTION TOROLAB1;

  -- execute statements referencing objects at TOROLAB1
```

The first CONNECT statement creates the TOROLAB1 connection, the second CONNECT statement places it in the dormant state, and the SET CONNECTION statement returns it to the current state.

SET assignment-statement

The SET *assignment-statement* statement assigns values to variables and array elements.

Invocation

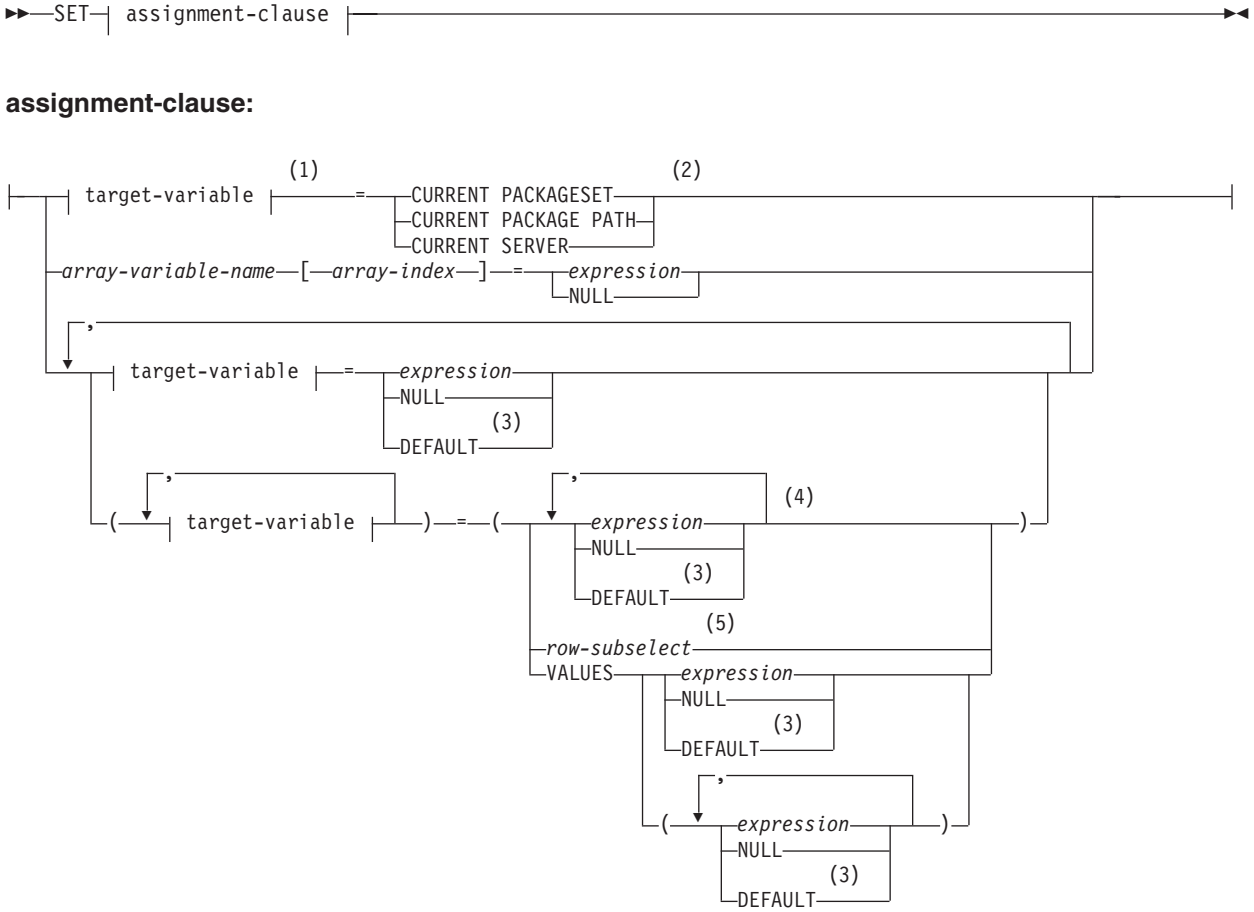
If all targets for the assignment statement are global variables, this statement can be embedded in an application program or issued interactively. It is an executable statement that can by dynamically prepared.

Otherwise, this statement can be embedded only in an application program. It is an executable statement that cannot by dynamically prepared.

Authorization

The privileges that are held by the current authorization ID must include those required to execute any of the expressions.

Syntax



target-variable:

Notes:

1 *target-variable* must not be an array type in this context.

2 When the target is not a transition variable, these special registers can be referenced only as a source value in this form of the syntax for this statement.

3 DEFAULT must only be specified when the corresponding target is a transition variable.

4 The number of source value specifications (expression, NULL, or DEFAULT) on the right side of the equal sign must match the number of target specifications on the left side of the statement.

5 *row-subselect* can be specified only in the outermost subselect within SQL PL. *target-variable* cannot be a *global-variable-name* or *transition-variable-name*.

Description

target-variable
Identifies one or more targets for the assignment of values. The number of targets must equal the number of values that are to be assigned.

The value that is to be assigned to each target variable can be specified immediately following the variable. For example:

```
variable=expression, variable=expression
```

Alternatively, sets of parentheses can be used to specify all of the target variables, and then all of the values. For example:

```
(variable,variable)=(expression,expression)
```

The value that is to be assigned to an array element must be specified immediately following the array element. For example:

```
array-variable[array-index]=expression
```

The data type of each variable in the variable list must be compatible with its corresponding result column. Each assignment to a *target-variable* is made in sequence through the list, according to the rules described in "Assignment and comparison" on page 121.

The value 'W' is assigned to the SQLWARN3 field of the SQLCA if the number of targets is less than the number of result column values.

If an error occurs on any assignment, the value is not assigned to the target, and no more values are assigned to the specified targets. Any values that have already been assigned remain assigned.

global-variable-name
Identifies the global variable that is the assignment target.

host-variable-name
Identifies the host variable that is the assignment target. For LOB output values, the target can be a regular host variable (if it is large enough), a LOB locator variable, or a LOB file reference variable.

SQL-parameter-name
Identifies the parameter that is the assignment target.

SQL-variable-name
Identifies the SQL variable that is the assignment target. SQL variables must be declared before they are used.

transition-variable-name
Identifies the column that is to be updated in the transition row. A transition variable name must identify a column in the subject table of a trigger, and is optionally qualified by a correlation name that identifies the new value.

transition-variable-name must not correspond to a begin column or end column of a BUSINESS_TIME period, and must not be specified if the statement contains a *period-clause*.

array-variable **[***array-index***]**
Specifies an array element that is the target of the assignment.

An array element must not be specified as the target for an assignment if *common-table-expression* is also specified in the statement.

[*array-index*]
An expression that specifies which element in the array is the target of the assignment.

For an ordinary array, the array index expression must be castable to INTEGER, and must not be the null value. The index value must be between 1 and the maximum cardinality that is defined for the array.

For an associative array, the array index expression must be castable to the index data type of the associative array, and must not be the null value.

array-index must not be:

- An expression that references the CURRENT DATE, CURRENT TIME, or CURRENT TIMESTAMP special register
- A nondeterministic function
- A function that is defined with EXTERNAL ACTION
- A function that is defined with MODIFIES SQL DATA
- A sequence expression

expression
Specifies the value that is to be assigned to the corresponding assignment target. The expression is any expression of the type described in "Expressions" on page 240, except that it cannot contain a reference to the CURRENT PACKAGESET, CURRENT PACKAGE PATH, or CURRENT SERVER special register. All expressions are evaluated before any result is assigned to a target. If an expression refers to a variable or array element that is used in the list of assignment targets, the value of the variable or array element in the expression is the value of the variable or array element prior to any assignments.

Each assignment to a target is made according to the assignment rules described in "Assignment and comparison" on page 121. When the target variables and expressions are in the following form, the first value is assigned to the first target variable in the list, the second value is assigned to the second target variable in the list, and so on.

```
(target-variable,target-variable,...)=(expression,expression,...)
```

NULL Specifies the null value and can only be specified for host variables that have an associated indicator variable.

VALUES
Specifies the values that are to be assigned to the corresponding assignment targets. When more than one value is specified, the values must be enclosed in parentheses. Each value can be an expression or NULL, as previously described. The following syntaxes are equivalent:

- (*target-variable*, *target-variable*) = (VALUES(*expression*, NULL))
- (*target-variable*, *target-variable*) = (*expression*, NULL)

The CURRENT APPLICATION ENCODING SCHEME, CURRENT PACKAGESET, CURRENT PACKAGE PATH, or CURRENT SERVER special registers can be referenced only in

a SET *assignment-statement* statement or SQL PL *assignment-statement* statement that results in the assignment of a single target.

A parameter marker must not be specified.

row-subselect
A subselect that returns a single row. The number of columns corresponds to the number of target variables that are specified for assignment. Each result column value is assigned to the corresponding variable. If the result of the row subselect is no rows, then null values are assigned. An error is returned if there is more than one row in the result. *row-subselect* can be specified only in the outermost subselect within SQL PL. The target variable must not be a global variable or transition variable.

Notes

Assignment to targets:
If more than one assignment is included in the same assignment statement, all expressions are evaluated before the assignments are performed. For example, a reference to a variable in an expression always uses the value of the variable prior to any assignment in the assignment statement.

Normally, you use LOB locators to assign and retrieve data from LOB columns. However, because of compatibility rules, you can also use LOB locators to assign data to targets with other data types. For more information on using locators, see Saving storage when manipulating LOBs by using LOB locators (DB2 Application programming and SQL).

Default encoding scheme:
The default encoding scheme for the data is the value in the bind option ENCODING, which is the option for application encoding. If this statement is used with functions such as LENGTH or SUBSTRING that are operating on LOB locators, and the LOB data that is specifies by the locator is in a different encoding scheme from the ENCODING bind option, LOB materialization and character conversion occur. To avoid LOB materialization and character conversion, select the LOB data from the SYSIBM.SYSDUMMYA, SYSIBM.SYSDUMMYE, or SYSIBM.SYSDUMMYU sample table.

Examples

Example 1: Set the host variable HVL to the value of the CURRENT PATH special register.

```
SET :HVL = CURRENT PATH;
```

Example 2: Set the host variable PATH to the contents of the SQL PATH special register, the host variable XTIME to the local time at the current server, and the host variable MEM to the current member of the data sharing environment.

```
SET :SERVER = CURRENT PATH,
    :XTIME = CURRENT TIME,
    :MEM = CURRENT MEMBER;
```

Example 3: Set the host variable DETAILS to a portion of a LOB value, using a LOB expression with a LOB locator to refer the extracted portion of the value.

```
SET :DETAILS = SUBSTR(:LOCATOR,1,35);
```

If the LOB data that is specified by the LOB locator LOCATOR is in a different encoding scheme from the value of the ENCODING bind option, and you want to avoid LOB materialization and character conversion, use the following statement instead of the SET statement:

```
SELECT SUBSTR(:LOCATOR,1,35)
   INTO :DETAILS
   FROM SYSIBM.SYSDUMMYU;
```

Example 4: Set host variable HV1 to the results of external function CALC_SALARY and host variable HV2 to the value of special register CURRENT PATH. Use an indicator value with HV1 in case CALC_SALARY returns a null value.

```
SET (:HV1:IND1, :HV2) =
    (CALC_SALARY(:HV3, :HF4), CURRENT PATH);
```

Example 5: Assume that you want to create a before trigger that sets the salary and commission columns to default values for newly inserted rows in the EMPLOYEE table and that you will define the trigger only with NEW in the REFERENCING clause. Assign the default values to the SALARY and COMMISSION columns.

```
SET (SALARY, COMMISSION) = (50000, 8000);
```

Example 6: Assume that you want to create a before trigger that detects any commission increases greater than 10% for updated rows in the EMPLOYEE table and limits the commission increase to 10%. You will define the trigger with both OLD and NEW in the REFERENCING clause. Limit an increase to the COMMISSION column to 10%.

```
SET NEWROW.COMMISSION = 1.1 * OLDROW.COMMISSION;
```

Example 7: Suppose that the associative array variable CANADACAPITALS has array type CAPITALSARRAY. Use SET *assignment-statement* statements to assign values to CANADACAPITALS.

```
SET CANADACAPITALS['British Columbia'] = 'Victoria';
SET CANADACAPITALS['Alberta'] = 'Edmonton';
SET CANADACAPITALS['Manitoba'] = 'Winnipeg';
SET CANADACAPITALS['Ontario'] = 'Toronto';
SET CANADACAPITALS['Nova Scotia'] = 'Halifax';
```

In the CANADACAPITALS array, the array index values are province names, and the associated array element values are the names of the corresponding capital cities. The order in which values are assigned to associative array elements does not matter. The elements of an associative array are stored in the array in ascending order of the associated array index values.

Example 8: Suppose that the associative array variables CANADACAPITALSA and CANADACAPITALSB have array type CAPITALSARRAY. The following SET *assignment-statement* statements have been used to assign values to CANADACAPITALSA.

```
SET CANADACAPITALSA['British Columbia'] = 'Victoria';
SET CANADACAPITALSA['Alberta'] = 'Edmonton';
SET CANADACAPITALSA['Manitoba'] = 'Winnipeg';
SET CANADACAPITALSA['Ontario'] = 'Toronto';
SET CANADACAPITALSA['Nova Scotia'] = 'Halifax';
```

Use a single SET *assignment-statement* statement to assign all of the values that are in CANADACAPITALSA to CANADACAPITALSB.

```
SET CANADACAPITALSB = CANADACAPITALSA;
```

Example 9: Suppose that P_PHONENUMBERS SQL array variable is defined as an ordinary array. Set P_PHONENUMBERS to an array of fixed numbers.

```
SET P_PHONENUMBERS = ARRAY[9055553907, 4165554213, 4085553678];
```

Example 10: Set the SQL array variable P_PHONENUMBERS to an array of numbers that are retrieved from the PHONENUMBER table.

```
SET P_PHONENUMBERS =
 ARRAY [SELECT NUMBER
 FROM PHONENUMBERS
 WHERE EMPID = 624];
```

Example 11: Suppose that no values have been assigned to SQL array variable P_PHONENUMBERS. Assign the value of SQL variable P_MYNUMBER to the first and tenth elements of P_PHONENUMBERS. After the first assignment, the cardinality of P_PHONENUMBERS is 1. After the second assignment, the cardinality is 10, and elements 2 to 9 have been implicitly assigned the null value.

```
SET P_PHONENUMBERS[1]  = P_MYNUMBER;
SET P_PHONENUMBERS[10] = P_MYNUMBER;
```

SET CURRENT APPLICATION COMPATIBILITY

The SET CURRENT APPLICATION COMPATIBILITY statement assigns a value to the CURRENT APPLICATION COMPATIBILITY special register. This special register allows users to control the package compatibility level behavior for dynamic SQL.

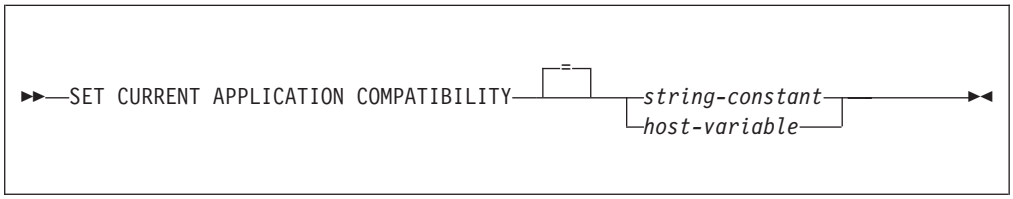
Invocation

This statement can be embedded only in an application program. It is an executable statement that cannot be dynamically prepared.

Authorization

None required.

Syntax



Description

string-constant
The following values are supported:

V10R1 The dynamic SQL statements in the package have V10R1 compatibility behavior.

V11R1 The dynamic SQL statements in the package will V11R1 compatibility behavior. This value is only allowed in new-function mode.

host-variable
A variable with a data type of CHAR or VARCHAR. The value of *host-variable* must not be null and must represent a valid release compatibility level.

The value must:
- Be left-aligned within the *host-variable*
- Be padded on the right with blanks if its length is less than the *host-variable*

Examples

The following examples set the CURRENT APPLICATION COMPATIBILITY special register to 'V10R1' (in the second example, Host variable HV1 = 'V10R1').

```
EXEC SQL SET CURRENT APPLICATION COMPATIBILITY = 'V10R1';
EXEC SQL SET CURRENT APPLICATION COMPATIBILITY = :HV1;
```

Related reference:

"CURRENT APPLICATION COMPATIBILITY" on page 161

SET CURRENT APPLICATION ENCODING SCHEME

The SET CURRENT APPLICATION ENCODING SCHEME statement assigns a value to the CURRENT APPLICATION ENCODING SCHEME special register. This special register allows users to control which encoding scheme will be used for dynamic SQL statements after the SET statement has been executed.

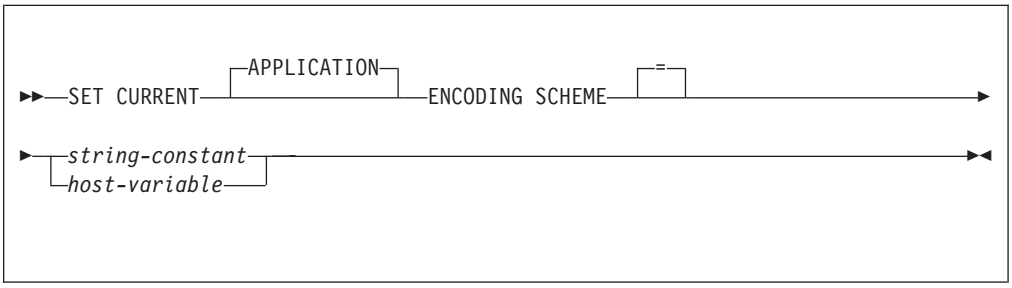
Invocation

This statement can be embedded only in an application program. It is an executable statement that cannot be dynamically prepared.

Authorization

None required.

Syntax



Description

string-constant
A character string constant that represents a valid encoding scheme (ASCII, EBCDIC, UNICODE, or a character representation of a number between 1 and 65533).

host variable
A variable with a data type of CHAR or VARCHAR. The value of *host-variable* must not be null and must represent a valid encoding scheme or a character representation of a number between 1 and 65533). An associated indicator variable must not be provided.

The value must:
- Be left justified within the host variable
- Be padded on the right with blanks if its length is less than that of the host variable

Examples

The following examples set the CURRENT APPLICATION ENCODING SCHEME special register to 'EBCDIC' (in the second example, Host variable HV1 = 'EBCDIC').

```
EXEC SQL SET CURRENT APPLICATION ENCODING SCHEME = 'EBCDIC';
EXEC SQL SET CURRENT ENCODING SCHEME  = :HV1;
```

Related reference:

"CURRENT APPLICATION ENCODING SCHEME" on page 162

SET CURRENT DEBUG MODE

The SET CURRENT DEBUG MODE statement assigns a value to the CURRENT DEBUG MODE special register.

The special register sets the default value for the DEBUG MODE option for the following statements:

- CREATE FUNCTION statements that define an SQL scalar function
- ALTER FUNCTION statements that create or replace a version of an SQL scalar function
- CREATE PROCEDURE statements that define a native SQL or Java procedure
- ALTER PROCEDURE statements that create or replace a version of a native SQL procedure

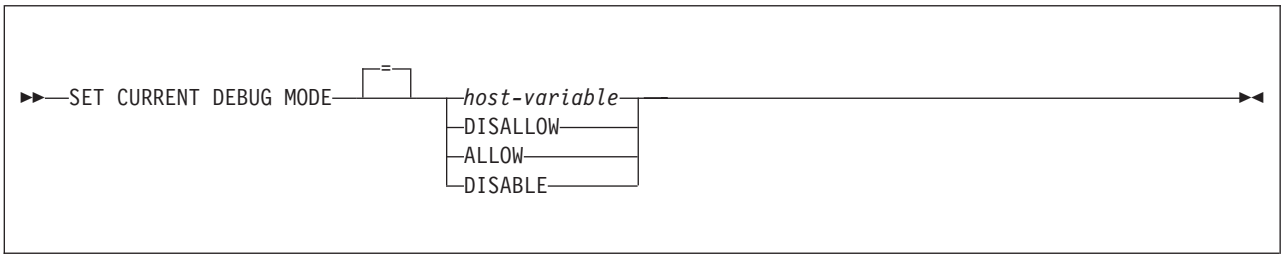
Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax



Description

host-variable
Specifies a host variable that contains the debugging option. The host variable must conform to the following rules:

- Be a CHAR, VARCHAR, GRAPHIC, or VARGRAPHIC variable. The actual length of the contents of the host variable must not exceed the length of the special register.
- Include a keyword value of DISALLOW, ALLOW, or DISABLE that is left justified
- Be padded on the right with blanks if the host variable is a fixed length character
- Not contain lowercase letters or characters that cannot be specified in an ordinary identifier
- Not be empty or contain only blanks
- Not be the null value

DISALLOW
Specifies that DISALLOW DEBUG MODE is the default option for CREATE statements when defining an SQL scalar function, a native SQL procedure, or a

Java procedure, or ALTER statements that create or replace a version of an SQL scalar function or a native SQL procedure.

ALLOW
Specifies that ALLOW DEBUG MODE is the default option for CREATE statements when defining an SQL scalar function, a native SQL procedure, a Java procedure, or ALTER statements that create or replace a version of an SQL scalar function or a native SQL procedure.

DISABLE
Specifies that DISABLE DEBUG MODE is the default option for CREATE statements when defining an SQL scalar function, a native SQL procedure, a Java procedure, or ALTER statements that create or replace a version of an SQL scalar function or a native SQL procedure.

Examples

Example: The following statement sets the CURRENT DEBUG MODE special register so that the default option for CREATE PROCEDURE statements will be ALLOW DEBUG MODE:

```
SET CURRENT DEBUG MODE = ALLOW;
```

Related reference:

"CURRENT DEBUG MODE" on page 171

SET CURRENT DECFLOAT ROUNDING MODE

The SET CURRENT DECFLOAT ROUNDING MODE statement assigns a value to the CURRENT DECFLOAT ROUNDING MODE special register. The special register sets the default rounding mode that is used with decimal floating point values (DECFLOAT).

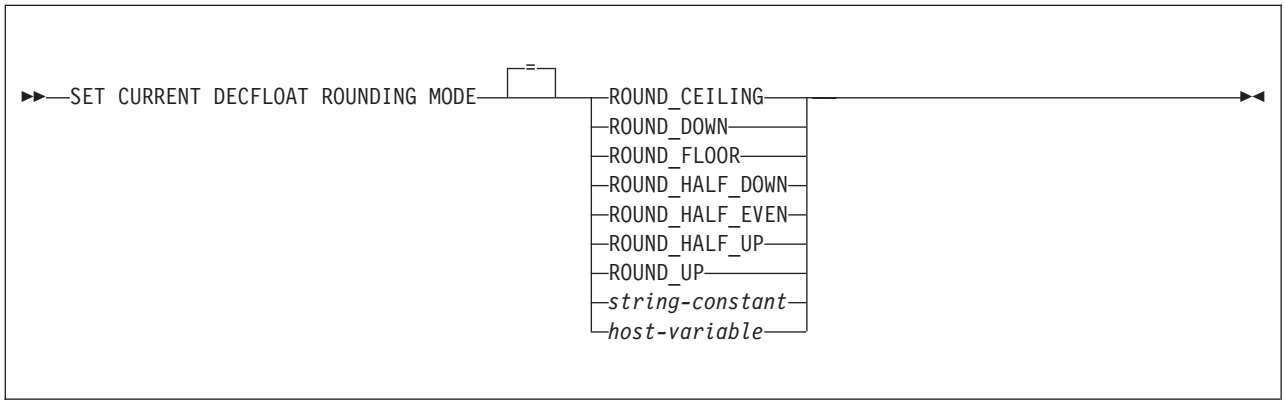
Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax



Description

ROUND_CEILING
Round towards positive infinity. If all of the discarded digits are zero or if the sign is negative, the result is unchanged other than the removal of discarded digits. Otherwise, the result coefficient is incremented by 1 (round up).

ROUND_DOWN
Round towards 0 (truncation). The discarded digits are ignored.

ROUND_FLOOR
Round towards negative infinity. If all of the discarded digits are zero or if the sign is positive, the result is unchanged other than the removal of discarded digits. Otherwise, the sign is negative and the result coefficient is incremented by 1 (round down).

ROUND_HALF_DOWN
Round to nearest value; if values are equidistant, rounds down. If the discarded digits represent greater than half (0.5) of the value of a number in the next left position, the result coefficient is incremented by 1 (round up). Otherwise, the discarded digits are ignored. This rounding mode is not recommended when creating a portable application because it is not supported by the IEEE draft standard for floating-point arithmetic.

ROUND_HALF_EVEN
Round to nearest value; if values are equidistant, round so that the final digit

is even. If the discarded digits represent greater than half (0.5) of the value of a number in the next left position, the result coefficient is incremented by 1 (round up). If the discarded digits represent less than half of the value, the result coefficient is not adjusted (that is, the discarded digits are ignored). Otherwise, the result coefficient is unaltered if its rightmost digit is even, or is incremented by 1 (round up) if its rightmost digit is odd (to make an even digit).

ROUND_HALF_UP
Round to nearest value; if values are equidistant, round up. If the discarded digits represent greater than or equal to half (0.5) of the value of a number in the next left position, the result coefficient is incremented by 1 (round up). Otherwise the discarded digits are ignored.

ROUND_UP
Round away from 0. If all of the discarded digits are zero, the result is unchanged other than the removal of discarded digits. Otherwise, the result coefficient is incremented by 1 (round up). This rounding mode is not recommended when creating a portable application because it is not supported by the IEEE draft standard for floating-point arithmetic.

string-constant
Specifies a string constant that contains a specification of the rounding mode. The string-constant must have the following characteristics:

- Must be a string constant. The actual length of the contents of the string constant, after trailing blanks have been removed, must not exceed 19 characters.
- Must not be the null value.
- Must not contain lower case letters or characters that cannot be specified in an ordinary identifier.
- Must specify one of the seven rounding mode keywords as a string constant.

host-variable
Specifies a variable that contains a specification of the rounding mode. The variable must have the following characteristics:

- Must have a length, after trailing blanks have been removed, that does not exceed 19 bytes.
- Must not be followed by an indicator variable.
- Must not be a CLOB or DBCLOB.
- Must include a rounding mode that is left justified and conforms to the rules for forming an ordinary identifier.
- Must not contain lower case letters or characters that cannot be specified in an ordinary identifier.
- Must be padded on the right with blanks if the variable is a fixed length string.
- Must contain one of the seven rounding mode keywords.

Examples

Example: The following statement sets the CURRENT DECFLOAT ROUNDING MODE to ROUND_CEILING, using a string constant and a keyword.

```
SET CURRENT DECFLOAT ROUNDING MODE = ROUND_CEILING;
```

Related reference:
"CURRENT DECFLOAT ROUNDING MODE" on page 172

SET CURRENT DEGREE

The SET CURRENT DEGREE statement assigns a value to the CURRENT DEGREE special register.

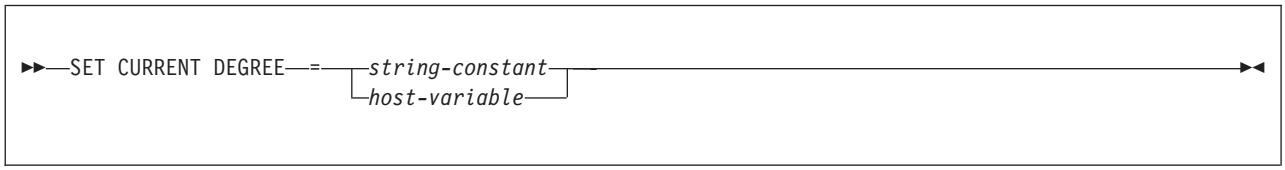
Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax



Description

The value of CURRENT DEGREE is replaced by the value of the string constant or host variable. The value must be a character string that is not longer than 3 bytes and the value must be 'ANY', '1', or '1 '.

Notes

If the value of CURRENT DEGREE is '1' when a query is dynamically prepared, the execution of that query will not use parallel operations. If the value of CURRENT DEGREE is 'ANY' when a query is dynamically prepared, the execution of that query can involve parallel operations.

For distributed applications, the default value at the server is used unless the requesting application issues the SQL statement SET CURRENT DEGREE. For requests using DRDA, the SET CURRENT DEGREE statement must be within the scope of the CONNECT statement.

The value specified in the SET CURRENT DEGREE statement remains in effect until it is changed by the execution of another SET CURRENT DEGREE statement or until deallocation of the application process. For applications that connect to DB2 using the call attachment facility, the value of register CURRENT DEGREE can be requested to remain in effect for a longer duration. For more information, see the description of the call attachment facility CONNECT statement in *DB2 Application Programming and SQL Guide*.

Examples

Example 1: The following statement inhibits parallel operations:

```
SET CURRENT DEGREE = '1';
```

Example 2: The following statement allows parallel operations:

```
SET CURRENT DEGREE = 'ANY';
```

Related concepts:

Parallel processing (DB2 Performance)

SET CURRENT EXPLAIN MODE

The SET CURRENT EXPLAIN MODE statement assigns a value to the CURRENT EXPLAIN MODE special register.

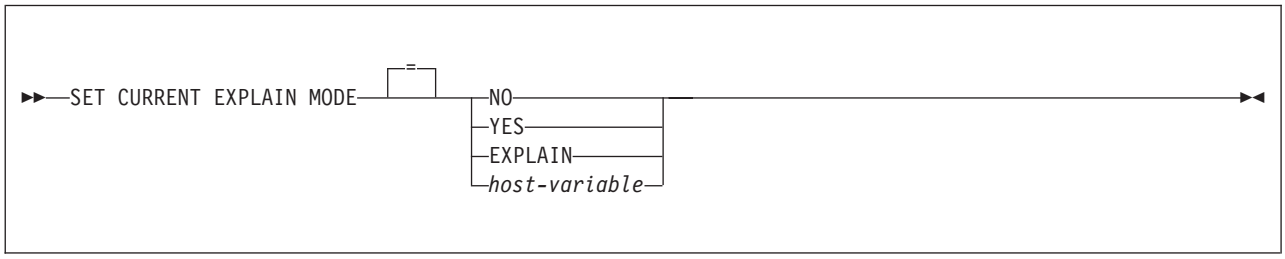
Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax



Description

This statement replaces the value of the CURRENT EXPLAIN MODE special register with the value of the specified keyword or host variable.

NO Specifies that no EXPLAIN information is captured. NO is the initial value of the EXPLAIN MODE special register.

YES
Enables the EXPLAIN facility and causes EXPLAIN information to be inserted into the EXPLAIN tables for eligible dynamic SQL statements after the statement is prepared and executed. All dynamic SQL statements are compiled and executed normally.

EXPLAIN
Enables the EXPLAIN facility and causes EXPLAIN information to be captured for any eligible dynamic SQL statement after the statement is prepared. This setting behaves similarly to YES, however, dynamic statements, except for SET statements, are not executed.

host-variable
host-variable must be a CHAR or VARCHAR value and must be NO, YES, or EXPLAIN. Leading blanks are not allowed. All input values must be uppercase, must be left justified within the host variable, and must be padded on the right with blanks if the length of the value is less than the length of the host variable.

For values YES and EXPLAIN, prepared statements are not saved into the dynamic statement cache.

Examples

Example 1: The following statement sets the CURRENT EXPLAIN MODE special register, so that EXPLAIN information will be captured for any subsequent eligible dynamic SQL statements during execution.

```
SET CURRENT EXPLAIN MODE = YES;
```

Related reference:

"CURRENT EXPLAIN MODE" on page 175

SET CURRENT GET_ACCEL_ARCHIVE

The SET CURRENT GET_ACCEL_ARCHIVE statement changes the value of the CURRENT GET_ACCEL_ARCHIVE special register.

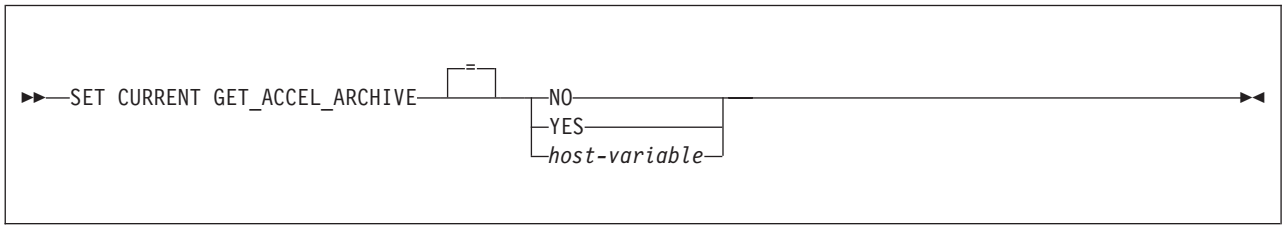
Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax



Description

NO Specifies that if a table is archived in an accelerator server, and a query references that table, the query does not use the data that is archived.

YES
Specifies that if a table is archived in an accelerator server, and a query references that table, the query uses the data that is archived.

host-variable
A variable with a data type of CHAR or VARCHAR. The length must not exceed 255 bytes. Valid values are YES or NO. If *host-variable* has an associated indicator variable, the value of that indicator variable must not indicate a null value. The value of *host-variable* must be left justified and must be padded on the right with blanks.

Examples

The following statement sets the CURRENT GET_ACCEL_ARCHIVE special register to NO to indicate that when a table is archived in an accelerator server, the table reference does not include the archived data.

```
SET CURRENT GET_ACCEL_ARCHIVE=NO;
```

Related reference:

"CURRENT GET_ACCEL_ARCHIVE" on page 176

SET CURRENT LOCALE LC_CTYPE

The SET CURRENT LOCALE LC_CTYPE statement assigns a value to the CURRENT LOCALE LC_CTYPE special register. The special register allows control over the LC_CTYPE locale for statements that use a built-in function that refers to a locale, such as LCASE, UCASE, and TRANSLATE (with a single argument).

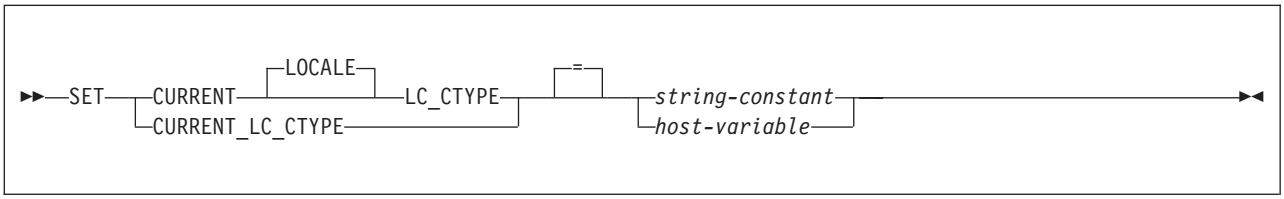
Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax



Description

The value of CURRENT LOCALE LC_CTYPE is replaced by the value specified.

string-constant
A character string constant that must not be longer than 50 bytes and must represent a valid locale.

host-variable
A variable with a data type of CHAR or VARCHAR and a length that is not longer than 50 bytes. The value of *host-variable* must not be null and must represent a valid locale. If the host variable has an associated indicator variable, the value of the indicator variable must not indicate a null value.

The locale must:

- Be left justified within the host variable
- Be padded on the right with blanks if its length is less than that of the host variable

A locale can be specified in uppercase characters, lowercase characters, or a combination of the two. For more information, see CURRENT LOCALE LC_CTYPE.

Note: The existence of a locale is not validated when the CURRENT LOCALE LC_CTYPE special register is set. For example, a locale name that is misspelled is not detected, which could affect the way subsequent SQL operates. When the special register value is used at execution time, an error is returned if the locale does not exist. For example, if the LOWER function is invoked without specifying a locale name, the special register determines the locale that is used.

Examples

Example 1: Set the CURRENT LOCALE LC_CTYPE special register to the locale 'En_US'.

```
EXEC SQL SET CURRENT LOCALE LC_CTYPE = 'En_US';
```

Example 2: Set the CURRENT LOCALE LC_CTYPE special register to the value of host variable HV1, which contains 'Fr_FR@EURO'.

```
EXEC SQL SET CURRENT LOCALE LC_CTYPE = :HV1;
```

Related concepts:

z/OS: Unicode Services User's Guide and Reference

Related reference:

"CURRENT LOCALE LC_CTYPE" on page 177

SET CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION

The SET CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION statement changes the value of the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION special register.

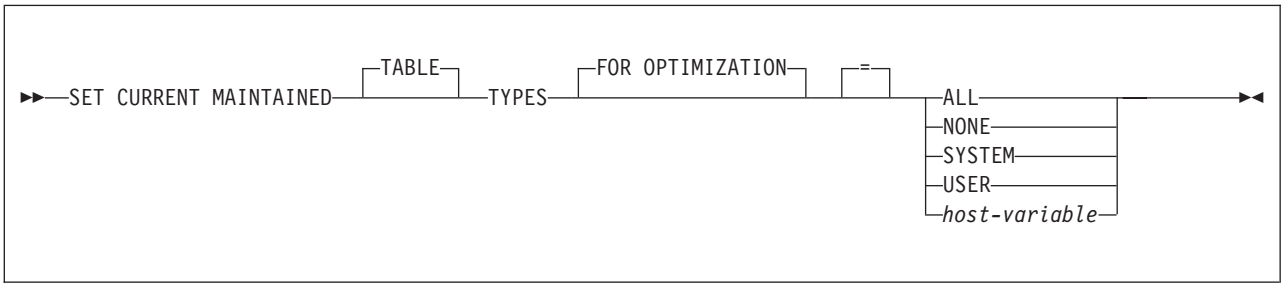
Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax



Description

The value indicates which materialized query tables that are enabled for optimization are considered when optimizing the processing of dynamic SQL queries.

ALL
Indicates that all materialized query tables will be considered.

NONE
Indicates that no materialized query tables will be considered.

SYSTEM
Indicates that only system-maintained materialized query tables that are refresh deferred will be considered.

USER
Indicates that only user-maintained materialized query tables that are refresh deferred will be considered.

host-variable
A variable of type CHAR or VARCHAR. The length of the contents of *host-variable* must not exceed 255 bytes. It cannot be set to null. If *host-variable* has an associated indicator variable, the value of that indicator variable must not indicate a null value.

The characters of *host-variable* must be left justified. The content of the host variable must be a string that would match what can be specified as keywords for the special register in the exact case intended as there is no conversion to uppercase characters.

Notes

The CURRENT REFRESH AGE special register needs to be set to a value other than zero in order for the specified types of objects to be considered for optimizing the processing of dynamic SQL queries.

The CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION special register affects dynamic statement cache matching.

Examples

Example 1: The following statement sets the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION special register:

```
SET CURRENT MAINTAINED TABLE TYPES ALL;
```

Example 2: The following example retrieves the current value of the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION special register into the host variable called CURMAINTYPES.

```
EXEC SQL VALUES (CURRENT MAINTAINED TABLE TYPES) INTO :CURMAINTYPES;
```

The value would be ALL if set by the previous example.

Example 3: The following example resets the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION special register so that no materialized query tables can be considered to optimize the processing of dynamic SQL queries.

```
SET CURRENT MAINTAINED TABLE TYPES NONE;
```

Related reference:

"CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION" on page 179

SET CURRENT OPTIMIZATION HINT

The SET CURRENT OPTIMIZATION HINT statement assigns a value to the CURRENT OPTIMIZATION HINT special register.

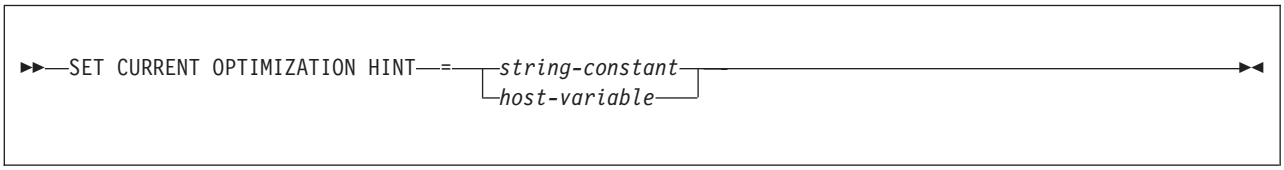
Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax



Description

The value of special register CURRENT OPTIMIZATION HINT is replaced by the value of the string constant or host variable. The value must be a character string that is not longer than 128 bytes.

Notes

Using the OPTIMIZATION HINT special register: The CURRENT OPTIMIZATION HINT special register specifies whether optimization hints are used in determining the access path of dynamic statements. An empty string or all blanks indicates that DB2 uses normal optimization techniques and ignores optimization hints.

Example

Example 1: Assume that string constant 'NOHYB' identifies a user-defined optimization hint in owner.PLAN_TABLE. Set the CURRENT OPTIMIZATION HINT special register so that DB2 uses this optimization hint to generate the access path for dynamic statements.

```
SET CURRENT OPTIMIZATION HINT = 'NOHYB';
```

If you set the register this way, DB2 validates and considers information in the rows in owner.PLAN_TABLE where the value in the OPTHINT column matches 'NOHYB' for dynamic SQL statements.

Example 2: Clear the CURRENT OPTIMIZATION HINT special register by specifying an empty string.

```
SET CURRENT OPTIMIZATION HINT = '';
```

Related reference:

"CURRENT OPTIMIZATION HINT" on page 181

SET CURRENT PACKAGE PATH

The SET CURRENT PACKAGE PATH statement assigns a value to the CURRENT PACKAGE PATH special register.

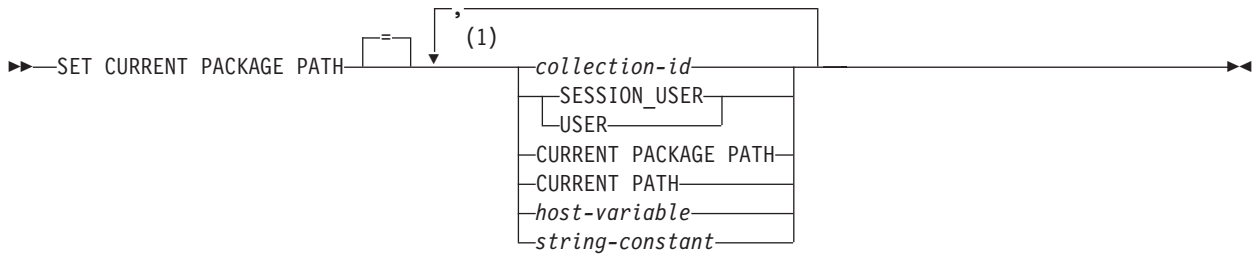
Invocation

This statement can be embedded only in an application program. It is an executable statement that cannot be dynamically prepared.

Authorization

None required.

Syntax



Notes:

1 SESSION_USER (or USER), CURRENT PACKAGE PATH, and CURRENT PATH can each be specified only once on the right side of the statement.

Description

The value of CURRENT PACKAGE PATH is replaced by the values specified.

collection-id
Identifies a collection. *collection-id* must not be a delimited identifier that is empty or contains only blanks.

SESSION_USER or USER
Specifies the value of the SESSION_USER (USER) special register.

CURRENT PACKAGE PATH
Specifies the value of the CURRENT PACKAGE PATH special register before the execution of the SET CURRENT PACKAGE PATH statement.

CURRENT PATH
Specifies the value of the CURRENT PATH special register.

host-variable
Specifies a host variable that contains one or more collection IDs, separated by commas. The host variable must:

- Have a data type of CHAR or VARCHAR. The actual length of the contents of the host variable must not exceed the maximum length of the CURRENT PACKAGE PATH special register.
- Not be the null value if an indicator variable is provided.

- Contain an empty or blank string, or one or more collection IDs that are separated by commas.
- Be padded on the right with blanks if the host variable is fixed-length, or if the actual length of the host variable is longer than the content.
- Not contain a delimited identifier that is empty or contains only blanks.

string-constant
Specifies a string constant that contains one or more collection IDs, separated by commas. The string constant must:

- Have a length that does not exceed the maximum length of the CURRENT PACKAGE PATH special register.
- Contain an empty or blank string, or one or more collection IDs separated by commas.
- Not contain a delimited identifier that is empty or contains only blanks.

Notes

Contents of host variable or string constant: The contents of a host variable or string constant are interpreted as a list of collection IDs if the value contains at least one comma. If multiple collection IDs are specified, they must be separated by commas. Each collection ID in the list must conform to the rules for forming an ordinary identifier or be specified as a delimited identifier.

Checking for the existence of collections: No validation that the collections exist is made at the time that the CURRENT PACKAGE PATH special register is set. For example, a collection ID that is misspelled is not detected, which could affect the way subsequent SQL operates. At package execution time, authorization to the specific package is checked, and if this authorization check fails, an error is issued.

Resulting contents of the special register: The special register string is built by taking each collection ID specified and removing trailing blanks, delimiting with double quotation marks, doubling any double quotation marks within the collection ID as necessary, and then separating each collection ID by a comma. If the same collection ID appears more than once in the list, the first occurrence of the collection is used, and a warning is issued. The length of the resulting list cannot exceed the length of the special register. For example, assume that the following statements are issued:

```
SET CURRENT PACKAGE PATH = MYPKGS, "ABC E", SYSIBM
SET :HVPKLIST = CURRENT PACKAGE PATH
```

These statements result in the value of the host variable being set to: "MYPKGS", "ABC E", "SYSIBM".

A collection ID that does not conform to the rules for an ordinary identifier must be specified as a delimited collection ID and must not be specified within a host variable or string constant.

Considerations for keywords: A difference exists between specifying a single keyword, such as SESSION_USER, as a single keyword or as a delimited identifier. To indicate that the current value of a special register that is specified as a single keyword should be used in the package path, specify the name of the special register as a keyword. If you specify the name of the special register as a delimited identifier, it is interpreted as a collection ID of that value. For example, assume that the current value of the SESSION_USER special register is SMITH and that the following statement is issued:

```
SET CURRENT PACKAGE PATH = SYSIBM, SESSION_USER, "USER"
```

The result is that the value of the CURRENT PACKAGE PATH special register is set to: "SYSIBM, "SMITH", "USER".

Specifying a collection ID in an SQL procedure: Because a host variable (SQL variable) in an SQL procedure does not begin with a colon, DB2 uses the following rules to determine whether a value that is specified in a SET PACKAGE PATH = *name* statement is a variable or a collection ID:

- If *name* is the same as a parameter or SQL variable in the SQL procedure, DB2 uses *name* as a parameter or SQL variable and assigns the value in *name* to the package path.
- If *name* is not the same as a parameter or SQL variable in the SQL procedure, DB2 uses *name* as a collection ID and assigns and the value in *name* is the package path.

DRDA classification: The SET CURRENT PACKAGE PATH statement is executed by the database server and, therefore, is classified as a non-local SET statement in DRDA. The SET CURRENT PACKAGE PATH statement requires a new level of DRDA support. If SET CURRENT PACKAGE PATH is issued when connected to the local server, the SET CURRENT PACKAGE PATH special register at the local server is set. Otherwise, when SET CURRENT PACKAGE PATH is issued when connected to a remote server, the SET CURRENT PACKAGE PATH special register at the remote server is set.

Examples

Example 1: Set the CURRENT PACKAGE PATH special register to the list of collections COLL4 and COLL5, where :hvar1 contains the value COLL4,COLL5:

```
SET CURRENT PACKAGE PATH :hvar1;
```

The value of CURRENT PACKAGE PATH is set to the following two collection IDs: "COLL4","COLL5".

Example 2: Set the CURRENT PACKAGE PATH special register to the list of collections: COLL1, COLL#2, COLL3, COLL4, and COLL5, where :hvar1 contains the value COLL4,COLL5:

```
SET CURRENT PACKAGE PATH = "COLL1","COLL#2","COLL3", :hvar1;
```

The value of CURRENT PACKAGE PATH is set to the following five collection IDs: "COLL1,"COLL#2","COLL3","COLL4","COLL5".

Example 3: Clear the CURRENT PACKAGE PATH special register.

```
SET CURRENT PACKAGE PATH = ' ';
```

Example 4: In preparation of calling a stored procedure that is named SUMARIZE, temporarily add two collections, COLL_PROD1" and "COLL_PROD2, to the end of the CURRENT PACKAGE PATH special register (the values of the collections are in host variables :prodcoll1 and prodcoll2, respectively). Because the stored procedure SUMARIZE is not defined with a COLLID value and is defined with INHERIT SPECIAL REGISTERS, the stored procedure will inherit the value of CURRENT PACKAGE PATH. When the stored procedure returns, set the value of the CURRENT PACKAGE PATH special register back to its original value.

```
SET :oldCPP = CURRENT PACKAGE PATH;
SET CURRENT PACKAGE PATH = CURRENT PACKAGE PATH, :prodcoll1, :prodcoll2;
CALL SUMARIZE(:V1,:V2);
SET CURRENT PACKAGE PATH = :oldCPP;
```

Related reference:

"CURRENT PACKAGE PATH" on page 182

SET CURRENT PACKAGESET

The SET CURRENT PACKAGESET statement assigns a value to the CURRENT PACKAGESET special register.

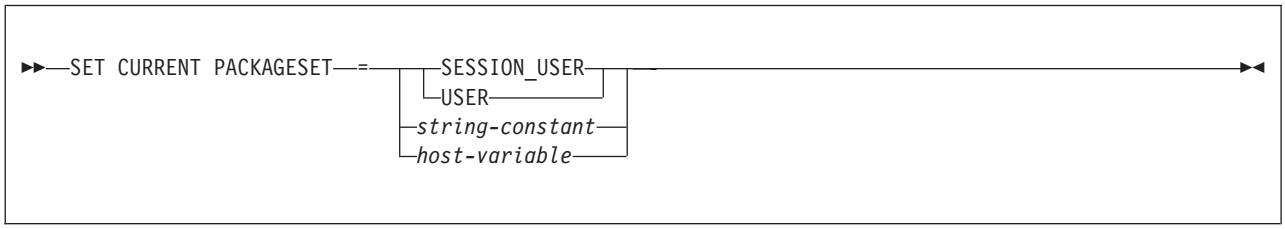
Invocation

This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared.

Authorization

None required.

Syntax



Description

The value of CURRENT PACKAGESET is replaced by the value of the SESSION_USER special register, *string-constant*, or *host-variable*. The value specified by *string-constant* or *host-variable* must be a character string that is not longer than 128 bytes.

Notes

Selection of plan elements: A *plan element* is a DBRM that has been bound into the plan or a package that is implicitly or explicitly identified in the package list of the plan. Plan elements contain the control structures used to execute certain SQL statements.

Since a plan can have many elements, one of the first steps involved in the execution of an SQL statement that requires a control structure is the selection of the plan element that contains its control structure. The information used by DB2 to select plan elements includes the value of CURRENT PACKAGESET.

SET CURRENT PACKAGESET is used to specify the collection ID of a package that exists at the current server. SET CURRENT PACKAGESET is optional and should not be used without an understanding of the following rules for selecting a plan element.

If the CURRENT PACKAGESET special register is an empty string, DB2 searches for a DBRM or a package in one of these sequences:

At the local location (if CURRENT SERVER is blank or explicitly names that location), the order is:

1. All DBRMs bound directly to the plan
2. All packages that have already been allocated for the application process

3. All unallocated packages explicitly named in, and all collections completely included in, the package list of the plan. The order of search is the order those packages are named in the package list.

At a remote location, the order is:

1. All packages that have already been allocated for the application process at that location
2. All unallocated packages explicitly named in, and all collections completely included in, the package list of the plan, whose locations match the value of CURRENT SERVER. The order of search is the order those packages are named in the package list.

If the special register CURRENT PACKAGESET is set, DB2 skips the check for programs that are part of the plan and uses the value of CURRENT PACKAGESET as the collection. For example, if CURRENT PACKAGESET contains COL5, then DB2 uses COL5.PROG1.*timestamp* for the search. For additional information, see *DB2 Application Programming and SQL Guide*.

DRDA classification: SET CURRENT PACKAGESET is executed by the requester and is therefore classified as a local SET statement in DRDA.

CURRENT PACKAGESET special register with stored procedures and user-defined functions: The initial value of the CURRENT PACKAGESET special register in a stored procedure or user-defined function is the value of the COLLID parameter with which the stored procedure or user-defined function was defined. If the routine was defined without a value for the COLLID parameter, the value of the special register is inherited from the calling program. A stored procedure or user-defined function can use the SET CURRENT PACKAGESET statement to change the value of the special register. This allows the routine to select the version of the DB2 package that is used to process the SQL statements in a called routine that is not defined with a COLLID value.

When control returns from the stored procedure to the calling program, the special register CURRENT PACKAGESET is restored to the value it contained before the stored procedure was called.

Examples

Example 1: Limit the plan element selection to packages in the PERSONNEL collection at the current server.

```
EXEC SQL SET CURRENT PACKAGESET = 'PERSONNEL';
```

Example 2: Eliminate collections as a factor in plan element selection.

```
EXEC SQL SET CURRENT PACKAGESET = '';
```

Related reference:

"CURRENT PACKAGESET" on page 183

SET CURRENT PRECISION

The SET CURRENT PRECISION statement assigns a value to the CURRENT PRECISION special register.

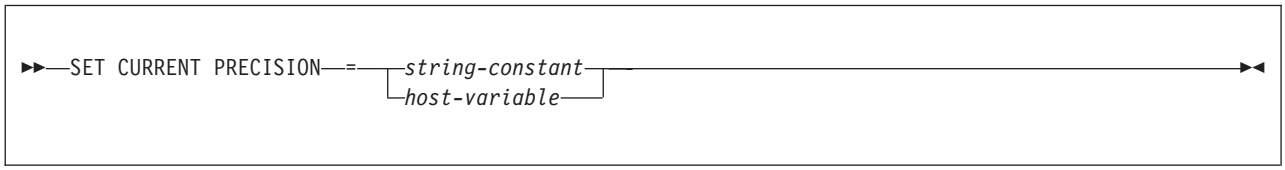
Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax



Description

This statement replaces the value of the CURRENT PRECISION special register with the value of the string constant or host variable. The value must be a character string 5 bytes in length. The value must be 'DEC15,' 'DEC31,' or 'Dpp.s', where 'pp' is either 15 or 31 and 's' is a number between 1 and 9. If the form 'Dpp.s' is used, 'pp' represents the precision that will be used with the rules that are used for DEC15 or DEC31, and 's' represents the minimum divide scale to use for division operations. The separator used in the form 'Dpp.s' can be either the '.'or the ',' character, regardless of the setting of the default decimal point.

Example

Set the CURRENT PRECISION special register so that subsequent statements that are prepared use DEC15 rules for decimal arithmetic.

```
EXEC SQL SET CURRENT PRECISION = 'DEC15';
```

Related reference:

"CURRENT PRECISION" on page 185

SET CURRENT QUERY ACCELERATION

The SET CURRENT QUERY ACCELERATION statement changes the value of the CURRENT QUERY ACCELERATION special register.

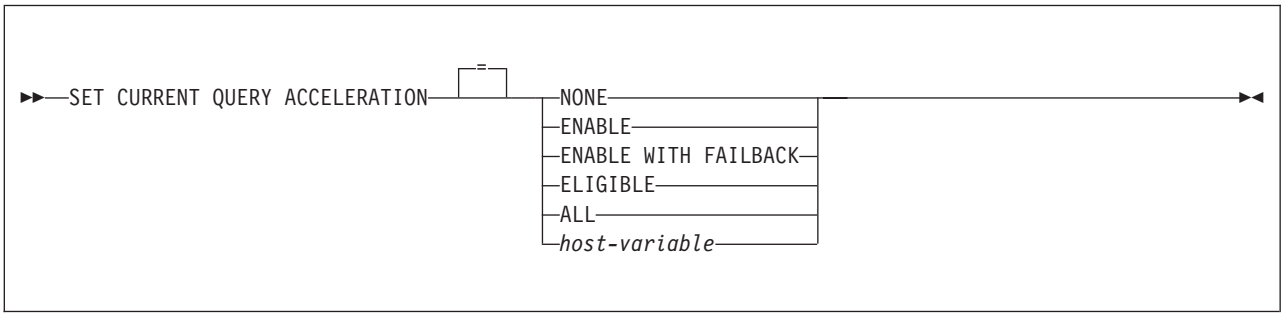
Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax



Description

NONE
Specifies that no query acceleration is done.

ENABLE
Specifies that queries are accelerated only if DB2 determines that it is advantageous to do so. If an accelerator failure occurs while a query is running or if the accelerator returns an error, DB2 returns a negative SQLCODE to the application.

ENABLE WITH FAILBACK
Specifies that queries are accelerated only if DB2 determines that it is advantageous to do so. If the accelerator returns an error during the PREPARE or first OPEN for the query, DB2 executes the query without the accelerator. If the accelerator returns an error during the PREPARE or first OPEN for the query, DB2 executes the query without the accelerator. If the accelerator returns an error during a FETCH or a subsequent OPEN, DB2 returns the error to the user and does not execute the query.

ELIGIBLE
Specifies that queries are accelerated if they are eligible for acceleration. DB2 does not use cost information to determine whether to accelerate the queries. Queries that are not eligible for acceleration are executed by DB2. If an accelerator failure occurs while a query is running or if the accelerator returns an error, DB2 returns a negative SQLCODE to the application.

ALL
Specifies that queries are accelerated if they are eligible for acceleration. DB2 does not use cost information to determine whether to accelerate the queries. Queries that are not eligible for acceleration are not executed by DB2, and an

SQL error is returned. If an accelerator failure occurs while a query is running or if the accelerator returns an error, DB2 returns a negative SQLCODE to the application.

host-variable
A variable with a data type of CHAR or VARCHAR. The length must not exceed 255 bytes. Valid values are NONE, ENABLE, or ENABLE WITH FAILBACK. If *host-variable* has an associated indicator variable, the value of that indicator variable must not indicate a null value. The value of *host-variable* must be left justified and must be padded on the right with blanks.

Examples

The following statement sets the CURRENT QUERY ACCELERATION special register to NONE to indicate that no acceleration is done.

```
SET CURRENT QUERY ACCELERATION NONE;
```

Related reference:

"CURRENT QUERY ACCELERATION" on page 186

SET CURRENT REFRESH AGE

The SET CURRENT REFRESH AGE statement changes the value of the CURRENT REFRESH AGE special register.

The CURRENT REFRESH AGE value corresponding to ANY (99 999 999 999 999) cannot be used in timestamp arithmetic operations because the result would be outside the valid range of dates.

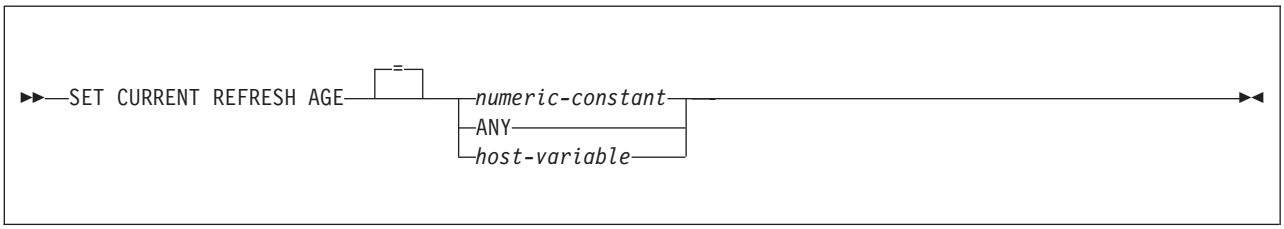
Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax



Description

numeric-constant
A DECIMAL(20,6) value representing a timestamp duration. The value must be 0 or 99 999 999 999 999, the partial seconds of which is ignored and thus can be any value.

0
Indicates that query optimization using materialized query tables will not be attempted.

99999999999999
Indicates that any materialized query tables identified by the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION special register may be used to optimize the processing of a query. This value represents 9999 years, 99 months, 99 days, 99 hours, 99 minutes, and 99 seconds.

ANY
Shorthand for 99999999999999.

host-variable
A variable of type DECIMAL(20,6) or other type that is assignable to DECIMAL(20,6). It cannot be set to null. If *host-variable* has an associated indicator variable, the value of that indicator variable must not indicate a null value. The value of *host-variable* must be 0 or 99 999 999 999 999, the partial seconds of which is ignored and thus can be any value.

Notes

Materialized query tables created or altered with DISABLE QUERY OPTIMIZATION specified are not eligible for automatic query rewrite. Thus, they are not affected by the setting of this special register.

Setting the CURRENT REFRESH AGE special register to a value other than zero should be done with caution. Allowing a materialized query table that may not represent the values of the underlying base table to be used to optimize the processing of a query may produce results that do not accurately represent the data in the underlying table. This situation may be acceptable when you know the underlying data has not changed or you are willing to accept the degree of error in the results based on your knowledge of the data.

Examples

Example: Set the CURRENT REFRESH AGE special register to 99 999 999 999 999 to indicate that any materialized query tables identified by the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION special register can be used to optimize the processing of a query.

```
SET CURRENT REFRESH AGE ANY;
```

Related reference:

"CURRENT REFRESH AGE" on page 187

SET CURRENT ROUTINE VERSION

The SET CURRENT ROUTINE VERSION statement assigns a value to the CURRENT ROUTINE VERSION special register. The special register sets the override value for the version identifier of native SQL procedures when they are invoked.

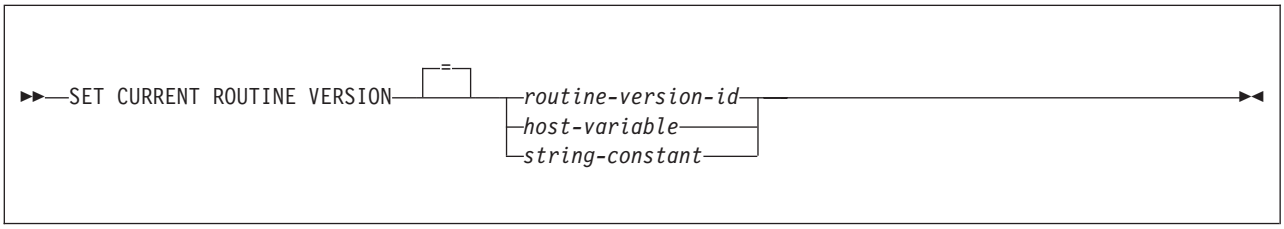
Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax



Description

routine-version-id
Specifies a routine version identifier.

host-variable
Specifies a host variable that contains a version identifier. The host variable must conform to the following rules:

- Be a CHAR, VARCHAR, GRAPHIC, or VARGRAPHIC variable. The actual length of the contents of the host variable must not exceed the length of a version identifier.
- Include a routine version identifier that is left justified and conforms to the rules for forming an ordinary identifier or a delimited identifier, or must be blank or empty.
- Be padded on the right with blanks if the host variable is a fixed length character.
- Not be empty or contain only blanks if the identifier is delimited.
- Not be the null value.

string-constant
Specifies a string constant that contains a version identifier. The string constant must conform to the following rules:

- Have a length that does not exceed the length of a *routine-version-id*.
- Include a routine version identifier that is left justified and conforms to the rules for forming an ordinary identifier or a delimited identifier, or must be blank or an empty string
- Not be empty or contain only blanks if the identifier is delimited

Notes

Resetting the special register: To reset the special register, specify an empty string constant, a string of blanks, or a host variable that is empty or contains only blanks. A routine version override is not in effect when the special register is reset.

Implications of using the special register: Setting the CURRENT ROUTINE VERSION special register to a version identifier will affect all SQL procedures that are subsequently invoked using CALL statements that specify the name of the procedure using a host variable, until the value of CURRENT ROUTINE VERSION is changed. If a version of the procedure that is identified by the version identifier in the special register exists for an SQL procedure that is being invoked, that version of the procedure is used. Otherwise, the currently active version of the procedure (as noted in the catalog) is used.

When you use the CURRENT ROUTINE VERSION special register to test a version of one or more native SQL procedures, you should use a routine version identifier that is a value other than the default value (V1) on the CREATE PROCEDURE statement. This will avoid having the special register affect more procedures that you intend when testing a new version of a procedure. For example, assume that you want to run version VER2 of procedure P1, and procedure P1 invokes another procedure, P2. If a version exists for both procedures P1 and P2 with the routine version identifier VER2, that version will be used for both procedures.

Examples

Example: The following statement sets the CURRENT ROUTINE VERSION special register so that the override value for the version identifier of native SQL procedures will be the value that is specified in the host variable *rvid*:

```
SET CURRENT ROUTINE VERSION = :rvid;
```

Related reference:

"CURRENT ROUTINE VERSION" on page 188

SET CURRENT RULES

The SET CURRENT RULES statement assigns a value to the CURRENT RULES special register.

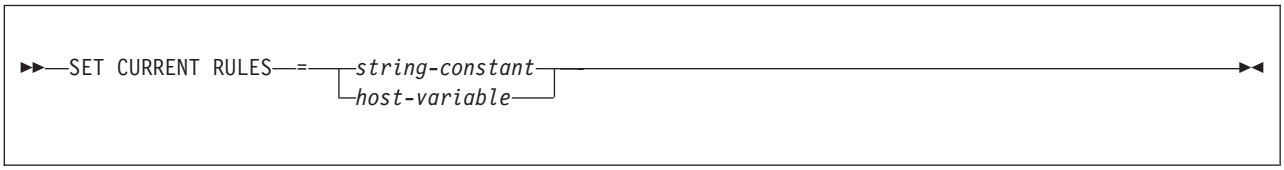
Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax



Description

This statement replaces the value of the CURRENT RULES special register with the value of the string constant or host variable. The value must be a character string that is 3 bytes in length, and the value must be 'DB2' or 'STD'.

Notes

For the effect of the values 'DB2' and 'STD' on the execution of certain SQL statements, see “CURRENT RULES” on page 189.

Example

Set the SQL rules to be followed to DB2.

```
EXEC SQL SET CURRENT RULES = 'DB2';
```

Related reference:

“CURRENT RULES” on page 189

SET CURRENT SQLID

The SET CURRENT SQLID statement assigns a value to the CURRENT SQLID special register.

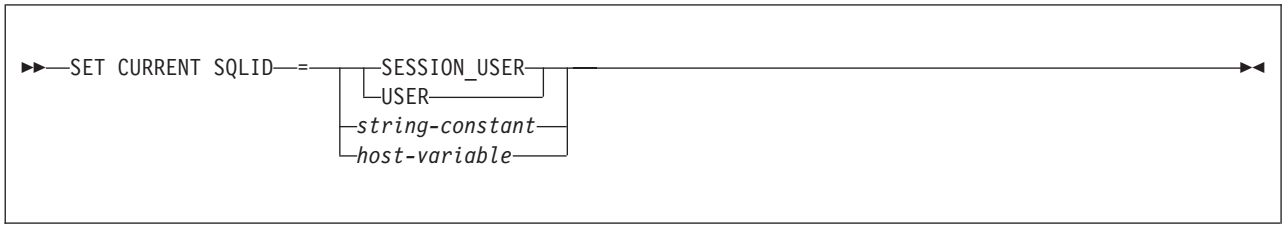
Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared. The value to which special register CURRENT SQLID is set is used as the SQL authorization ID for dynamic SQL statements only if DYNAMICRULES run behavior is in effect. The CURRENT SQLID value is ignored for the other DYNAMICRULES behaviors.

Authorization

If any of the authorization IDs of the process has SYSADM authority, CURRENT SQLID can be set to any value when the system parameter, SEPARATE SECURITY, is set to NO. Otherwise, the specified value must be equal to one of the authorization IDs of the application process. This rule always applies, even when SET CURRENT SQLID is a static statement.CURRENT SQLID cannot be set to the name of a role.

Syntax



Description

The value of CURRENT SQLID is replaced by the value of SESSION_USER, *string-constant*, or *host-variable*. The value specified by a *string-constant* or *host-variable* must be a character string that contains 8 characters or less. Unless some authorization ID of the process has SYSADM authority, the value must be equal to one of the authorization IDs of the process.

Notes

Effect on authorization IDs: SET CURRENT SQLID does not change the primary authorization ID of the process.

If the SET CURRENT SQLID statement is executed in a stored procedure or user-defined function package that has a dynamic SQL behavior other than run behavior, the SET CURRENT SQLID statement does not affect the authorization ID that is used for dynamic SQL statements in the package. The dynamic SQL behavior determines the authorization ID. For more information, see the discussion of DYNAMICRULES in *DB2 Command Reference*.

Effect on special register CURRENT PATH: When the value of the PATH special register depends on the value of the CURRENT SQLID special register, any changes to the CURRENT SQLID special register are not reflected in the value of

the PATH special register until a commit operation is performed or a SET PATH statement is issued to change the SQL path to use the new value of the CURRENT SQLID.

DRDA classification: SET CURRENT SQLID is executed by the database server and is therefore classified as a non-local SET statement in DRDA.

Examples

Example 1: Set the CURRENT SQLID to the primary authorization ID.

```
SET CURRENT SQLID = SESSION_USER;
```

SET CURRENT TEMPORAL BUSINESS_TIME

The SET CURRENT TEMPORAL BUSINESS_TIME statement changes the value of the CURRENT TEMPORAL BUSINESS_TIME special register.

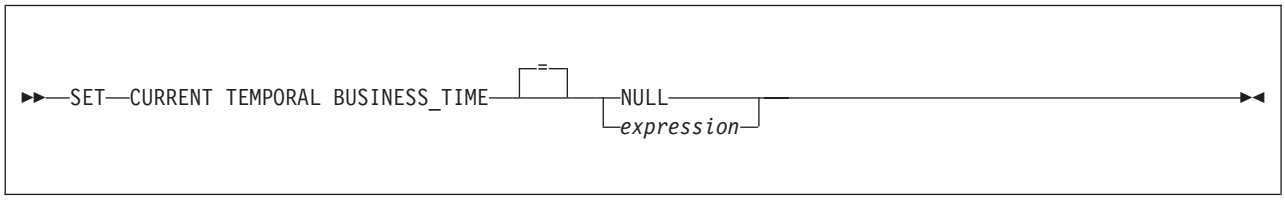
Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax



Description

NULL
Specifies the null value.

expression
Specifies an expression that returns the null value or the value of one of the following built-in data types:
- Timestamp
- Character string
- Graphic string

If the expression is a character or graphic string, it must meet the following requirements:
- It must not be a CLOB or DBCLOB.
- The value of the expression must be a valid character-string or graphic-string representation of a timestamp.
- The result of the expression must be castable to TIMESTAMP(12).

expression can contain any of the following supported operands:
- Constant
- Special register
- Variable (host variable, SQL parameter, SQL variable, or global variable)
- Scalar function whose arguments are supported operands
- CAST specification where the cast operand is a supported operand
- Expression that uses arithmetic operators and operands

Related information:

"String representations of datetime values" on page 101

"Casting between data types" on page 111

Notes

Transactions

The SET CURRENT TEMPORAL BUSINESS_TIME statement is not a committable operation. The ROLLBACK statement has no effect on CURRENT TEMPORAL BUSINESS_TIME.

Effects on other special registers

The setting of the CURRENT TEMPORAL BUSINESS_TIME special register does not affect other special registers, such as the CURRENT DATE and CURRENT TIMESTAMP special registers.

Examples

Example of setting the special register to a valid value

Both of the following statements set the CURRENT TEMPORAL BUSINESS_TIME special register to '2008-01-06-00.00.00.000000000000'.

```
SET CURRENT TEMPORAL BUSINESS_TIME = TIMESTAMP('2008-01-01') + 5 DAYS ;
SET CURRENT TEMPORAL BUSINESS_TIME = '2008-01-06-00.00.00.000000000000';
```

Example of how setting the special register affects subsequent SQL statements

In the following example, the first statement sets the CURRENT TEMPORAL BUSINESS_TIME special register to last month. Assume that table att1 is an application-period temporal table. The setting of the CURRENT TEMPORAL BUSINESS_TIME special register affects the update of att1.

```
SET CURRENT TEMPORAL BUSINESS_TIME = CURRENT TIMESTAMP - 1 MONTH
UPDATE att1 SET c1 = 5 WHERE pk = 100
```

Assume that the att1 table has columns bt_begin and bt_end to indicate the beginning and end of the BUSINESS_TIME period. In this example, DB2 interprets the UPDATE statement as follows:

```
UPDATE att1 SET c1 = 5 WHERE pk = 100
AND bt_begin <= CURRENT TEMPORAL BUSINESS_TIME
AND bt_end > CURRENT TEMPORAL BUSINESS_TIME
```

Example of setting the special register so that it does not affect subsequent SQL statements

The following statement sets the CURRENT TEMPORAL BUSINESS_TIME special register to the null value. Subsequent SQL statements that reference application-period temporal tables are not affected by the CURRENT TEMPORAL BUSINESS_TIME special register.

```
SET CURRENT TEMPORAL BUSINESS_TIME = NULL
```

Related concepts:

"Data types" on page 80

Related reference:

"CURRENT TEMPORAL BUSINESS_TIME" on page 194

SET CURRENT TEMPORAL SYSTEM_TIME

The SET CURRENT TEMPORAL SYSTEM_TIME statement changes the value of the CURRENT TEMPORAL SYSTEM_TIME special register.

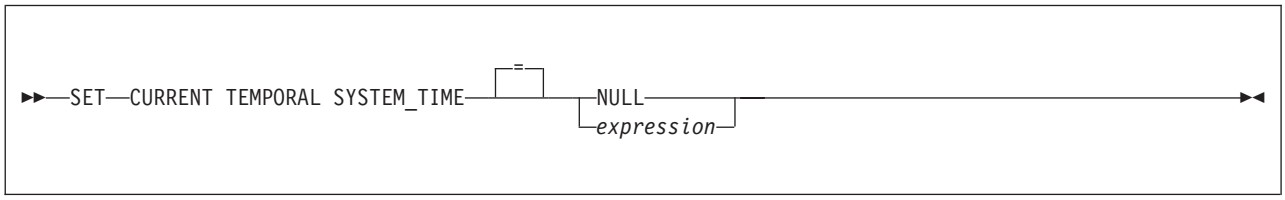
Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax



Description

NULL
Specifies the null value.

expression
Specifies an expression that returns the null value or the value of one of the following built-in data types:
- Timestamp
- Character string
- Graphic string

If the expression is a character or graphic string, it must meet the following requirements:
- It must not be a CLOB or DBCLOB.
- The value of the expression must be a valid character-string or graphic-string representation of a timestamp.
- The result of the expression must be castable to TIMESTAMP(12).

expression can contain any of the following supported operands:
- Constant
- Special register
- Variable (host variable, SQL parameter, SQL variable, or global variable)
- Scalar function whose arguments are supported operands
- CAST specification where the cast operand is a supported operand
- Expression that uses arithmetic operators and operands

Related information:

"String representations of datetime values" on page 101

"Casting between data types" on page 111

Notes

Transactions

The SET CURRENT TEMPORAL SYSTEM_TIME statement is not a committable operation. The ROLLBACK statement has no effect on CURRENT TEMPORAL SYSTEM_TIME.

Effects on other special registers

The setting of the CURRENT TEMPORAL SYSTEM_TIME special register does not affect other special registers, such as the CURRENT DATE and CURRENT TIMESTAMP special registers.

Examples

Example of setting the special register to a valid value

Both of the following statements set the CURRENT TEMPORAL SYSTEM_TIME special register to '2008-01-06-00.00.00.000000000000'.

```
SET CURRENT TEMPORAL SYSTEM_TIME = TIMESTAMP('2008-01-01') + 5 DAYS;
SET CURRENT TEMPORAL SYSTEM_TIME = '2008-01-06-00.00.00.000000000000';
```

Example of setting the special register so that it does not affect subsequent SQL statements

The following statement sets the CURRENT TEMPORAL SYSTEM_TIME special register to the null value. Subsequent SQL statements that reference system-period temporal tables are not affected by the CURRENT TEMPORAL SYSTEM_TIME special register.

```
SET CURRENT TEMPORAL SYSTEM_TIME = NULL
```

Related concepts:

"Data types" on page 80

Related reference:

"CURRENT TEMPORAL SYSTEM_TIME" on page 196

SET ENCRYPTION PASSWORD

The SET ENCRYPTION PASSWORD statement sets the value of the encryption password and, optionally, the password hint. The encryption and decryption built-in functions use this password and password hint for data encryption unless the functions are invoked with an explicitly specified password and hint. The password is not tied to DB2 authentication and is used only for data encryption.

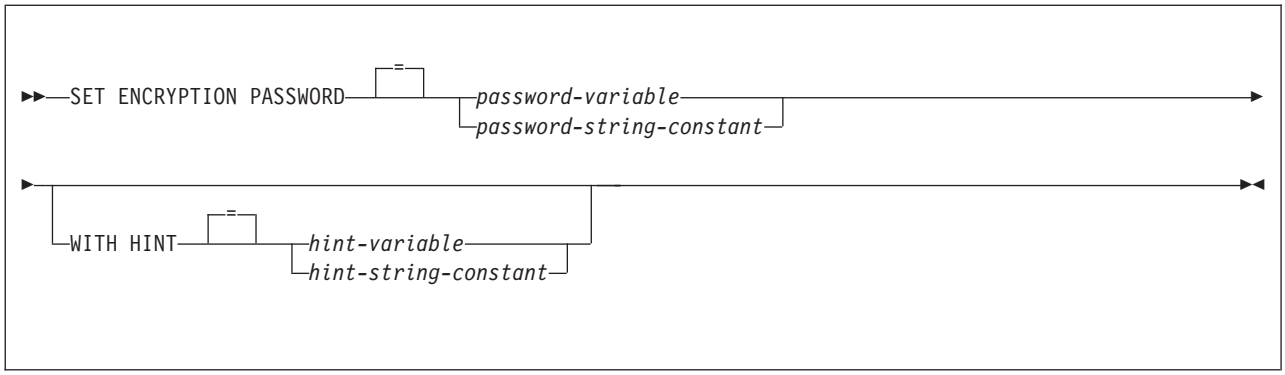
Invocation

The statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax



Description

password-variable
Specifies a variable that contains an encryption password. The variable:

- Must be a CHAR or VARCHAR variable. The actual length of the contents of the variable must be between 6 and 127 inclusive or must be an empty string. If an empty string is specified, the default encryption password is set to no value.
- Must not be the null value.
- All characters are case-sensitive and are not converted to uppercase characters.

password-string-constant
A character constant that contains an encryption password. The length of the constant must be between 6 and 127 inclusive or must be an empty string. If an empty string is specified, the default encryption password is set to no value. All characters are case-sensitive and are not converted to uppercase characters.

WITH HINT
Indicates that a value is specified that will help you remember passwords (for example, 'Ocean' as a hint to remember 'Pacific'). If a hint value is specified, the hint is used as the default for encryption functions. The hint can subsequently be retrieved for an encrypted value using the GETHINT function.

If this clause is not specified and a hint is not explicitly specified on the encryption function, no hint will be embedded in encrypted data result.

hint-variable
Specifies a variable that contains an encryption password hint. The variable:

- Must be a CHAR or VARCHAR variable. The actual length of the contents of the variable must not be greater than 32. If an empty string is specified, the default encryption password hint is set to an empty string.
- Must not be the null value.
- All characters are case-sensitive and are not converted to uppercase characters.

hint-string-constant
A character string constant that contains an encryption password hint. The length of the constant must not be greater than 32. If the value is an empty string, the default encryption password hint is set to an empty string.

Notes

Normal DB2 mechanisms are used to transmit the host variable or constant to the database server.

Examples

Example 1: Set the ENCRYPTION PASSWORD to the value in :hv1. Do not specify a hint for the password.

```
SET ENCRYPTION PASSWORD = :hv1
```

Example 2: Set the ENCRYPTION PASSWORD to the value in :hv1. Specify the value in :hv2 as the hint for the password.

```
SET ENCRYPTION PASSWORD = :hv1 WITH HINT :hv2
```

Related reference:

"ENCRYPTION PASSWORD" on page 201

"ENCRYPT_TDES" on page 464

"DECRYPT_BINARY, DECRYPT_BIT, DECRYPT_CHAR, and DECRYPT_DB" on page 451

SET PATH

The SET PATH statement assigns a value to the CURRENT PATH special register.

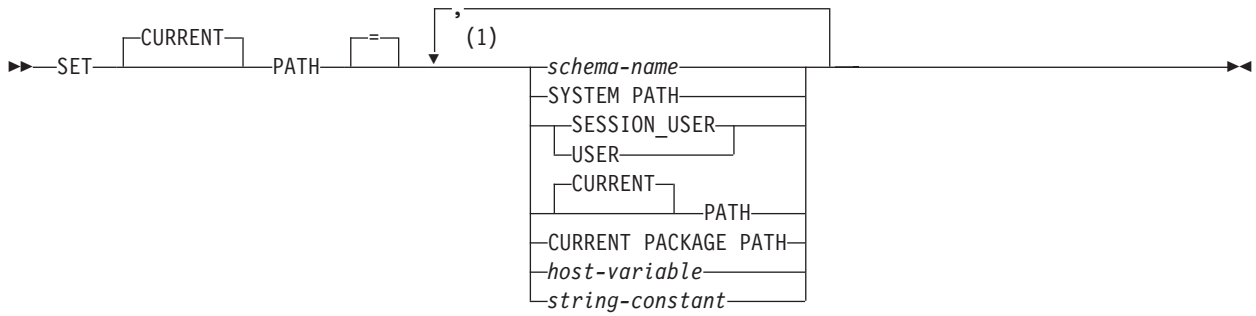
Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax



Notes:

1 SYSTEM PATH, SESSION_USER or USER, and CURRENT PATH can be specified only once each.

Description

The value of PATH is replaced by the values specified.

schema-name
Identifies a schema. DB2 does not verify that the schema exists. For example, a schema name that is misspelled is not detected, which could affect the way subsequent SQL operates.

SYSTEM PATH
Specifies the schema names "SYSIBM", "SYSFUN", "SYSPROC", "SYSIBMADM".

SESSION_USER or USER
Specifies the value of the SESSION_USER (USER) special register.

PATH
Specifies the value of the CURRENT PATH special register before the execution of this statement.

CURRENT PACKAGE PATH
Specifies the value of the CURRENT PACKAGE PATH special register.

host-variable
A variable with a data type of CHAR or VARCHAR. The value of *host-variable* must not be null and must represent a valid schema name.

The schema name must:

- Be left justified within the host variable
- Be padded on the right with blanks if its length is less than that of the host variable

string-constant
A character string constant that represents a valid schema name.

If the schema name specified in *string-constant* will also be specified in other SQL statements and the schema name does not conform to the rules for ordinary identifiers, the schema name must be specified as a delimited identifier in the other SQL statements.

Notes

Restrictions on SET PATH:
These restrictions apply to the SET PATH statement:

- If the same schema name appears more than one time in the path, the first occurrence of the name is used and a warning is issued.
- The length of the CURRENT PATH special register limits the number of schema names that can be specified. The special register string is built by taking each schema name that is specified and removing trailing blanks, delimiting with double quotes, changing each double quote character to two double quote characters within the schema name as necessary, and then separating each schema name with a comma. The length of the resulting string cannot exceed 2048 bytes.
- The schema name SYSPUBLIC cannot be specified in the SQL path, even if you specify the value as a delimited identifier.

Specifying "SYSIBM", "SYSFUN", "SYSPROC", "SYSIBMADM":
Schemas "SYSIBM", "SYSFUN", "SYSPROC", "SYSIBMADM" do not need to be specified in the special register. If these schemas are not explicitly specified in the CURRENT PATH special register, each schema is implicitly assumed at the front of the SQL path; if any of these schemas are not specified, they are assumed in the order of "SYSIBM", "SYSFUN", "SYSPROC", "SYSIBMADM" (see “SQL path” on page 64 for an example). Only the schemas that are explicitly specified in the CURRENT PATH register are included in the 2048 byte limit.

To avoid having "SYSIBM", "SYSFUN", "SYSPROC", "SYSIBMADM" implicitly added to the front of the SQL path, explicitly specify them in the path when setting the value of the register. If you specify them at the end of the path, DB2 will check all the other schemas in the path first.

Specifying keywords versus delimited identifiers:
There is a difference between specifying a keyword and specifying a delimited identifier. For example, specifying SESSION_USER with and without escape characters. To indicate that the value of the SESSION_USER special register should be used in the SQL path, specify the keyword SESSION_USER. If you specify SESSION_USER is as a delimited identifier instead (for example, "SESSION_USER"), it is interpreted as a schema name of 'SESSION_USER'. For example, assume that the current value of the SESSION_USER special register is SMITH and that the following statement is issued:

```
SET PATH = SYSIBM, SYSPROC, SESSION_USER, "SESSION_USER"
```

The result is that the value of the SQL path is set to:
"SYSIBM","SYSPROC","SMITH","SESSION_USER".

Specifying a schema name in an SQL procedure:

Because a host variable (SQL variable) in an SQL procedure does not begin with a colon, DB2 uses the following rules to determine whether a value that is specified in a SET PATH=*name* statement is a variable or a *schema-name*:

- If *name* is the same as a parameter or SQL variable in the SQL procedure, DB2 uses *name* as a parameter or SQL variable and assigns the value in *name* to PATH.
- If *name* is not the same as a parameter or SQL variable in the SQL procedure, DB2 uses *name* as a *schema-name* and assigns the value *name* to PATH.

The use of the path to resolve object names:

For information on when the SQL path is used to resolve unqualified data type, function, and procedure names and when the CURRENT PATH special register provides the SQL path, see "SQL path" on page 64.

DRDA classification:

The SET PATH statement is executed by the database server and, therefore, is classified as a non-local SET statement in DRDA.

Alternative syntax and synonyms:

For compatibility with previous releases of DB2 or other products in the DB2 family, DB2 supports CURRENT FUNCTION PATH or CURRENT_PATH as a synonym for CURRENT PATH. CURRENT_PATH is consistent with the SQL standard name of the special register.

Examples

Example 1: Set the CURRENT PATH special register to the list of schemas: "SCHEMA1", "SCHEMA#2", "SYSIBM".

```
SET PATH = SCHEMA1,"SCHEMA#2", SYSIBM;
```

When the SQL path specified in the special register is used for name resolution the system schemas which were not explicitly specified in the special register are implicitly assumed at the front of the SQL path, making the effective value of the path:

```
SYSFUN, SYSPROC, SYSIBMADM, SCHEMA1, SCHEMA#2, SYSIBM
```

Example 2: Add schema SMITH and SYSPROC to the value of the CURRENT PATH special register that was set in Example 1.

```
SET PATH = CURRENT PATH, SMITH, SYSPROC;
```

The effective value of the SQL path specified by the special register becomes:

```
SYSFUN, SYSIBMADM, SCHEMA1, SCHEMA#2, SYSIBM, SMITH, SYSPROC
```

Related reference:

"CURRENT PATH" on page 184

SET SCHEMA

The SET SCHEMA statement assigns a value to the CURRENT SCHEMA special register. If the package is bound with the DYNAMICRULES BIND option, this statement does not affect the qualifier that is used for unqualified database object references.

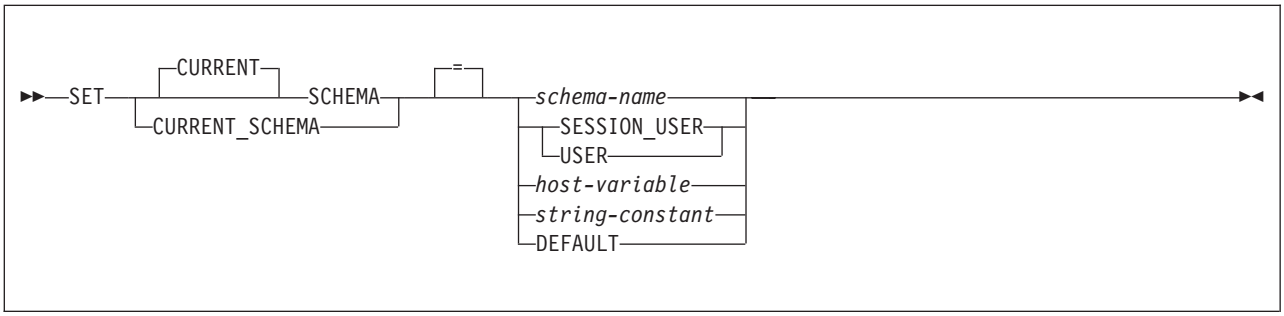
Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax



Description

schema-name
Identifies a schema. No validation that the schema exists is made at the time the CURRENT SCHEMA is set. For example, if a schema name is misspelled, it could affect the way subsequent SQL operates.

SESSION_USER or USER
Specifies the value of the SESSION_USER (USER) special register.

host-variable
Specifies a host variable that contains a schema name. The content is not folded to uppercase.

The host variable must:

- Be a CHAR, VARCHAR, GRAPHIC, or VARGRAPHIC variable. The actual length of the contents of the *host-variable* must not exceed the length of a schema name.
- Not be set to null. If *host-variable* has an associated indicator variable, the value of that indicator variable must not indicate a null value.
- Include a schema name that is left justified and conforms to the rules for forming an ordinary identifier or delimited identifier. If the identifier is delimited, it must not be empty or contain only blanks.
- Be padded on the right with blanks if the host variable is fixed length.
- Not contain SESSION_USER, USER, or DEFAULT.

string-constant
Specifies a string constant that contains a schema name. The content is not folded to uppercase.

The string constant must:

- Have a length that does not exceed the maximum length of a schema name.
- Include a schema name that is left justified and conforms to the rules for forming an ordinary identifier or delimited identifier. If the identifier is delimited, it must not be empty or contain only blanks.
- Not contain SESSION_USER, USER, or DEFAULT.

DEFAULT
Specifies that CURRENT SCHEMA is to be set to its initial value, as if it had never been explicitly set during the application process. For information about the initial value of CURRENT SCHEMA, see "CURRENT SCHEMA" on page 191.

Notes

Considerations for keywords:
There is a difference between specifying a single keyword (such as SESSION_USER or DEFAULT) as a single keyword or as a delimited identifier. To indicate that the current value of the SESSION_USER special register should be used for setting the current schema, specify SESSION_USER as a keyword. To indicate that the special register should be set to its default value, specify DEFAULT as a keyword. If SESSION_USER or DEFAULT is specified as a delimited identifier instead (for example, "SESSION_USER"), it is interpreted as a schema name of that value ("SESSION_USER").

Transaction considerations:
The SET SCHEMA statement is not a committable operation. ROLLBACK has no effect on CURRENT SCHEMA.

Usage of the assigned value:
The value of the CURRENT SCHEMA special register, as set by this statement, is used as the schema name in all dynamic SQL statements. The QUALIFIER bind option specifies the schema name for use as the qualifier for unqualified database object names in static SQL statements.

Impact on other special registers:
Setting the CURRENT SCHEMA special register does not affect any other special register. Therefore, the CURRENT SCHEMA is not be included in the SQL path that is used to resolve the schema name for unqualified references to function, procedures and user-defined types in dynamic SQL statements. To include the current schema value in the SQL path, whenever the SET SCHEMA statement is issued, also issue the SET PATH statement including the schema name from the SET SCHEMA statement.

Examples

Example 1: The following statement sets the CURRENT SCHEMA special register.

```
EXEC SQL SET SCHEMA RICK;
```

Example 2: The following example retrieves the current value of the CURRENT SCHEMA special register into the host variable called CURSCHEMA.

```
EXEC SQL SELECT CURRENT SCHEMA INTO :CURSCHEMA
   FROM SYSIBM.SYSDUMMY1;
```

The value of the host variable is RICK.

Example 3: Assume that the following statements are issued:

```
SET CURRENT SQLID = 'USRT001';
SET CURRENT SCHEMA = 'USRT002';
```

At this point, the two special registers contain different values. Any subsequent CREATE statements will use USRT002 as the implicit qualifier, but the owner of the newly created objects is USRT001.

Example 4: Assume that the value of CURRENT SCHEMA is 'Jane' and that the default value of the PATH special register was established using that value (that is, the value of PATH is "SYSIBM", "SYSFUN", "SYSPROC", "SYSIBMADM", "JANE"). Change the value of the CURRENT SCHEMA special register to 'John'.

```
SET CURRENT SCHEMA = 'JOHN';
```

To change the SQL path to use the updated CURRENT SCHEMA value of "JOHN", issue a SET PATH statement to change the value of the PATH special register to specify "JOHN" as the first schema to check:

```
SET PATH = 'JOHN', CURRENT PATH;
```

Alternatively, a commit would cause PATH to be re-initialized. Otherwise, the path remains "SYSIBM", "SYSFUN", "SYSPROC", "SYSIBMADM", "JANE"), which might cause unqualified object names to resolve to "JANE" when you want them to resolve to "JOHN".

SET SESSION TIME ZONE

The SET SESSION TIME ZONE statement assigns a value to the SESSION TIME ZONE special register.

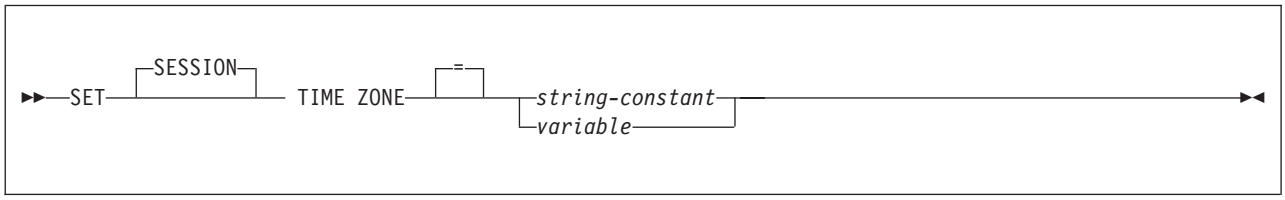
Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax



Description

string-constant
Identifies a time zone with a value of the form '±*th*:*tm*', where *th* represents the time zone hour between -12 and +14, and *tm* represents the time zone minutes between 0 and 59, with values ranging from -12:59 to +14:00.

variable
Specifies a variable that contains a time zone. The variable must be a CHAR or VARCHAR variable that is not followed by an indicator variable. The variable must not be the null value. The value must be left justified and be of the form '±*th*:*tm*', where *th* represents the time zone hour between -12 and +14, and *tm* represents the time zone minutes between 0 and 59, with values ranging from -12:59 to +14:00.

Notes

Impact on other special registers:
Setting the SESSION TIME ZONE special register does not affect the CURRENT TIMEZONE special register.

Syntax alternatives:
SESSIONTIMEZONE, SESSION TIMEZONE, and TIMEZONE can be specified as an alternative to SESSION TIME ZONE or TIME ZONE.

Example

Set the SESSION TIME ZONE as -8:00:

```
SET SESSION TIME ZONE = '-8:00';
```

Related reference:
"SESSION TIME ZONE" on page 203

SIGNAL

The SIGNAL statement is used to signal an error. It causes an error to be returned with the specified SQLSTATE and error description.

For a description of the statement, see “SIGNAL statement” on page 2006.

TRUNCATE

The DB2 TRUNCATE statement deletes all rows for either base tables or declared global temporary tables. The base table can be in a simple table space, a segmented table space, a partitioned table space, or a universal table space. If the table contains LOB or XML columns, the corresponding table spaces and indexes are also truncated.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

The privilege set that is defined below must include at least one of the following privileges:

- The DELETE privilege for the table
- Ownership of the table
- DBADM authority for the database
- DATAACCESS authority
- SYSADM authority

If the database is implicitly created, the database privileges must be on the implicit database or on DSNDB04.

If the IGNORE DELETE TRIGGERS option is specified, the privilege set must include at least one of the following privileges:

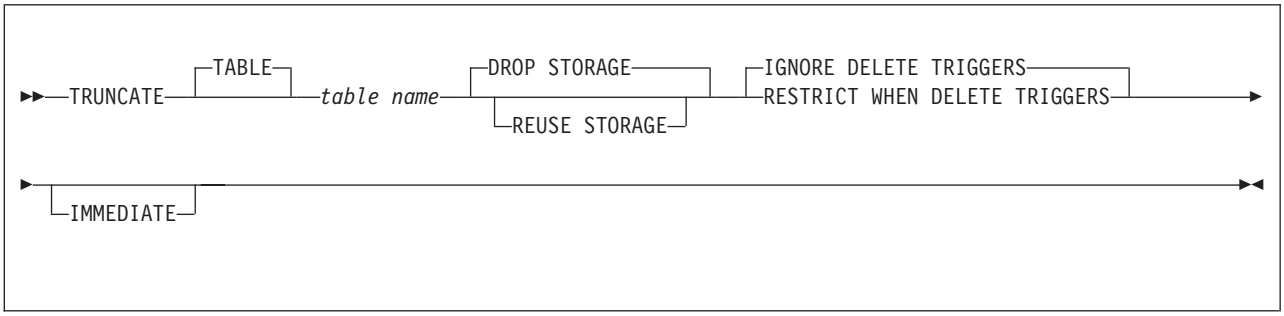
- The ALTER privilege for the table
- Ownership of the table
- DBADM authority for the database
- System DBADM authority
- SYSADM authority

If row access control is activated for the table, the privilege set must include at least one of the following privileges or authorities:

- Ownership of the table
- DBADM authority
- SYSADM authority
- SYSCTRL authority
- System DBADM authority

Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. If the statement is dynamically prepared, the privilege set is determined by the DYNAMICRULES behavior in effect (run, bind, define, or invoke) and is summarized in Table 94 on page 841. (For more details on these behaviors, including a list of the DYNAMICRULES bind option values that determine them, see "Authorization IDs and dynamic SQL" on page 75.)

Syntax



Description

table-name
Identifies the table that is to be truncated. The name must identify a table that exists at the current server. The name must not identify the following objects:

- a view
- an auxiliary table
- an XML table
- a catalog table
- a system-period temporal table

If *table-name* is a base table of a table space, all tables that are defined under the table will also be truncated (for example: auxiliary LOB table spaces and XML table spaces), and all of its associated indexes will also be truncated.

DROP STORAGE or REUSE STORAGE
Specifies whether to drop or reuse the existing storage that is allocated for the table.

DROP STORAGE
Specifies that all storage that is allocated for the table is released and made available for use for the same table or any other table that resides in the table space. The scope of **DROP STORAGE** is always at the table space level and the deallocated space is always available for reuse by all tables in the table space.

DROP STORAGE is the default.

REUSE STORAGE
Specifies that all storage that is allocated for the table will be emptied, but will continue to be allocated for the table. **REUSE STORAGE** is ignored for a table in a simple table space and the statement is processed as if **DROP STORAGE** is specified.

RESTRICT WHEN DELETE TRIGGERS or IGNORE DELETE TRIGGERS
Specifies what to do when delete triggers are defined on the table.

RESTRICT WHEN DELETE TRIGGERS
Specifies that an error is returned if delete triggers are defined on the table.

IGNORE DELETE TRIGGERS
Specifies that any delete triggers that are defined for the table are not activated by the truncate operation.

IGNORE DELETE TRIGGERS is the default.

IMMEDIATE

Specifies that the truncate operation is processed immediately and cannot be undone. If the **IMMEDIATE** option is specified, the table must not contain any uncommitted updates. In the case of a table in a multi-table table space, if there are any uncommitted updates to any table in the table space, the truncate operation will fail. Also, if there are any uncommitted CREATE, ALTER or DROP statements for any table in the table space, the truncate operation will fail.

The truncated table is immediately available for use in the same unit of work. Although a ROLLBACK statement is allowed to execute after a TRUNCATE statement, the truncate operation is not undone, and the table remains in a truncated state. For example, if another data change operation is done on the table after the TRUNCATE IMMEDIATE statement and then the ROLLBACK statement is executed, the truncate operation will not be undone, but all other data change operations are undone.

If **IMMEDIATE** is not specified, a ROLLBACK statement can undo the truncate operation.

The **IMMEDIATE** option can be specified for a table in a segmented table space or a universal table space which allows deallocated spaces to be reclaimed immediately for subsequent insert operations in the same unit of work without committing the truncate operation.

Notes

Rules and restrictions:

The truncate operation cannot be executed if the table is a parent table in an enforced referential constraint. The DB2 subsystem issues an error when it detects the existence of rule violations. Therefore, if the referential integrity constraint exists, the TRUNCATE statement will be restricted regardless of whether the child table contains rows.

The TRUNCATE statement cannot be used if the table is a system-maintained temporal table.

If the TRUNCATE statement is used on a tables where any of the following conditions is true, the truncate operation will perform in a similar way to a mass delete operation:

- Tables with Change Data Capture (CDC) attribute

  The DB2 subsystem allows a table with the CDC-enabled attribute to be truncated without imposing any new restrictions.
- Tables with multi-level security

  If the table contains a column that is defined as a security label, the truncate operation needs to examine each row to determine if the security label of the authorization ID or role has the authority to delete that row. However, if the primary authorization ID or role has write-down privilege, verification of each row in the table is not necessary.
- Tables with a VALIDPROC attribute

  If a VALIDPROC is defined for the table, the truncate operation needs to verify the validity of each row in the table.

TRUNCATE and table spaces that are not logged:

The TRUNCATE TABLE statement can be used to remove a table space from the logical page list and to reset recover-pending status. When the table space is segmented or universal, the table is the only table in the

table space, and the table does not have a VALIDPROC, referential constraints, delete triggers, or a SECURITY LABEL column, use the TRUNCATE TABLE statement to empty the table and the table space will be removed from the LPL and recover-pending status will be reset.

Truncating rows from a table with activated row permissions or column access control:

Row permissions and column access control is not enforced for the TRUNCATE statement.

Examples

Example 1: Empty an unused inventory table regardless of any existing triggers and return its allocated space.

```
TRUNCATE TABLE INVENTORY
DROP STORAGE
    IGNORE DELETE TRIGGERS;
```

Example 2: Empty an unused inventory table regardless of any existing delete triggers but preserve its allocated space for later reuse.

```
TRUNCATE TABLE INVENTORY
   REUSE STORAGE
   IGNORE DELETE TRIGGERS;
```

Example 3: Empty an unused inventory table permanently (a ROLLBACK statement cannot undo the truncate operation when the **IMMEDIATE** option is specified) regardless of any existing delete triggers and preserve its allocated space for immediate use.

```
TRUNCATE TABLE INVENTORY
    REUSE STORAGE
    IGNORE DELETE TRIGGERS
    IMMEDIATE;
```

UPDATE

The UPDATE statement updates the values of specified columns in rows of a table or view or activates an instead of update trigger. Updating a row of a view updates a row of the table on which the view is based if no instead of update trigger is defined for the update operation on the view. If such a trigger is defined, the trigger is activated instead of the UPDATE statement. The table or view can exist at the current server or at any DB2 subsystem with which the current server can establish a connection.

There are two forms of this statement:

- The *searched* UPDATE form is used to update one or more rows optionally determined by a search condition.
- The *positioned* UPDATE form specifies that one or more rows corresponding to the current cursor position are to be updated.

Invocation

This statement can be embedded in an application program or issued interactively. A positioned UPDATE can be embedded in an application program. Both forms are executable statements that can be dynamically prepared.

Authorization

Authority requirements depend on whether the object identified in the statement is a user-defined table, a catalog table for which updates are allowed, or a view, and whether SQL standard rules are in effect:

When a user-defined table is identified: The privilege set must include at least one of the following:

- The UPDATE privilege on the table
- The UPDATE privilege on each column to be updated
- Ownership of the table
- DBADM authority on the database that contains the table
- SYSADM authority

If the database is implicitly created, the database privileges must be on the implicit database or on DSNDB04.

When a catalog table is identified: The privilege set must include at least one of the following:

- The UPDATE privilege on each column to be updated
- DBADM authority on the catalog database
- SYSCTRL authority
- SYSADM authority

When a view is identified: The privilege set must include at least one of the following:

- The UPDATE privilege on the view
- The UPDATE privilege on each column to be updated
- SYSADM authority

If the *expression* in the *assignment-clause* contains a reference to a column of the table or view, or if the *search-condition* in a searched UPDATE contains a reference to a column of the table or view, the privilege set must include at least one of the following:

- The SELECT privilege on the table or view
- Ownership of the table or view
- DBADM authority on the database that contains the table, if the target is a table and that table that is not a catalog table
- DATAACCESS
- SYSADM authority

When FOR PORTION OF BUSINESS_TIME is specified: The privilege set must include at least one of the following:

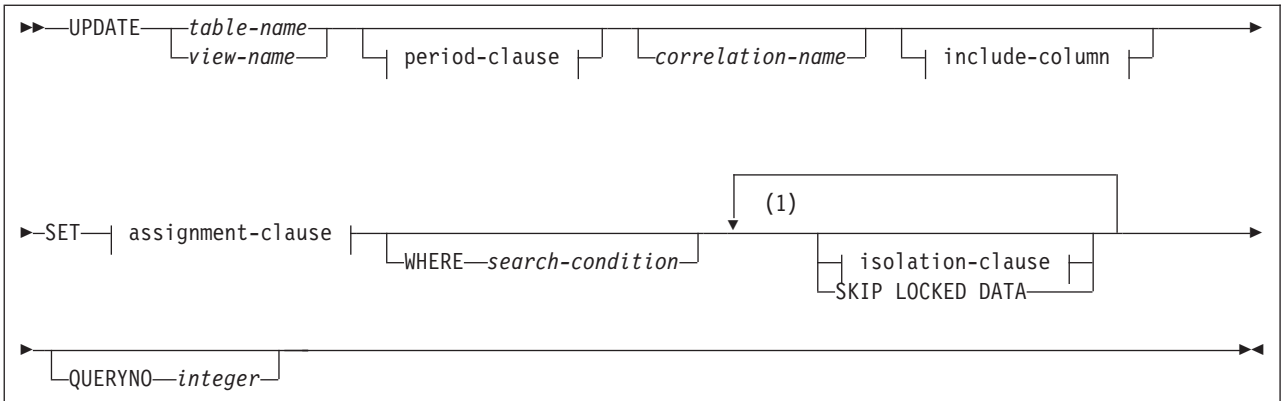
- The UPDATE privilege on the columns of the BUSINESS_TIME period
- The UPDATE privilege on the table
- Ownership of the table or view
- DBADM authority on the database that contains the table, if the target is a table and that table that is not a catalog table
- DATAACCESS
- SYSADM authority

If the *search-condition* in a searched UPDATE includes a subquery, or if the *assignment-clause* includes a *scalar-fullselect* or a *row-fullselect*, see "Authorization" on page 762 for an explanation of the authorization required.

The owner of a view, unlike the owner of a table, might not have UPDATE authority on the view (or might have UPDATE authority without being able to grant it to others). The nature of the view itself can preclude its use for UPDATE. For more information, see the discussion of authority in "CREATE VIEW" on page 1527.

Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. If the statement is dynamically prepared, the privilege set is determined by the DYNAMICRULES behavior in effect (run, bind, define, or invoke) and is summarized in Table 94 on page 841. (For more information on these behaviors, including a list of the DYNAMICRULES bind option values that determine them, see "Authorization IDs and dynamic SQL" on page 75).

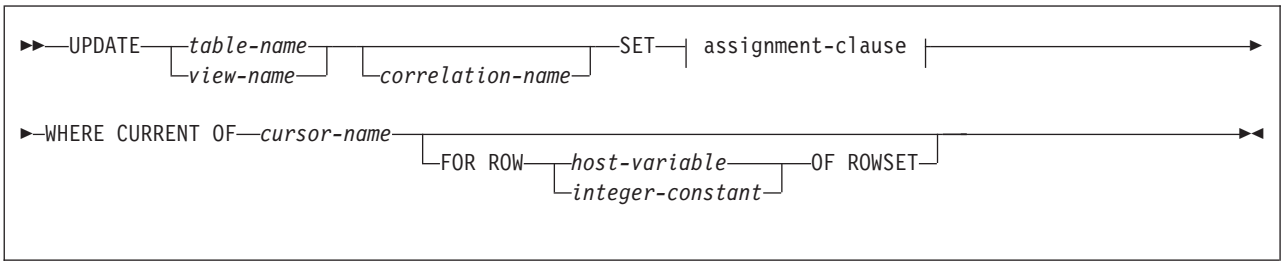
searched update:



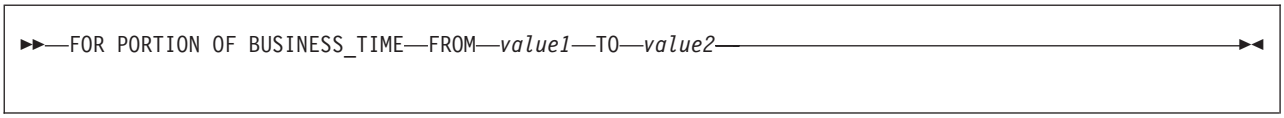
Notes:

1 The same clause must not be specified more than one time.

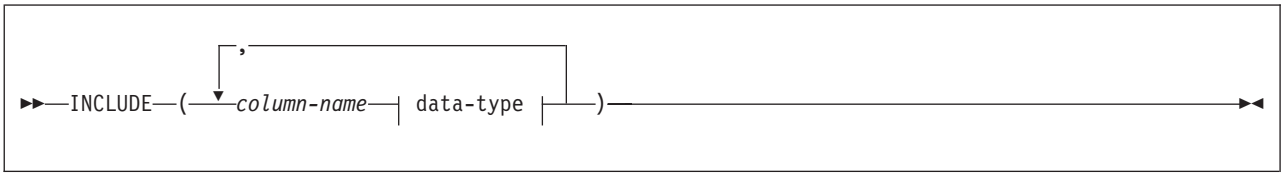
positioned update:



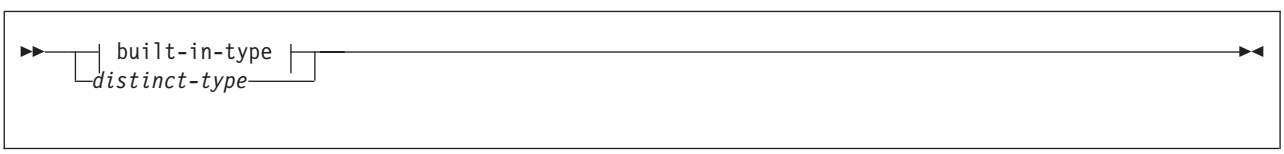
period-clause:



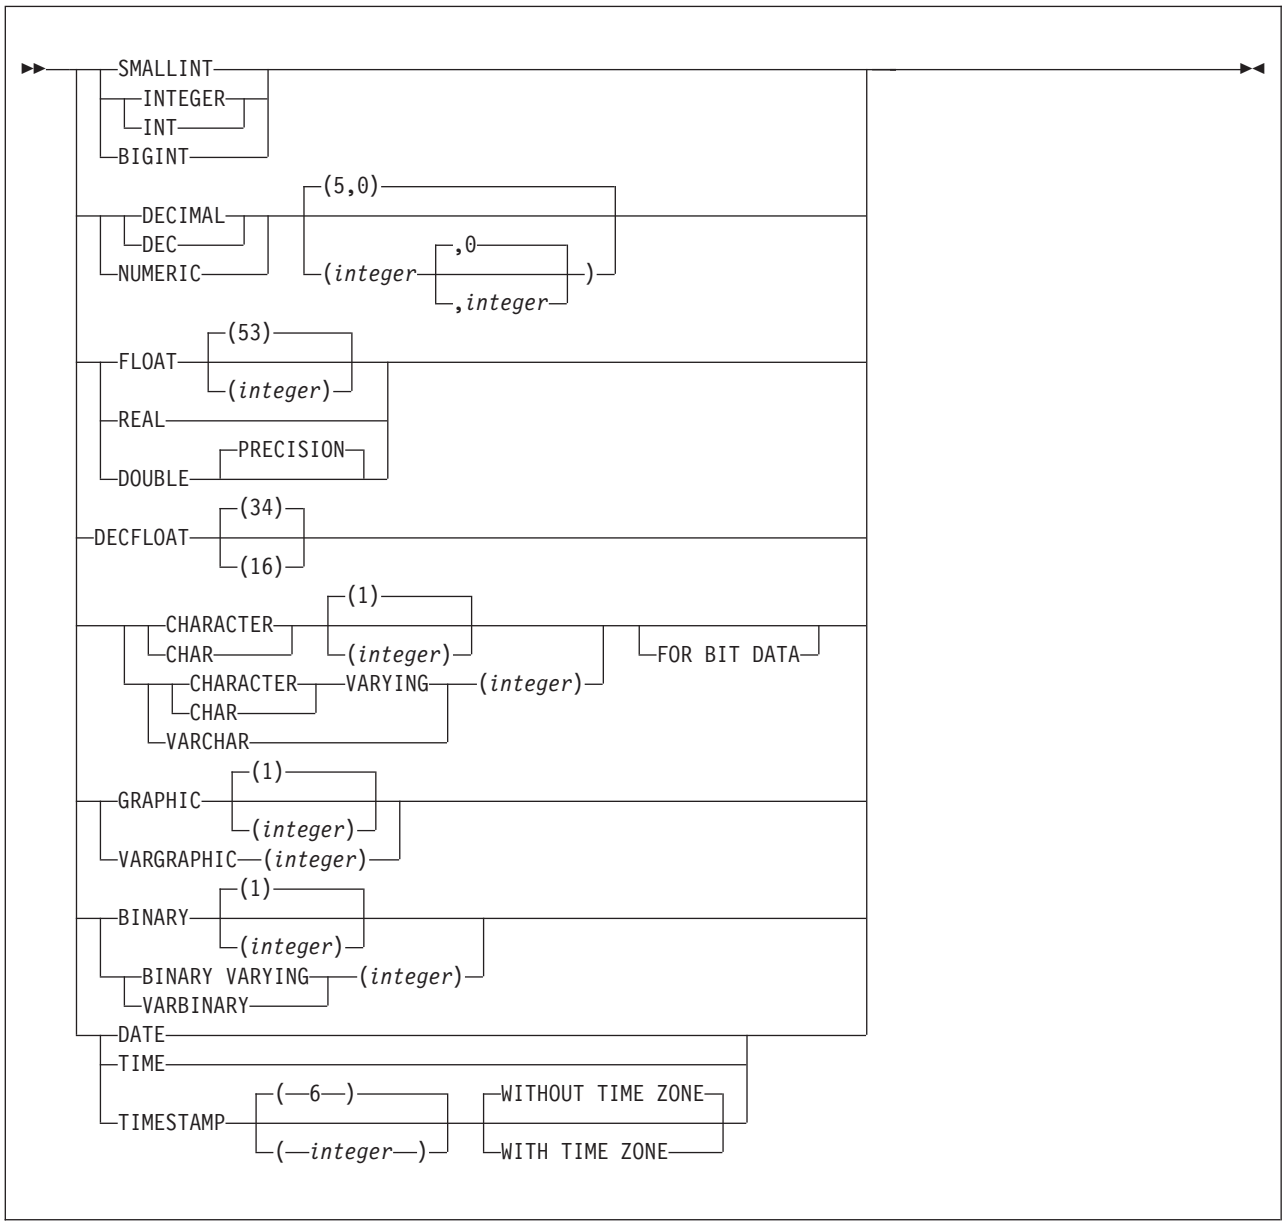
include-column:



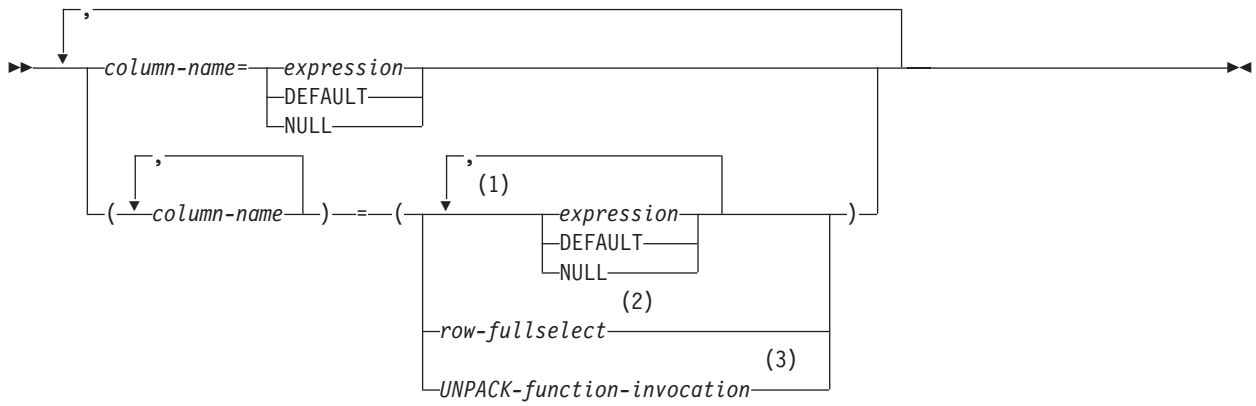
data-type:



built-in-type:



assignment clause:



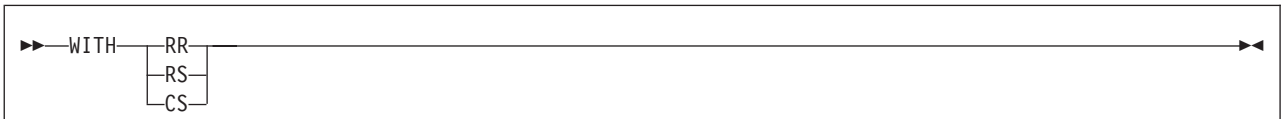
Notes:

1 The number of *expressions*, DEFAULT, and NULL keywords must match the number of *column-names*. *Expressions* must not refer to UNPACK-function-invocation..

2 The number of columns in the select list must match the number of *column-names*.

3 The number of items returned from *UNPACK-function-invocation* must match the number of column names.

isolation-clause:



Description

table-name **or** *view-name*

Identifies the object of the UPDATE statement. The name must identify a table or view that exists at the DB2 subsystem that is identified by the implicitly or explicitly specified location name. The name must not identify one of the following tables:

- An auxiliary table
- A created temporary table or a view of a created temporary table
- A catalog table with no updatable columns or a view of a catalog table with no updatable columns
- A read-only view that has no INSTEAD OF trigger defined for its update operations. (For a description of a read-only view, see "CREATE VIEW" on page 1527.)
- A system-maintained materialized query table
- A table that is implicitly created for an XML column
- An archive-enabled table if any of the following conditions are true:
  - The SYSIBMADM.MOVE_TO_ARCHIVE global variable is set to Y.
  - The SYSIBMADM.GET_ARCHIVE global variable is set to Y, the ARCHIVESENSITIVE bind option is set to YES, and the operation is a positioned update.

In an IMS or CICS application, the DB2 subsystem that contains the identified table or view must be a remote server that supports two-phase commit.

A catalog table or a view of a catalog table can be identified if every column identified in the SET clause is an updatable column. If a column of a catalog table is updatable, its description in "DB2 catalog tables" on page 2102 indicates that the column can be updated. If the object table is SYSIBM.SYSSTRINGS, any column other than IBMREQD can be updated, but the rows that are selected for update must be rows that are provided by the user (the value of the IBMREQD column is N) and only certain values can be specified as explained in *DB2 Administration Guide*.

period-clause
Specifies that a period clause applies to the target of the update operation. The same period name must not be specified more than one time. If the target of the update operation is a view:

- The FROM clause of the outer fullselect of the view definition must include a reference, directly or indirectly, to an application-period temporal table.
- The result table of the outer fullselect of the view definition must include, explicitly or implicitly, the start and end columns of the BUSINESS_TIME period.
- An INSTEAD OF trigger must not be defined for the view.

FOR PORTION OF BUSINESS_TIME
Specifies that the update only applies to row values for the portion of the BUSINESS_TIME period in the row that is specified by the period clause. BUSINESS_TIME must be a period that is defined on the table.

FROM *value1* **TO** *value2*
Specifies that the update applies to rows for the period that is specified from *value1* to *value2*. No rows are updated if *value1* is greater than or equal to *value2* or if *value1* or *value2* is the null value.

For the period condition that is specified with **FROM** *value1* **TO** *value2*, the period that is specified with *period-name* in a row of the target update covers one of the following ranges:

- If the value of the begin column is less than *value1* and the value of the end column is greater than *value1*, the range overlaps the beginning of the specified period.
- If the value of the end column is greater than or equal to *value2* and the value of the begin column is less than *value2*, the range overlaps the end of the specified period.
- If the value for the begin column is greater than or equal to *value1* and the value for the end column is less than or equal to *value2*, the range is fully contained within the specified period.
- If both columns of *period-name* are less than or equal to *value1* or greater than or equal to *value2*, the range is not contained in the period
- If the period in the row overlaps the beginning of the specified period or the end of the specified period, but not both, the range is partially contained in the specified period.
- If the period in the row overlaps both the beginning and the end of the specified period, the range fully overlaps the specified period.

If the period, *period-name* in a row is not contained in the specified period, the row is not updated. Otherwise, the update is applied based on the specification of PORTION OF and how the values in the columns of *period-name* overlap the specified period as follows:

- If the period, *period-name* in a row is fully contained within the specified period, the row is updated and the values of the begin column and end column of *period-name* are unchanged.
- If the period, *period-name* in a row is partially contained in the specified period and overlaps the beginning of the specified period:
  - The row is updated. In the updated row, the value of the begin column is set to *value1* and the value of the end column is the original value of the end column.
  - An additional row is inserted using the original values from the row, except that the end column is set to *value1*.
- If the period, *period-name* in a row is partially contained in the specified period and overlaps the end of the specified period:
  - The row is updated. In the updated row, the value of the begin column is the original value of the begin column and the end column is set to *value2*.
  - An additional row is inserted using the original values from the row, except that the begin column is set to *value2*.
- If the period, *period-name* in a row fully overlaps the specified period:
  - The row is updated. In the updated row, the value of the begin column is set to *value1* and the value of the end column is set to *value2*.
  - An additional row is inserted using the original values from the row, except that the end column is set to *value1* and the begin column is set to *value2*.

Any existing update triggers are activated for the updated rows and any existing insert triggers are activated for rows that are implicitly inserted.

value1, *value2*
Specifies expressions that return a value of a built-in data type. The result of each expression must be comparable to the data type of the columns of the specified period. See the comparison rules described in "Assignment and comparison" on page 121. Each expression can contain any of the following supported operands:

- A constant
- A special register
- A variable (host variable, SQL variable, SQL parameter, or transition variable)
- An array element specification
- A built-in scalar function whose arguments are supported operands
- A CAST specification where the cast operand is a supported operand
- An expression that uses arithmetic operators and operands

Each expression must not have a timestamp precision that is greater than the precision of the columns for the period.

If the begin and end columns of the period are defined as TIMESTAMP WITHOUT TIME ZONE, each expression must not return a value of a timestamp with a time zone.

A period clause for a view must not contain a global variable or an untyped parameter marker.

correlation-name
Can be used within *search-condition* or *assignment-clause* to designate the table or view. (For an explanation of *correlation-name*, see "Correlation names" on page 209.)

include-column
Specifies a set of columns that are included, along with the columns of *table-name* or *view-name*, in the result table of the UPDATE statement when it is nested in the FROM clause of the outer fullselect that is used in a subselect, SELECT statement, or in a SELECT INTO statement. The included columns are appended to the end of the list of columns that is identified by *table-name* or *view-name*. If no value is assigned to a column that is specified by an *include-column*, a NULL value is returned for that column.

INCLUDE
Introduces a list of columns that are to be included in the result table of the UPDATE statement. The included columns are only available if the UPDATE statement is nested in the FROM clause of a SELECT statement or a SELECT INTO statement.

column-name
Specifies the name for a column of the result table of the UPDATE statement that is not the same name as another included column nor a column in the table or view that is specified in *table-name* or *view-name*.

data-type
Specifies the data type of the included column. The included columns are nullable.

built-in-type
Specifies a built-in data type. See "CREATE TABLE" on page 1388 for a description of each built-in type.

The CCSID 1208 and CCSID 1200 clauses must not be specified for an include column.

distinct-type
Specifies a distinct type. Any length, precision, or scale attributes for the column are those of the source type of the distinct type as specified by using the CREATE TYPE statement.

SET
Introduces the assignment of values to column names.

assignment-clause
If *row-fullselect* is specified, the number of columns in the result of *row-fullselect* must match the number of *column-names* that are specified. If *row-fullselect* is not specified, the number of expressions, and NULL and DEFAULT keywords must match the number of *column-names* that are specified.

column-name
Identifies a column that is to be updated. *column-name* must identify a column of the specified table or view, and that column must be updatableif extended indicator variables are not enabled. The column must not identify a generated column or a view column where the column is derived from a scalar function, constant, or expression. *column-name* can also identify an INCLUDE column that must not be qualified. The same column must not be specified more than one time.

A column that is defined as part of a BUSINESS_TIME period must not be specified if the UPDATE statement contains a *period-clause*.

Assignments to included columns are only processed when the UPDATE statement is nested in the FROM clause of a SELECT statement or a SELECT INTO statement. There must be at least one assignment clause that specifies a *column-name* that is not an INCLUDE column. The null value is returned for an included column that is not set by using an explicit SET clause.

For a positioned update, allowable column names can be further restricted to those in a certain list. This list appears in the FOR UPDATE clause of the SELECT statement for the associated cursor. The clause can be omitted by using the conditions that are described in "Positioned updates of columns" on page 333.

A view column that is derived from the same column as another column of the view can be updated, but both columns cannot be updated in the same UPDATE statement.

expression
Indicates the new value of the column. The *expression* is any expression of the type described in "Expressions" on page 240. It must not include an aggregate function.

If *expression* is a host variable, the host variable can include an indicator variable. When extended indicator variables are enabled, an expression must not be more complex than a reference to a single host variable if the indicator is set to an extended indicator value of default (-5) or unassigned (-7). In addition, a CAST specification can be used if either of the following is true:

- The target column is defined as nullable.
- the target column is defined as NOT NULL with a non-null default, the source of the CAST specification is a single host variable, and the data attributes (data type, length, precision, and scale) of the host variable are the same as the result of the cast specification.

A *column-name* in an expression must identify a column of the table or view. For each row that is updated, the value of the column in the expression is the value of the column in the row before the row is updated.

DEFAULT
Specifies that the default value is used based on how the corresponding column is defined in the table. The value that is assigned depends on how the column is defined.

- If the column is defined using the **IDENTITY** clause, the column is generated by the DB2 system.
- If the column is defined as a row change timestamp column, the column value is generated by the DB2 system.
- If the column is defined using the **WITH DEFAULT** clause, the value is set to the default that is defined for the column.
- If the column is defined without specifying the **WITH DEFAULT** clause, the **GENERATED** clause, or the **NOT NULL** clause, the value is NULL.
- If the column is specified in the **INCLUDE** column list, the column value is set to null.

A ROWID column must not be set to the **DEFAULT** keyword.

An identity column or a row change timestamp column that is defined as GENERATED ALWAYS can be set only to the **DEFAULT** keyword.

If the column is defined using the **NOT NULL** clause and the **GENERATED** clause is not used, or the **WITH DEFAULT** clause is not used, the **DEFAULT** keyword cannot be specified for that column.

NULL
Specifies the null value as the new value of the column. Specify **NULL** only for nullable columns.

row-fullselect
Specifies a fullselect that returns a single row. The column values are assigned to each of the corresponding *column-names*. If the fullselect returns no rows, the null value is assigned to each column; an error occurs if any column to be updated is not nullable. An error also occurs if there is more than one row in the result.

For a positioned update, if the table or view that is the object of the UPDATE statement is used in the fullselect, a column from the instance of the table or view in the fullselect cannot be the same as *column-name*, a column being updated.

If the fullselect refers to columns to be updated, the value of such a column in the fullselect is the value of the column in the row before the row is updated.

UNPACK-function-invocation
Specifies an invocation of the UNPACK built-in function. The number of fields that are returned by the UNPACK function invocation must be the same as the number of *column-names*.

WHERE
Specifies the rows to be updated. You can omit the clause, give a search condition, or specify a cursor. If you omit the clause, all rows of the table or view are updated.

search-condition
Specifies any search condition described in Chapter 2, "Language elements," on page 53. Each *column-name* in the search condition, other than in a subquery, must identify a column of the table or view.

The *search-condition* is applied to each row of the table or view and the updated rows are those for which the result of the *search-condition* is true. If the unique key or primary key is a parent key, the constraints are effectively checked at the end of the operation.

If the search condition contains a subquery, the subquery can be thought of as being executed each time the search condition is applied to a row, and the results used in applying the search condition. In actuality, a subquery with no correlated references is executed just once, whereas it is possible that a subquery with a correlated reference must be executed once for each row.

WHERE CURRENT OF *cursor-name*
Identifies the cursor to be used in the update operation. *cursor-name* must identify a declared cursor as explained in the description of the DECLARE CURSOR statement in "DECLARE CURSOR" on page 1535. If the UPDATE statement is embedded in a program, the DECLARE CURSOR statement must include *select-statement* rather than *statement-name*.

The object of the UPDATE statement must also be identified in the FROM clause of the SELECT statement of the cursor. The columns to be updated can be identified in the FOR UPDATE clause of that SELECT statement though they do not have to be identified. If the columns are not specified, the columns that can be updated include all the updatable columns of the table or view that is identified in the first FROM clause of the fullselect.

The result table of the cursor must not be read-only. For an explanation of read-only result tables, see Read-only cursors. Note that the object of the UPDATE statement must not be identified as the object of the subquery in the WHERE clause of the SELECT statement of the cursor.

When the UPDATE statement is executed, the cursor must be open and positioned on a row or rowset of the result table.

- If the cursor is positioned on a single row, that row is the one updated.
- If the cursor is positioned on a rowset, all rows corresponding to the rows of the current rowset are updated.

A positioned UPDATE must not be specified for a cursor that references a view on which an instead of update trigger is defined, even if the view is an updatable view.

FOR ROW *n* **OF ROWSET**
Specifies which row of the current rowset is to be updated. The corresponding row of the rowset is updated, and the cursor remains positioned on the current rowset.

host-variable or *integer-constant* is assigned to an integral value *k*. If *host-variable* is specified, it must be an exact numeric type with scale zero, must not include an indicator variable, and *k* must be in the range of 1 to 32767.

The cursor must be positioned on a rowset, and the specified value must be a valid value for the set of rows most recently retrieved for the cursor. If the specified row cannot be updated, an error is returned. It is possible that the specified row is within the bounds of the rowset most recently requested, but the current rowset contains less than the number of rows that were implicitly or explicitly requested when that rowset was established.

If this clause is not specified, the cursor position determines the rows that will be affected. If the cursor is positioned on a single row, that row is the one updated. In the case where the most recent FETCH statement returned multiple rows of data (but not as a rowset), this position would be on the last row of data that was returned. If the cursor is positioned on a rowset, all rows corresponding to the current rowset are updated. The cursor position remains unchanged.

It is possible for another application process to update a row in the base table of the SELECT statement so that the specified row of the cursor no longer has a corresponding row in the base table. An attempt to update such a row results in an error.

isolation-clause
Specifies the isolation level used when locating the rows to be updated by the statement.

WITH
Introduces the isolation level, which may be one of the following:
RR Repeatable read
RS Read stability
CS Cursor stability

The default isolation level of the statement is the isolation level of the package or plan in which the statement is bound, with the package isolation taking precedence over the plan isolation. When a package isolation is not specified, the plan isolation is the default.

SKIP LOCKED DATA
Specifies that rows are skipped when incompatible locks are held on the row by other transactions. These rows can belong to any accessed table that is specified in the statement. **SKIP LOCKED DATA** can be used only when isolation CS or RS is in effect and applies only to row level or page level locks.

SKIP LOCKED DATA can be specified only in the searched UPDATE statement (or the searched update operation of a MERGE statement). **SKIP LOCKED DATA** is ignored if it is specified when the isolation level that is in effect is repeatable read (**WITH RR**) or uncommitted read (**WITH UR**). The default isolation level of the statement depends on the isolation level of the package or plan with which the statement is bound, with the package isolation taking precedence over the plan isolation. When a package isolation is not specified, the plan isolation is the default.

QUERYNO *integer*
Specifies the number to be used for this SQL statement in EXPLAIN output and trace records. The number is used for the QUERYNO column of the plan table for the rows that contain information about this SQL statement. This number is also used in the QUERYNO column of the SYSIBM.SYSSTMT and SYSIBM.SYSPACKSTMT catalog tables.

If the clause is omitted, the number associated with the SQL statement is the statement number assigned during precompilation. Thus, if the application program is changed and then precompiled, that statement number might change.

Using the **QUERYNO** clause to assign unique numbers to the SQL statements in a program is helpful:
- For simplifying the use of optimization hints for access path selection
- For correlating SQL statement text with EXPLAIN output in the plan table

For information on using optimization hints, such as enabling the system for optimization hints and setting valid hint values, and for information on accessing the plan table, see *DB2 Performance Monitoring and Tuning Guide*.

Notes

Update rules:
Update values must satisfy the following rules. If they do not, or if other errors occur during the execution of the UPDATE statement, no rows are updated and the position of the cursors are not changed.
- *Assignment*. Update values are assigned to columns using the assignment rules described in Chapter 2, “Language elements,” on page 53.
- *Validity*. Updates must obey the following rules. If they do not, or if any other errors occur during the execution of the UPDATE statement, no rows are updated.
  - *Fullselects:* The row-fullselect and expressions that contain a *scalar-fullselect* must return no more than one row.
  - *Unique constraints and unique indexes:* If the identified table (or base table of the identified view) has any unique indexes or unique constraints, each row that is updated in the table must conform to the limitations that are imposed by those indexes and constraints.

All uniqueness checks are effectively made at the end of the statement. In the case of a multi-row update, this validation occurs after all the rows are updated.

- *Check constraints:* If the identified table (or base table of the identified view) has any check constraints, each check constraint must be true or unknown for each row that is updated in the table.

  All checks constraints are effectively validated at the end of the statement. In the case of a multi-row update, this validation occurs after all the rows are updated.

- *Views and the WITH CHECK OPTION*. For views defined with WITH CHECK OPTION, an updated row must conform to the definition of the view. If the view you name is dependent on other views whose definitions include WITH CHECK OPTION, the updated rows must also conform to the definitions of those views. For an explanation of the rules governing this situation, see "CREATE VIEW" on page 1527.

  For views that are not defined with WITH CHECK OPTION, you can change the rows so that they no longer conform to the definition of the view. Such rows are updated in the base table of the view and no longer appear in the view.

- *Field and validation procedures*. The updated rows must conform to any constraints imposed by any field or validation procedures on the identified table (or on the base table of the identified view).

- *Referential constraints*. The value of the parent key in a parent row must not be changed. If the update value produces a foreign key that is nonnull, the foreign key must be equal to some value of the parent key of the parent table of the relationship.

  All referential constraints are effectively checked at the end of the statement. In the case of a multi-row update, this validation occurs after all the rows are updated.

- *Indexes with VARBINARY columns*. If the identified table has an index on a VARBINARY column or a column that is a distinct type that is based on VARBINARY data type, that index column cannot specify the DESC attribute. To use the SQL data change operation on the identified table, either drop the index or alter the data type of the column to BINARY and then rebuild the index.

- *Triggers*. An UPDATE statement might cause triggers to activate. A trigger might cause other statements to be executed or raise error conditions based on the update values.If an UPDATE statement for a view causes an instead of trigger to activate, validity, referential integrity, and check constraints are checked against the data changes that are performed in the trigger and not against the view that causes the trigger to activate or its underlying base tables.

Number of rows updated:

Normally, after an UPDATE statement completes execution, the value of SQLERRD(3) in the SQLCA is the number of rows updated. (For a complete description of the SQLCA, including exceptions to the preceding sentence, see "SQL communication area (SQLCA)" on page 2069.)

Nesting user-defined functions or stored procedures:

An UPDATE statement can implicitly or explicitly refer to user-defined functions or stored procedures. This is known as *nesting* of SQL statements. A user-defined function or stored procedure that is nested within the UPDATE must not access the table being updated.

Locking:

Unless appropriate locks already exist, one or more exclusive locks are acquired by the execution of a successful update operation. Until a commit or rollback operation releases the locks, only the application process that performed the insert can access the updated row. If LOBs are not updated, application processes that are running with uncommitted read can also access the updated row. The locks can also prevent other application processes from performing operations on the table. However, application processes that are running with uncommitted read can access locked pages and rows.

Locks are not acquired on declared temporary tables.

Datetime representation when using datetime registers:

As explained under Datetime special registers, when two or more datetime registers are implicitly or explicitly specified in a single SQL statement, they represent the same point in time. This is also true when multiple rows are updated.

Rules for positioned UPDATE with a SENSITIVE STATIC scrollable cursor:

When a SENSITIVE STATIC scrollable cursor has been declared, the following rules apply:

- *Update attempt of delete holes.* If, with a positioned update against a SENSITIVE STATIC scrollable cursor, an attempt is made to update a row that has been identified as a delete hole, an error occurs.
- *Update operations.* Positioned update operations with SENSITIVE STATIC scrollable cursors perform as follows:
  1. The SELECT list items in the target row of the base table of the cursor are compared with the values in the corresponding row of the result table (that is, the result table must still agree with the base table). If the values are not identical, then the update operation is rejected, and an error occurs. The operation may be attempted again after a successful FETCH SENSITIVE has occurred for the target row.
  2. The WHERE clause of the SELECT statement is re-evaluated to determine whether the current values in the base table still satisfy the search criteria. The values in the SELECT list are compared to determine that these values have not changed. If the WHERE clause evaluates as true, and the values in the SELECT have not changed, the update operation is allowed to proceed. Otherwise, the update operation is rejected, an error occurs, and an *update hole* appears in the cursor.
- *Update of update holes.* Update holes are not permanent. It is possible for another process, or a searched update in the same process, to update an update hole row so that it is no longer an update hole. Update holes become visible with a FETCH SENSITIVE for positioned updates and positioned deletes.
- *Result table.* After the base table is updated, the row is re-evaluated and updated in the temporary result table. At this time, it is possible that the positioned update changed the data such that the row does not qualify the search condition, in which case the row is marked as an update hole for subsequent FETCH operations.

Updating rows in a table with multilevel security:

When you update rows in a table with multilevel security, DB2 compares the security label of the user (the primary authorization ID) to the security label of the row. The update proceeds according to the following rules:

- If the security label of the user and the security label of the row are equivalent, the row is updated and the value of the security label is determined by whether the user has write-down privilege:
  - If the user has write-down privilege or write-down control is not enabled, the user can set the security label of the row to any valid security label. The value that is specified for the security label column must be assignable to a column that is defined as CHAR(8) FOR SBCS DATA NOT NULL.
  - If the user does not have write-down privilege and write-down control is enabled, the security label of the row is set to the value of the security label of the user.
- If the security label of the user dominates the security label of the row, the result of the UPDATE statement is determined by whether the user has write-down privilege:
  - If the user has write-down privilege or write-down control is not enabled, the row is updated and the user can set the security label of the row to any valid security label.
  - If the user does not have write-down privilege and write-down control is enabled, the row is not updated.
- If the security label of the row dominates the security label of the user, the row is not updated.

Updating rows in a table for which row or column access control is enforced:
When an UPDATE statement is issued for a table for which row or column access control is enforced, the rules specified in the enabled row permissions or column masks determine whether the row can be updated. Typically those rules are based on the authorization ID or role of the process. The following describes how enabled row permissions and column masks are used during UPDATE:

- Row permissions are used to identify the set of rows to be updated.

  When multiple enabled row permissions are defined for a table, a row access control search condition is derived by application of the logical OR operator to the search condition in each enabled permission. This row access control search condition is applied to the table to determine which rows are accessible to the authorization ID or role of the UPDATE statement. If the WHERE clause is specified in the UPDATE statement, the user-specified predicates are applied on the accessible rows to determine the rows to be updated. If there is no WHERE clause, the accessible rows are the rows to be updated.

  Column masks are not applicable in this step.

  If the table is not enforced by row access control, the WHERE clause determines the rows to be updated, otherwise all rows in the table are to be updated.
- If there are rows to be updated, the following rules determine whether those rows can be updated:
  - For every column to be updated, the new value of the column must not be affected by enabled column masks whose columns are referenced when deriving the new value.

    When a column is referenced while deriving the values of a new row, if the column has an enabled column mask, the masked value is used to derive the new values. If the object table is also column access control activated, the column mask applied to derive the new values must ensure the evaluation of the access control rules defined in the

column mask resolves the column to itself, not to a constant or an expression. If the column mask does not mask the column to itself, the new value cannot be used for update and an error is returned at run time.

- If the rows are updatable, and there is a BEFORE UPDATE trigger for the table, the trigger is activated.

  Within the trigger actions, the new values for update might be modified in transition variables. When the final values are returned from the trigger, the new values are used for the update.
- The rows that are to be updated must conform to the enabled row permissions:

  For each row that is to be updated, the old values are replaced with the new values that were specified in the UPDATE statement. A row that conforms to the enabled row permissions is a row that, if updated, can be retrieved using the derived row access control search condition.
- If the rows are updatable, and there is an AFTER UPDATE trigger for the table, the trigger is activated.

The above rules are not applicable to the included columns. The included columns are subject to the rules for the select list because they are not the columns of the object table of the UPDATE statement.

Extended indicator variable usage:
When extended indicator variables are enabled, negative indicator values that are outside the range of -1 through -7 must not be specified, and the default and unassigned extended indicator values must not appear in contexts in which they are not supported.

Extended indicator variables:
Assigning an extended indicator value of unassigned has the effect of leaving the target column set to its current value, as if it had not been specified in the statement. Assigning an extended indicator value of default assigns the default value to the column.

If a target column is not updatable (for example, an identity column that is defined as GENERATED ALWAYS), it must be assigned the extended indicator value of unassigned unless the **OVERRIDING USER VALUE** clause is specified.

The UPDATE statement must not assign all target columns to the extended indicator value of unassigned.

Extended indicator variables and update triggers:
If a target column has been assigned an extended indicator value of unassigned, the column is not considered to have been updated. The column is treated as if it had not been specified in the **OF** *column-name* list of any update trigger that is defined on the target table.

Extended indicator variables and deferred error checks:
When extended indicator variables are enabled, validation that would otherwise be done in statement preparation (to recognize an update of a non-updatable column) is deferred until statement execution. If statement validation fails, an error is returned when the statement is run, not when the statement is prepared.

Considerations for a generated column:
A generated column that is defined as **GENERATED ALWAYS** should not be specified as the target of an assignment clause unless the value that is

to be assigned is specified with the DEFAULT keyword or an extended indicator that specifies that a default value is to be assigned. The user can specify the OVERRIDING USER VALUE clause to indicate that any user-specified value should be ignored and that DB2 should assign the default value.

Considerations for a system-period temporal table:

When a row of a system-period temporal table is updated, DB2 updates the values of the *row-begin* and *transaction-start-ID* columns as follows:

- A row-begin column is assigned a value that is generated by using the time-of-day clock during the execution of the first data change statement in the transaction that requires a value to be assigned to a row-begin column or transaction-start-ID column in a table. This also occurs when a row in a system-period temporal table is deleted. DB2 ensures the uniqueness of the generated values for a row-begin column across transactions. If multiple rows are updated within a single SQL transaction, the values for the row-begin column are the same for all the rows and are unique from the values that are generated for the column for another transaction.
- A transaction-start-ID column is assigned a unique timestamp value per transaction or the null value. The null value is assigned to the transaction-start-ID column if the column is nullable. Otherwise, the value is generated by using the time-of-day clock during execution of the first data change statement in the transaction that requires a value to be assigned to a row-begin column or transaction-start-ID column in a table. This also occurs when a row in a system-period temporal table is deleted. If multiple rows are updated within a single SQL transaction, the values for the transaction-start-ID column are the same for all the rows and are unique from the values that are generated for the column for another transaction.

If the UPDATE statement has a search condition that contains a correlated subquery that references historical rows (explicitly referencing the name of the history table or implicitly referenced through the use of a period specification in the FROM clause), the old version of the updated rows that are inserted as historical rows (into the history table) are potentially visible to update operations for the rows that are subsequently processed for the statement.

Considerations for a history table:

When a row of a system-period temporal table is updated, a historical copy of the row is inserted into the corresponding history table and the end timestamp of the historical row is captured in the form of a system determined value that corresponds to the time of the data change operation. DB2 generates the value by using the time-of-day clock during the execution of the first data change statement in the transaction that requires a value to be assigned to a row-begin or transaction-start-ID column in a table. This also occurs when a row in a system-period temporal table is deleted. DB2 ensures uniqueness of the generated values for an end column in a history table across transactions. If a conflicting transaction is updating the same row in the system-period temporal table and the row that is to be inserted into the associated history table would have an end timestamp value that is greater than the begin timestamp value, an error is returned.

Considerations for an application-period temporal table:

An UPDATE statement for an application-period temporal table that

contains a **FOR PORTION OF BUSINESS_TIME** clause indicates between which two points in time that the specified updates are effective. When **FOR PORTION OF BUSINESS_TIME** is specified, and the period value for a row that is specified by the values of the begin column and end column for the BUSINESS_TIME period is only partially contained in the period that is specified from *value1* up to *value2*, the row is updated and one or two rows are automatically inserted to represent the portion of the row that is not changed. New values are generated for each generated column in an application-period temporal table for each row that is automatically inserted as a result of an update operation on the table. If a generated column is defined as part of a unique or primary key, parent key in a referential constraint, or unique index, it is possible that an automatic insert can violate a constraint or index in which case an error is returned.

Effect of the CURRENT TEMPORAL SYSTEM_TIME and CURRENT TEMPORAL BUSINESS_TIME special registers

If the CURRENT TEMPORAL SYSTEM_TIME special register is set to a non-null value, the underlying target of the UPDATE statement cannot be a system-period temporal table. This restriction applies regardless of whether the system-period temporal table is directly or indirectly referenced.

If the CURRENT TEMPORAL BUSINESS_TIME special register is set to a non-null value, the UPDATE statement is affected if the following conditions are also true:

- An application-period temporal table is the target of the UPDATE statement.
- The BUSTIMESENSITIVE bind option is set to YES.

In this situation, DB2 implicitly adds the following additional predicates to the statement:

```
    bt_begin <= CURRENT TEMPORAL BUSINESS_TIME
AND bt_end > CURRENT TEMPORAL BUSINESS_TIME
```

In the preceding code, bt_begin and bt_end are the begin and end columns of the BUSINESS_TIME period of the target table of the UPDATE statement.

Archive-enabled tables:

A reference to an archive-enabled table as the target of the UPDATE statement does not affect rows in the associated archive table.

A data change statement must not reference an archive-enabled table when a system-period temporal table or application-period temporal table is also referenced.

Other SQL statements in the same unit of work:

The following statements cannot follow an UPDATE statement in the same unit of work:

- An ALTER TABLE statement that changes the data type of a column (ALTER COLUMN SET DATA TYPE)
- An ALTER INDEX statement that changes the padding attribute of an index with varying-length columns (PADDED to NOT PADDED or vice versa)

Using UPDATE to reset AREO* status on a table:

An UPDATE statement will reset the AREO* state of a table if all conditions are true:

- The statement is a searched UPDATE statement. An UPDATE statement within a SELECT statement will not reset the AREO* state.
- The expression in the SET clause is not a *scalar-fullselect* or *row-fullselect*
- The update operation is against a table in a universal table space
- The table does not have row access control activated
- The SKIP LOCKED DATA clause is not specified
- The WHERE clause is not specified
- A resource unavailable condition is not encountered.

  No error or warning SQLCODE is returned if a resource unavailable condition is encountered. Only a resource unavailable console message will be displayed.

A DISPLAY DATABASE command can be used to determine if AREO* is reset.

Examples

Example 1: Change employee 000190's telephone number to 3565 in DSN8B10.EMP.

```
UPDATE DSN8B10.EMP
  SET PHONENO='3565'
  WHERE EMPNO='000190';
```

Example 2: Give each member of department D11 a 100-dollar raise.

```
UPDATE DSN8B10.EMP
  SET SALARY = SALARY + 100
  WHERE WORKDEPT = 'D11';
```

Example 3: Employee 000250 is going on a leave of absence. Set the employee's pay values (SALARY, BONUS, and COMMISSION) to null.

```
UPDATE DSN8B10.EMP
  SET SALARY = NULL, BONUS = NULL, COMM = NULL
  WHERE EMPNO='000250';
```

Alternatively, the statement could also be written as follows:

```
UPDATE DSN8B10.EMP
  SET (SALARY, BONUS, COMM) = (NULL, NULL, NULL)
  WHERE EMPNO='000250';
```

Example 4: Assume that a column named PROJSIZE has been added to DSN8B10.EMP. The column records the number of projects for which the employee's department has responsibility. For each employee in department E21, update PROJSIZE with the number of projects for which the department is responsible.

```
UPDATE DSN8B10.EMP
  SET PROJSIZE = (SELECT COUNT(*)
                  FROM DSN8B10.PROJ
                  WHERE DEPTNO = 'E21')
  WHERE WORKDEPT = 'E21';
```

Example 5: Double the salary of the employee represented by the row on which the cursor C1 is positioned.

```
EXEC SQL UPDATE DSN8B10.EMP
  SET SALARY = 2 * SALARY
  WHERE CURRENT OF C1;
```

Example 6: Assume that employee table EMP1 was created with the following statement:

```
CREATE TABLE EMP1
  (EMP_ROWID    ROWID GENERATED ALWAYS,
   EMPNO        CHAR(6),
   NAME         CHAR(30),
   SALARY       DECIMAL(9,2),
   PICTURE      BLOB(250K),
   RESUME       CLOB(32K));
```

Assume that host variable *HV_EMP_ROWID* contains the value of the ROWID column for employee with employee number '350000'. Using that ROWID value to identify the employee and user-defined function UPDATE_RESUME, increase the employee's salary by $1000 and update that employee's resume.

```
EXEC SQL UPDATE EMP1
  SET SALARY = SALARY + 1000,
      RESUME = UPDATE_RESUME(:HV_RESUME)
  WHERE EMP_ROWID = :HV_EMP_ROWID;
```

Example 7: In employee table X, give each employee whose salary is below average a salary increase of 10%.

```
EXEC SQL UPDATE EMP X
  SET SALARY = 1.10 * SALARY
  WHERE SALARY < (SELECT AVG(SALARY) FROM EMP Y
  WHERE X.JOBCODE = Y.JOBCODE);
```

Example 8: Raise the salary of the employees in department 'E11' whose salary is below average to the average salary.

```
EXEC SQL UPDATE EMP T1
  SET SALARY = (SELECT AVG(T2.SALARY) FROM EMP T2)
  WHERE WORKDEPT = 'E11' AND
        SALARY < (SELECT AVG(T3.SALARY) FROM EMP T3);
```

Example 9: Give the employees in department 'E11' a bonus equal to 10% of their salary.

```
EXEC SQL
  DECLARE C1 CURSOR FOR
    SELECT BONUS
    FROM DSN8710.EMP
    WHERE WORKDEPT = 'E12'
    FOR UPDATE OF BONUS;
EXEC SQL
  UPDATE DSN8710.EMP
    SET BONUS = ( SELECT .10 * SALARY FROM DSN8710.EMP Y
                  WHERE EMPNO = Y.EMPNO )
    WHERE CURRENT OF C1;
```

Example 10: Assuming that cursor CS1 is positioned on a rowset consisting of 10 rows in table T1, update all 10 rows in the rowset.

```
EXEC SQL UPDATE T1 SET C1 = 5 WHERE CURRENT OF CS1;
```

Example 11: Assuming that cursor CS1 is positioned on a rowset consisting of 10 rows in table T1, update the fourth row of the rowset.

```
short ind1, ind2;

int n, updt_value;

stmt = 'UPDATE T1 SET C1 = ? WHERE CURRENT OF CS1 FOR ROW ? OF ROWSET'

ind1 = 0;
```

```
ind2 = 0;

n = 4;

updt_value = 5;

...

strcpy(my_sqlda.sqldaid,"SQLDA");

my_sqlda.sqln = 2;

my_sqlda.sqld = 2;

my_sqlda.sqlvar[0].sqltype = 497;
my_sqlda.sqlvar[0].sqllen = 4;
my_sqlda.sqlvar[0].sqldata = (int *) &updt_value;
my_sqlda.sqlvar[0].sqlind = (short *) &ind1;

my_sqlda.sqlvar[1].sqltype = 497;
my_sqlda.sqlvar[1].sqllen = 4;
my_sqlda.sqlvar[1].sqldata = (int *) &n;
my_sqlda.sqlvar[1].sqlind = (short *) &ind2;

EXEC SQL PREPARE S1 FROM :stmt;

EXEC SQL EXECUTE S1 USING DESCRIPTOR :my_sqlda;
```

Example 12: Assume that table POLICY exists and that it is defined with a single period, BUSINESS_TIME. The table contains a row where column BK has a value of 'P138' and column CLIENT has a value of 'C882', and column TYPE has a value of 'PPO'. Update the portion of the row beginning from the current date to set the TYPE column to 'HMO':

```
UPDATE POLICY
 FOR PORTION OF BUSINESS_TIME
  FROM CURRENT DATE TO DATE '9999-12-31'
  SET TYPE='HMO'
  WHERE BK='P138', CLIENT='C882';
```

After the UPDATE statement is processed, the table contains 2 rows in place of the original row. One row represents a value of 'PPO' for the TYPE column (the value before the update) and the other row represents a value of 'HMO' for the TYPE column (that began with the UPDATE statement).

Example 13: Suppose that the INTARRAY and CHARARRAY array types, the INTA, CHARA, and SI variables, and the T1 table are defined as follows:

```
CREATE TYPE INTARRAY AS INTEGER ARRAY [6];
CREATE TYPE CHARARRAY AS CHAR(20) ARRAY [7];
DECLARE INTA AS INTARRAY;
DECLARE CHARA AS CHARARRAY;
CREATE VARIABLE SI INT;
CREATE TABLE T1 (COL1 CHAR(7), COL2 INT);
```

Assign values to CHARA, INTA, and SI.

```
SET CHARA = ARRAY [ 'a', 'b', 'c' ];
SET INTA = ARRAY [ 1, 2, 3, 4, 5 ];
SET SI = 1;
```

Insert a row into table T1, and then update the row values using values from the CHARA and INTA arrays, which are indexed by the value of variable SI.

```
INSERT INTO T1 VALUES ('abc', 10);
UPDATE T1
 SET COL1 = CHARA[SI],
 COL2 = INTA[SI];
```

In the table row, COL1 now contains 'a', and COL2 contains 1.

Set the value of column COL2 for all rows to the cardinality of array INTA.

```
UPDATE T1
 SET COL2 = CARDINALITY(INTA);
```

In the table row, COL2 now contains 5.

VALUES

The VALUES statement provides a method for invoking a user-defined function from a trigger. Transition variables and transition tables can be passed to the user-defined function.

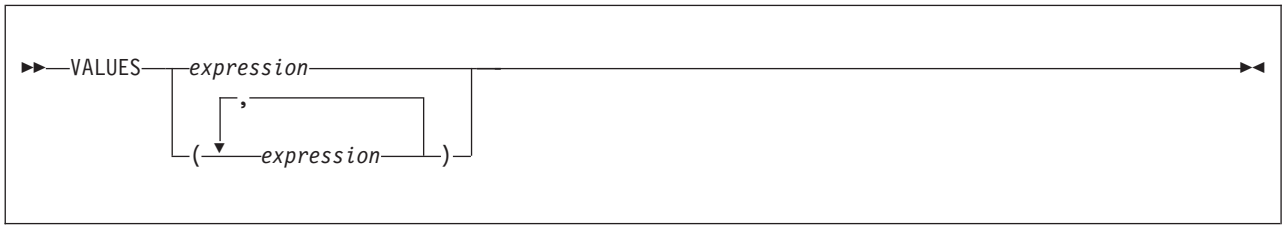
Invocation

This statement can only be used in the triggered action of a trigger.

Authorization

Authorization is required for any expressions that are used in the statement. For more information, see "Expressions" on page 240.

Syntax



Description

VALUES

Specifies one or more expressions. If more than one expression is specified, the expressions must be enclosed within parentheses.

expression

Any expression of the type described in "Expressions" on page 240. The expression must not contain a host variable.

The expressions are evaluated, but the resulting values are discarded and are not assigned to any output variables.

If a user-defined function is specified as part of an expression, the user-defined function is invoked. If a negative SQLCODE is returned when the function is invoked, DB2 stops executing the trigger and rolls back any triggered actions that were performed.

Example

Example: Create an after trigger EMPISRT1 that invokes user-defined function NEWEMP when the trigger is activated. An insert operation on table EMP activates the trigger. Pass transition variables for the new employee number, last name, and first name to the user-defined function.

```
CREATE TRIGGER EMPISRT1
   AFTER INSERT ON EMP
   REFERENCING NEW AS N
   FOR EACH ROW
   MODE DB2SQL
   BEGIN ATOMIC
      VALUES(NEWEMP(N.EMPNO, N.LASTNAME, N.FIRSTNAME));
   END
```

VALUES INTO

The VALUES INTO statement assigns one or more values to variables.

Invocation

This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared.

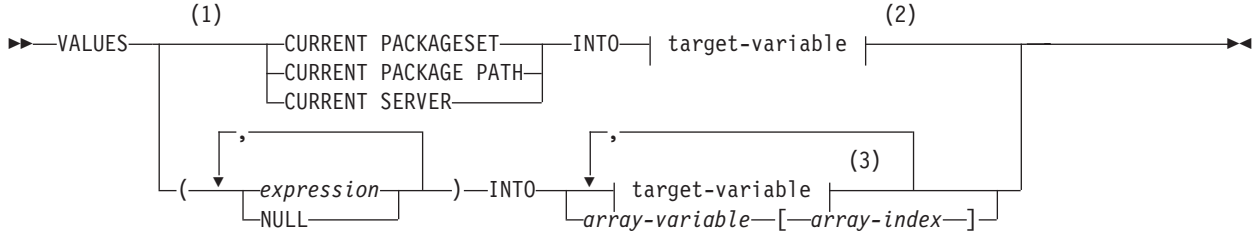
Authorization

The privileges that are held by the authorization ID of the statement must include at least one of the following privileges or authorities:

- The SELECT privilege on every table and view identified in the statement
- Ownership of every table and view identified in the statement
- READ and WRITE privileges on any global variables that are identified in the statement
- Ownership of any global variables that are identified in the statement
- DBADM authority for the database (tables only)
- DATAACCESS authority
- SYSADM authority
- SYSCTRL authority (catalog tables only)

Authorization is required for any expressions that are used in the statement. For more information, see "Expressions" on page 240.

Syntax



target-variable:

Notes:

1 These special registers can be referenced only as a source value in this form of the syntax for this statement.

2 *target-variable* must not be an array type in this context.

3 The number of source value specifications (*expression*, NULL, or DEFAULT) on the right side of the equal sign must match the number of target specifications on the left side of the statement.

Description

VALUES

Introduces a single row that consists of one or more columns. If more than one value is specified, the list of values must be enclosed within parentheses.

expression

The expression is any expression of the type described in "Expressions" on page 240, except that it cannot contain a reference to the CURRENT PACKAGESET, CURRENT PACKAGE PATH, or CURRENT SERVER special registers. The expression must not include a column name.

NULL

The null value. **NULL** can only be specified for host variables that have an associated indicator variable.

INTO *target-variable* **or** *array-variable*[*array-index*]

Identifies one or more targets for the assignment of output values. The number of targets in the INTO clause must equal the number of values that are to be assigned. The first value in the result row is assigned to the first target in the list, the second value to the second target, and so on. A target variable must not be specified more than once in the INTO clause. Each assignment to a target is made in sequence through the list, according to the rules described in "Assignment and comparison" on page 121.

The value 'W' is assigned to the SQLWARN3 field of the SQLCA if the number of targets is less than the number of result column values.

If an error occurs on any assignment, the value is not assigned to the target, and no more values are assigned to the specified targets. Any values that have already been assigned remain assigned.

global-variable-name
Identifies the global variable that is the assignment target.

host-variable-name
Identifies the host variable that is the assignment target. For LOB output values, the target can be a regular host variable (if it is large enough), a LOB locator variable, or a LOB file reference variable.

SQL-parameter-name
Identifies the parameter that is the assignment target.

SQL-variable-name
Identifies the SQL variable that is the assignment target. SQL variables must be declared before they are used.

array-variable **[***array-index***]**
Specifies an array element that is the target of the assignment.

An array element must not be specified as the target for an assignment if *common-table-expression* is also specified in the statement.

[*array-index***]**
An expression that specifies which element in the array is the target of the assignment.

For an ordinary array, the array index expression must be castable to INTEGER, and must not be the null value. The index value must be between 1 and the maximum cardinality that is defined for the array.

For an associative array, the array index expression must be castable to the index data type of the associative array, and must not be the null value.

array-index must not be:

- An expression that references the CURRENT DATE, CURRENT TIME, or CURRENT TIMESTAMP special register
- A nondeterministic function
- A function that is defined with EXTERNAL ACTION
- A function that is defined with MODIFIES SQL DATA
- A sequence expression

Notes

Assignment to targets:
The *n*th target identified by the INTO clause or described in the SQLDA corresponds to the *n*th column of the result table of the cursor. The data type of target must be compatible with its corresponding value. If the value is numeric, the target must have the capacity to represent the whole part of the value. For a datetime value, the target must be a character string variable of a minimum length as defined in "String representations of datetime values" on page 101. When the target is a host variable, if the value is null, an indicator variable must be specified.

Assignments are made in sequence through the list. Each assignment to a target is made according to the rules described in Chapter 2, "Language elements," on page 53. If the number of targets is less than the number of

values in the row, the SQLWARN3 field of the SQLCA is set to 'W'. There is no warning if there are more targets than the number of result columns. If the target is a host variable and the value is null, an indicator variable must be provided. If an assignment error occurs, the value is not assigned to the target and no more values are assigned to targets. Any values that have already been assigned to targets remain assigned. However, if LOB values are involved, there is a possibility that the corresponding target was modified, but the variable's contents are unpredictable.

If more than one assignment is included in the same assignment statement, all expressions are evaluated before the assignments are performed. For example, a reference to a variable in an expression always uses the value of the variable prior to any assignment in the assignment statement.

Normally, you use LOB locators to assign and retrieve data from LOB columns. However, because of compatibility rules, you can also use LOB locators to assign data to targets with other data types. For more information on using locators, see Saving storage when manipulating LOBs by using LOB locators (DB2 Application programming and SQL).

Default encoding scheme:

The default encoding scheme for the data is the value in the bind option ENCODING, which is the option for application encoding. If this statement is used with functions such as LENGTH or SUBSTRING that are operating on LOB locators, and the LOB data that is specifies by the locator is in a different encoding scheme from the ENCODING bind option, LOB materialization and character conversion occur. To avoid LOB materialization and character conversion, select the LOB data from the SYSIBM.SYSDUMMYA, SYSIBM.SYSDUMMYE, or SYSIBM.SYSDUMMYU sample table.

Examples

Example 1: Assign the value of the CURRENT PATH special register to host variable *HV1*.

```
EXEC SQL VALUES(CURRENT PATH)
         INTO :HV1;
```

Example 2: Assign the value of the CURRENT MEMBER special register to host variable *MEM*.

```
EXEC SQL VALUES(CURRENT MEMBER)
         INTO :MEM;
```

Example 3: Assume that LOB locator *LOB1* is associated with a CLOB value. Assign a portion of the CLOB value to host variable *DETAILS* using the LOB locator.

```
EXEC SQL VALUES (SUBSTR(:LOB1,1,35))
         INTO :DETAILS;
```

If the LOB data that is specified by the LOB locator *LOB1* is in a different encoding scheme from the value of the ENCODING bind option, and you want to avoid LOB materialization and character conversion, use the following statement instead of the VALUES INTO statement:

```
EXEC SQL SELECT SUBSTR(:LOB1,1,35)
         INTO :DETAILS
         FROM SYSIBM.SYSDUMMYU;
```

Example 4: Using a VALUES INTO statement, retrieve the value of INTVAR1 into an element in array MYINTARRAY1, which is indexed by the value of the expression INTCOL2+MYINTVAR+1.

```
VALUES INTVAR1 INTO MYINTARRAY1[INTCOL2+MYINTVAR+1];
```

WHENEVER

The WHENEVER statement specifies the host language statement to be executed when a specified exception condition occurs.

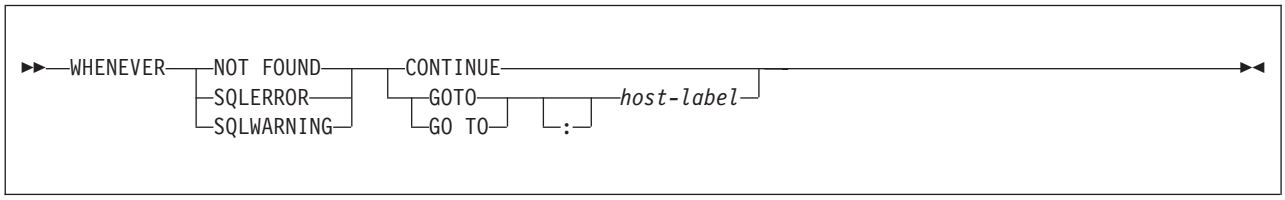
Invocation

This statement can only be embedded in an application program. It is not an executable statement. It must not be specified in Java or REXX.

Authorization

None required.

Syntax



Description

The **NOT FOUND**, **SQLERROR**, or **SQLWARNING** clause is used to identify the type of exception condition.

NOT FOUND
Identifies any condition that results in an SQLCODE of +100 (equivalently, an SQLSTATE code of '02000').

SQLERROR
Identifies any condition that results in a negative SQLCODE.

SQLWARNING
Identifies any condition that results in a warning condition (SQLWARN0 is W), or that results in a positive SQLCODE other than +100.

The **CONTINUE** or **GO TO** clause specifies the next statement to be executed when the identified type of exception condition exists.

CONTINUE
Specifies the next sequential statement of the source program.

GOTO or GO TO *host-label*
Specifies the statement identified by *host-label*. For *host-label*, substitute a single token, optionally preceded by a colon. The form of the token depends on the host language. In COBOL, for example, it can be *section-name* or an unqualified *paragraph-name*.

Notes

There are three types of WHENEVER statements:

- WHENEVER NOT FOUND
- WHENEVER SQLERROR
- WHENEVER SQLWARNING

Every executable SQL statement in an application program is within the scope of one implicit or explicit WHENEVER statement of each type. The scope of a WHENEVER statement is related to the listing sequence of the statements in the application program, not their execution sequence.

An SQL statement is within the scope of the last WHENEVER statement of each type that is specified before that SQL statement in the source program. If a WHENEVER statement of some type is not specified before an SQL statement, that SQL statement is within the scope of an implicit WHENEVER statement of that type in which **CONTINUE** is specified. If a WHENEVER statement is specified in a Fortran subprogram, its scope is that subprogram, not the source program.

The GET DIAGNOSTICS statement can be used to provide additional information.

Examples

The following statements can be embedded in a COBOL program.

Example 1: Go to the label HANDLER for any statement that produces an error.

```
EXEC SQL WHENEVER SQLERROR GOTO HANDLER END-EXEC.
```

Example 2: Continue processing for any statement that produces a warning.

```
EXEC SQL WHENEVER SQLWARNING CONTINUE END-EXEC.
```

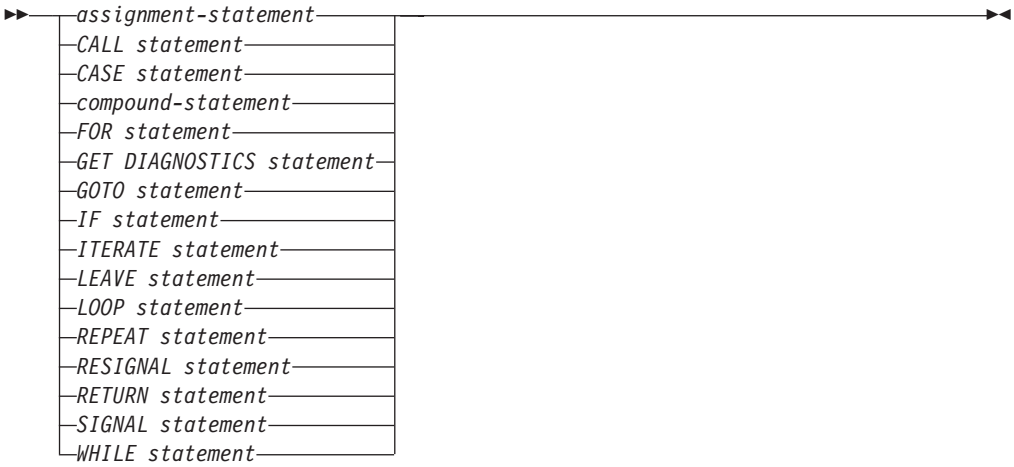
Example 3: Go to the label ENDDATA for any statement that does not return.

```
EXEC SQL WHENEVER NOT FOUND GO TO ENDDATA END-EXEC.
```

Chapter 6. SQL control statements for SQL routines

SQL control statements for SQL routines can be used in SQL functions and native SQL procedures. *SQL control statements* provide the capability to control the logic flow, declare and set variables, and handle warnings and exceptions. Some SQL control statements include other nested SQL statements.

SQL-control-statement:



Control statements are supported in SQL functions and SQL procedures.

- SQL functions are created by specifying LANGUAGE SQL and an SQL routine body in a CREATE FUNCTION statement. An SQL function can be changed. A new SQL routine body can be specified in an ALTER FUNCTION statement.
- SQL procedures are created by specifying LANGUAGE SQL and an SQL routine body in a CREATE PROCEDURE statement. An SQL procedure can be changed. A new SQL routine body can be specified in an ALTER PROCEDURE statement.

The SQL routine body must be a single SQL statement, which might be an SQL control statement.

The SQL routine body is the executable part of the function or procedure and is transformed by DB2 into a program.

The remainder of the topics about SQL control statements for SQL routines contain information about references to SQL parameters and variables, SQL condition names, SQL cursor names, labels, and reference information for the use of the statements that constitute the SQL routine body.

The two common elements that are used in describing specific SQL control statements are:

- SQL control statements as described above
- "SQL-procedure-statement" on page 1968

References to SQL parameters and SQL variables

SQL parameters and SQL variables can be referenced anywhere in the statement where an expression or a variable can be specified. Host variables cannot be specified in SQL routines. SQL parameters can be referenced anywhere in the routine and can be qualified with the routine name. SQL variables can be referenced anywhere in the compound statement in which they are declared, including any statement that is directly or indirectly nested within that compound statement.

If the compound statement where the variable is declared has a label, references to the variable name can be qualified with that label.

All SQL parameters and SQL variables are considered nullable. The name of an SQL parameter or an SQL variable in an SQL routine can be the same as the name of a column in a table or view that is referenced in the routine. The name of an SQL variable can also be the same as the name of another SQL variable that is declared in the same routine. This can occur when the two SQL variables are declared in different *compound-statements*. The *compound-statement* that contains the declaration of an SQL variable determines the scope of that variable. See "compound-statement" on page 1977 for additional information.

Names that are the same should be explicitly qualified. Qualifying a name clearly indicates whether the name refers to a column, an SQL variable, or an SQL parameter. If the name is not qualified or is qualified but is still ambiguous, the following rules describe whether the name refers to a column or to an SQL variable or an SQL parameter in an SQL routine:

- The name is checked to see if it is the name of a column of any existing table or a view that is specified in the SQL routine body at the current server. If the name is found as a column name, but the privilege set that is used to issue the CREATE PROCEDURE or ALTER PROCEDURE statement does not have the proper authority to access the table or view, the VALIDATE option that is in effect for the procedure determines what happens:
  - If VALIDATE BIND is in effect, an error is returned.
  - If VALIDATE RUN is in effect, the name is assumed to be a column name. If the privilege set that is used to issue the CREATE statement does not have the proper authority to access the table or view at run time, an error is returned.
- If the referenced tables or views do not exist at the current server, the name will be checked first as an SQL variable name in the compound statement and then as an SQL parameter name. The variable can be declared within the *compound-statement* that contains the reference, or within a compound statement in which that compound statement is nested. If two SQL variables are within the same scope and have the same name, the SQL variable that is declared in the innermost compound statement is used.

  If the name is not found as an SQL parameter or SQL variable, the VALIDATE option that is in effect for the procedure determines what happens:
  - If VALIDATE BIND is in effect, an error is returned.
  - If VALIDATE RUN is in effect, the name is assumed to a be column name. If a column does not exist with that name at run time, an error is returned.

The name of an SQL variable or an SQL parameter in an SQL routine can be the name of an identifier that is used in certain SQL statements. If the name is not qualified, the following rules describe whether the name refers to an identifier, an SQL variable, or and SQL parameter:

- In the SET CURRENT PACKAGE PATH, SET PATH and SET SCHEMA statements, the name is checked as an SQL variable name or an SQL parameter name. If an SQL variable or SQL parameter with that name is not found, the name is assumed to be an identifier.
- In the ASSOCIATE LOCATORS, CONNECT, RELEASE (connection), and SET CONNECTION statements, the name is used as an identifier.

References to SQL condition names

A condition name can only be referenced within the compound statement in which it is declared, including any compound statements that are nested within that compound statement. When there is a reference to a condition name, the condition that is declared in the innermost compound statement is the condition that is used.

The name of an SQL condition can be the same as the name of another SQL condition that is declared in the same routine. This can occur when the two SQL conditions are declared in different *compound-statements*. The *compound-statement* that contains the declaration of an SQL condition name determines the scope of that condition name. A condition name must be unique within the compound statement in which it is declared, excluding any declarations in compound statements that are nested within that compound statement. A condition name can only be referenced within the compound statement in which it is declared, including any compound statements that are nested within that compound statement. When there is a reference to a condition name, the condition that is declared in the innermost compound statement is the condition that is used. See “compound-statement” on page 1977 for additional information.

References to SQL cursor names

A cursor name can only be referenced within the compound statement in which it is declared, including any compound statements that are nested within that compound statement.

The name of an SQL cursor can not be the same as the name of another SQL cursor that is declared on the same routine. The *compound-statement* that contains the declaration of an SQL cursor name determines the scope of that cursor name. A cursor name can only be referenced within the compound statement in which it is declared, including any compound statements that are nested within that compound statement. See “compound-statement” on page 1977 for additional information.

References to labels

Specifying a label for an SQL procedure statement defines that label and determines the scope of that label. A label name can only be referenced within the compound statement in which it is defined, including a reference from any statement that is directly or indirectly nested within that compound statement. The FOR statement is considered the same as a compound statement with respect to defining and referencing labels. A label can be specified as the target of a GOTO, LEAVE, or ITERATE statement, subject to the rules for the statement that references the label as a target.

Labels can be specified on most SQL procedure statements. If a label is specified on an SQL procedure statement, it must be unique from other labels within the same scope. A label must not be the same as any other label within the same compound statement, must not be the same as a label specified on the compound statement itself, and if the compound statement is nested within another compound statement, the label must not be the same as the label specified on any higher level compound statement. The label must not be the same as the name of the SQL procedure.

Nested compound statements and scope of names

Nested compound statements can be used within an SQL routine to define the scope of SQL variable declarations, cursors, condition names, and condition handlers.

In addition, labels have a defined scope in the context of nested compound statements. However, the rules for name spaces and how non-unique names can be referenced, differs depending on the type of name. The following table summarizes these differences:

Table 153. Scope and qualification of names within nested compound statements

Type of name	Name can be qualified	Name must be unique within	Name can be referenced within
SQL variable	Yes. The name can be qualified with the label of the compound statement in which the variable is declared	the compound statement in which it is declared, excluding any declarations in compound statements that are nested within that compound statement	The compound statement in which it is declared, including any compound statements that are nested within that compound statement. When multiple SQL variables are defined with the same name, a label can be used to explicitly refer to a specific variable that is not the most local in scope
condition name	No	the compound statement in which it is declared, excluding any declarations in compound statements that are nested within that compound statement	The compound statement in which it is declared, including any compound statements that are nested within that compound statement. Condition names can be used in the declaration of a condition handler, or in a SIGNAL or RESIGNAL statement. If multiple conditions are defined with the same name, there is no way to explicitly refer to the condition that is not the most local in scope.

Table 153. Scope and qualification of names within nested compound statements (continued)

Type of name	Name can be qualified	Name must be unique within	Name can be referenced within
cursor name	No	the routine	The compound statement in which it is declared, including any compound statements that are nested within that compound statement. If the cursor is defined as a result set cursor, the invoking application can access the result set.
label	No	the compound statement that defined the label, including any definitions in compound statements that are nested within that compound statement	The compound statement in which it is defined, including any compound statements that are nested within that compound statement. Use a label to qualify the name of an SQL variable or as the target of a GOTO, LEAVE, or ITERATE statement, subject to the rules for these statements.

SQL-procedure-statement

An SQL control statement can allow multiple SQL statements to be specified within the SQL control statement. These statements are defined as SQL procedure statements.

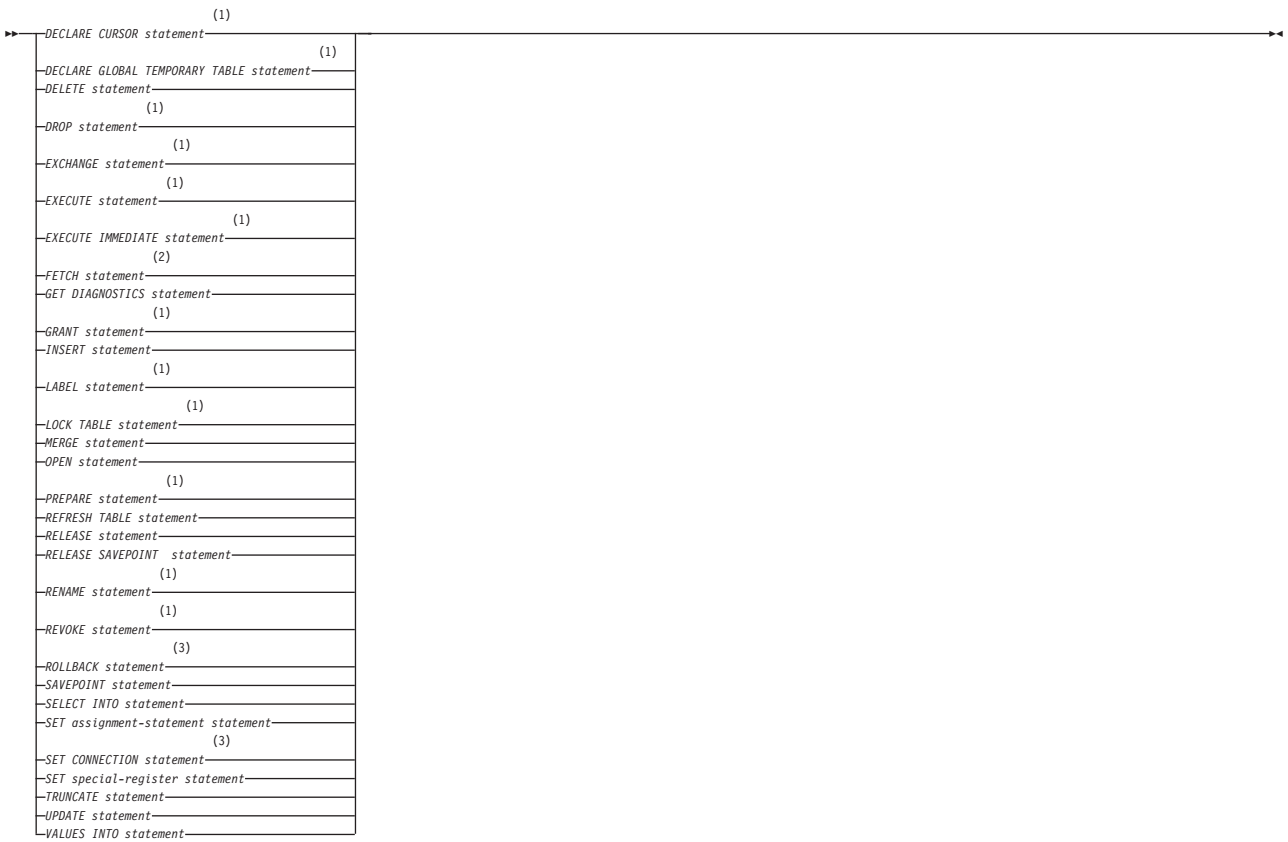
Syntax

Notes:

1 The statement is not allowed in an *SQL-routine-body* for an SQL function

2 An ALTER FUNCTION statement (SQL scalar) or an ALTER PROCEDURE statement (SQL - native) with an ADD VERSION or REPLACE clause is not allowed in an *SQL-routine-body*.

3 The COMMIT, ROLLBACK, CONNECT, and SET CONNECTION statements must only be specified within the body of an SQL procedure. The COMMIT statement and the ROLLBACK statement (without the TO SAVEPOINT clause) must not be issued in a routine body if the routine is in the calling chain of an SQL routine, or an external routine.



Notes:

1 The statement is not allowed in an *SQL-routine-body* for an SQL function

2 A FETCH statement must not specify a *fetch-orientation* clause, *multiple-row-fetch* clause, the WITH CONTINUE or the CURRENT CONTINUE clauses.

3 The COMMIT, ROLLBACK, CONNECT, and SET CONNECTION statements must only be specified within the body of an SQL procedure. The COMMIT statement and the ROLLBACK statement (without the TO SAVEPOINT clause) must not be issued in a routine body if the routine is in the calling chain of an SQL routine, or an external routine.

Description

SQL-control-statement
Specifies an SQL statement that provides the capability to control logic flow, declare and set variables, and handle warnings and exceptions, as defined in this section. Control statements are supported in SQL routines.

SQL-statement
Specifies an SQL statement. These statements are described in Chapter 5, "Statements," on page 833.

Notes

Comments: Comments can be included within the body of an SQL routine. In addition to the double-dash form of comments (--), a comment can begin with /* and end with */. The following rules apply to this form of comment:
- The beginning characters /* must be adjacent and on the same line.
- The ending characters */ must be adjacent and on the same line.
- Comments can be started wherever a space is valid.

- Comments can be continued to the next line.

Detecting and processing error and warning conditions: As an SQL statement is executed, DB2 stores information about the processing of the statement in a diagnostics area (including the SQLSTATE and SQLCODE), unless otherwise noted in the description of the SQL statement. A completion condition can indicate that the SQL statement completed successfully, completed with a warning condition, or completed with a not found condition. An exception condition indicates that the SQL statement was not successful.

A condition handler can be defined to execute when an exception condition, a warning condition, or a not found condition occurs in a compound statement. The declaration of a condition handler includes the code that is executed when the condition handler is activated. When a condition other than a successful completion occurs in the processing of *SQL-procedure-statement* and a condition handler that can handle the condition is within scope, one such condition handler will be activated to process the condition. See "compound-statement" on page 1977 for information about defining condition handlers. The code in the condition handler can check for a warning condition, a not found condition, or an exception condition and can take the appropriate action. Use one of the following methods at the beginning of the body of a condition handler to check the condition in the diagnostics area that caused the handler to be activated.

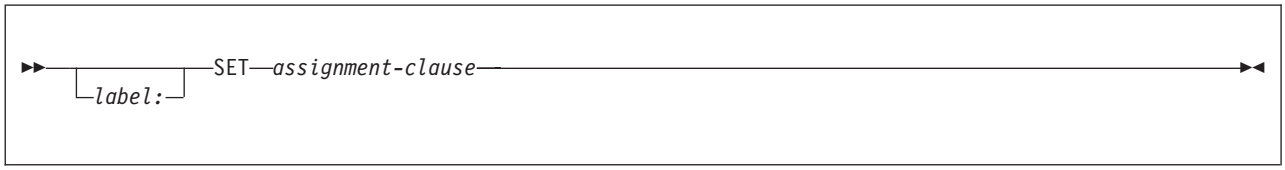
- Issue a GET DIAGNOSTICS statement to request the information from the diagnostics area. See "GET DIAGNOSTICS" on page 1679.
- Test the SQLSTATE and SQLCODE SQL variables.

If the condition is a warning and no handler exists for the condition, the previous two methods can be used outside of the body of a condition handler, if they are used immediately following the statement for which the condition is wanted. If the condition is an error and no handler exists for the condition, the routine terminates with the error condition.

assignment-statement

The assignment statement assigns a value to variables or array elements. The target value can be an SQL parameter or an SQL variable.

Syntax



Description

label

Specifies the label for *assignment-statement*. The label name cannot be the same as the name of the SQL routine, or another label within the same scope. For additional information, see "References to labels" on page 1965.

See "SET assignment-statement" on page 1875 for details.

Notes

Assignment rules: Assignment statements in SQL routines must conform to the SQL assignment rules. For example, the data type of the target and source must be compatible. See "Assignment and comparison" on page 121 for assignment rules.

When a string is assigned to a fixed-length variable and the length of the string is less than the length attribute of the target, the string is padded on the right with the necessary number of single-byte or double-byte blanks. When a string is assigned to a variable and the string is longer than the length attribute of the variable, the value is truncated and a warning is returned.

If truncation of the whole part of a number occurs on assignment to a numeric variable, the value is truncated and a warning is returned.

Assignments involving SQL parameters for SQL procedures: An IN parameter can appear on the left or right side in an assignment statement. When control returns to the caller, the original value of the IN parameter is retained. An OUT parameter can also appear on the left or right side in an assignment statement. If used without first being assigned a value, the value is undefined. When control returns to the caller, the last value that is assigned to an OUT parameter is returned to the caller. For an INOUT parameter, the first value of the parameter is determined by the caller, and the last value that is assigned to the parameter is returned to the caller.

Multiple assignments: If more than one assignment is included in the same assignment statement, all *expressions* are evaluated before the assignments are performed. Thus, references to an SQL variable or SQL parameter in an expression always use the value of the SQL variable or SQL parameter prior to any assignment in the assignment statement.

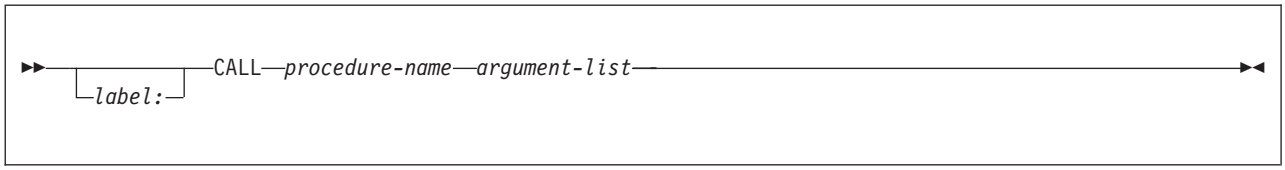
Considerations for SQLSTATE and SQLCODE SQL variables: Assignment to these variables is not prohibited. However, it is not recommended as assignment does not affect the diagnostic area or result in the activation of condition handlers.

Furthermore, processing an assignment to these SQL variables causes the specified values for the assignment to be overlayed with the SQL return codes returned from executing the statement that does the assignment.

CALL statement

The CALL statement invokes a stored procedure.

Syntax



argument-list:

Description

label
Specifies the label for the CALL statement. The label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 1965.

procedure-name
Identifies the stored procedure to call. The procedure name must identify a stored procedure that exists at the current server.

argument-list
Identifies a list of values to be passed as parameters to the stored procedure. The *n*th value corresponds to the *n*th parameter in the procedure. The number of parameters must be the same as the number of parameters defined for the stored procedure. See "CALL" on page 1117 for more information.

Control is passed to the stored procedure according to the calling conventions for SQL routines. When execution of the stored procedure is complete, the value of each parameter of the stored procedure is assigned to the corresponding parameter of the CALL statement defined as OUT or INOUT.

SQL-variable-name
Specifies an SQL variable as an argument to the stored procedure. For an explanation of references to SQL variables, see "References to SQL parameters and SQL variables" on page 1964.

SQL-parameter-name
Specifies an SQL parameter as an argument to the stored procedure. For an explanation of references to SQL parameters, see "References to SQL parameters and SQL variables" on page 1964.

expression
The parameter is the result of the specified *expression*, which is evaluated

before the stored procedure is invoked. If *expression* is a single *SQL-parameter-name* or *SQL-variable-name*, the corresponding parameter of the procedure can be defined as IN, INOUT, or OUT. Otherwise, the corresponding parameter of the procedure must be defined as IN. If the result of the *expression* can be the null value, either the description of the procedure must allow for null parameters or the corresponding parameter of the stored procedure must be defined as OUT.

The following additional rules apply depending on how the corresponding parameter was defined in the CREATE PROCEDURE statement for the procedure:

- IN *expression* can contain references to multiple SQL parameters or variables. In addition to the rules stated in "Expressions" on page 240 for *expression*, *expression* cannot include a column name, an aggregate function, or a user-defined function that is sourced on an aggregate function.
- INOUT or OUT *expression* can only be a single SQL parameter or variable.

NULL
The parameter is a null value. The corresponding parameter of the procedure must be defined as IN and the description of the procedure must allow for null parameters.

Notes

See "CALL" on page 1117 for more information on the SQL CALL statement.

Examples

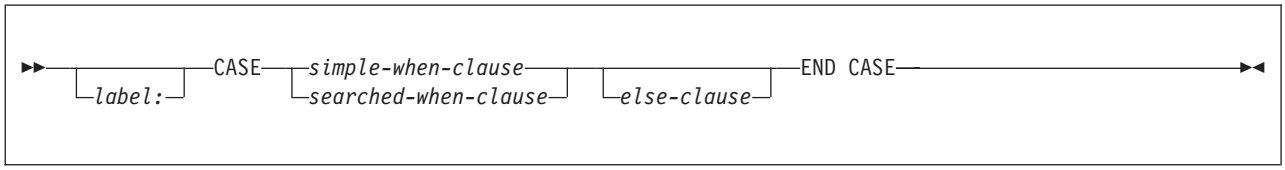
Call stored procedure proc1 and pass SQL variables as parameters.

```
CALL proc1(v_empno, v_salary)
```

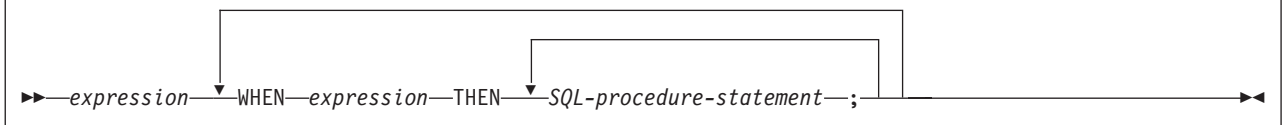
CASE statement

The CASE statement selects an execution path based on multiple conditions. A CASE statement operates in the same way as a CASE expression.

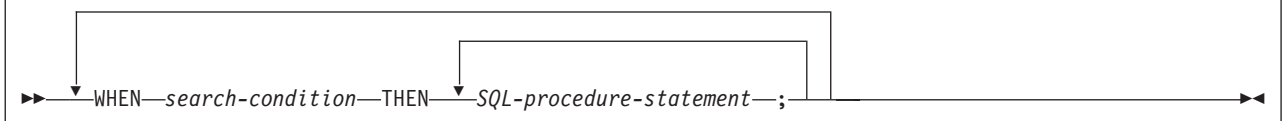
Syntax



simple-when-clause:



searched-when-clause:



else-clause:

Description

label
Specifies the label for the CASE statement. The label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 1965.

CASE
Begins a *case-expression*.

simple-when-clause
The value of the *expression* prior to the first WHEN keyword is tested for equality with the value of the *expression* that follows each WHEN keyword. If the comparison is true, the statements in the associated THEN clause are

executed and processing of the CASE statement ends. If the result is unknown or false, processing continues to the next comparison. If the result does not match any of the comparisons, and an ELSE clause is present, the statements in the ELSE clause are executed.

searched-when-clause
The *search-condition* following the WHEN keyword is evaluated. If it evaluates to true, the statements in the associated THEN clause are executed and processing of the CASE statement ends. If it evaluates to false, or unknown, the next *search-condition* is evaluated. If no *search-condition* evaluates to true and an ELSE clause is present, the statements in the ELSE clause are executed.

When *searched-when-clause* is used, *search-condition* cannot contain a *fullselect*.

SQL-procedure-statement
Specifies a statement to execute. See"SQL-procedure-statement" on page 1968.

search-condition
Specifies a condition that is true, false, or unknown about a row or group of table data.

ELSE *SQL-procedure-statement*
If none of the conditions specified in the *simple-when-clause* or *searched-when-clause* are true, the statements specified in *SQL-procedure-statement* are executed.

If none of the conditions specified in the WHEN clauses are true and an ELSE is not specified, an error is issued when the statement executes, and the execution of the CASE statement is terminated.

END CASE
Ends a *case-statement*.

Examples

Example 1: Use a simple case statement WHEN clause to update column DEPTNAME in table DEPT, depending on the value of SQL variable *v_workdept*.

```
CASE v_workdept
 WHEN 'A00'
  THEN UPDATE DEPT SET
   DEPTNAME = 'DATA ACCESS 1';
 WHEN 'B01'
  THEN UPDATE DEPT SET
   DEPTNAME = 'DATA ACCESS 2';
 ELSE UPDATE DEPT SET
   DEPTNAME = 'DATA ACCESS 3';
END CASE
```

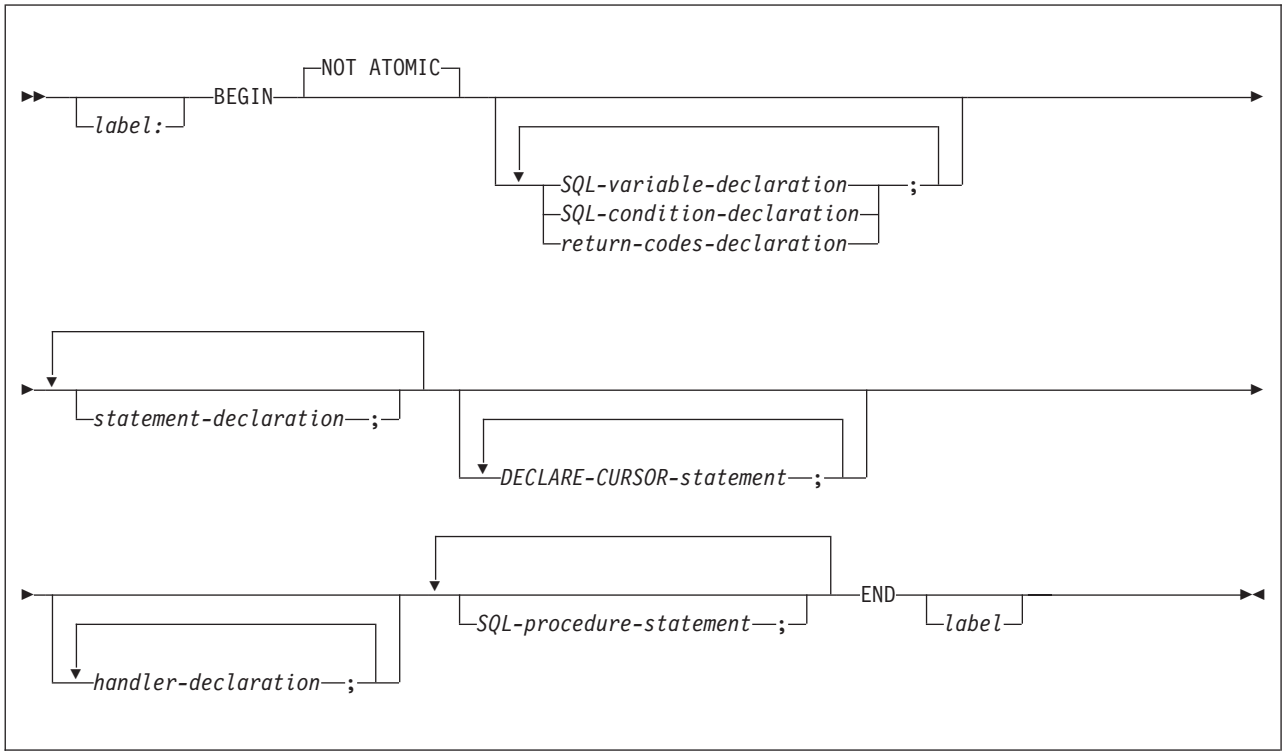
Example 2: Use a searched case statement WHEN clause to update column DEPTNAME in table DEPT, depending on the value of SQL variable *v_workdept*.

```
CASE
 WHEN v_workdept < 'B01'
  THEN UPDATE DEPT SET
   DEPTNAME = 'DATA ACCESS 1';
 WHEN v_workdept < 'C01'
  THEN UPDATE DEPT SET
   DEPTNAME = 'DATA ACCESS 2';
 ELSE UPDATE DEPT SET
   DEPTNAME = 'DATA ACCESS 3';
END CASE
```

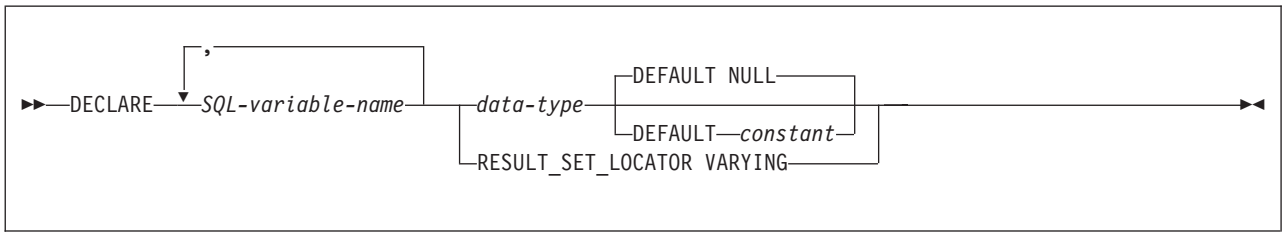
compound-statement

A compound statement groups other statements together in an SQL routine. A compound statement allows the declaration of SQL variables, cursors, and condition handlers.

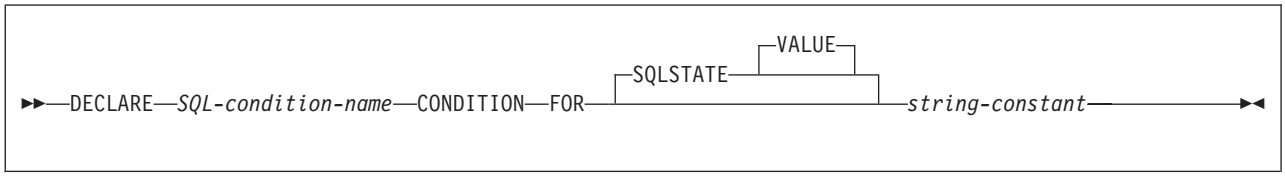
Syntax



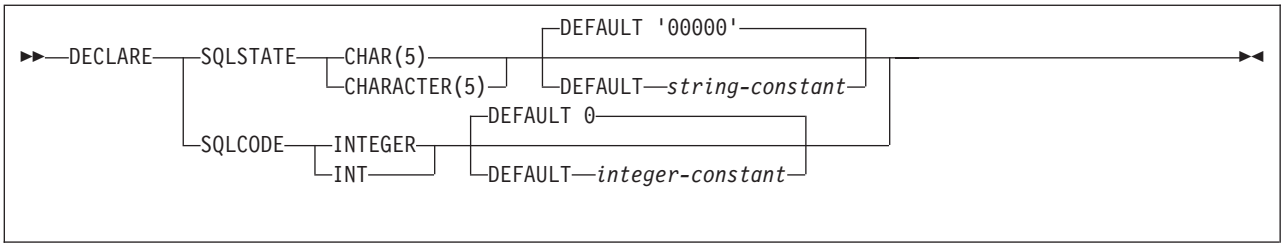
SQL-variable-declaration:



SQL-condition-declaration:

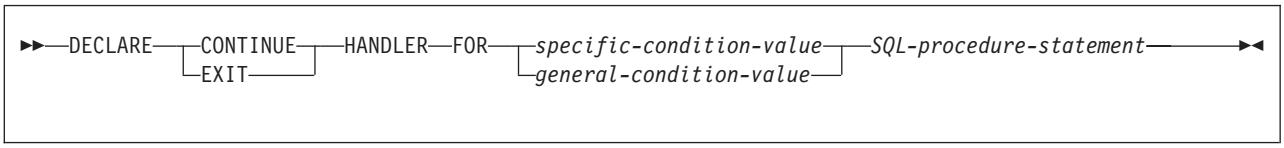


return-codes-declaration:

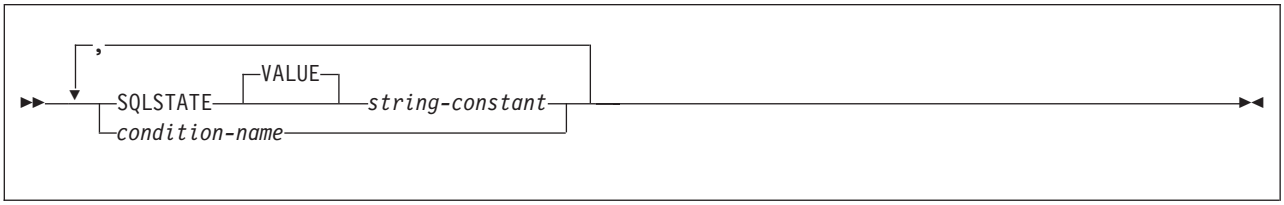


statement-declaration:

handler-declaration:



specific-condition-value:



general-condition-value:

Description

label

Specifies the label for the *compound-statement*. If the beginning label is specified, it can be used to qualify SQL variables declared in the compound statement and can also be specified as the target on a LEAVE statement. If the ending label is specified, it must be the same as beginning label. The label name cannot be the same as the routine name or another label within the same scope.

NOT ATOMIC
NOT ATOMIC indicates that an unhandled exception condition within the *compound-statement* does not cause the *compound-statement* to be rolled back.

SQL-variable-declaration
Declares a variable that is local to the compound statement.

SQL-variable-name
Defines the name of a variable. DB2 converts all SBCS SQL variable names that are not delimited to uppercase. *SQL-variable-name* must be unique within the compound statement in which is it declared, excluding any declarations in compound statements that are nested within that compound statement. *SQL-variable-name* must not be the same as a parameter name. See "References to SQL parameters and SQL variables" on page 1964 for information about how SQL variable names are resolved when there are columns with the same name as an SQL variable involved in a statement, or when multiple SQL variables exist with the same name in the routine body.

SQL-variable-name can only be referenced within the compound statement in which it is declared, including any compound statement that is nested within that compound statement. If the compound statement where the variable is declared has a label, references to the variable name can be qualified with that label. For example, an SQL variable V that is declared in a compound statement that is labeled C can be referenced as C.V.

data-type
Specifies the data type and length of the variable. SQL variables follow the same rules for default lengths and maximum lengths as SQL routine parameters. See "CREATE FUNCTION (SQL scalar)" on page 1224 and "CREATE PROCEDURE (SQL - native)" on page 1350 for descriptions of SQL data types and lengths.

DEFAULT *constant* **or NULL**
Defines the default for the SQL variable. The specified constant must represent a value that could be assigned to the variable in accordance with the rules of assignment as described in "Assignment and comparison" on page 121. The variable is initialized when the compound statement begins processing. If a default value is not specified, the SQL variable is initialized to NULL. Only DEFAULT NULL can be explicitly specified if *array-type-name* is specified.

RESULT_SET_LOCATOR VARYING
Specifies the data type for a result set locator variable.

SQL-condition-declaration
Declares a condition name and corresponding SQLSTATE value.

SQL-condition-name
Specifies the name of the condition. The condition name must be unique within the compound statement in which it is declared, excluding any declarations that are in compound statements that are nested within that compound statement. A condition name can only be referenced within the compound statement in which it is declared, including any compound statements that are nested within that compound statement.

FOR SQLSTATE *string-constant*
Specifies the SQLSTATE that is associated with the condition. The string must be specified as five characters enclosed in single quotes, and the SQLSTATE class (the first two characters) must not be '00'.

return-codes-declaration
Declares special variables named SQLSTATE and SQLCODE. These variables are automatically set to the SQLSTATE and SQLCODE values for the first condition in the diagnostics area after executing an SQL statement other than GET DIAGNOSTICS or an empty compound statement.

The SQLSTATE and SQLCODE SQL variables are only intended to be used as a means of obtaining the SQL return codes that resulted from processing the previous SQL statement other than GET DIAGNOSTICS. If there is any intention to use the SQLSTATE and SQLCODE values, save the values immediately to other SQL variables to avoid having the values replaced by the SQL return codes returned after executing the next SQL statement. If a handler is defined that handles an SQLSTATE, you can use an assignment statement to save that SQLSTATE (or the associated SQLCODE) value in another SQL variable, if the assignment is the first statement in the handler.

Assignment to these variables is not prohibited; however, it is not recommended. Assignment to these variables is ignored by condition handlers, and processing an assignment to these special variables causes the specified values for the assignment to be overlayed with the SQL return codes returned from executing the statement that does the assignment. The SQLSTATE and SQLCODE SQL variables cannot be set to NULL.

statement-declaration
Declares a list of one or more names that are local to the compound statement. A statement name cannot be the same as another statement name within the same compound statement.

DECLARE-CURSOR-statement
Declares a cursor in the procedure body. Each cursor must have a unique name within the routine. The cursor can only be referenced from within the compound statement in which it is declared, including any compound statements that are nested within that compound statement. Use an OPEN statement to open the cursor, a FETCH statement to read a row using the cursor, and a CLOSE statement to close the cursor. If the cursor is intended for use as a result set cursor:

- Specify WITH RETURN when the cursor is declared
- Create the procedure using the DYNAMIC RESULT SETS clause with a non-zero value
- Do not specify a CLOSE statement for the cursor in the compound statement

For additional information about declaring a cursor, see "DECLARE CURSOR" on page 1535.

handler-declaration
Specifies a condition handler, an *SQL-procedure-statement* to execute when an exception or completion condition occurs in the *compound-statement*. The *SQL-procedure-statement* executes when a condition handler receives control.

A condition handler declaration cannot reference the same condition value or SQLSTATE value more than one time. It cannot reference an SQLSTATE value and a condition name that represent the same SQLSTATE value.

When two or more condition handlers are declared in a compound statement, no two condition handler declarations can specify the same:

- general condition category
- specific condition, either as an SQLSTATE value or as a condition name that represents the same value

A condition handler is active for the set of *SQL-procedure-statements* that follow the condition handler declarations within the compound statement in which the condition handler is declared, including any nested compound statements.

CONTINUE
Specifies that after the condition handler is activated and completes successfully, control is returned to the SQL statement that follows the statement that raised the condition. However, if the condition is an error condition and it was encountered while evaluating a search condition, as in a CASE, FOR, IF, REPEAT or WHILE statement, control returns to the statement that follows the corresponding END CASE, END FOR, END IF, END REPEAT, or END WHILE.

EXIT
Specifies that after the condition handler is activated and completes successfully, control is returned to the end of the compound statement that declared the condition handler.

The conditions that can cause the handler to gain control are:

SQLSTATE *string-constant*
Specifies that the handler is invoked when the specific SQLSTATE occurs. The first two characters of the SQLSTATE value must not be '00'.

SQL-condition-name
Specifies that the handler is invoked when the specific SQLSTATE that is associated with the condition name occurs. The *SQL-condition-name* must be declared within the compound statement that contains the handler declarations, or within a compound statement in which that compound statement is nested.

SQLEXCEPTION
Specifies that the handler is invoked when an SQLEXCEPTION occurs. An SQLEXCEPTION is an SQLSTATE in which the class code is a value other than '00', '01', or '02'. For more information on SQLSTATE values, see *DB2 Codes*.

SQLWARNING
Specifies that the handler is invoked when an SQLWARNING occurs. An SQLWARNING is an SQLSTATE value with a class code of '01'.

NOT FOUND
Specifies that the handler is invoked when a NOT FOUND condition occurs. NOT FOUND corresponds to an SQLSTATE value with a class code of '02'.

Notes

Unlike host variables, SQL variables are not preceded by colons when they are used in SQL statements.

Nesting compound statements: Compound statements can be nested. Nested compound statements can be used to scope variable definitions, condition names, condition handlers, and cursors to a subset of the statements in a routine. This can simplify the processing that is done for each SQL routine statement. Nested compound statements enable the use of a compound statement within the declaration of a condition handler.

The scope of a cursor: The scope of a cursor name is the compound statement in which it is declared, including any compound statements that are nested within that compound statement. A cursor name can only be referenced within the compound statement in which it is declared, including any compound statements that are nested within that compound statement.

Considerations for statement-name: The scope of a *statement-name* that is declared in a compound statement is the compound statement and any nested compound statements (unless the same *statement-name* is declared in a nested compound statement). If a *statement-name* is used in a DECLARE CURSOR statement or a PREPARE statement and has not been declared in the compound statement where it is used or any outer compound statements in which it is nested, the statement-name is assumed to be declared globally for the routine.

Condition handlers: Condition handlers in SQL routines are similar to WHENEVER statements that are used in external SQL application programs. A condition handler can be defined to automatically get control when an exception, warning, or not found condition occurs. The body of a condition handler contains code that is executed when the condition handler is activated. A condition handler can be activated as the result of an exception, a warning, or a not found condition that is returned by DB2 for the processing of an SQL statement. Or the condition that activates the handler can be the result of a SIGNAL or RESIGNAL statement that is issued within the SQL routine body.

A condition handler is declared within a compound statement, and it is active for the set of *SQL-procedure-statements* that follow all of the condition handler declarations within the compound statement in which the condition handler is declared. For example, the scope of a condition handler declaration H is the list of *SQL-procedure-statements* that follow the condition handler declarations that are contained within the compound statement in which H appears. This means that the scope of H does not include the statements that are contained in the body of the condition handler H, implying that a condition handler cannot handle conditions that arise inside its own body. Similarly, for any two condition handlers H1 and H2 that are declared in the same compound statement, H1 will not handle conditions that arise in the body of H2, and H2 will not handle conditions that arise in the body of H1.

The declaration of a condition handler specifies the condition that activates it, the type of condition handler (CONTINUE or EXIT), and the handler action. The type of condition handler determines to where control is returned after the handler action successfully completes.

Condition handler activation: When a condition other than a successful completion occurs in the processing of *SQL-procedure-statement*, if a condition handler that could handle the condition is within scope, one such condition handler will be activated to process the condition.

In a routine with nested compound statements, condition handlers that could handle a specific condition might exist at several levels of the nested compound statements. The condition handler that is activated is a condition handler that is declared innermost to the scope in which the condition was encountered. If more than one condition handler at the nesting level could handle the condition, the condition handler that is activated is the most appropriate handler that is declared in that compound statement.

The most appropriate handler is the condition handler that most closely matches the SQLSTATE or the exception or completion condition. For a given compound statement, when both a specific handler for a condition and a general handler are declared that address the same condition, the specific handler takes precedence over the general handler.

For example, if the innermost compound statement declares a specific handler for SQLSTATE '22001', as well as a general handler for SQLEXCEPTION, the specific handler for SQLSTATE '22001' is the most appropriate handler when SQLSTATE '22001' is encountered. In this case, the specific handler is activated.

When a condition handler is activated, the condition handler action is executed. If the handler action completes successfully or with an unhandled warning, the diagnostics area is cleared, and the type of the condition handler (CONTINUE or EXIT handler) determines to where control is returned. Additionally, the SQLSTATE and SQLCODE SQL variables are cleared when a handler completes successfully or with an unhandled warning.

If the handler action does not complete successfully and an appropriate handler exists for the condition that is encountered in the handler action, that condition handler is activated. Otherwise, the condition that is encountered within the condition handler is unhandled.

Unhandled conditions: If a condition is encountered and an appropriate handler does not exist for that condition, the condition is unhandled.

- If the unhandled condition is an exception, the SQL routine that contains the failing statement is terminated with an unhandled exception condition.
- If the unhandled condition is a warning or is a not found condition, processing continues with the next statement. Note that the processing of the next SQL statement will cause information about the unhandled condition in the diagnostics area to be overwritten, and evidence of the unhandled condition will no longer exist.

Considerations for using SIGNAL and RESIGNAL statements with nested compound statements: If an *SQL-procedure-statement* that is specified in the condition handler is either a SIGNAL or RESIGNAL statement with an exception SQLSTATE, the compound statement terminates with the specified exception. This happens even when this condition handler or another condition handler in the same compound statement specifies CONTINUE, since these condition handlers are not in the scope of this exception. If a compound statement is nested in another compound statement, condition handlers in the higher level compound statement can handle the exception because those condition handlers are within the scope of the exception.

SQLSTATE and SQLCODE variables in SQL routines: To help debug your SQL routines, you might find it useful to check the SQLSTATE and SQLCODE value after executing a statement. An SQLCODE or SQLSTATE variable can be declared and subsequently referenced in an SQL routine. You could insert the value of the SQLCODE and SQLSTATE into a table at various points in the SQL routine, or return the SQLCODE and SQLSTATE values in a diagnostics string as an OUT parameter. To use the SQLCODE and SQLSTATE values, you must declare the following SQL variables in the SQL routine body:

```
DECLARE SQLCODE INTEGER DEFAULT 0;
DECLARE SQLSTATE CHAR(5) DEFAULT '00000';
```

When you reference the SQLCODE or SQLSTATE variables in an SQL routine, DB2 sets the value of SQLCODE to 0 and SQLSTATE to '00000' for the subsequent statement. You can also use CONTINUE condition handlers to assign the value of the SQLSTATE and SQLCODE variables to variables in your SQL routine body. You can then use these SQL variables to control your routine logic, or pass the value back as an output parameter. In the following example, the SQL routine returns control to the statement following each SQL statement with the SQLCODE set in a SQL variable called RETCODE:

```
DECLARE SQLCODE INTEGER DEFAULT 0;
DECLARE retcode INTEGER DEFAULT 0;
DECLARE CONTINUE HANDLER FOR SQLEXCEPTION SET retcode = SQLCODE;
DECLARE CONTINUE HANDLER FOR SQLWARNING SET retcode = SQLCODE;
DECLARE CONTINUE HANDLER FOR NOT FOUND SET retcode = SQLCODE;
```

The compound statement itself does not affect the SQLSTATE and SQLCODE SQL variables. However, SQL statements contained within the compound statement can affect the SQLSTATE and SQLCODE SQL variables. At the end of the compound statement, the SQLSTATE and SQLCODE SQL variables reflect the result of the last SQL statement executed within the compound statement that caused a change to the SQLSTATE and SQLCODE SQL variables. If the SQLSTATE and SQLCODE SQL variables were not changed within the compound statement, they contain the same values as when the compound statement was entered.

Null values in SQL parameters and SQL variables: If the value of an SQL parameter or SQL variable is null and it is used in an SQL statement that does not allow an indicator variable, an error is returned.

Effect on open cursors: At the end of the compound statement, all open cursors that are declared in that compound statement, except cursors that are used to return result sets, are closed.

Atomic processing of a compound statement: Atomic processing is not supported for a compound statement. If atomic behavior is needed for a block of code in a compound statement, set a savepoint before the nested compound statement is entered. This will allow changes to be undone with a ROLLBACK TO SAVEPOINT statement.

Examples

Example 1: Create a procedure body with a compound statement that performs the following actions:

- Declares SQL variables.
- Declares a cursor to return the salary of employees in a department determined by an IN parameter.
- Declares an EXIT handler for the condition NOT FOUND (end of file) which assigns the value 6666 to the OUT parameter *medianSalary*.
- Select the number of employees in the given department into the SQL variable *v_numRecords*.
- Fetch rows from the cursor in a WHILE loop until 50% + 1 of the employees have been retrieved.
- Return the median salary.

```
CREATE PROCEDURE DEPT_MEDIAN
   (IN deptNumber SMALLINT,
    OUT medianSalary DOUBLE)
   LANGUAGE SQL
```

```
BEGIN
  DECLARE v_numRecords INTEGER DEFAULT 1;
  DECLARE v_counter INTEGER DEFAULT 0;
  DECLARE c1 CURSOR FOR
     SELECT salary FROM staff
       WHERE DEPT = deptNumber
       ORDER BY salary;
  DECLARE EXIT HANDLER FOR NOT FOUND
     SET medianSalary = 6666;
     /* initialize OUT parameter */
     SET medianSalary = 0;
     SELECT COUNT(*) INTO v_numRecords FROM staff
        WHERE DEPT = deptNumber;
     OPEN c1;
     WHILE v_counter < (v_numRecords / 2 + 1) DO
        FETCH c1 INTO medianSalary;
        SET v_counter = v_counter + 1;
     END WHILE;
     CLOSE c1;
END
```

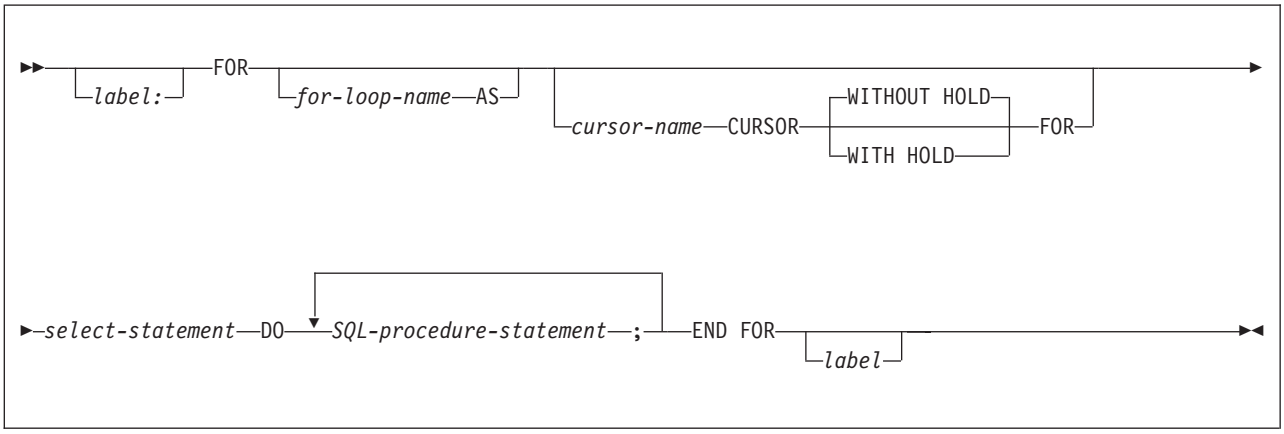
Example 2: Define an exit handler for any error, warning, or case of end of data. When this procedure is invoked and it returns to the caller, the value 45000 is returned for the output parameter:

```
CREATE PROCEDURE JMBLIB.PROCL(OUT MEDIANSALARY INT)
  LANGUAGE SQL
  BEGIN
   DECLARE CHAR1 CHAR;
   DECLARE C1 CURSOR FOR SELECT *
     FROM SYSIBM.SYSDUMMY1;
   DECLARE EXIT HANDLER FOR NOT FOUND,
        SQLEXCEPTION,
        SQLWARNING;
   OPEN C1;
   FETCH C1 INTO CHAR1;
   SET MEDIANSALARY = 45000;
   FETCH C1 INTO CHAR1;
   SET MEDIANSALARY = 50000;
  END
```

FOR statement

The FOR statement executes a statement for each row of a table. An implicit compound statement is generated to implement the FOR statement.

Syntax



Description

label
Specifies the label for the FOR statement. If the ending label is specified, it must be the same as the beginning label. The label name cannot be the same as the routine name or another label within the same scope. For more information, see "References to labels" on page 1965.

for-loop-name
Specifies the label for the implicit compound statement that is generated to implement the FOR statement. *for-loop-name* follows the rules for the label of a compound statement except that it cannot be used with an ITERATE, GOTO, or LEAVE statement within the FOR statement. *for-loop-name* must not be the same as any label within the same scope.

for-loop-name can be used to qualify generated SQL variables that correspond to the columns that are returned by *select-statement*.

cursor-name
Names a cursor that is generated to select rows from the result table of *select-statement*. If *cursor-name* is not specified, a unique cursor name is generated.

cursor-name cannot be referenced outside of the FOR statement and cannot be specified on an OPEN, FETCH, or CLOSE statement.

WITH HOLD or WITHOUT HOLD
Specifies whether the cursor should be prevented from being closed as a consequence of a commit operation.

WITHOUT HOLD
Specifies that the cursor is not prevented from being closed as a consequence of a commit operation. **WITHOUT HOLD** is the default.

WITH HOLD
Specifies that the cursor should not be closed as a consequence of a commit operation. A cursor that is declared using the **WITH HOLD** clause is implicitly closed at commit time only if the connection that is associated

with the cursor is ended during the commit operation. For more information, see "DECLARE CURSOR" on page 1535.

select-statement
Specifies the select statement of the cursor.

Each expression in the SELECT list must have a name. If an expression is not a simple column name, the AS clause must be used to name the expression. If the AS clause is specified, that name is used for the generated SQL variable that corresponds to the column returned by *select-statement*. The names for all of the generated SQL variables must be unique.

The SELECT list must not include an untyped array value.

SQL-procedure-statement
Specifies the SQL statements to be executed for each row of the table. The SQL statements must not include an OPEN, FETCH, or CLOSE statement that specifies the cursor name of the FOR statement.

Notes

FOR statement rules: The FOR statement executes one or multiple statements for each row in a table. The cursor is defined by specifying a SELECT list that describes the columns and rows selected. The statements within the FOR statement are executed for each row selected.

The SELECT list must consist of unique column names and the table that is specified in the FROM clause of *select-statement* must exist when the routine is created.

Handler warning: Handlers can be used to handle errors that might occur on the open of the cursor or fetch of a row using the cursor in the FOR statement. Handlers defined to handle these open or fetch conditions should not be CONTINUE handlers as they might cause the FOR statement to loop indefinitely.

Examples

In the following example, the FOR statement is used to specify a cursor that selects three columns from the employee table. For every row selected, SQL variable *fullname* is set to the last name followed by a comma, the first name, a blank, and the middle initial. Each value for *fullname* is inserted into table TNAMES.

```
BEGIN
  DECLARE fullname CHAR(40);
  FOR v1 AS
      c1 CURSOR FOR
   SELECT firstname, midinit, lastname FROM employee
    DO
      SET fullname =
          lastname CONCAT ', '
                   CONCAT firstname
                   CONCAT ' '
                   CONCAT midinit;
      INSERT INTO TNAMES VALUES ( fullname );
  END FOR;
END;
```

GET DIAGNOSTICS statement

The GET DIAGNOSTICS statement obtains information about the previous SQL statement that was executed.

See "GET DIAGNOSTICS" on page 1679.

When you need to specify a variable in a GET DIAGNOSTICS statement that is used within an SQL routine, you would use either *SQL-variable-name* or *SQL-parameter-name*. In an embedded GET DIAGNOSTICS statement, you would use a *host-variable*. You can replace the instances of *host-variable* in the description of "GET DIAGNOSTICS" on page 1679 with *SQL-variable-name* or *SQL-parameter-name*.

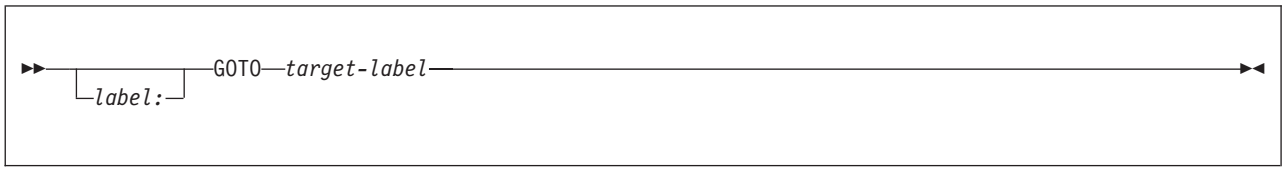
Effects of the statement: The GET DIAGNOSTICS statement does not change the contents of the diagnostics area except for DB2_GET_DIAGNOSTICS_DIAGNOSTICS.

Considerations for the SQLSTATE and SQLCODE SQL variables: The GET DIAGNOSTICS statement does not change the value of the SQLSTATE and SQLCODE SQL variables.

The stacked diagnostics area: The stacked diagnostics area is only available within a handler in a native SQL procedure and non-inline SQL functions.

GOTO statement

Syntax



Description

label
Specifies the label for the GOTO statement. The label name cannot be the same as the name of the SQL routine in which the label is used or another label in the same scope.

target-label
Specifies a label of the statement where processing is to continue. *target-label* must be defined as a label for an SQL procedure statement. The target label must be accessible to the GOTO statement as defined in "References to labels" on page 1965, subject to the following restrictions:

- If the GOTO statement is in a condition handler, *target-label* must be defined in that condition handler.
- If the GOTO statement is not defined in a condition handler, *target-label* must not be defined in a condition handler.

Notes

Using a GOTO statement: It is recommended that the GOTO statement be used sparingly. This statement interferes with the normal sequence of processing SQL statements, thus making a routine more difficult to read and maintain. Before using a GOTO statement, determine whether another statement, such as IF or LEAVE, can be used in place, to eliminate the need for a GOTO statement.

Effect on open cursors: When a GOTO statement transfers control out of a compound statement, all open cursors that are declared in the compound statement that contains the GOTO statement are closed, except cursors that are used to return result sets.

Examples

Example 1: In the following procedure, the GOTO statement branches outside of the current compound statement to a higher level:

```
CREATE PROCEDURE TESTGOTO5 ( )
P1: BEGIN
   DECLARE I ,A INTEGER;
     SET I = 1;
  LAB1: SET A = 1;
    BEGIN
      LAB2: SET A = 2;
         BEGIN
           SET I = I+1;
           IF I<3 THEN GOTO LAB1;
```

```
          END IF;
        END;
    END;
END P1
```

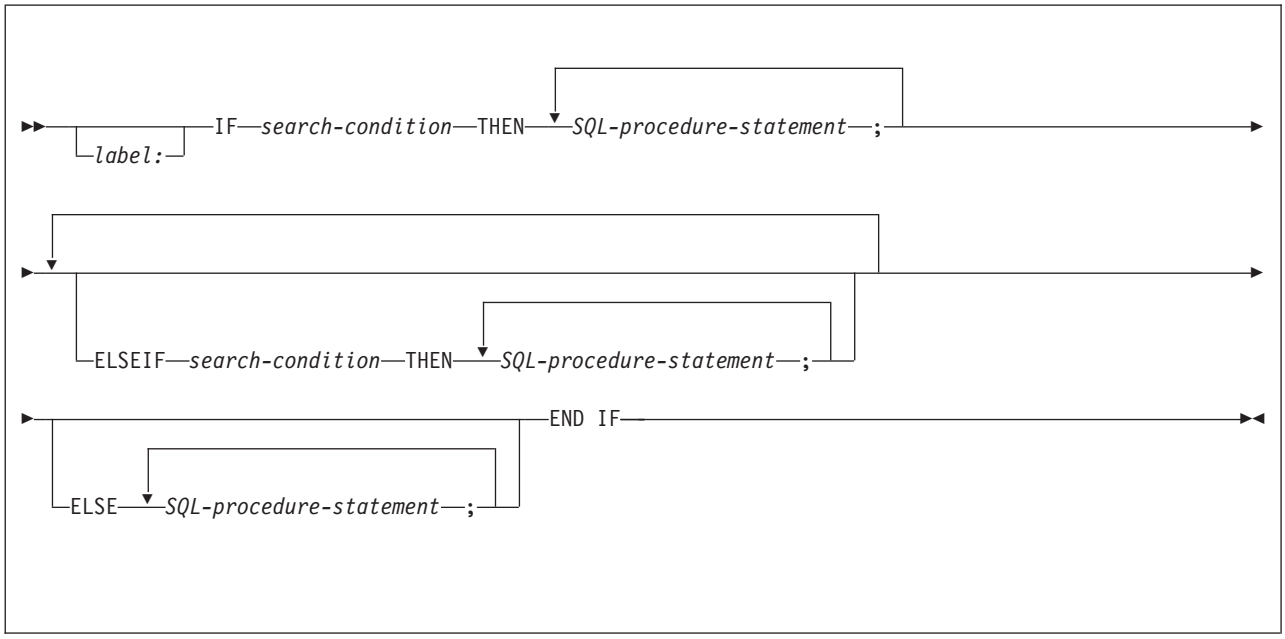
Example 2: In the following example, cursors are declared at multiple levels. The GOTO statement that specified TargLabel as the target label, results in the closing of cursors C1, C2, and C3. This is because cursors C1, C2, and C3 are all declared directly or indirectly in the compound statement with the label L1. The GOTO statement causes control to transfer out of the compound statement with label L1, so the cursors that are defined within that compound statement (at any level) are closed.

```
L0: BEGIN
      DECLARE CURSOR C0 ...
  ...
  TARGLABEL: ...
  ...
  L1: BEGIN
        DECLARE CURSOR C1 ...
        ...
      L2: BEGIN
            DECLARE CURSOR C2 ...
            ...
            GOTO TARGLABEL;
            ...
          L3: BEGIN
              DECALUE CURSOR C3 ...
            ...
          END L3;
      END L2;
   END L1;
END L0
```

IF statement

The IF statement executes different sets of SQL statements based on the result of search conditions.

Syntax



Description

label
Specifies the label for the IF statement. The label name cannot be the same as the name of the SQL routine or another label name within the same scope. For additional information, see "References to labels" on page 1965.

search-condition
Specifies the *search-condition* for which an SQL statement should be executed. If the condition is unknown or false, processing continues to the next search condition, until either a condition is true or processing reaches the ELSE clause.

SQL-procedure-statement
Specifies an SQL statement to be executed if the preceding *search-condition* is true. See "SQL-procedure-statement" on page 1968.

Examples

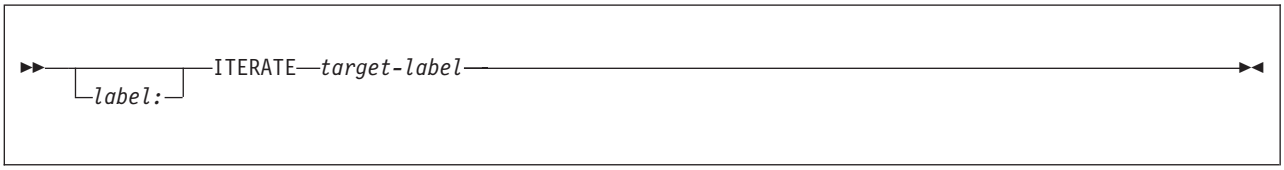
Assign a value to the SQL variable *new_salary* based on the value of SQL variable rating.

```
IF rating = 1
 THEN SET new_salary =
  new_salary + (new_salary * .10);
 ELSEIF rating = 2
  THEN SET new_salary =
   new_salary + (new_salary * .05);
 ELSE SET new_salary =
  new_salary + (new_salary * .02);
END IF
```

ITERATE statement

The ITERATE statement causes the flow of control to return to the beginning of a labeled loop.

Syntax



Description

label

Specifies the label for the ITERATE statement. The label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 1965.

target-label

Specifies the label of the FOR, LOOP, REPEAT, or WHILE statement to which the flow of control is passed. *target-label* must be defined as a label for a FOR, LOOP, REPEAT, or WHILE statement. The ITERATE statement must be in that FOR, LOOP, REPEAT, or WHILE statement, or in the block of code that is directly or indirectly nested within that statement, subject to the following restrictions:

- If the ITERATE statement is in a condition handler, *target-label* must be defined in that condition handler.
- If the ITERATE statement is not in a condition handler, *target-label* must not be defined in a condition handler.

Examples

Example 1: This example uses a cursor to return information for a new department. If the not_found condition handler is invoked, the flow of control passes out of the loop. If the value of *v_dept* is 'D11', an ITERATE statement causes the flow of control to be passed back to the top of the LOOP statement. Otherwise, a new row is inserted into the table.

```
CREATE PROCEDURE ITERATOR ()
  LANGUAGE SQL
  MODIFIES SQL DATA
  BEGIN
    DECLARE v_dept CHAR(3);
    DECLARE v_deptname VARCHAR(29);
    DECLARE v_admdept CHAR(3);
    DECLARE at_end INTEGER DEFAULT 0;
    DECLARE not_found CONDITION FOR SQLSTATE '02000';
    DECLARE c1 CURSOR FOR
      SELECT deptno,deptname,admrdept
        FROM department
        ORDER BY deptno;
    DECLARE CONTINUE HANDLER FOR not_found
      SET at_end = 1;
    OPEN c1;
    ins_loop:
    LOOP
      FETCH c1 INTO v_dept, v_deptname, v_admdept;
      IF at_end = 1 THEN
```

```
      LEAVE ins_loop;
    ELSEIF v_dept = 'D11' THEN
      ITERATE ins_loop;
    END IF;
    INSERT INTO department (deptno,deptname,admrdept)
                    VALUES('NEW', v_deptname, v_admdept);
  END LOOP;
  CLOSE c1;
END
```

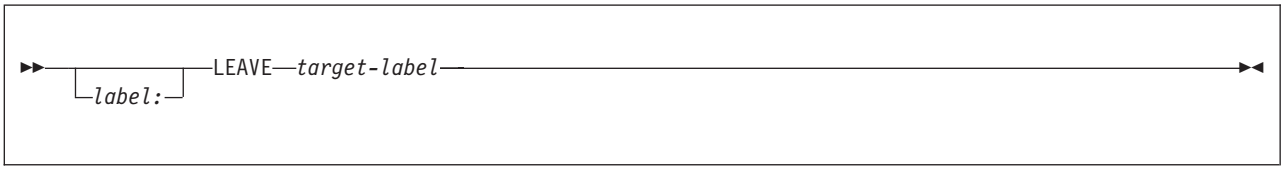
Example 2: An ITERATE statement can be issued from a nested block to cause that flow of control to return to the beginning of a loop at a higher level. In the following example, the ITERATE statement within the LAB2 compound statement causes the flow of control to return to the beginning of the LAB1 LOOP statement:

```
LAB1: LOOP
   SET A = 0;
   LAB2: BEGIN
     ...
     LAB3: BEGIN
        ...
        ITERATE LAB1;  -- Multilevel ITERATE
        ...
     END LAB3;
     ...
     ITERATE LAB1;   --  Multilevel ITERATE
     ...
   END LAB2;
END LOOP;S
```

LEAVE statement

The LEAVE statement transfers program control out of a FOR, LOOP, REPEAT, WHILE, or compound statement.

Syntax



Description

label
Specifies the label for the LEAVE statement. The label name cannot be the same as the name of the SQL routine or the same as another label that is within the same scope. For additional information, see "References to labels" on page 1965.

target-label
Specifies the label of the compound, FOR, LOOP, REPEAT, or WHILE statement to exit. *target-label* must be defined as a label for a compound, FOR, LOOP, REPEAT, or WHILE statement, or in a block of code that is directly or indirectly nested within that statement, subject to the following rules:

- If the LEAVE statement is in a condition handler, *target-label* must be defined in that condition handler.
- If the LEAVE statement is not in a condition handler, *target-label* must not be defined in a condition handler.

Notes

Effect on open cursors: When a LEAVE statement transfers control out of a compound statement, all open cursors in the compound statement, except cursors that are used to return result sets, are closed.

Examples

Example 1: The example contains a loop that fetches data for cursor c1. If the value of SQL variable *at_end* is not zero, the LEAVE statement transfers control out of the loop.

```
CREATE PROCEDURE LEAVE_LOOP (OUT COUNTER INTEGER)
  LANGUAGE SQL
  BEGIN
    DECLARE v_counter INTEGER;
    DECLARE v_firstnme VARCHAR(12);
    DECLARE v_midinit CHAR(1);
    DECLARE v_lastname VARCHAR(15);
    DECLARE at_end SMALLINT DEFAULT 0;
    DECLARE not_found CONDITION FOR SQLSTATE '02000';
    DECLARE c1 CURSOR FOR
      SELECT firstnme, midinit, lastname
      FROM employee;
    DECLARE CONTINUE HANDLER FOR not_found
      SET at_end = 1;
    SET v_counter = 0;
    OPEN c1;
```

```
   fetch_loop:
    LOOP
      FETCH c1 INTO v_firstnme, v_midinit, v_lastname;
      IF at_end <> 0 THEN
       LEAVE fetch_loop;
      END IF;
      SET v_counter = v_counter + 1;
    END LOOP fetch_loop;
    SET counter = v_counter;
    CLOSE c1;
  END
```

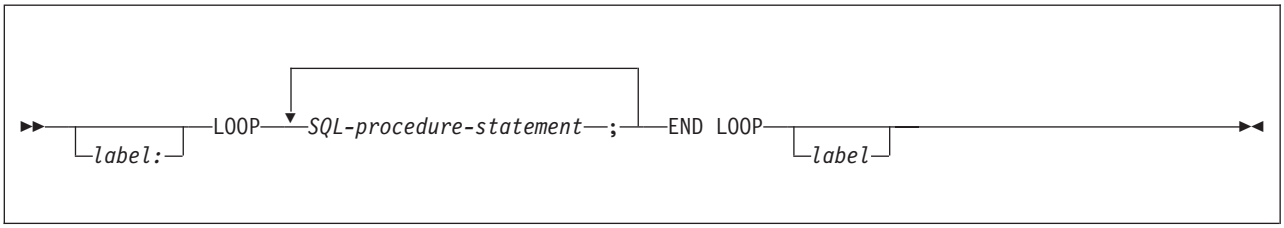
Example 2: A LEAVE statement can be issued from a nested block to leave a statement at a higher level. In the following example, the LEAVE statement within the LAB2 compound statement causes the LAB1 LOOP statement to terminate:

```
LAB1: LOOP
    ...
    LAB2: BEGIN
     SET A = 0;
     ...
     LAB3: BEGIN
        ...
        LEAVE LAB1;  -- Multilevel LEAVE
        ...
     END LAB3;
     ...
     LEAVE LAB1;   --  Multilevel LEAVE
     ...
   END LAB2;
END LOOP;S
```

LOOP statement

The LOOP statement executes a statement or group of statements multiple times.

Syntax



Description

label
Specifies the label for the LOOP statement. If the ending label is specified, a matching beginning label must be specified. A label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 1965.

SQL-procedure-statement
Specifies an SQL statement to be executed in the loop. The statement must be one of the statements listed under "SQL-procedure-statement" on page 1968.

Notes

Considerations for the diagnostics area: At the beginning of the first iteration of the LOOP statement, and with every subsequent iteration, the diagnostics area is cleared.

Considerations for the SQLSTATE and SQLCODE SQL variables: Prior to executing the first SQL-procedure-statement within that LOOP statement, the SQLSTATE and SQLCODE values reflect the last values that were set prior to the LOOP statement. If the loop is terminated with a GOTO or a LEAVE statement, the SQLSTATE and SQLCODE values reflect successful completion of that statement. When the LOOP statement iterates, the SQLSTATE and SQLCODE values reflect the result of the last SQL statement that is executed within the LOOP statement.

Examples

This procedure uses a LOOP statement to fetch values from the employee table. Each time the loop iterates, the OUT parameter counter is incremented and the value of *v_midinit* is checked to ensure that the value is not a single space (' '). If *v_midinit* is a single space, the LEAVE statement passes the flow of control outside of the loop.

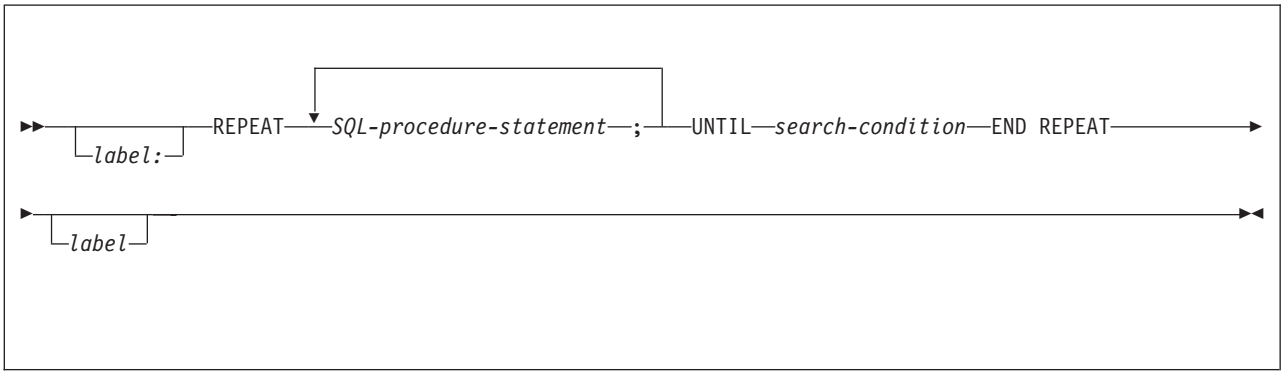
```
CREATE PROCEDURE LOOP_UNTIL_SPACE(OUT counter INTEGER)
   LANGUAGE SQL
   BEGIN
      DECLARE v_counter INTEGER DEFAULT 0;
      DECLARE v_firstnme VARCHAR(12);
      DECLARE v_midinit CHAR(1);
      DECLARE v_lastname VARCHAR(15);
      DECLARE c1 CURSOR FOR
         SELECT firstnme, midinit, lastname
           FROM employee;
      DECLARE EXIT HANDLER FOR NOT FOUND
```

```
      SET counter = -1;
   OPEN c1;
   fetch_loop:
   LOOP
     FETCH c1 INTO v_firstnme, v_midinit, v_lastname;
     IF v_midinit = ' ' THEN
        LEAVE fetch_loop;
     END IF;
     SET v_counter = v_counter + 1;
   END LOOP fetch_loop;
   SET counter = v_counter;
   CLOSE c1;
END
```

REPEAT statement

The REPEAT statement executes a statement or group of statements until a search condition is true.

Syntax



Description

label
Specifies the label for the REPEAT statement. If an ending label is specified, a matching beginning label must be specified. A label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 1965.

SQL-procedure-statement
Specifies an SQL statement to be executed within the REPEAT loop. The statement must be one of the statements listed under "SQL-procedure-statement" on page 1968.

search-condition
Specifies a condition that is evaluated after each execution of the REPEAT loop. If the condition is true, the REPEAT loop will exit. If the condition is unknown or false, the looping continues.

Notes

Considerations for the diagnostics area: At the beginning of the first iteration of the REPEAT statement, and with every subsequent iteration, the diagnostics area is cleared.

Considerations for the SQLSTATE and SQLCODE SQL variables: At the beginning of the first iteration of the REPEAT statement, the SQLSTATE and SQLCODE values reflect the values that were set prior to the REPEAT statement. At the beginning of iterations 2 through *n* of the REPEAT statement, the SQLSTATE and SQLCODE SQL values reflect the result of evaluating the search condition in the UNTIL clause of that REPEAT. If the loop is terminated with a GOTO, ITERATE, or LEAVE statement, the SQLSTATE and SQLCODE values reflect the successful completion of that statement. Otherwise, after the END REPEAT of the REPEAT statement completes, the SQLSTATE and SQLCODE reflect the result of evaluating the search condition in the UNTIL clause of that REPEAT statement.

Examples

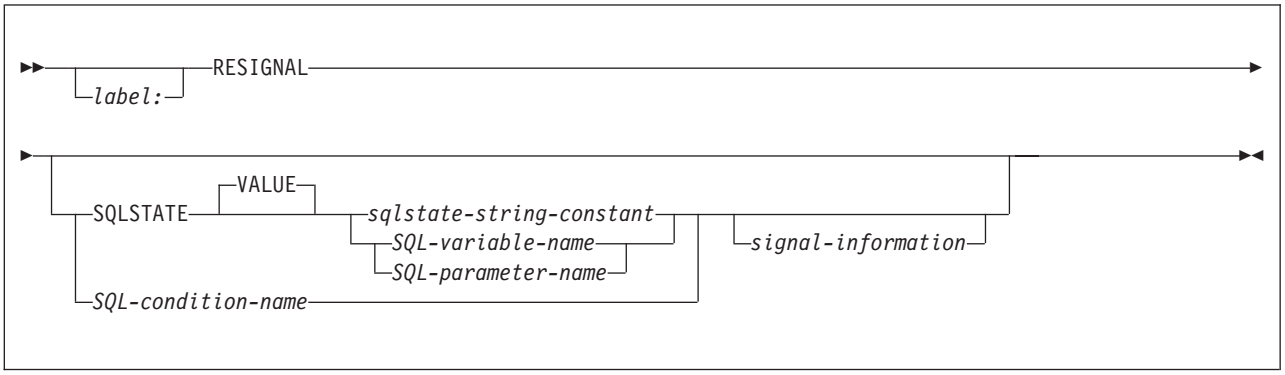
Use a REPEAT statement to fetch rows from a table.

```
fetch_loop:
REPEAT
 FETCH c1 INTO
  v_firstnme, v_midinit, v_lastname;
UNTIL
    SQLCODE <> 0
END REPEAT fetch_loop
```

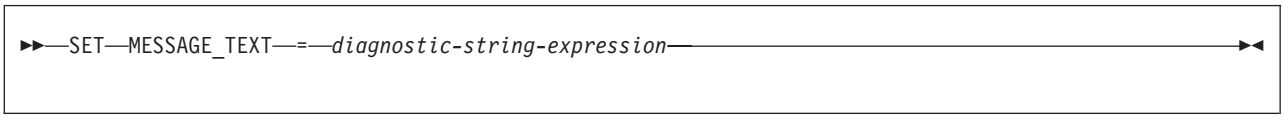
RESIGNAL statement

The RESIGNAL statement is used within a condition handler to resignal the condition that activated the handler, or to raise an alternate condition so that it can be processed at a higher level. It causes an exception, warning, or not found condition to be returned along with optional message text.

Syntax



signal-information:



Description

label
Specifies the label for the RESIGNAL statement. A label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 1965.

SQLSTATE VALUE
Specifies the SQLSTATE that will be returned. Any valid SQLSTATE value can be used. It must be a character string constant with exactly five characters that follow the rules for SQLSTATE values:

- Each character must be from the set of digits ('0' through '9') or non-accented upper case letter ('A' through 'Z').
- The SQLSTATE class (the first two characters) cannot be '00' because it represents successful completion.

If the SQLSTATE does not conform to these rules, an error occurs.

sqlstate-string-constant
A character string constant with an actual length of five bytes that is a valid SQLSTATE value.

SQL-variable-name **or** *SQL-parameter-name*
Specifies an SQL variable or SQL parameter that is defined for the routine.

SQL-variable-name
Specifies an SQL variable that is declared within the *compound-statement* that contains the RESIGNAL statement or within a compound statement in which that compound statement is nested.

SQL-variable-name must be defined as CHAR or VARCHAR data type with an actual length of five bytes, must not be null, and must contain a valid SQLSTATE value.

SQL_parameter-name
Specifies an SQL parameter that is defined for the routine that contains the SQLSTATE value. The SQL parameter must be defined as CHAR or VARCHAR data type with an actual length of five bytes, must not be null, and must contain a valid SQLSTATE value.

SQL-condition-name
Specifies the name of the condition that will be returned. *SQL-condition-name* must be declared within the *compound-statement* that contains the RESIGNAL statement, or within a compound statement in which that compound statement is nested.

SET MESSAGE_TEXT
Specifies a string that describes the error or warning. The string is returned in the SQLERRMC field of the SQLCA or with the GET DIAGNOSTICS statement.

diagnostic-string-expression
An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see "GET DIAGNOSTICS" on page 1679.

Notes

While any valid SQLSTATE value can be used in the RESIGNAL statement, programmers should define new SQLSTATEs based on ranges reserved for applications. This practice prevents the unintentional use of an SQLSTATE value that might be defined by the database manager in a future release.

If the SQLSTATE or condition indicates that an exception is signaled (SQLSTATE class other than '01' or '02'):

- If a condition handler exists in the same compound statement as the RESIGNAL statement, and the compound statement contains a condition handler for SQLEXCEPTION or the specified SQLSTATE or condition, the exception is handled and control is transferred to that condition handler.
- If the compound statement is nested and an outer level compound statement has a condition handler for SQLEXCEPTION or the specified SQLSTATE or condition, the exception is handled and control is transferred to that condition handler.
- Otherwise, the exception is not handled and control is immediately returned to the end of the compound statement.

If an SQLSTATE or a condition indicates that a warning or a not found condition is signaled:

- If a condition handler exists in the same compound statement as the RESIGNAL statement, and the compound statement contains a condition handler for SQLWARNING, NOT FOUND, or the specified SQLSTATE or condition, the warning or not found condition is handled and control is transferred to that condition handler.
- If the compound statement is nested and an outer level compound statement contains a condition handler for SQLWARNING, NOT FOUND, or the specified

SQLSTATE or condition, the warning or not found condition is handled and control is returned to that condition handler.
- Otherwise, the warning is not handled and processing continues with the next statement.

Considerations for the diagnostics area: The RESIGNAL statement might modify the contents of the current diagnostics area. If an SQLSTATE or *condition-name* is specified as part of the RESIGNAL statement, the RESIGNAL statement starts with a clear diagnostics area and sets the RETURNED_SQLSTATE to reflect the specified SQLSTATE or *condition-name*. If message text is specified, the MESSAGE_TEXT item of the condition area is assigned the specified value. DB2_RETURNED_SQLCODE is set to +438 or -438 corresponding to the specified SQLSTATE or *condition-name*.

Processing a RESIGNAL statement: If the RESIGNAL statement is specified without an SQLSTATE clause or a *condition-name*, the SQL routine resignals the identical condition that invoked the handler and the SQLCODE is not changed.

When a RESIGNAL statement is issued and an SQLSTATE or *condition-name* is specified, the SQLCODE is based on he SQLSTATE value as follows:
- If the specified SQLSTATE class is either '01' or ‘02', a warning or not found is signaled and the SQLCODE is set to +438.
- Otherwise, an exception is returned and the SQLCODE is set to -438.

Examples

The following example detects a division by zero error. The IF statement uses a SIGNAL statement to invoke the overflow condition handler. The condition handler uses a RESIGNAL statement to return a different SQLSTATE to the client application.

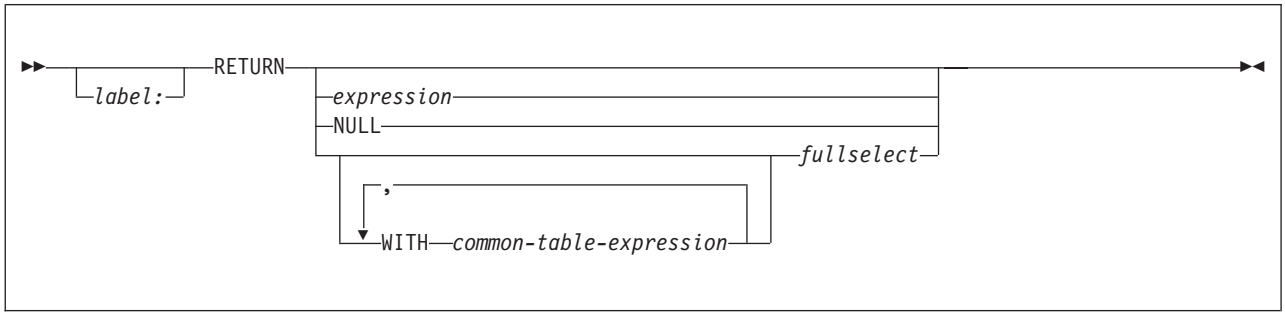
```
CREATE PROCEDURE divide (IN numerator INTEGER,
        IN denominator INTEGER,
        OUT divide_result INTEGER)
  LANGUAGE SQL
  CONTAINS SQL
  BEGIN
   DECLARE overflow CONDITION for SQLSTATE '22003';
   DECLARE CONTINUE HANDLER FOR overflow
     RESIGNAL SQLSTATE '22375';
   IF denominator = 0 THEN
     SIGNAL overflow;
   ELSE
     SET divide_result = numerator / denominator;
   END IF;
  END
```

RETURN statement

The RETURN statement is used to return from the routine.

- For an SQL scalar function, the scalar result of the function is returned. The body of an SQL scalar function must contain at least one RETURN statement and a RETURN statement must be executed when the function is invoked.
- For an SQL table function, the result table of the function is returned. A RETURN statement must be specified in the body of an SQL table function.
- For an SQL procedure, the RETURNS statement optionally returns an integer status value.

Syntax



Description

label

Specifies the label for the RETURN statement. A label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 1965.

expression

Specifies a value that is returned from the routine.

- If the routine is a scalar function, the data type of the result must be assignable to the data type that is defined for the function result, using the storage assignment rules as described in "Assignment and comparison" on page 121. The RETURN statement must not contain a period specification.
- If the routine is a table function, a scalar expression (other than a scalar fullselect) cannot be specified. The data type of the result column of the fullselect must be assignable to the data type that is defined for the function result, using the storage assignment rules as described in "Assignment and comparison" on page 121. The RETURN statement must not contain a period specification.
- If the routine is a procedure, the data type of *expression* must be INTEGER.

NULL

The null value is returned from the SQL routine.

- If the routine is a scalar function, the null value is returned.
- If the routine is a table function, NULL must not be specified.
- If the routine is a procedure, NULL must not be specified.

WITH *common-table-expression*

Specifies one or more common table expressions that are to be used in the fullselect.

fullselect
Specifies the row or rows that are returned from the routine.

- If the routine is a scalar function, the fullselect must return one column and, at most, one row. The data type of the result column must be assignable to the data type that is defined for the function result, using the storage assignment rules as described in "Assignment and comparison" on page 121.
- If the routine is a table function, the fullselect can return zero or more rows with one or more columns. The number of columns in the fullselect must match the number of columns in the function result. In addition, the data types of the result table columns of the fullselect must be assignable to the data types of the columns that are defined for the function result, using the storage assignment rules as described in "Assignment and comparison" on page 121.
- If the routine is a procedure, fullselect must not be specified.

Notes

Considerations for SQL functions: A RETURN statement in an SQL function must specify *expression*, NULL, or *fullselect*. Only a single RETURN statement can be specified in the routine body of an SQL table function. The execution of an SQL function must end with a RETURN statement.

A data change table reference is not allowed in a RETURN statement in an SQL function.

Considerations for SQL procedures:

- **When a RETURN statement is used within an SQL procedure:** If a RETURN statement with a specified return value was used to return from a procedure, the SQLCODE, SQLSTATE, and message length in the SQLCA are initialized to zeros and the message text is set to blanks. An error is not returned to the caller.
- **When a RETURN statement is not used within an SQL procedure or when no value is specified:** If a RETURN statement was not used to return from a procedure or if a value is not specified on the RETURN statement, one of the following values is set:
  - If the procedure returns with an SQLCODE that is greater or equal to zero, the specified target for DB2_RETURN_STATUS in a GET DIAGNOSTICS statement will be set to a value of zero.
  - If the procedure returns with an SQLCODE that is less than zero, the specified target for DB2_RETURN_STATUS in a GET DIAGNOSTICS statement will be set to a value of '-1'.
- **When the value is returned from an SQL procedure:** When a value is returned from a procedure, the caller may access the value using one of the following methods:
  - The GET DIAGNOSTICS statement to retrieve the RETURN_STATUS when the SQL procedure was called from another SQL procedure.
  - The parameter bound for the return value parameter marker in the escape clause CALL syntax (?=CALL...) in a CLI application.
  - Directly from the SQLCA returned from processing the CALL of an SQL procedure by retrieving the value of sqlerrd[0]. When the SQLCODE is less than zero, the sqlerrd[0] value is not set. The application should assume a return status value of '-1'.

Examples

Example 1: Use a RETURN statement to return from an SQL procedure with a status value of zero if successful or '-200' if not successful.

```
BEGIN
       . . .
           GOTO FAIL;
       . . .
SUCCESS: RETURN 0;
   FAIL: RETURN -200;
END
```

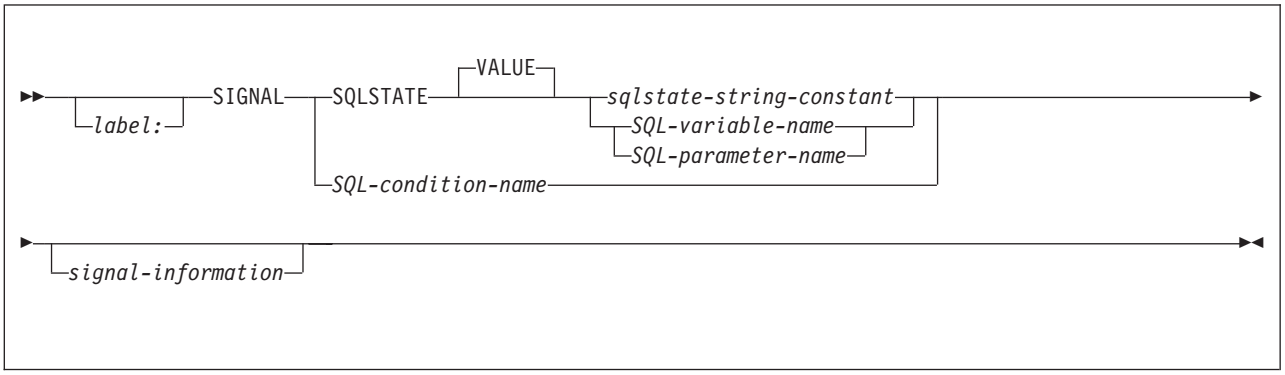
Example 2: Define a scalar function that returns the tangent of a value using the existing sine and cosine functions:

```
 CREATE FUNCTION TAN (X DOUBLE)
       RETURNS DOUBLE
       LANGUAGE SQL CONTAINS SQL NO EXTERNAL ACTION
       DETERMINISTIC
       RETURN SIN(x)/COS(x)
```

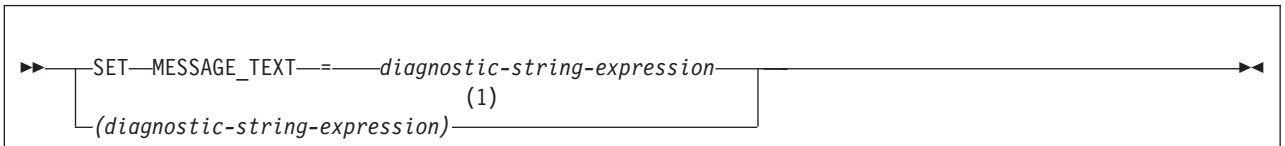
SIGNAL statement

The SIGNAL statement is used to return an exception or warning condition. It causes an error or warning to be returned with the specified SQLSTATE, along with optional message text. The SIGNAL statement places the specified condition information in the cleared diagnostics area.

Syntax



signal-information:



Notes:

1 *(diagnostic-string-expression)* must only be specified within a trigger body.

Description

label

Specifies the label for the SIGNAL statement. A label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 1965.

SQLSTATE VALUE

Specifies the SQLSTATE that will be returned. Any valid SQLSTATE value can be used. It must be a character string constant with exactly five characters that follow the rules for SQLSTATEs:

- Each character must be from the set of digits ('0' through '9') or non-accented upper case letter ('A' through 'Z').
- The SQLSTATE class (the first two characters) cannot be '00' because it represents successful completion.

If the SQLSTATE does not conform to these rules, an error occurs.

sqlstate-string-constant

A character string constant with an actual length of five bytes that is a valid SQLSTATE value.

SQL-variable-name **or** *SQL-parameter-name*
Specifies an SQL variable or SQL parameter that contains a valid SQLSTATE value.

SQL-variable-name
Specifies an SQL variable that is declared within the *compound-statement* that contains the SIGNAL statement, or within a compound statement in which that compound statement is nested. *SQL-variable-name* must be defined as a CHAR or VARCHAR data type with an actual length of five bytes, must not be null, and must contain a valid SQLSTATE value.

SQL-parameter-name
Specifies an SQL parameter that is defined for the routine and contains the SQLSTATE value. The SQL parameter must be defined as a CHAR or VARCHAR data type with an actual length of five bytes, must not be null, and must contain a valid SQLSTATE value.

SQL-condition-name
Specifies the name of the condition that will be returned. The *SQL-condition-name* must be declared within the compound statement that contains the SIGNAL statement, or within a compound statement in which that compound statement is nested.

SET MESSAGE_TEXT
Specifies a string that describes the error or warning. The string is returned in the SQLERRMC field of the SQLCA or with the GET DIAGNOSTICS statement.

diagnostic-string-expression
An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see "GET DIAGNOSTICS" on page 1679.

(diagnostic-string-expression)
An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see "GET DIAGNOSTICS" on page 1679.

This syntax variation is only provided within the scope of a CREATE TRIGGER statement for compatibility with previous versions of DB2. To conform with the ANS and ISO standards, this form should not be used.

Notes

While any valid SQLSTATE value can be used in the SIGNAL statement, programmers should define new SQLSTATEs based on ranges reserved for applications. This practice prevents the unintentional use of an SQLSTATE value that might be defined by the database manager in a future release.

If the SQLSTATE or condition indicates that an exception is signaled:

- If a condition handler exists in the same compound statement as the SIGNAL statement, and the compound statement contains a condition handler for SQLEXCEPTION or the specified SQLSTATE or condition, the exception is handled and control is transferred to that condition handler.

- If the compound statement is nested and the outer level compound statement has a condition handler for SQLEXCEPTION or the specified SQLSTATE or condition, the exception is handled and control is transferred to that condition handler.
- Otherwise, the exception is not handled and control is immediately returned to the end of the compound statement.

If the SQLSTATE or condition indicates that a warning or not found condition is signaled:

- If a condition handler exists in the same compound statement as the SIGNAL statement, and the compound statement contains a condition handler for SQLWARNING, NOT FOUND, or the specified SQLSTATE or condition, the warning or not found condition is handled and control is transferred to that condition handler.
- If the compound statement is nested and an outer level compound statement contains a condition handler for SQLWARNING, NOT FOUND, or the specified SQLSTATE or condition, the warning or not found condition is handled and control is transferred to that condition handler.
- Otherwise, the warning or not found condition is not handled and processing continues with the next statement.

Considerations for the diagnostics area: The SIGNAL statement starts with a clear diagnostics area and sets the RETURNED_SQLSTATE to reflect the specified SQLSTATE or *condition-name*. If message text is specified, the MESSAGE_TEXT item of the condition area is assigned the specified value. DB2_RETURNED_SQLCODE is set to +438 or -438 corresponding to the specified SQLSTATE or *condition-name*.

Examples

Example 1: The following example shows an SQL procedure for an order system that signals an application error when a customer number is not known to the application. The ORDERS table includes a foreign key to the CUSTOMER table, requiring that the CUSTNO exist before an order can be inserted.

```
CREATE PROCEDURE SUBMIT_ORDER
            (IN ONUM INTEGER, IN CNUM INTEGER,
             IN PNUM INTEGER, IN QNUM INTEGER)
 LANGUAGE SQL
 SPECIFIC SUBMIT_ORDER
 MODIFIES SQL DATA
BEGIN
   DECLARE EXIT HANDLER FOR SQLSTATE VALUE '23503'
     SIGNAL SQLSTATE '75002'
         SET MESSAGE_TEXT = 'Customer number is not known';
   INSERT INTO ORDERS (ORDERNO, CUSTNO, PARTNO, QUANTITY)
      VALUES (ONUM, CNUM, PNUM, QNUM);
END
```

Example 2: The following example shows a trigger for an order system that allows orders to be recorded in an ORDERS table (ORDERNO, CUSTNO, PARTNO, QUANTITY) only if there is sufficient stock in the PARTS tables. When there is insufficient stock for an order, SQLSTATE '75001' is returned along with an appropriate error description.

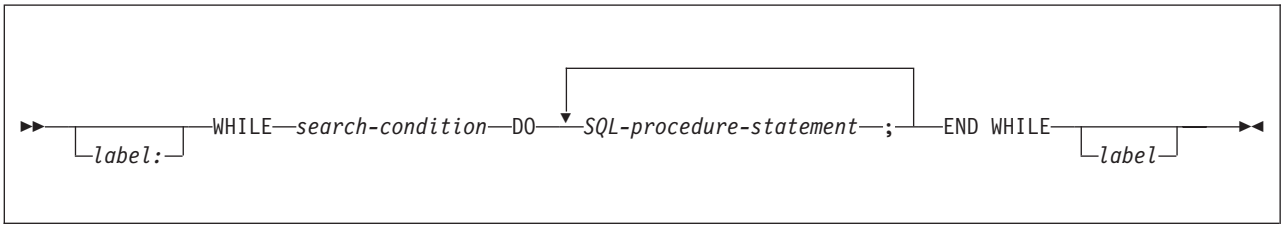
```
  CREATE TRIGGER CK_AVAIL
        NO CASCADE BEFORE INSERT ON ORDERS
        REFERENCING NEW AS NEW_ORDER
        FOR EACH ROW MODE DB2SQL
```

```
WHEN (NEW_ORDER.QUANTITY > (SELECT ON_HAND FROM PARTS
                            WHERE NEW_ORDER.PARTNO = PARTS.PARTNO))
  BEGIN ATOMIC
    SIGNAL SQLSTATE '75001' ('Insufficient stock for order');
  END
```

WHILE statement

The WHILE statement repeats the execution of a statement or group of statements while a specified condition is true.

Syntax



Description

label
Specifies the label for the WHILE statement. If the ending label is specified, it must be the same as the beginning label. A label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 1965.

search-condition
Specifies a condition that is evaluated before each execution of the loop. If the condition is true, the SQL procedure statements in the loop are executed.

SQL-procedure-statement
Specifies a statement to be run within the WHILE loop. The statement must be one of the statements listed under "SQL-procedure-statement" on page 1968.

Notes

Considerations for the diagnostics area: At the beginning of the first iteration of the WHILE statement, and with every subsequent iteration, the diagnostics area is cleared.

Considerations for the SQLSTATE and SQLCODE SQL variables: With each iteration of the WHILE statement, when the first SQL-procedure-statement is executed, the SQLSTATE and SQLCODE SQL variables reflect the result of evaluating the search condition of that WHILE statement. If the loop is terminated with a GOTO, ITERATE, or LEAVE statement, the SQLSTATE and SQLCODE values reflect the successful completion of that statement. Otherwise, after the END WHILE of the WHILE statement completes, the SQLSTATE and SQLCODE reflect the result of evaluating that search condition of that WHILE statement.

Examples

Use a WHILE statement to fetch rows from a table while SQL variable at_end, which indicates whether the end of the table has been reached, is 0.

```
WHILE at_end = 0 DO
 FETCH c1 INTO
  v_firstnme, v_midinit,
  v_lastname, v_edlevel, v_salary;
 IF SQLCODE=100 THEN SET at_end=1;
 END IF;
END WHILE
```

Appendix. Additional information for DB2 SQL

These topics contain additional information for DB2 SQL.

Limits in DB2 for z/OS

DB2 for z/OS has system limits, object and SQL limits, length limits for identifiers and strings, and limits for certain data type values.

System storage limits might preclude the limits specified in this section. The limit for items not that are not specified below is limited by system storage.

The following table shows the length limits for identifiers.

Table 154. Identifier length limits. The term *byte(s)* in this table means the number of bytes for the UTF-8 representation unless noted otherwise.

Item	Limit
External-java-routine-name	1305 bytes
Name of an alias [1], auxiliary table, collection, clone table, constraint, correlation, cursor (except for DECLARE CURSOR WITH RETURN or the EXEC SQL utility), distinct type (both parts of two-part name), function (both parts of two-part name), host identifier, index, JARs, parameter, procedure, role, schema, sequence, specific, statement, storage group, savepoint, SQL condition, SQL label, SQL parameter, SQL variable, synonym, table, trigger, view, XML attribute name, XML element name	128 bytes
Name of an authorization ID or name of a security label.	8 bytes
Routine version identifier	64 EBCDIC bytes, and the UTF-8 representation of the name must not exceed 122 bytes.
Name of a column	30 bytes [1]
Name of cursor that is created with DECLARE CURSOR WITH RETURN	30 bytes
Name of cursor that is created with the EXEC SQL utility	8 bytes
Name of a location	16 bytes
Name of buffer pool name, catalog, database, plan, program, table space	8 bytes
Name of package	8 bytes (Only 8 EBCDIC characters are used for packages that are created with the BIND PACKAGE command. 128 bytes can be used for packages that are created as a result of the CREATE FUNCTION (SQL scalar) statement, the CREATE PROCEDURE (SQL - native) statement, the CREATE TRIGGER statement, or a BIND command that specifies a zFS file as DBRM library.)
Name of a profile that is created with CREATE TRUSTED CONTEXT or ALTER TRUSTED CONTEXT	127 bytes

Notes:

1. If the column name length or the distinct type schema or name length is greater than 30 Unicode bytes, truncation occurs in the sqlname field of the SQLDA when those objects are described in an application.

Table 155 shows the minimum and maximum limits for numeric values.

Table 155. Numeric limits

Item	Limit
Smallest SMALLINT value	-32768

Table 155. Numeric limits (continued)

Item	Limit
Largest SMALLINT value	32767
Smallest INTEGER value	-2147483648
Largest INTEGER value	2147483647
Smallest BIGINT value	-9223372036854775808
Largest BIGINT value	9223372036854775807
Smallest REAL value	About -7.2×10^{75}
Largest REAL value	About 7.2×10^{75}
Smallest positive REAL value	About 5.4×10^{-79}
Largest negative REAL value	About -5.4×10^{-79}
Smallest FLOAT value	About -7.2×10^{75}
Largest FLOAT value	About 7.2×10^{75}
Smallest positive FLOAT value	About 5.4×10^{-79}
Largest negative FLOAT value	About -5.4×10^{-79}
Smallest DECIMAL value	$1 - 10^{31}$
Largest DECIMAL value	$10^{31} - 1$
Largest decimal precision	31
Smallest DECFLOAT(16) value[1]	$-9.999999999999999 \times 10^{384}$
Largest DECFLOAT(16) value[1]	$9.999999999999999 \times 10^{384}$
Smallest positive DECFLOAT(16) value[1]	$1.000000000000000 \times 10^{-383}$
Largest negative DECFLOAT(16) value[1]	$-1.000000000000000 \times 10^{-383}$
Smallest DECFLOAT(34) value[1]	$-9.999999999999999999999999999999999 \times 10^{6144}$.
Largest DECFLOAT(34) value[1]	$9.999999999999999999999999999999999 \times 10^{6144}$.
Smallest positive DECFLOAT(34) value[1]	$1.000000000000000000000000000000000 \times 10^{-6143}$
Largest negative DECFLOAT(34) value[1]	$-1.000000000000000000000000000000000 \times 10^{-6143}$
Coefficient length for DECFLOAT values	DECFLOAT(16) is 16 digits; DECFLOAT(34) is 34 digits
Maximum Exponent (E_{max}) for DECFLOAT values	DECFLOAT(16) is 384; DECFLOAT(34) is 6144
Minimum Exponent (E_{min}) for DECFLOAT values	DECFLOAT(16) is -383; DECFLOAT(34) is -6143
Bias for DECFLOAT values	DECFLOAT(16) is 398; DECFLOAT(34) is 6176

Note:

1. These are the limits for normal numbers in DECFLOAT. DECFLOAT also contains special values such as NaN and Infinity that are also valid. DECFLOAT also supports subnormal numbers that are outside of the documented range.

The following table shows the length limits for strings.

Table 156. String length limits

Item	Limit
Maximum length of CHAR	255 bytes
Maximum length of GRAPHIC	127 double-byte characters
Maximum length of BINARY	255 bytes

Table 156. String length limits (continued)

Item	Limit
Maximum length[1] of VARCHAR	4046 bytes for 4 KB pages 8128 bytes for 8 KB pages 16320 bytes for 16 KB pages 32704 bytes for 32 KB pages
Maximum length of VARCHAR that can be indexed by an XML index	1000 bytes after conversion to UTF-8
Maximum length[1] of VARGRAPHIC	2023 double-byte characters for 4 KB pages 4064 double-byte characters for 8 KB pages 8160 double-byte characters for 16 KB pages 16352 double-byte characters for 32 KB pages
Maximum length of VARBINARY	32704 bytes
Maximum length of CLOB	2 147 483 647 bytes (2 GB - 1 byte)
Maximum length of DBCLOB	1 073 741 823 double-byte characters
Maximum length of BLOB	2 147 483 647 bytes (2 GB - 1 byte)
Maximum length of a character constant	32704 UTF-8 bytes
Maximum length of a hexadecimal character constant	32704 hexadecimal digits
Maximum length of a graphic string constant	16352 double-byte characters (32704 bytes when expressed in UTF-8)
Maximum length of a hexadecimal graphic string constant	32704 hexadecimal digits
Maximum length of a text string used for a scalar expression	4000 UTF-8 bytes
Maximum length of a concatenated character string	2 147 483 647 bytes (2 GB - 1 byte)
Maximum length of a concatenated graphic string	1 073 741 824 double-byte characters
Maximum length of a concatenated binary string	2 147 483 647 bytes (2 GB - 1 byte)
Maximum length of XML pattern text	4000 bytes after conversion to UTF-8
Maximum length of an XML element or attribute name in an XML document	1000 bytes
Maximum length of a namespace uri	1000 bytes
Maximum length of a namespace prefix	998 bytes
Largest depth of an internal XML tree	128 levels

Note:

1. The maximum length can be achieved only if the column is the only column in the table. Otherwise, the maximum length depends on the amount of space remaining on a page.

The following table shows the minimum and maximum limits for datetime values.

Table 157. Datetime limits

Item	Limit
Smallest DATE value (shown in ISO format)	0001-01-01
Largest DATE value (shown in ISO format)	9999-12-31
Smallest TIME value (shown in ISO format)	00.00.00
Largest TIME value (shown in ISO format)	24.00.00
Smallest TIMESTAMP WITHOUT TIME ZONE value	0001-01-01-00.00.00.000000000000

Table 157. Datetime limits (continued)

Item	Limit
Largest TIMESTAMP WITHOUT TIME ZONE value	9999-12-31-24.00.00.000000000000 [1]
Smallest TIMESTAMP WITH TIME ZONE value	0001-01-01-00.00.00.000000000000 +00:00
Largest TIMESTAMP WITH TIME ZONE value	9999-12-31-24.00.00.000000000000 +00:00 [1]
TIMESTAMP precision range	0 to 12
TIME ZONE hour range	-12 to 14
TIME ZONE minute range	0 to 59

Note:

1. The maximum value is stated as a UTC value. When a timestamp without a time zone is compared to a timestamp with time zone, a necessary adjustment is made using the implicit time zone. During that adjustment, the timestamp without time zone could be converted to a value that is greater than the maximum value for a timestamp with time zone value (this could occur on operations such as comparison and assignment). This situation can be avoided by using '9999-12-30-00.00.00.000000000000' as the maximum value for timestamp without time zone and '9999-12-30-00.00.00.000000000000 +00:00' as the maximum value for timestamp with time zone columns.

The following table shows the DB2 limits on SQL statements.

Table 158. DB2 limits on SQL statements

Item	Limit
Maximum number of columns that are in a table or view (the value depends on the complexity of the CREATE VIEW statement) or columns returned by a table function.	750 or fewer (including hidden columns) 749 if the table is a dependent
Maximum number of base tables in a view, SELECT, UPDATE, INSERT, MERGE, or DELETE	225
Maximum number of rows that can be inserted with a single INSERT or MERGE statement	32767
Maximum row and record sizes for a table	See the maximum record size table under CREATE TABLE.
Maximum number of volume IDs in a storage group	133
Maximum number of partitions in a partitioned table space or partitioned index	64 for table spaces that are not defined with LARGE or a DSSIZE greater than 2 GB. 4096, depending on what is specified for DSSIZE or LARGE and the page size.
Maximum sum of the lengths of limit key values of a partition boundary	765 UTF-8 bytes

Table 158. DB2 limits on SQL statements (continued)

Item	Limit
Maximum size of a partition (table space or index)	For table spaces that are not defined with LARGE or a DSSIZE greater than 2 GB: 4 GB, for 1 to 16 partitions 2 GB, for 17 to 32 partitions 1 GB, for 33 to 64 partitions For table spaces that are defined with LARGE or a DSSIZE of 4 GB: 4 GB, for 1 to 4096 partitions For table spaces that are defined with a DSSIZE greater than 4 GB: 256 GB, depending on the page size (for 1 to 64 partitions for 4 KB pages, for 1 to 128 partitions for 8 KB pages, for 1 to 256 partitions for 16 KB pages, and 1 to 512 partitions for 32 KB pages)
Maximum size of a non-partitioned index for a partitioned table space	For 5-byte EA table spaces: 16 TB for 4 KB pages 32 TB for 8 KB pages 64 TB for 16 KB pages 128 TB for 32 KB pages For table spaces that are defined with LARGE: 16 TB
Maximum length of an index key	Partitioning index: 255-*n* Nonpartitioning index that is padded: 2000-*n* Nonpartitioning index that is not padded: 2000-*n*-2*m* Where *n* is the number of columns in the key that allow nulls and *m* is the number of varying-length columns in the key
Maximum number of bytes used in the partitioning of a partitioned index	255 (This maximum limit is subject to additional limitations, depending on the number of partitions in the table space. The number of partitions * (106 + limit key size) must be less than 65394.)
Maximum number of columns in an index key	64
Maximum number of expressions in an index key	64
Maximum number of tables in a FROM clause	225 or fewer, depending on the complexity of the statement
Maximum number of subqueries in a statement	224
Maximum total length of host and indicator variables pointed to in an SQLDA	32767 bytes 2 147 483 647 bytes (2 GB - 1 byte) for a LOB, subject to the limitations that are imposed by the application environment and host language
Maximum size of application SQLDA for any statement that references host variables or parameter markers	99016 bytes
Maximum length of host variable used for insert or update operation	32704 bytes for a non-LOB 2 147 483 647 bytes (2 GB - 1 byte) for a LOB, subject to the limitations that are imposed by the application environment and host language
Maximum length of an SQL statement	2 097 152 bytes

Table 158. DB2 limits on SQL statements (continued)

Item	Limit
Maximum number of elements in a select list	750 or fewer, depending on whether the select list is for the result table of static scrollable cursor[1]
Maximum number of predicates in a WHERE or HAVING clause	Limited by storage
Maximum total length of columns of a query operation requiring a sort key (SELECT DISTINCT, ORDER BY, UNION, EXCEPT, and INTERSECT, without the ALL keyword, and the DISTINCT keyword for aggregate functions)	4032 bytes
Maximum total length of columns of a query operation requiring sort and evaluating column functions (MULTIPLE DISTINCT and GROUP BY)	65529 bytes
Maximum length of a sort key	16000 bytes
Maximum length of a check constraint	3800 bytes
Maximum number of bytes that can be passed in a single parameter of an SQL CALL statement	32765 bytes for a non-LOB 2 147 483 647 bytes (2 GB - 1 byte) for a LOB, subject to the limitations imposed by the application environment and host language
Maximum number of stored procedures, triggers, and user-defined functions that an SQL statement can implicitly or explicitly reference	64 nesting levels
Maximum length of the SQL path	2048 bytes
Maximum length of a WLM environment name in a CREATE PROCEDURE, CREATE FUNCTION, ALTER PROCEDURE, or ALTER FUNCTION statement.	32 bytes
Maximum number of XPath level in the XMLPATTERN clause of the CREATE INDEX statement.	50 nesting levels

Note:

1. If the scrollable cursor is read-only, the maximum number is 749 less the number of columns in the ORDER BY that are not in the select list. If the scrollable cursor is not read-only, the maximum number is 747.

The following table shows the DB2 system limits.

Table 159. DB2 system limits

Item	Limit
Maximum number of concurrent DB2 or application agents	Limited by the EDM pool size, buffer pool size, and the amount of storage that is used by each DB2 or application agent
Maximum size of a non-LOB table or table space	128 terabytes (TB)
Maximum size of a simple or segmented table space	64 GB
Maximum size of a log space	6-byte format: 2^{48} bytes 10-byte format: 2^{80} bytes
Maximum size of an active log data set	4 GB -1 byte
Maximum size of an archive log data set	4 GB -1 byte
Maximum number of active log copies	2
Maximum number of archive log copies	2

Table 159. DB2 system limits (continued)

Item	Limit
Maximum number of active log data sets (each copy)	93
Maximum number of archive log volumes (each copy)	10000
Maximum number of databases accessible to an application or user	Limited by system storage and EDM pool size
Maximum number of databases	65217
Maximum number of implicitly created databases	Maximum value of the sequence SYSIBM.DSNSEQ_IMPLICITDB, with a default of 10000
Maximum number of internal objects for each database [1]	32767
Maximum number of indexes on declared global temporary tables	10000
Maximum size of an EDM pool	The installation parameter maximum depends on available space
Maximum number of rows per page	255 for all table spaces except catalog and directory tables spaces, which have a maximum of 127
Maximum simple or segmented data set size	2 GB
Maximum partitioned data set size	See item "maximum size of a partition" in Table 158 on page 2015
Maximum LOB data set size	64 GB
Maximum number of table spaces that can be defined in a work file database	500
Maximum number of tables and triggers that can be defined in a work file database	11767

Note:

1. The number of internal object descriptors (OBDs) for external objects are as follows:
   - Table space: 2
   - Table: 1
   - Index: 2
   - Check constraint: 1
   - Referential integrity relationship: 2
   - Auxiliary relationship for each LOB column: 1
   - XML relationship for each XML column: 1
   - Trigger: 1
   - View that has an INSTEAD OF trigger: 1

Reserved schema names and reserved words

Restrictions exist on the use of certain names that are used by DB2. In some cases, names are reserved and cannot be used by application programs. In other cases, certain names are not recommended for use by application programs though not prevented by the database manager.

Reserved schema names

In general, for certain objects, schema names that begin with the prefix SYS are reserved. The schema name for these objects cannot begin with SYS except for certain exceptions.

The schema name for the objects listed in the following table must follow the restrictions listed in the table.

Recommendations:

- Do not to use SESSION name as a schema name.
- Do not use SYSPUBLIC as a schema name for a table or view.

Table 160. Objects with schema name restrictions and exceptions.

Object	Schema name restriction	Schema name exceptions
Distinct types	Cannot begin with SYS	The schema name can be: • SYSADM • SYSTOOLS[1]
User-defined functions	Cannot begin with SYS	The schema name can be: • SYSADM • SYSTOOLS[1] • SYSFUN[2]
Stored procedures	Cannot begin with SYS	The schema name can be: • SYSADM • SYSFUN[2] • SYSIBM • SYSIBMADM • SYSPROC • SYSTOOLS[1]
Sequences	Cannot begin with SYS	The schema name can be: • SYSADM
Triggers	Cannot begin with SYS	The schema name can be: • SYSADM • SYSTOOLS[1]
Column masks	Cannot begin with SYS	The schema name can be: • SYSADM
Row permissions	Cannot begin with SYS	The schema name can be: • SYSADM

Notes:

1. If the user who executes the CREATE statement has the SYSADM or SYSCTRL privilege.
2. For external user-defined scalar functions or external user-defined table functions if the user who executes the CREATE statement has the SYSADM or SYSCTRL privilege.

Reserved words

Certain words cannot be used as ordinary identifiers in some contexts because those words might be interpreted as SQL keywords. For example, ALL cannot be a column name in a SELECT statement. Each word, however, can be used as a delimited identifier in contexts where it otherwise cannot be used as an ordinary identifier. For example, if the quotation mark (") is the escape character that begins and ends delimited identifiers, "ALL" can appear as a column name in a SELECT statement.

New reserved words for this version of DB2 for z/OS are identified with notes in this topic. In addition, some topics in this information might indicate words that cannot be used in the specific context that is being described.

IBM SQL has additional reserved words that DB2 for z/OS does not enforce. Therefore, you should not use these additional reserved words as ordinary identifiers in names that have a continuing use. See *IBM DB2 SQL Reference for Cross-Platform Development* for a list of the words.

Characteristics of SQL statements in DB2 for z/OS

DB2 allows specific actions on each SQL statement, and only certain SQL statements are allowed in external routines and SQL procedures.

Actions allowed on SQL statements

Specific DB2 statements can be executed, prepared interactively or dynamically, or processed by the requester, the server, or the precompiler or coprocessor.

The following table shows whether a specific DB2 statement can be executed, prepared interactively or dynamically, or processed by the requester, the server, or the precompiler or coprocessor. The letter **Y** means *yes*.

Table 161. Actions allowed on SQL statements in DB2 for z/OS

UPDATE	**Y**	**Y**		**Y**	
VALUES[6]	**Y**			**Y**	
VALUES INTO[7]	**Y**			**Y**	
WHENEVER					**Y**

Note:

1. The statement can be dynamically prepared. It cannot be issued dynamically.
2. The statement can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.
3. The statement can be dynamically prepared, but only from an ODBC or CLI driver that supports dynamic CALL statements.
4. The requesting system processes the PREPARE statement when the statement being prepared is ALLOCATE CURSOR or ASSOCIATE LOCATORS.
5. The value to which special register CURRENT SQLID is set is used as the SQL authorization ID for dynamic SQL statements only when DYNAMICRULES run behavior is in effect. The CURRENT SQLID value is ignored for the other DYNAMICRULES behaviors.
6. This statement can be used only in the triggered action of a trigger.
7. Local special registers can be referenced in a VALUES INTO statement if it results in the assignment of a single host-variable, not if it results in setting more than one value.
8. Some processing also occurs at the requester.

SQL statements allowed in external functions and stored procedures

Certain SQL statements can be executed in an external stored procedure or in an external user-defined function. Whether the statements can be executed depends on the level of SQL data access with which the stored procedure or external function is defined.

The following table shows which SQL statements in an external stored procedure or in an external user-defined function can execute. The letter **Y** means *yes*.

In general, if an executable SQL statement is encountered in a stored procedure or function defined as NO SQL, SQLSTATE 38001 is returned. If the routine is defined to allow some level of SQL access, SQL statements that are not supported in any context return SQLSTATE 38003. SQL statements not allowed for routines defined as CONTAINS SQL return SQLSTATE 38004, and SQL statements not allowed for READS SQL DATA return SQLSTATE 38002.

Table 162. SQL statements in external user-defined functions and stored procedures

	Level of SQL access			
SQL statement	**NO SQL**	**CONTAINS SQL**	**READS SQL DATA**	**MODIFIES SQL DATA**
ALLOCATE CURSOR			**Y**	**Y**

WHENEVER	**Y**[1]	**Y**	**Y**	**Y**

Table 162. SQL statements in external user-defined functions and stored procedures (continued)

	Level of SQL access			
SQL statement	**NO SQL**	**CONTAINS SQL**	**READS SQL DATA**	**MODIFIES SQL DATA**

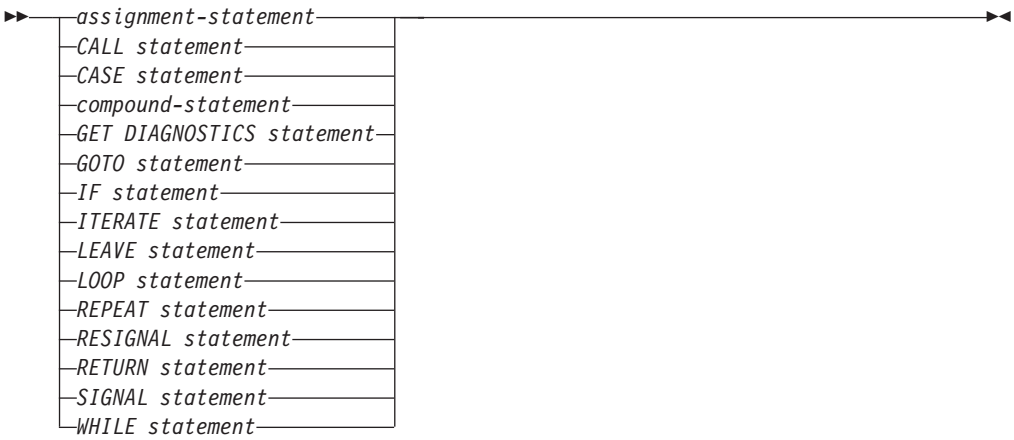
Notes:

1. Although the SQL option implies that no SQL statements can be specified, non-executable statements are not restricted.
2. The stored procedure that is called must have the same or more restrictive level of SQL data access than the current level in effect. For example, a routine defined as MODIFIES SQL DATA can call a stored procedure defined as MODIFIES SQL DATA, READS SQL DATA, CONTAINS SQL, or NO SQL. A routine defined as CONTAINS SQL can call a procedure defined as CONTAINS SQL or NO SQL.
3. The COMMIT statement cannot be executed in a user-defined function. The COMMIT statement cannot be executed in a stored procedure if the procedure is in the calling chain of a user-defined function or trigger.
4. The statement specified for the EXECUTE statement must be a statement that is allowed for the particular level of SQL data access in effect. For example, if the level in effect is READS SQL DATA, the statement must not be an INSERT, UPDATE, MERGE, or DELETE statement.
5. The statement is supported only if it does not contain a subquery or query-expression.
6. RELEASE SAVEPOINT, SAVEPOINT, and ROLLBACK (with the TO SAVEPOINT clause) cannot be executed from a user-defined function.
7. If the ROLLBACK statement (without the TO SAVEPOINT clause) is executed in a user-defined function, an error is returned to the calling program, and the application is placed in a *must rollback* state.
8. The ROLLBACK statement (without the TO SAVEPOINT clause) cannot be executed in a stored procedure if the procedure is in the calling chain of a user-defined function or trigger.

SQL control statements for external SQL procedures

SQL control statements for external SQL procedures can be used only with SQL procedures that are created with the FENCED or EXTERNAL clause. *SQL control statements* provide the capability to control the logic flow, declare and set variables, and handle warnings and exceptions. Some SQL control statements include other nested SQL statements.

SQL-control-statement:



Control statements are supported in SQL procedures. External SQL procedures are created by specifying either FENCED or EXTERNAL, LANGUAGE SQL, and an SQL routine body on the "CREATE PROCEDURE (SQL - external)" on page 1338 statement. The SQL routine body must be a single SQL statement which may be an SQL control statement.

The remainder of this chapter contains a description of the control statements that are supported for external SQL procedures, and includes syntax diagrams, semantic descriptions, usage notes, and examples of the use of the statements that constitute the SQL routine body. In addition, you can find information about referencing SQL parameters and variables in "References to SQL parameters and SQL variables."

The two common elements that are used in describing specific SQL control statements are:

- SQL control statements as described above
- "SQL-procedure-statement" on page 2035

References to SQL parameters and SQL variables

SQL parameters and SQL variables can be referenced anywhere in the statement where an expression or a host variable can be specified. Host variables can be specified in SQL routines. SQL parameters and SQL variables can be referenced anywhere in the compound statement in which they are declared and can be qualified with the label name that is specified at the beginning of the compound statement.

All SQL parameters and SQL variables are considered nullable. The name of an SQL parameter or SQL variable in an SQL routine can be the same as the name of a column in a table or view that the SQL routine references. Names that are the same should be explicitly qualified. Qualifying a name clearly indicates whether the name refers to a column, SQL variable, or SQL parameter.

If the name is not qualified, the following rules describe whether the name refers to the column, the SQL variable, or the SQL parameter:

- The name is checked first as an SQL variable name and then as an SQL parameter name.
- If an SQL variable or SQL parameter by that name is not found, the name is assumed to be a column name.

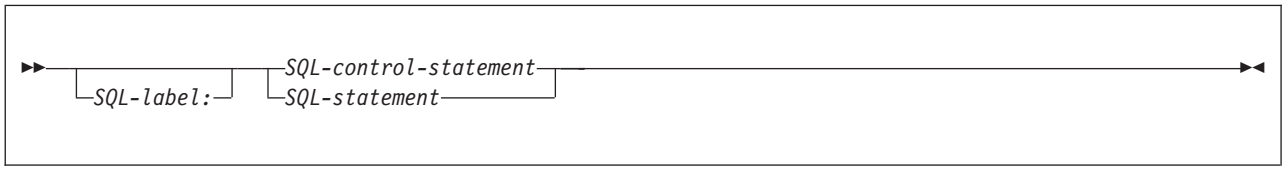
The name of an SQL variable or SQL parameter in an SQL routine can be the name of an identifier that is used in certain SQL statements. If the name is not qualified, the following rules describe whether the name refers to the identifier, the SQL variable, or the SQL parameter:

- In the SET PATH and SET SCHEMA statements, the name is checked as an SQL variable name or an SQL parameter name. If an SQL variable or SQL parameter by that name is not found, the name is assumed to be an identifier.
- In the ASSOCIATE LOCATORS, CONNECT statement, the SET CONNECTION statement, and the RELEASE (connection) statement the name is used as an identifier.

SQL-procedure-statement

An SQL control statement may allow multiple SQL statements to be specified within the SQL control statement. These statements are defined as SQL procedure statements.

Syntax



Description

SQL-label
Specifies a label for the statement. *SQL-label* must not be a delimited identifier that includes lowercase letters or special characters. The label must be unique within the procedure.

SQL-control-statement
Specifies an SQL statement that provides the capability to control logic flow, declare and set variables, and handle warnings and exceptions, as defined in this section. Control statements are supported in SQL procedures.

SQL-statement
Specifies an SQL statement. These statements are described in Chapter 5, "Statements," on page 833.

Notes

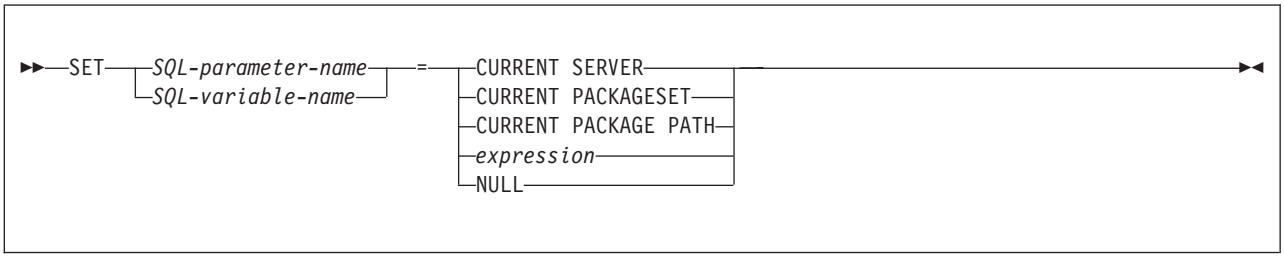
Comments: Comments can be included within the body of an SQL procedure. In addition to the double-dash form of comments (--), a comment can begin with /* and end with */. The following rules apply to this form of comment:
- The beginning characters /* must be adjacent and on the same line.
- The ending characters */ must be adjacent and on the same line.
- Comments can be started wherever a space is valid.
- Comments can be continued to the next line.

Handling errors and warnings: Conditions can be detected within an SQL procedure by using the following methods:
- Test the special SQL variables SQLSTATE and SQLCODE.
- Issue a GET DIAGNOSTICS statement to request the condition information. See "GET DIAGNOSTICS" on page 1679.
- Define condition handlers to detect and process conditions. See "compound-statement" on page 2043 for information about defining condition handlers.

assignment-statement (SQL control statements for external routines)

The assignment statement assigns a value to an SQL parameter or to an SQL variable.

Syntax



Description

SQL-parameter-name
Identifies the parameter that is the assignment target. The parameter must be specified in *parameter-declaration* in the CREATE PROCEDURE statement and must be defined as OUT or INOUT.

SQL-variable-name
Identifies the SQL variable that is the assignment target. SQL variables can be declared in a compound-statement and must be declared before it is used. For information on declaring SQL variables, see "compound-statement" on page 2043.

expression **or NULL**
Specifies the expression or value that is the assignment source. The expression can be any expression of the type described in "Expressions" on page 240 except it cannot contain a reference to local special registers (CURRENT SERVER, CURRENT PACKAGESET, or CURRENT PACKAGE PATH).

Notes

Assignment rules: Assignment statements in SQL procedures must conform to the SQL assignment rules. For example, the data type of the target and source must be compatible. See "Assignment and comparison" on page 121 for assignment rules.

When a string is assigned to a fixed-length variable and the length of the string is less than the length attribute of the target, the string is padded on the right with the necessary number of single-byte or double-byte blanks. When a string is assigned to a variable and the string is longer than the length attribute of the variable, the value is truncated and a warning is returned.

The ENCODING bind option is not used during processing of assignments to string variables. For example, assume that the system does not use mixed or DBCS, and the system EBCDIC SBCS CCSID is 37. Character conversion will not occur on assignment even if CCSID 500 is specified for the ENCODING bind parameter for the package for the procedure.

If truncation of the whole part of a number occurs on assignment to a numeric variable, the value is truncated and a warning is returned.

Assignments involving SQL parameters:

- An IN parameter can appear on the left side of an assignment statement. When control returns to the caller, the original value of an IN parameter is passed to the caller.
- An OUT parameter can appear on the left or right side of an assignment statement. When control returns to the caller, the last value that is assigned to an OUT parameter is returned to the caller.
- An INOUT parameter can appear on the left or right side of an assignment statement. The first value of the parameter is determined by the caller, and the last value that is assigned to the parameter is returned to the caller.
- A LOB parameter can not be used as an output value in an SQL statement in an SQL procedure when connected to a remote site. To circumvent the restriction, use a LOB SQL variable instead of a LOB parameter.

Considerations for SQLSTATE and SQLCODE SQL variables: Assignment to these variables is not prohibited. However, it is not recommended as assignment does not affect the diagnostic area or result in the activation of condition handlers. Furthermore, processing an assignment to these SQL variables causes the specified values for the assignment to be overlayed with the SQL return codes returned from executing the statement that does the assignment.

Examples

Increase the SQL variable *p_salary* by 10 percent.

```
SET p_salary = p_salary + (p_salary * .10)
```

Set SQL variable *p_salary* to the null value.

```
SET p_salary = NULL
```

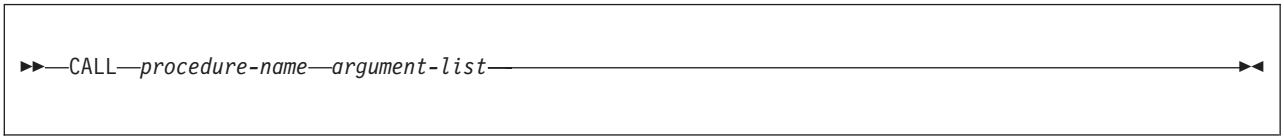
Set SQL variable *midinit* to the first character of SQL variable *midname*.

```
SET midinit = SUBSTR(midname,1,1)
```

CALL statement

The CALL statement invokes a stored procedure.

Syntax



argument-list:

Description

procedure-name

Identifies the stored procedure to call. The procedure name must identify a stored procedure that exists at the current server.

argument-list

Identifies a list of values to be passed as parameters to the stored procedure. The number of parameters must be the same as the number of parameters defined for the stored procedure. See "CALL" on page 1117 for more information.

Control is passed to the stored procedure according to the calling conventions for SQL procedures. When execution of the stored procedure is complete, the value of each parameter of the stored procedure is assigned to the corresponding parameter of the CALL statement defined as OUT or INOUT.

SQL-variable-name

Specifies an SQL variable as an argument to the stored procedure. For an explanation of references to SQL variables, see "References to SQL parameters and SQL variables" on page 2033.

SQL-parameter-name

Specifies an SQL parameter as an argument to the stored procedure. For an explanation of references to SQL parameters, see "References to SQL parameters and SQL variables" on page 2033.

expression

The parameter is the result of the specified *expression*, which is evaluated before the stored procedure is invoked. If *expression* is a single *SQL-parameter-name* or *SQL-variable-name*, the corresponding parameter of the procedure can be defined as IN, INOUT, or OUT. Otherwise, the corresponding parameter of the procedure must be defined as IN. If the result of the *expression* can be the null value, either the description of the

procedure must allow for null parameters or the corresponding parameter of the stored procedure must be defined as OUT.

The following additional rules apply depending on how the corresponding parameter was defined in the CREATE PROCEDURE statement for the procedure:

- IN *expression* can contain references to multiple SQL parameters or variables. In addition to the rules stated in "Expressions" on page 240 for *expression*, *expression* cannot include a column name, an aggregate function, or a user-defined function that is sourced on an aggregate function.
- INOUT or OUT *expression* can only be a single SQL parameter or variable.

NULL
The parameter is a null value. The corresponding parameter of the procedure must be defined as IN and the description of the procedure must allow for null parameters.

Notes

See "CALL" on page 1117 for more information on the SQL CALL statement.

Examples

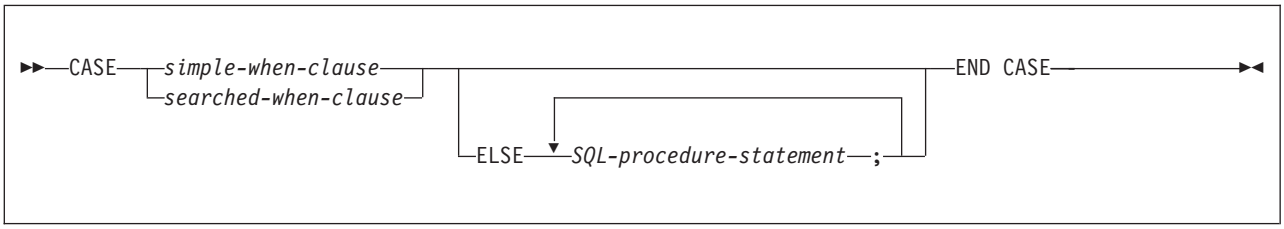
Call stored procedure proc1 and pass SQL variables as parameters.

```
CALL proc1(v_empno, v_salary)
```

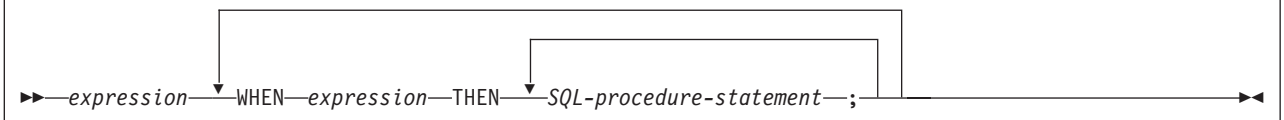
CASE statement

The CASE statement selects an execution path based on the evaluation of one or more conditions. A CASE statement operates in the same way as a CASE expression.

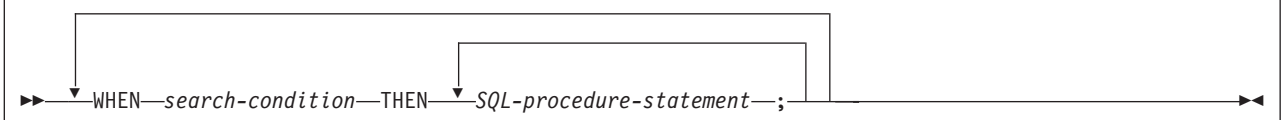
Syntax



simple-when-clause:



searched-when-clause:



Description

CASE
Begins a *case-expression*.

simple-when-clause
Specifies the *expression* prior to the first WHEN keyword that is tested for equality with the value of each *expression* that follows the WHEN keyword, and the result to be executed when those expressions are equal. If the comparison is true, the THEN statement is executed. If the result is unknown or false, processing continues to the next expression or the ELSE statement.

The data type of the *expression* prior to the first WHEN keyword must be comparable to the data types of each *expression* that follows the WHEN keywords.

searched-when-clause
Specifies the *search-condition* that is applied to each row or group of table data presented for evaluation, and the result when that condition is true. *search-condition* cannot contain a *fullselect*. If the search condition is true, the

THEN statement is executed. If the condition is unknown or false, processing continues to the next search condition or the ELSE statement.

SQL-procedure-statement
Specifies a statement that follows the THEN and ELSE keyword. The statement specifies the result of a *searched-when-clause* or a *simple-when-clause* that is true, or the result if no case is true. The statement must be one of the statements listed under "SQL-procedure-statement" on page 2035.

search-condition
Specifies a condition that is true, false, or unknown about a row or group of table data.

ELSE *SQL-procedure-statement*
If none of the conditions specified in the *simple-when-clause* or *searched-when-clause* are true, the statements in the *else-clause* are executed.

If none of the conditions specified in the WHEN clause are true and an ELSE clause is not specified, an error is returned at run time, and the execution of the CASE statement is terminated.

END CASE
Ends a *case-statement*.

Notes

If none of the conditions specified in the WHEN clause are true and an ELSE clause is not specified, an error is returned at run time, and the execution of the CASE statement is terminated.

CASE statements that use a simple case statement WHEN clause can be nested up to three levels. CASE statements that use a searched statement WHEN clause have no limit to the number of nesting levels.

Considerations for the SQLSTATE and SQLCODE SQL variables: When the first SQL-procedure-statement in the CASE statement is executed, the SQLSTATE and SQLCODE SQL variables reflect the result of evaluating the expression or search conditions of that CASE statement. If a CASE statement does not include an ELSE clause and none of the search conditions evaluate to true, an error is returned.

Examples

Example 1: Use a simple case statement WHEN clause to update column DEPTNAME in table DEPT, depending on the value of SQL variable *v_workdept*.

```
CASE v_workdept
 WHEN 'A00'
  THEN UPDATE DEPT SET
   DEPTNAME = 'DATA ACCESS 1';
 WHEN 'B01'
  THEN UPDATE DEPT SET
   DEPTNAME = 'DATA ACCESS 2';
 ELSE UPDATE DEPT SET
   DEPTNAME = 'DATA ACCESS 3';
END CASE
```

Example 2: Use a searched case statement WHEN clause to update column DEPTNAME in table DEPT, depending on the value of SQL variable *v_workdept*.

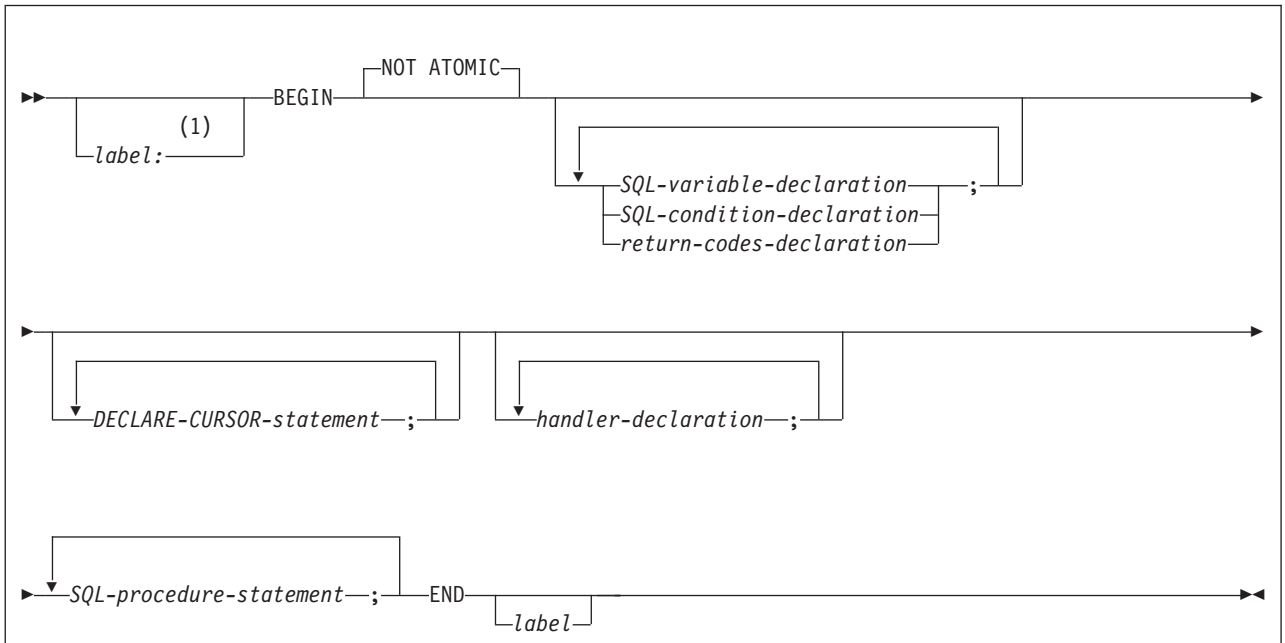
```
CASE
 WHEN v_workdept < 'B01'
  THEN UPDATE DEPT SET
```

```
    DEPTNAME = 'DATA ACCESS 1';
  WHEN v_workdept < 'C01'
   THEN UPDATE DEPT SET
    DEPTNAME = 'DATA ACCESS 2';
  ELSE UPDATE DEPT SET
    DEPTNAME = 'DATA ACCESS 3';
END CASE
```

compound-statement

A compound statement contains a group of statements and declarations for SQL variables, cursors, and condition handlers.

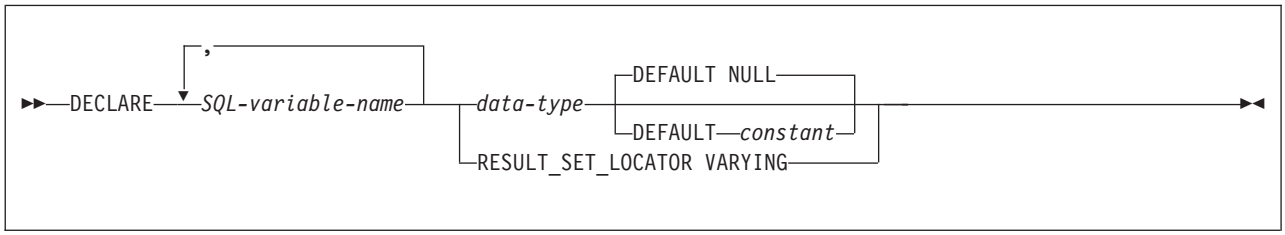
Syntax



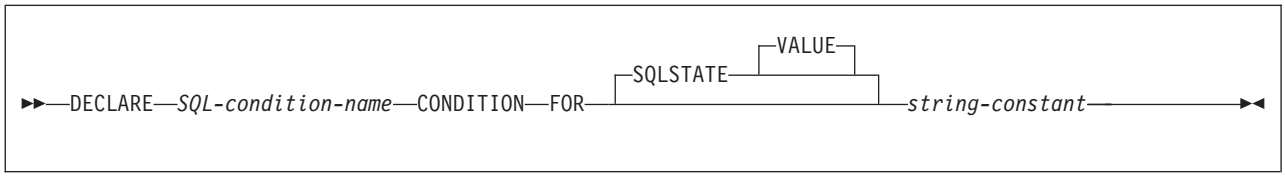
Notes:

1 Only one *label:* can be specified for each *SQL-procedure-statement*. If an ending label is specified for this beginning label, the labels must be the same.

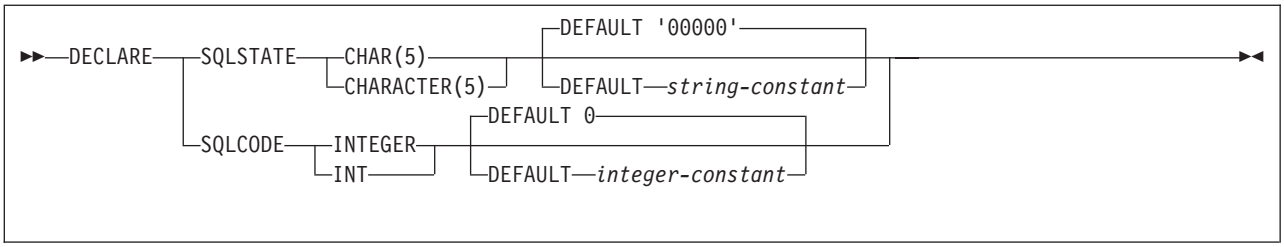
SQL-variable-declaration:



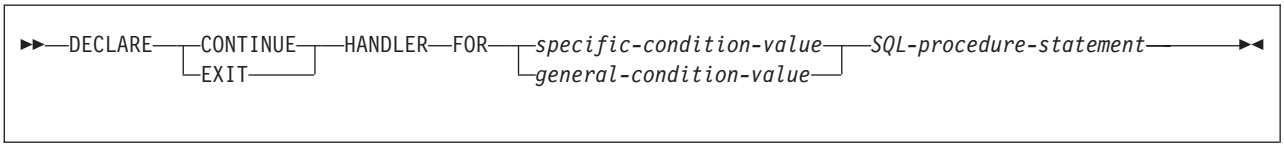
SQL-condition-declaration:



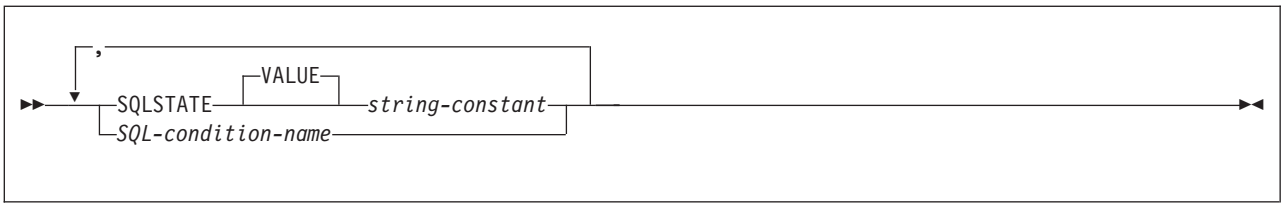
return-codes-declaration:



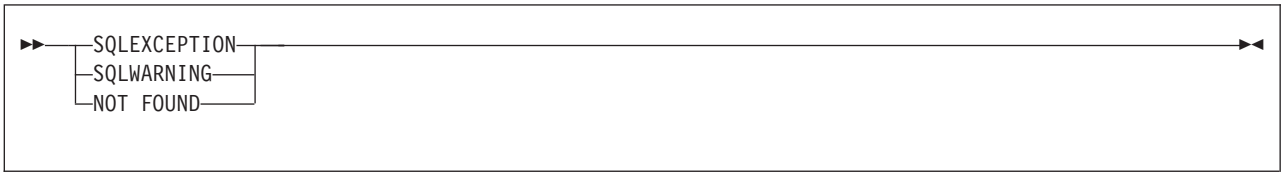
handler-declaration:



specific-condition-value:



general-condition-value:



Description

label
Defines the label for the code block. If the beginning label is specified, it can be used to qualify SQL variables declared in the compound statement and can also be specified on a LEAVE statement. If the ending label is specified, it must be the same as the beginning label.

NOT ATOMIC
NOT ATOMIC indicates that an error within the compound statement does not cause the compound statement to be rolled back.

SQL-variable-declaration
Declares a variable that is local to the compound statement.

SQL-variable-name
A qualified or unqualified name that designates a variable in an SQL procedure body. The unqualified form of *SQL-variable-name* is an SQL identifier and must not be a delimited identifier that contains lowercase letters or special characters. The qualified form is an SQL procedure statement label followed by a period (.) and an SQL identifier.

DB2 folds all SBCS SQL variable names to uppercase. SQL variable names should not be the same as column names. If an SQL statement contains an SQL variable or parameter and a column reference with the same name, DB2 interprets the name as an SQL variable or parameter name. To refer to the column, qualify the column name with the table name. Further, to avoid ambiguous variable references and to ensure compatibility with other DB2 platforms, qualify the SQL variable or parameter name with the label of the SQL procedure statement.

data-type
Specifies the data type and length of the variable. SQL variables follow the same rules for default lengths and maximum lengths as SQL procedure parameters. See "CREATE PROCEDURE (SQL - external)" on page 1338 for a description of SQL data types and lengths.

DEFAULT *constant* **or NULL**
Defines the default for the SQL variable. The variable is initialized when the SQL procedure is called. If a default value is not specified, the variable is initialized to NULL.

RESULT_SET_LOCATOR VARYING
Specifies the data type for a result set locator variable.

SQL-condition-declaration
Declares a condition name and corresponding SQLSTATE value.

SQL-condition-name
Specifies the name of the condition. The condition name is an SQL identifier and must not be a delimited identifier that includes lowercase letters or special characters. *SQL-condition-name* must be unique within the procedure body and can be referenced only within the compound statement in which it is declared.

FOR SQLSTATE *string-constant*
Specifies the SQLSTATE that is associated with the condition. The string must be specified as five characters enclosed in single quotes, and cannot be '00000'.

return-codes-declaration
Declares special variables called SQLSTATE and SQLCODE that are set automatically to the value returned after processing an SQL statement. Both the SQLSTATE and SQLCODE variables can be declared only in the outermost compound statement of the SQL procedure. Assignment to these variables is not prohibited; however, assignment is ignored by exception handlers, and processing the next SQL statement replaces the assigned value.

DECLARE-CURSOR-statement
Declares a cursor. Each cursor in the procedure body must have a unique name. An OPEN statement must be specified to open the cursor, and a FETCH statement can be specified to read rows. The cursor can be referenced only from within the compound statement. For more information on declaring a cursor, see "DECLARE CURSOR" on page 1535.

handler-declaration
Specifies a set of statements to execute when an exception or completion condition occurs in the compound statement. *SQL-procedure-statement* is the set of statements that execute when the handler receives control. See "SQL-procedure-statement" on page 2035 for information on *SQL-procedure-statement*.

A handler is active only within the compound statement in which it is declared.

The actions that a handler can perform are:

CONTINUE
Specifies that after the condition handler is activated and completes successfully, control is returned to the SQL statement that follows the statement that raised the condition. However, if the condition is an error condition and it was encountered while evaluating a search condition, as in a CASE, IF, REPEAT or WHILE statement, control returns to the statement that follows the corresponding END CASE, END IF, END REPEAT, or END WHILE.

EXIT
After the handler is invoked successfully, control is returned to the end of the compound statement.

The conditions that can cause the handler to gain control are:

SQLSTATE *string-constant*
Specifies an SQLSTATE for which the handler is invoked. The SQLSTATE cannot be '00000'.

SQL-condition-name
Specifies a condition name for which the handler is invoked. The condition name must be previously defined in a condition declaration.

SQLEXCEPTION
Specifies that the handler is invoked when an SQLEXCEPTION occurs. An SQLEXCEPTION is an SQLSTATE in which the class code is a value other than '00', '01', or '02'. For more information on SQLSTATE values, see *DB2 Codes*.

SQLWARNING
Specifies that the handler is invoked when an SQLWARNING occurs. An SQLWARNING is an SQLSTATE value with a class code of '01'.

NOT FOUND
Specifies that the handler is invoked when a NOT FOUND condition occurs. NOT FOUND corresponds to an SQLSTATE value with a class code of '02'.

Notes

The order of statements in a compound statement must be:
1. SQL variable, condition declarations, and return codes declarations
2. Cursor declarations
3. Handler declarations
4. SQL procedure statements

Compound statements cannot be nested.

Unlike host variables, SQL variables are not preceded by colons when they are used in SQL statements.

The following rules apply to handlers:

- A handler declaration that contains SQLEXCEPTION, SQLWARNING, or NOT FOUND cannot contain additional SQLSTATE or condition names.

- Handler declarations within the same compound statement cannot contain duplicate conditions.
- A handler declaration cannot contain the same condition code or SQLSTATE value more than once, and cannot contain an SQLSTATE value and a condition name that represent the same SQLSTATE value.
- A handler is activated when it is the most appropriate handler for an exception or completion condition.
- If there is no handler for an SQL error, the error is passed to the caller in the SQLCA.
- A handler cannot be activated by an assignment statement that assigns a value to SQLSTATE.

The following rules and recommendations apply to the SQLCODE and SQLSTATE SQL variables:

- A null value cannot be assigned to SQLSTATE or SQLCODE.
- The SQLSTATE and SQLCODE variable values should be saved immediately to temporary variables if there is any intention to use the values. If a handler exists for SQLSTATE, this assignment must be done as the first statement to be processed in the handler to avoid having the value replaced by the next SQL procedure statement. If the condition raised by the SQL statement is handled, the value is changed by the first SQL statement contained in the handler.

Considerations for the SQLSTATE and SQLCODE SQL variables: The compound statement itself does not affect the SQLSTATE and SQLCODE SQL variables. However, SQL statements contained within the compound statement can affect the SQLSTATE and SQLCODE SQL variables. At the end of the compound statement, the SQLSTATE and SQLCODE SQL variables reflect the result of the last SQL statement executed within the compound statement that caused a change to the SQLSTATE and SQLCODE SQL variables. If the SQLSTATE and SQLCODE SQL variables were not changed within the compound statement, they contain the same values as when the compound statement was entered.

Examples

Create a procedure body with a compound statement that performs the following actions:

- Declares SQL variables, a condition for SQLSTATE '02000', a handler for the condition, and a cursor
- Opens the cursor, fetches a row, and closes the cursor

```
CREATE PROCEDURE PROC1(OUT NOROWS INT) LANGUAGE SQL
BEGIN
 DECLARE v_firstnme VARCHAR(12);
 DECLARE v_midinit CHAR(1);
 DECLARE v_lastname VARCHAR(15);
 DECLARE v_edlevel SMALLINT;
 DECLARE v_salary DECIMAL(9,2);
 DECLARE at_end INT DEFAULT 0;
 DECLARE not_found
  CONDITION FOR '02000';
 DECLARE c1 CURSOR FOR
  SELECT FIRSTNME, MIDINIT, LASTNAME,
   EDLEVEL, SALARY
  FROM EMP;
 DECLARE CONTINUE HANDLER FOR not_found SET NOROWS=1;
```

```
 OPEN c1;
 FETCH c1 INTO v_firstnme, v_midinit,
  v_lastname, v_edlevel, v_salary;
END
```

GET DIAGNOSTICS statement

The GET DIAGNOSTICS statement obtains information about the previous SQL statement that was executed.

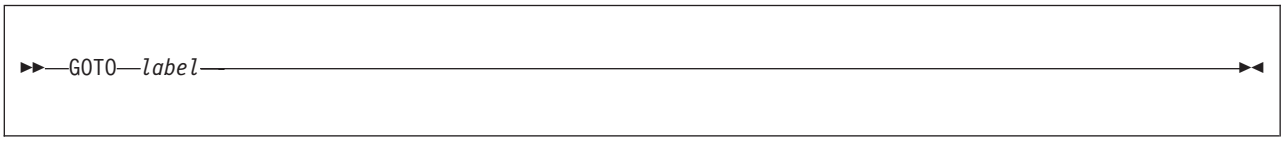
See “GET DIAGNOSTICS” on page 1679.

When you need to specify a variable in a GET DIAGNOSTICS statement that is used within an SQL procedure, you would use either *SQL-variable-name* or *SQL-parameter-name*. In an embedded GET DIAGNOSTICS statement, you would use a *host-variable*. You can replace the instances of *host-variable* in the description of “GET DIAGNOSTICS” on page 1679 with *SQL-variable-name* or *SQL-parameter-name*.

GOTO statement

The GOTO statement is used to branch to a user-defined label within an SQL procedure.

Syntax



Description

label

Specifies a labeled statement at which processing is to continue.

The labeled statement and the GOTO statement must be in the same scope. The following rules apply to the scope:

- If the GOTO statement is defined in a compound statement, *label* must be defined inside the same compound statement.
- If the GOTO statement is defined in a handler, *label* must be defined in the same handler and follow the other scope rules.
- If the GOTO statement is defined outside of a handler, *label* must not be defined within a handler.

If *label* is not defined within a scope that the GOTO statement can reach, an error is returned.

A label name cannot be the same as the name of the SQL procedure in which the label is used.

Notes

Use the GOTO statement sparingly. Because the GOTO statement interferes with the normal sequence of processing, it makes an SQL procedure more difficult to read and maintain. Before using a GOTO statement, determine whether some other statement, such as an IF statement or LEAVE statement, can be used instead.

Examples

Use a GOTO statement to transfer control to the end of a compound statement if the value of an SQL variable is less than 600.

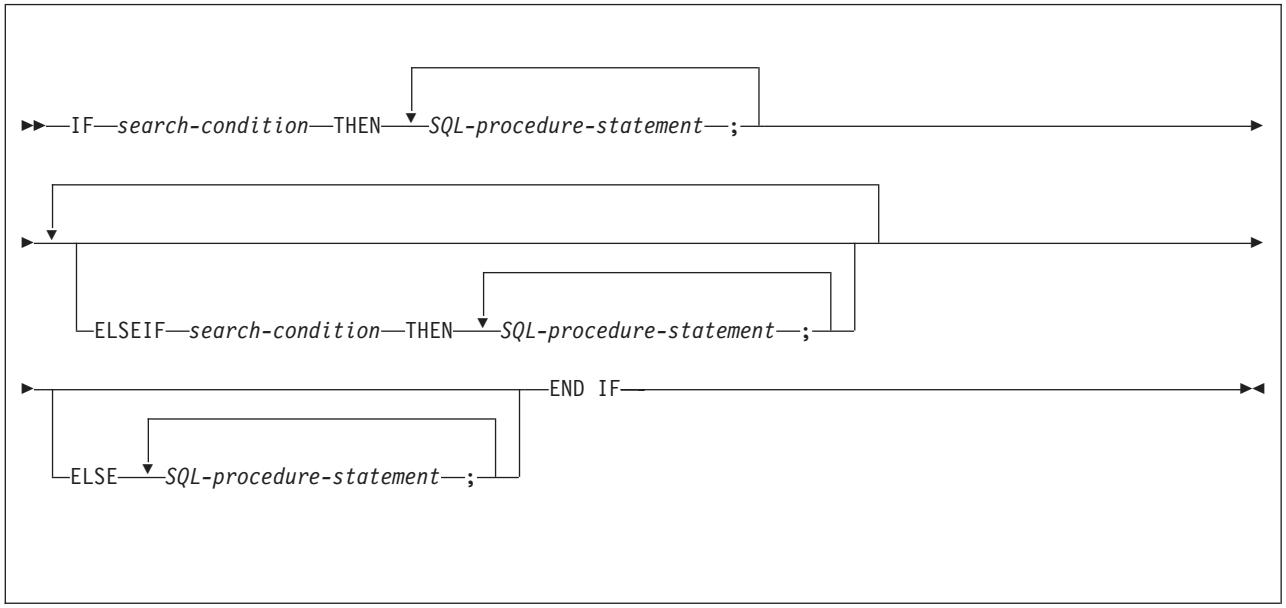
```
BEGIN
 DECLARE new_salary DECIMAL(9,2);
 DECLARE service DECIMAL(8,2);
 SELECT SALARY, CURRENT_DATE - HIREDATE
  INTO new_salary, service
 FROM EMP
WHERE EMPNO = v_empno;
IF service < 600
 THEN GOTO EXIT;
END IF;
IF rating = 1
 THEN SET new_salary =
  new_salary + (new_salary * .10);
ELSEIF rating = 2
 THEN SET new_salary =
  new_salary + (new_salary * .05);
```

```
END IF;
UPDATE EMP
SET SALARY = new_salary
WHERE EMPNO = v_empno;
EXIT: SET return_parm = service;
END
```

IF statement

The IF statement selects an execution path based on the evaluation of a condition.

Syntax



Description

search-condition
Specifies the condition for which an SQL statement should be invoked. If the condition is unknown or false, processing continues to the next search condition until either a condition is true or processing reaches the ELSE clause.

SQL-procedure-statement
Specifies the statement to be invoked if the preceding *search-condition* is true. If no *search-condition* evaluates to true, then the *SQL-procedure-statement* following the ELSE keyword is invoked. The statement must be one of the statements listed under "SQL-procedure-statement" on page 2035.

Notes

Considerations for the SQLSTATE and SQLCODE SQL variables: When the first SQL-procedure-statement in the IF statement is executed, the SQLSTATE and SQLCODE SQL variables reflect the result of evaluating the search conditions of that IF statement. If an IF statement does not include an ELSE clause and none of the search conditions evaluate to true, then when the statement that follows that IF statement is executed, the SQLSTATE and SQLCODE SQL variables reflect the result of evaluating the search conditions of that IF statement.

Examples

Assign a value to the SQL variable *new_salary* based on the value of SQL variable rating.

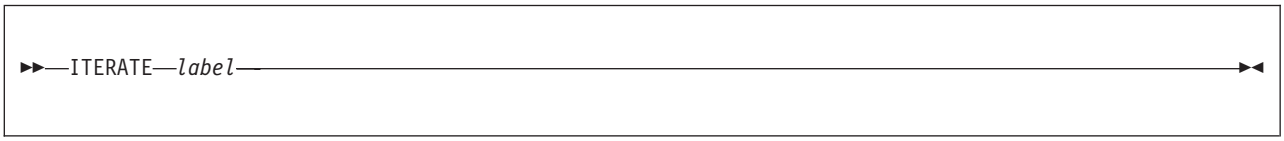
```
IF rating = 1
 THEN SET new_salary =
  new_salary + (new_salary * .10);
 ELSEIF rating = 2
```

```
  THEN SET new_salary =
   new_salary + (new_salary * .05);
 ELSE SET new_salary =
  new_salary + (new_salary * .02);
END IF
```

ITERATE statement

The ITERATE statement causes the flow of control to return to the beginning of a labeled loop.

Syntax



Description

label

Specifies the label of the LOOP, REPEAT, or WHILE statement to which the flow of control is passed.

Examples

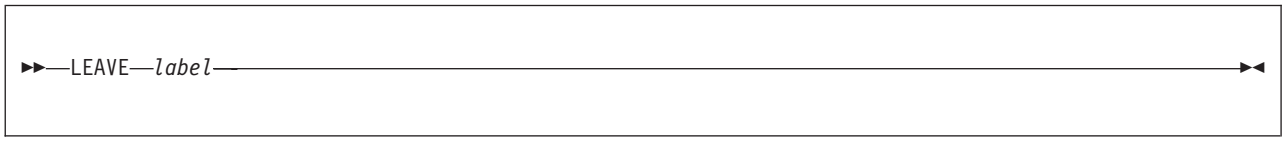
This example uses a cursor to return information for a new department. If the not_found condition handler is invoked, the flow of control passes out of the loop. If the value of *v_dept* is 'D11', an ITERATE statement causes the flow of control to be passed back to the top of the LOOP statement. Otherwise, a new row is inserted into the table.

```
CREATE PROCEDURE ITERATOR ()
  LANGUAGE SQL
  MODIFIES SQL DATA
  BEGIN
    DECLARE v_dept CHAR(3);
    DECLARE v_deptname VARCHAR(29);
    DECLARE v_admdept CHAR(3);
    DECLARE at_end INTEGER DEFAULT 0;
    DECLARE not_found CONDITION FOR SQLSTATE '02000';
    DECLARE c1 CURSOR FOR
      SELECT deptno,deptname,admrdept
        FROM department
        ORDER BY deptno;
    DECLARE CONTINUE HANDLER FOR not_found
    SET at_end = 1;
    OPEN c1;
    ins_loop:
    LOOP
      FETCH c1 INTO v_dept, v_deptname, v_admdept;
      IF at_end = 1 THEN
        LEAVE ins_loop;
      ELSEIF v_dept = 'D11' THEN
        ITERATE ins_loop;
      END IF;
      INSERT INTO department (deptno,deptname,admrdept)
                      VALUES('NEW', v_deptname, v_admdept);
    END LOOP;
    CLOSE c1;
  END
```

LEAVE statement

The LEAVE statement transfers program control out of a loop or a compound statement.

Syntax



Description

label

Specifies the label of the compound statement or loop to exit.

A label name cannot be the same as the name of the SQL procedure in which the label is used.

Notes

When a LEAVE statement transfers control out of a compound statement, all open cursors in the compound statement, except cursors that are used to return result sets, are closed.

Examples

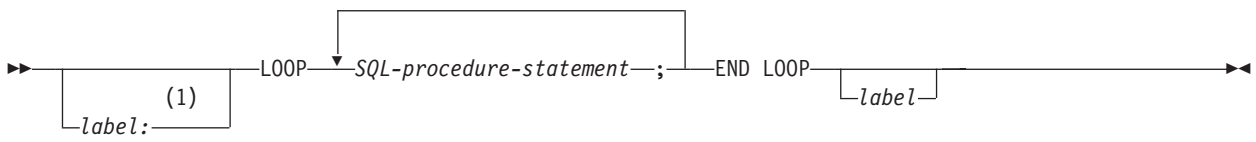
Use a LEAVE statement to transfer control out of a LOOP statement when a negative SQLCODE occurs.

```
ftch_loop: LOOP
 FETCH c1 INTO
  v_firstnme, v_midinit,
  v_lastname, v_edlevel, v_salary;
 IF SQLCODE=100 THEN LEAVE ftch_loop;
 END IF;
END LOOP
```

LOOP statement

The LOOP statement executes a statement or group of statements multiple times.

Syntax



Notes:

1 Only one *label:* can be specified for each *SQL-procedure-statement*.

Description

label

Specifies the label for the LOOP statement. If the ending label is specified, the beginning label must be specified, and the two must match.

A label name cannot be the same as the name of the SQL procedure in which the label is used.

SQL-procedure-statement

Specifies the statements to be executed in the loop. The statement must be one of the statements listed under "SQL-procedure-statement" on page 2035.

Examples

This procedure uses a LOOP statement to fetch values from the employee table. Each time the loop iterates, the OUT parameter counter is incremented and the value of *v_midinit* is checked to ensure that the value is not a single space (' '). If *v_midinit* is a single space, the LEAVE statement passes the flow of control outside of the loop.

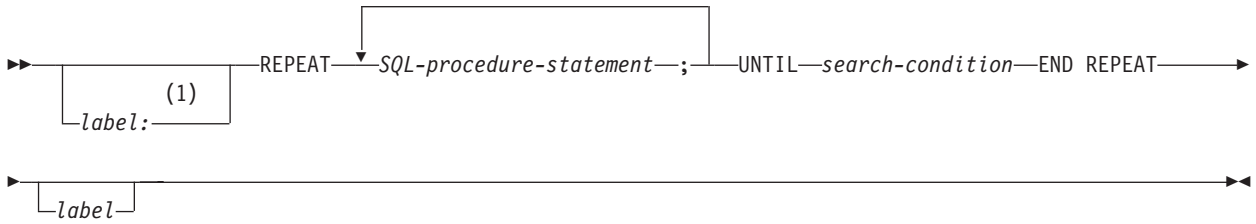
```
CREATE PROCEDURE LOOP_UNTIL_SPACE(OUT counter INTEGER)
   LANGUAGE SQL
   BEGIN
      DECLARE v_counter INTEGER DEFAULT 0;
      DECLARE v_firstnme VARCHAR(12);
      DECLARE v_midinit CHAR(1);
      DECLARE v_lastname VARCHAR(15);
      DECLARE c1 CURSOR FOR
         SELECT firstnme, midinit, lastname
           FROM employee;
      DECLARE EXIT HANDLER FOR NOT FOUND
         SET counter = -1;
      OPEN c1;
      fetch_loop:
      LOOP
        FETCH c1 INTO v_firstnme, v_midinit, v_lastname;
        IF v_midinit = ' ' THEN
           LEAVE fetch_loop;
        END IF;
        SET v_counter = v_counter + 1;
```

```
   END LOOP fetch_loop;
   SET counter = v_counter;
   CLOSE c1;
END
```

REPEAT statement

The REPEAT statement executes a statement or group of statements until a search condition is true.

Syntax



Notes:

1 Only one *label*: can be specified for each *SQL-procedure-statement*.

Description

label
Specifies the label for the REPEAT statement. If the ending label is specified, the beginning label must be specified, and the two must match.

A label name cannot be the same as the name of the SQL procedure in which the label is used.

SQL-procedure-statement
Specifies the statements to be executed. The statement must be one of the statements listed under "SQL-procedure-statement" on page 2035.

search-condition
Specifies a condition that is evaluated after each execution of the REPEAT statement. If the condition is true, the REPEAT loop will exit. If the condition is unknown or false, the REPEAT loop continues.

Examples

Use a REPEAT statement to fetch rows from a table.

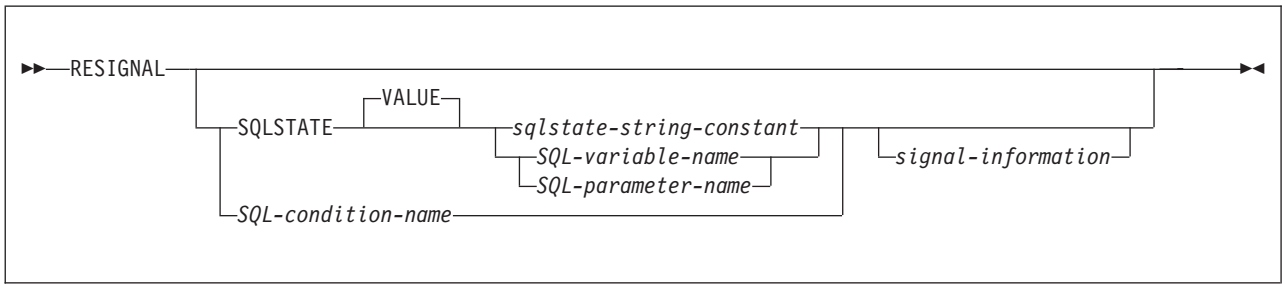
```
fetch_loop:
REPEAT
 FETCH c1 INTO
  v_firstnme, v_midinit, v_lastname;
UNTIL
    SQLCODE <> 0
END REPEAT fetch_loop
```

RESIGNAL statement

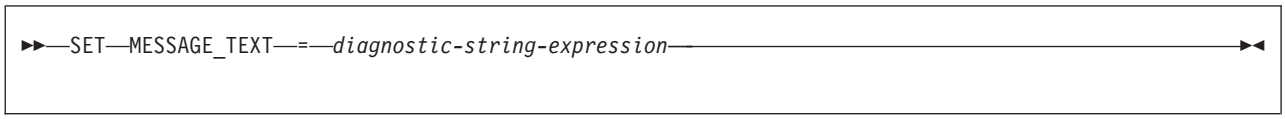
The RESIGNAL statement is used within a condition handler to re-raise the current condition, or to raise an alternate condition so that it can be processed at a higher level. It causes an exception, warning, or not found condition to be returned along with optional message text.

Issuing the RESIGNAL statement without an operand causes the current condition to be passed upwards.

Syntax



signal-information:



Description

SQLSTATE VALUE

Specifies the SQLSTATE that will be returned. Any valid SQLSTATE value can be used. It must be a character string constant with exactly five characters that follow the rules for SQLSTATE values:

- Each character must be from the set of digits ('0' through '9') or non-accented upper case letter ('A' through 'Z').
- The SQLSTATE class (the first two characters) cannot be '00' because it represents successful completion.

If the SQLSTATE does not conform to these rules, an error occurs.

sqlstate-string-constant

A character string constant with a length of five bytes that is a valid SQLSTATE value.

SQL-variable-name **or** *SQL-parameter-name*

Specifies an SQL variable or SQL parameter that is defined for the procedure.

SQL-variable-name

Specifies an SQL variable that is declared within the *compound-statement* that contains the RESIGNAL statement. *SQL-variable-name* must be defined as CHAR or VARCHAR data type with a length of five bytes, must not be null, and must contain a valid SQLSTATE value.

SQL_parameter-name

Specifies an SQL parameter that is defined for the procedure that contains the SQLSTATE value. The SQL parameter must be defined as

a CHAR or VARCHAR value and have a length of five bytes and must not be null. The SQL parameter must contain a valid SQLSTATE value.

SQL-condition-name
Specifies the name of the condition that will be returned. *condition-name* must be declared within the *compound-statement*.

SET MESSAGE_TEXT
Specifies a string that describes the error or warning. The string is returned in the SQLERRMC field of the SQLCA or with the GET DIAGNOSTICS statement.

diagnostic-string-expression
An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see "GET DIAGNOSTICS" on page 1679.

Notes

While any valid SQLSTATE value can be used in the RESIGNAL statement, programmers should define new SQLSTATE values based on ranges reserved for applications. This practice prevents the unintentional use of an SQLSTATE value that might be defined by the database manager in a future release.

If the RESIGNAL statement is issued without an SQLSTATE clause or a *condition-name*, the RESIGNAL statement must be in a handler and the identical condition that activated the handler is returned. The SQLSTATE, SQLCODE, and the SQLCA associated with the condition are unchanged.

If an SQLSTATE clause or a *condition-name* was specified, the SQLCODE returned is based on the SQLSTATE value as follows:

- If the specified SQLSTATE class is either '01' or '02', a warning or not-found message is returned, and the SQLCODE is set to +438.
- Otherwise, an exception is returned and the SQLCODE is set to -438.

The other fields of the SQLCA are set as follows:

- SQLERRD*x* fields are set to zero.
- SQLWARN*x* fields are set to blank.
- SQLERRMC is set to the first 70 bytes of MESSAGE_TEXT.
- SQLERRML is set to the length of SQLERRMC.
- SQLERRP is set to ROUTINE.

When the SQLSTATE or condition indicates that an exception is returned (an SQLSTATE class other than '01' or '02'), the exception is not handled, and control is immediately returned to the end of the compound statement.

When the SQLSTATE or condition indicates that a warning (SQLSTATE class '02') is returned, the warning is not handled, and processing continues with the next statement.

When the SQLSTATE or condition indicates that a not-found condition (SQLSTATE class '02') is returned, the not-found condition is not handled, and processing continues with the next statement.

Examples

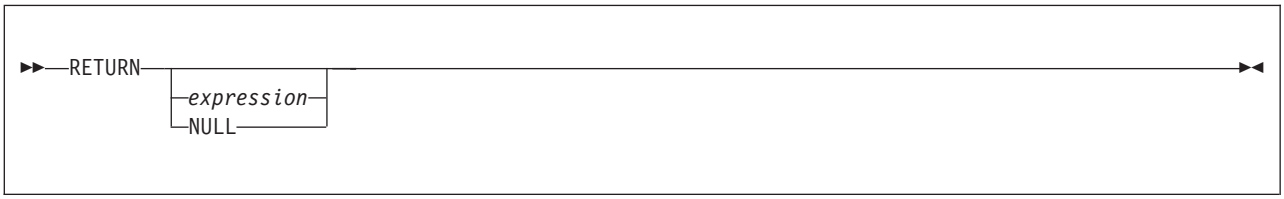
The following example detects a division by zero error. The IF statement uses a SIGNAL statement to invoke the overflow condition handler. The condition handler uses a RESIGNAL statement to return a different SQLSTATE to the client application.

```
CREATE PROCEDURE divide (  IN numerator INTEGER,
                                  IN denominator INTEGER,
                                  OUT divide_result INTEGER)
 LANGUAGE SQL
 CONTAINS SQL
BEGIN
   DECLARE overflow CONDITION for SQLSTATE '22003' ;
     DECLARE CONTINUE HANDLER FOR overflow
     RESIGNAL SQLSTATE '22375';
   IF denominator = 0 THEN
   SIGNAL overflow;
ELSE
  SET divide_result = numerator / denominator;
END IF;
END
```

RETURN statement

The RETURN statement is used to return from the routine. For SQL functions, it returns the result of the function. For an SQL procedure, it optionally returns an integer status value.

Syntax



Description

expression
Specifies a value that is returned from the routine.

- If the routine is a function, *expression* must be specified and the value of *expression* must conform to the SQL assignment rules as described in "Assignment and comparison" on page 121. If the value is being assigned to a string variable, storage assignment rules apply.
- If the routine is a procedure, the data type of *expression* must be INTEGER. If *expression* evaluates to the null value, a value of 0 is returned.

The *expression* cannot include a column name or a host variable. See "Expressions" on page 240 for information on expressions. The *expression* cannot contain a scalar fullselect.

NULL
The null value is returned from the SQL function. **NULL** is not allowed in SQL procedures.

Notes

When a RETURN statement is not used within an SQL procedure or when no value is specified: If a RETURN statement was not used to return from a procedure or if a value is not specified on the RETURN statement, one of the following values is set:

- If the procedure returns with an SQLCODE that is greater or equal to zero, the return status is set to a value of '0'.
- If the procedure returns with an SQLCODE that is less than zero, the return status is set to a value of '-1'.

When a RETURN statement is used within an SQL procedure: If a RETURN statement with a specified return value was used to return from a procedure, the SQLCODE, SQLSTATE, and message length in the SQLCA are initialized to zeros and the message text is set to blanks. An error is not returned to the caller.

When the value is returned: When a value is returned from a procedure, the caller may access the value using one of the following methods:

- The GET DIAGNOSTICS statement to retrieve the RETURN_STATUS when the SQL procedure was called from another SQL procedure.
- The parameter bound for the return value parameter marker in the escape clause CALL syntax (?=CALL...) in a CLI application.

- Directly from the SQLCA returned from processing the CALL of an SQL procedure by retrieving the value of sqlerrd[0]. When the SQLCODE is less than zero, the sqlerrd[0] value is not set. The application should assume a return status value of '-1'.

Examples

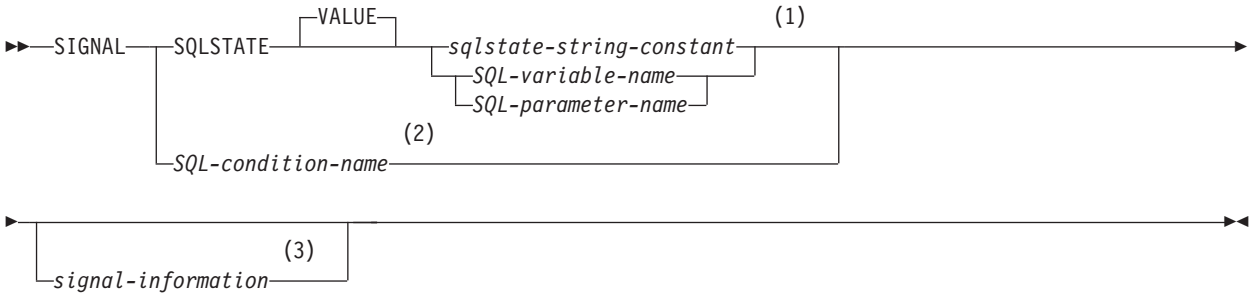
Use a RETURN statement to return from an SQL procedure with a status value of zero if successful or '-200' if not successful.

```
BEGIN
       . . .
           GOTO FAIL;
       . . .
SUCCESS: RETURN 0;
   FAIL: RETURN -200;
END
```

SIGNAL statement

The SIGNAL statement is used to return an error or warning condition. It causes an error or warning to be returned with the specified SQLSTATE, along with optional message text.

Syntax



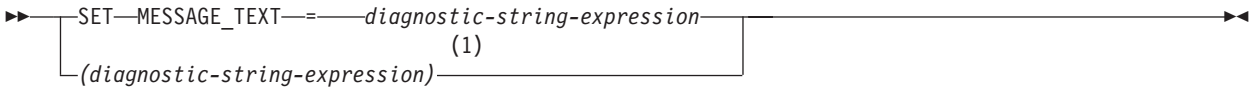
Notes:

1 The **SQLSTATE** variation must be used within a trigger body.

2 *SQL-condition-name* must not be specified within a trigger body.

3 *signal-information* must be specified within a trigger body

signal-information:



Notes:

1 *(diagnostic-string-expression)* must only be specified within a trigger body.

Description

SQLSTATE VALUE

Specifies the SQLSTATE that will be returned. Any valid SQLSTATE value can be used. It must be a character string constant with exactly five characters that follow the rules for SQLSTATEs:

- Each character must be from the set of digits ('0' through '9') or non-accented upper case letter ('A' through 'Z').
- The SQLSTATE class (the first two characters) cannot be '00' because it represents successful completion.

If the SQLSTATE does not conform to these rules, an error occurs.

sqlstate-string-constant

A character string constant with a length of five bytes that is a valid SQLSTATE value.

SQL-variable-name **or** *SQL-parameter-name*
Specifies an SQL variable or SQL parameter that contains a valid SQLSTATE value.

SQL-variable-name
Specifies an SQL variable that is declared within the *compound-statement*. *SQL-variable-name* must be defined as a CHAR or VARCHAR data type, have a length of five bytes, must not be null, and must contain a valid SQLSTATE value.

SQL-parameter-name
Specifies an SQL parameter that is defined for the procedure and contains the SQLSTATE value. The SQL parameter must be defined as a CHAR or VARCHAR value, have a length of five bytes, must not be null, and must contain a valid SQLSTATE value.

SQL-condition-name
Specifies the name of the condition that will be returned. *condition-name* must be declared within the *compound-statement*.

SET MESSAGE_TEXT
Specifies a string that describes the error or warning. The string is returned in the SQLERRMC field of the SQLCA or with the GET DIAGNOSTICS statement.

diagnostic-string-expression
An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see "GET DIAGNOSTICS" on page 1679.

(diagnostic-string-expression)
An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see "GET DIAGNOSTICS" on page 1679.

This syntax variation is only provided within the scope of a CREATE TRIGGER statement for compatibility with previous versions of DB2. To conform with the ANS and ISO standards, this form should not be used.

Notes

While any valid SQLSTATE value can be used in the SIGNAL statement, programmers should define new SQLSTATEs based on ranges reserved for applications. This practice prevents the unintentional use of an SQLSTATE value that might be defined by the database manager in a future release.

If a SIGNAL statement is issued, the SQLCODE that is returned is based on the SQLSTATE as follows:

- If the specified SQLSTATE class is either '01' or '02', a warning or not-found message is returned, and the SQLCODE is set to +438.
- Otherwise, an exception is returned and the SQLCODE is set to -438.

The other fields of the SQLCA are set as follows:

- SQLERRDx fields are set to zero.
- SQLWARNx fields are set to blank.
- SQLERRMC is set to the first 70 bytes of MESSAGE_TEXT.

- SQLERRML is set to the length of SQLERRMC.
- SQLERRP is set to ROUTINE.

When the SQLSTATE or condition indicates that an exception (an SQLSTATE class other than '01' or '02') is returned, one of the following actions occurs:

- If a handler exists for the specified SQLSTATE, condition, or SQLEXCEPTION, the exception is handled, and control is transferred to that handler.
- Otherwise, the exception is not handled, and control is immediately returned to the end of the compound statement.

When the SQLSTATE or condition indicates that a warning (SQLSTATE class '01') is returned, one of the following actions occurs:

- If an active handler exists for the specified SQLSTATE, condition, or SQLWARNING, the warning is handled, and control is transferred to that handler.
- Otherwise, the warning is not handled, and processing continues with the next statement.

When the SQLSTATE or condition indicates that a not-found condition (SQLSTATE class '02') is returned, one of the following actions occurs:

- If an active handler exists for the specified SQLSTATE, condition, or not-found condition, the not-found condition is handled, and control is transferred to that handler.
- Otherwise, the not-found condition is not handled, and processing continues with the next statement.

When the SIGNAL statement is issued in a handler, no active handler exists.

Using a SIGNAL statement in the body of a trigger: Within the triggered action of a CREATE TRIGGER statement, the message text can be specified using only these variations:

```
SIGNAL SQLSTATE sqlstate-string-constant
    SET MESSAGE_TEXT = diagnostic-string-expression
SIGNAL SQLSTATE sqlstate-string-constant
   (diagnostic-string-expression)
```

Examples

Example 1: The following example shows an SQL procedure for an order system that signals an application error when a customer number is not known to the application. The ORDERS table includes a foreign key to the CUSTOMER table, requiring that the CUSTNO exist before an order can be inserted.

```
CREATE PROCEDURE SUBMIT_ORDER
            (IN ONUM INTEGER, IN CNUM INTEGER,
             IN PNUM INTEGER, IN QNUM INTEGER)
 LANGUAGE SQL
 SPECIFIC SUBMIT_ORDER
 MODIFIES SQL DATA
BEGIN
   DECLARE EXIT HANDLER FOR SQLSTATE VALUE '23503'
     SIGNAL SQLSTATE '75002'
         SET MESSAGE_TEXT = 'Customer number is not known';
   INSERT INTO ORDERS (ORDERNO, CUSTNO, PARTNO, QUANTITY)
      VALUES (ONUM, CNUM, PNUM, QNUM);
END
```

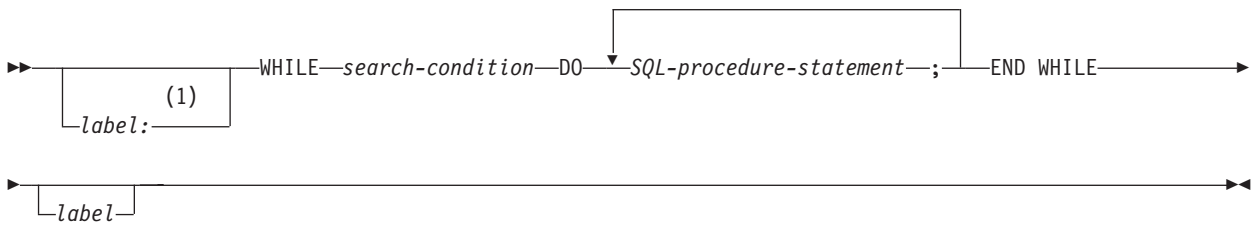
Example 2: The following example shows a trigger for an order system that allows orders to be recorded in an ORDERS table (ORDERNO, CUSTNO, PARTNO, QUANTITY) only if there is sufficient stock in the PARTS tables. When there is insufficient stock for an order, SQLSTATE '75001' is returned along with an appropriate error description.

```
CREATE TRIGGER CK_AVAIL
      NO CASCADE BEFORE INSERT ON ORDERS
      REFERENCING NEW AS NEW_ORDER
      FOR EACH ROW MODE DB2SQL
      WHEN (NEW_ORDER.QUANTITY > (SELECT ON_HAND FROM PARTS
                                  WHERE NEW_ORDER.PARTNO = PARTS.PARTNO))
        BEGIN ATOMIC
          SIGNAL SQLSTATE '75001' ('Insufficient stock for order');
        END
```

WHILE statement

The WHILE statement repeats the execution of a statement or group of statements while a specified condition is true.

Syntax



Notes:

1 Only one *label:* can be specified for each *SQL-procedure-statement*. If an ending label is specified for this beginning label, the labels must be the same.

Description

label
Specifies the label for the WHILE statement. If the ending label is specified, it must be the same as the beginning label.

A label name cannot be the same as the name of the SQL procedure in which the label is used.

search-condition
Specifies a condition that is evaluated before each execution of the loop. If the condition is true, the SQL procedure statement in the loop is executed.

SQL-procedure-statement
Specifies the statements to be executed in the loop. The statement must be one of the statements listed under "SQL-procedure-statement" on page 2035.

Examples

Use a WHILE statement to fetch rows from a table while SQL variable at_end, which indicates whether the end of the table has been reached, is 0.

```
WHILE at_end = 0 DO
 FETCH c1 INTO
  v_firstnme, v_midinit,
  v_lastname, v_edlevel, v_salary;
 IF SQLCODE=100 THEN SET at_end=1;
 END IF;
END WHILE
```

SQL communication area (SQLCA)

An SQLCA is a structure or collection of variables that is updated after each SQL statement executes. An application program that contains executable SQL statements must provide exactly one SQLCA, with a few exceptions.

The following exceptions exist:

- A program that is precompiled with the STDSQL(YES) option must not provide an SQLCA
- In some cases a Fortran program must provide more than one SQLCA.

In all host languages except REXX, the SQL INCLUDE statement can be used to provide the declaration of the SQLCA.

In COBOL and assembler:
The name of the storage area must be SQLCA.

In PL/I, and C:
The name of the structure must be SQLCA. Every executable SQL statement must be within the scope of its declaration.

Unless noted otherwise, *C* is used to represent C/370™ and C/C++ programming languages.

In Fortran:
The name of the COMMON area for the INTEGER variables of the SQLCA must be SQLCA1; the name of the COMMON area for the CHARACTER variables must be SQLCA2. An SQLCA definition is required for every subprogram that contains SQL statements. One is also needed for the main program if it contains SQL statements.

In Java:
The DB2Sqlca class, which is an encapsulation of the SQLCA, should be used.

In REXX:
DB2 generates the SQLCA automatically. A REXX procedure cannot use the INCLUDE statement. The REXX SQLCA has a somewhat different format from SQLCAs for the other languages.

DB2Sqlca class (DB2 Application Programming for Java)

"The REXX SQLCA" on page 2077

Description of SQLCA fields

For the most part, COBOL, C, PL/I, and assembler use the same names for the SQLCA fields, and Fortran uses different names. However, there is one instance where C, PL/I, and assembler names differ from COBOL.

The names in the following table are those provided by the SQL INCLUDE statement.

Table 163. Fields of SQLCA

assembler, COBOL, or PL/I Name	C Name	Fortran Name	Data type	Purpose
SQLCAID	sqlcaid	Not used.	CHAR(8)	An "eye catcher" for storage dumps, containing the text 'SQLCA'. The sixth byte is 'L' if line number information is returned from parsing a dynamic statement or a native SQL procedure. The sixth byte is not set when processing an external SQL procedure.
SQLCABC	sqlcabc	Not used.	INTEGER	Contains the length of the SQLCA: 136.
SQLCODE (See note 1)	SQLCODE	SQLCOD	INTEGER	Contains the SQL return code. (See note 2) **Code** **Means** **0** Successful execution (though there might have been warning messages). **positive** Successful execution, but with a warning condition or other information. **negative** Error condition.
SQLERRML (See note 3)	sqlerrml (See note 3)	SQLTXL	SMALLINT	Length indicator for SQLERRMC, in the range 0 through 70. 0 means that the value of SQLERRMC is not pertinent.
SQLERRMC (See note 3)	sqlerrmc (See note 3)	SQLTXT	VARCHAR(70)	Contains one or more tokens, separated by X'FF', that are substituted for variables in the descriptions of error conditions. It may contain truncated tokens. A message length of 70 bytes indicates a possible truncation.
SQLERRP	sqlerrp	SQLERP	CHAR(8)	Provides a product signature and, in the case of an error, diagnostic information such as the name of the module that detected the error. In all cases, the first three characters are 'DSN' for DB2 for z/OS.
SQLERRD(1)	sqlerrd[0]	SQLERR(1)	INTEGER	For a sensitive static cursor, contains the number of rows in a result table when the cursor position is after the last row (that is, when SQLCODE is equal to +100). On successful return from an SQL procedure, contains the return status value from the SQL procedure. SQLERRD(1) can also contain an internal error code.

Table 163. Fields of SQLCA (continued)

assembler, COBOL, or PL/I Name	C Name	Fortran Name	Data type	Purpose
SQLERRD(2)	sqlerrd[1]	SQLERR(2)	INTEGER	For a sensitive static cursor, contains the number of rows in a result table when the cursor position is after the last row (that is, when SQLCODE is equal to +100). SQLERRD(2) can also contain an internal error code.

Table 163. Fields of SQLCA (continued)

assembler, COBOL, or PL/I Name	C Name	Fortran Name	Data type	Purpose
SQLERRD(3)	sqlerrd[2]	SQLERR(3)	INTEGER	Contains the number of rows that qualified to be deleted, inserted, or updated after a DELETE, INSERT, UPDATE, or MERGE statement. The number excludes rows affected by triggers, referential integrity constraints, or inserted rows that are the result of processing a FOR PORTION OF clause for a BUSINESS_TIME period. For the OPEN of a cursor for a SELECT with a data change statement or for a SELECT INTO, SQLERRD(3) contains the number of rows affected by the embedded data change statement. The value is 0 if the SQL statement fails, indicating that all changes made in executing the statement canceled. For a DELETE statement the value will be -1 if the operation is a mass delete from a table in a segmented table space and the DELETE statement did not include selection criteria. If the delete was against a view, neither the DELETE statement nor the definition of the view included selection criteria. For a TRUNCATE statement, the value will be -1. For a PREPARE statement, contains the estimated number of rows selected. If the number of rows is greater than 2 147 483 647, a value of 2 147 483 647 is returned. For a REFRESH TABLE statement, SQLERRD(3) contains the number of rows inserted into the materialized query table. For a rowset-oriented FETCH, contains the number of rows fetched. For SQLCODES -911 and -913, SQLERRD(3) contains the reason code for the timeout or deadlock. When an error is encountered in parsing a dynamic statement, or when parsing, binding, or executing a native SQL procedure, SQLERRD(3) will contain the line number where the error was encountered. The sixth byte of SQLCAID must be 'L' for this to be a valid line number. This value will be meaningful only if the statement source contains new line control characters. This information is not returned for an external SQL procedure.

Table 163. Fields of SQLCA (continued)

assembler, COBOL, or PL/I Name	C Name	Fortran Name	Data type	Purpose
SQLERRD(4)	sqlerrd[3]	SQLERR(4)	INTEGER	Generally, contains timerons, a short floating-point value that indicates a rough relative estimate of resources required (See note 4). It does not reflect an estimate of the time required. When preparing a dynamically defined SQL statement, you can use this field as an indicator of the relative cost of the prepared SQL statement. For a particular statement, this number can vary with changes to the statistics in the catalog. It is also subject to change between releases of DB2 for z/OS.
SQLERRD(5)	sqlerrd[4]	SQLERR(5)	INTEGER	Contains the position or column of a syntax error for a PREPARE or EXECUTE IMMEDIATE statement.
SQLERRD(6)	sqlerrd[5]	SQLERR(6)	INTEGER	Contains an internal error code.
SQLWARN0	SQLWARN0	SQLWRN(0)	CHAR(1)	Contains a blank if no other indicator is set to a warning condition (that is, no other indicator contains a W or Z). Contains a W if at least one other indicator contains a W or Z.
SQLWARN1	SQLWARN1	SQLWRN(1)	CHAR(1)	Contains a W if the value of a string column was truncated when assigned to a host variable. Contains an N for non-scrollable cursors and S for scrollable cursors after the OPEN CURSOR or ALLOCATE CURSOR statement.
SQLWARN2	SQLWARN2	SQLWRN(2)	CHAR(1)	Contains a W if null values were eliminated from the argument of an aggregate function; not necessarily set to W for the MIN function because its results are not dependent on the elimination of null values.
SQLWARN3	SQLWARN3	SQLWRN(3)	CHAR(1)	Contains a W if the number of result columns is larger than the number of host variables. Contains a Z if fewer locators were provided in the ASSOCIATE LOCATORS statement than the stored procedure returned.
SQLWARN4	SQLWARN4	SQLWRN(4)	CHAR(1)	Contains a W if a prepared UPDATE or DELETE statement does not include a WHERE clause. For a scrollable cursor, contains a D for sensitive dynamic cursors, I for insensitive cursors, and S for sensitive static cursors after the OPEN CURSOR or ALLOCATE CURSOR statement; blank if cursor is not scrollable.
SQLWARN5	SQLWARN5	SQLWRN(5)	CHAR(1)	Contains a W if the SQL statement was not executed because it is not a valid SQL statement in DB2 for z/OS. Contains a character value of 1 (read only), 2 (read and delete), or 4 (read, delete, and update) to reflect capability of the cursor after the OPEN CURSOR or ALLOCATE CURSOR statement.

Table 163. Fields of SQLCA (continued)

assembler, COBOL, or PL/I Name	C Name	Fortran Name	Data type	Purpose
SQLWARN6	SQLWARN6	SQLWRN(6)	CHAR(1)	Contains a W if the addition of a month or year duration to a DATE or TIMESTAMP value results in an invalid day (for example, June 31). Indicates that the value of the day was changed to the last day of the month to make the result valid.
SQLWARN7	SQLWARN7	SQLWRN(7)	CHAR(1)	Contains a W if one or more nonzero digits were eliminated from the fractional part of a number used as the operand of a decimal multiply or divide operation.
SQLWARN8	SQLWARN8	SQLWRX(1)	CHAR(1)	Contains a W if a character that could not be converted was replaced with a substitute character. Contains a Y if there was an unsuccessful attempt to establish a trusted connection.
SQLWARN9	SQLWARN9	SQLWRX(2)	CHAR(1)	Contains a W if arithmetic exceptions were ignored during COUNT or COUNT_BIG processing. Contains a Z if the stored procedure returned multiple result sets.
SQLWARNA	SQLWARNA	SQLWRX(3)	CHAR(1)	Contains a W if at least one character field of the SQLCA or the SQLDA names or labels is invalid due to a character conversion error.
SQLSTATE	sqlstate	SQLSTT	CHAR(5)	Contains a return code for the outcome of the most recent execution of an SQL statement (See note 5).

Notes:

1. With the precompiler option STDSQL(YES) in effect, SQLCODE is replaced by SQLCADE in SQLCA.
2. For the specific meanings of SQL return codes, see *DB2 Codes*.
3. In COBOL, SQLERRM includes SQLERRML and SQLERRMC. In PL/I and C, the varying-length string SQLERRM is equivalent to SQLERRML prefixed to SQLERRMC. In assembler, the storage area SQLERRM is equivalent to SQLERRML and SQLERRMC. See the examples for the various host languages in "The included SQLCA" on page 2075.
4. The use of timerons may require special handling because they are floating-point values in an INTEGER array. In PL/I, for example, you could first copy the value into a BIN FIXED(31) based variable that coincides with a BIN FLOAT(24) variable.
5. For a description of SQLSTATE values, see *DB2 Codes*.

The included SQLCA

The description of the SQLCA that is given by INCLUDE SQLCA is shown for each of the host languages.

assembler:

```
SQLCA    DS   0F
SQLCAID  DS   CL8        ID
SQLCABC  DS   F          BYTE COUNT
SQLCODE  DS   F          RETURN CODE
SQLERRM  DS   H,CL70     ERR MSG PARMS
SQLERRP  DS   CL8        IMPL-DEPENDENT
SQLERRD  DS   6F
SQLWARN  DS   0C         WARNING FLAGS
SQLWARN0 DS   C'W' IF ANY

The REXX SQLCA

The REXX SQLCA consists of a set of variables, rather than a structure. DB2 makes the SQLCA available to your application automatically.

The following table lists the variables in a REXX SQLCA.

Table 164. Variables in a REXX SQLCA

Variable	Contents
SQLCODE	Contains the SQL return code.
SQLERRMC	Contains one or more tokens, separated by X'FF', that are substituted for variables in the descriptions of error conditions. It might contain truncated tokens. A message length of 70 bytes indicates a possible truncation.
SQLERRP	Provides a product signature and, in the case of an error, diagnostic information such as the name of the module that detected the error. For DB2 for z/OS, the product signature is 'DSN'.
SQLERRD.1	For a sensitive static cursor, contains the number of rows in a result table when the cursor position is after the last row (that is, when SQLCODE is equal to +100). SQLERRD(1) can also contain an internal error code.
SQLERRD.2	For a sensitive static cursor, contains the number of rows in a result table when the cursor position is after the last row (that is, when SQLCODE is equal to +100). SQLERRD(2) can also contain an internal error code.
SQLERRD.3	Contains the number of rows that qualified for the operation after an SQL data change statement (but not rows deleted as a result of CASCADE delete). For the OPEN of a cursor for a SELECT with an SQL data change statement or for a SELECT INTO, SQLERRD(3) contains the number of rows affected by the embedded data change statement. Set to 0 if the SQL statement fails, indicating that all changes made in executing the statement were canceled. Set to -1 for a mass delete from a table in a segmented table space, for a truncate operation, or a delete from a view when neither the DELETE statement nor the definition of the view included selection criteria. For rowset-oriented FETCH statements, contains the number of rows returned in the rowset. For SQLCODES -911 and -913, SQLERRD(3) contains the reason code for the timeout or deadlock. After successful execution of the REFRESH TABLE statement, SQLERRD(3) contains the number of rows inserted into the materialized query table. When an error is encountered in parsing a dynamic statement, or when parsing, binding, or executing a native SQL procedure, SQLERRD(3) will contain the line number where the error was encountered. The sixth byte of SQLCAID must be 'L' for this to be a valid line number. This value will be meaningful only if the statement source contains new line control characters. This information is not returned for an external SQL procedure.
SQLERRD.4	Generally, contains timerons, a short floating-point value that indicates a rough relative estimate of resources required. This value does not reflect an estimate of the time required to execute the SQL statement. After you prepare an SQL statement, you can use this field as an indicator of the relative cost of the prepared SQL statement. For a particular statement, this number can vary with changes to the statistics in the catalog. This value is subject to change between releases of DB2 for z/OS.
SQLERRD.5	Contains the position or column of a syntax error for a PREPARE or EXECUTE IMMEDIATE statement.
SQLERRD.6	Contains an internal error code.

Table 164. Variables in a REXX SQLCA (continued)

Variable	Contents
SQLWARN.0	Contains a blank if no other indicator is set to a warning condition (that is, no other indicator contains a W or Z). Contains a W if at least one other indicator contains a W or Z.
SQLWARN.1	Contains a W if the value of a string column was truncated when assigned to a host variable. Contains an N for non-scrollable cursors and S for scrollable cursors after the OPEN CURSOR or ALLOCATE CURSOR statement.
SQLWARN.2	Contains a W if null values were eliminated from the argument of an aggregate function; not necessarily set to W for the MIN function because its results are not dependent on the elimination of null values.
SQLWARN.3	Contains a W if the number of result columns is larger than the number of host variables. Contains Z if the ASSOCIATE LOCATORS statement contains fewer locators than the stored procedure returned.
SQLWARN.4	Contains a W if a prepared UPDATE or DELETE statement does not include a WHERE clause. For a scrollable cursor, contains a D for sensitive dynamic cursors, I for insensitive cursors, and S for sensitive static cursors after the OPEN CURSOR or ALLOCATE CURSOR statement; otherwise, blank if cursor is not scrollable.
SQLWARN.5	Contains a W if the SQL statement was not executed because it is not a valid SQL statement in DB2 for z/OS. Contains a character value of 1 (read only), 2 (read and delete), or 4 (read, delete, and update) to reflect capability of the cursor after the OPEN CURSOR or ALLOCATE CURSOR statement.
SQLWARN.6	Contains a W if the addition of a month or year duration to a DATE or TIMESTAMP value results in an invalid day (for example, June 31). Indicates that the value of the day was changed to the last day of the month to make the result valid.
SQLWARN.7	Contains a W if one or more nonzero digits were eliminated from the fractional part of a number that was used as the operand of a decimal multiply or divide operation.
SQLWARN.8	Contains a W if a character that could not be converted was replaced with a substitute character.
SQLWARN.9	Contains a W if arithmetic exceptions were ignored during COUNT or COUNT_BIG processing. Contains a Z if the stored procedure returned multiple result sets.
SQLWARN.10	Contains a W if at least one character field of the SQLCA is invalid due to a character conversion error.
SQLSTATE	Contains a return code for the outcome of the most recent execution of an SQL statement.

SQL descriptor area (SQLDA)

An SQLDA is a collection of variables that is required for execution of the SQL DESCRIBE statement, and can be optionally used by the PREPARE, OPEN, FETCH, EXECUTE, and CALL statements. An SQLDA can be used in a DESCRIBE or PREPARE INTO statement, modified with the addresses of host variables, and then reused in a FETCH statement.

The meaning of the information in an SQLDA depends on the context in which it is used. For DESCRIBE and PREPARE INTO, DB2 sets the fields in the SQLDA to provide information to the application program. For OPEN, EXECUTE, FETCH, and CALL, the application program sets the fields in the SQLDA to provide DB2 with information:

DESCRIBE *statement-name* **or PREPARE INTO**
With the exception of SQLN, DB2 sets fields of the SQLDA to provide information to an application program about a prepared statement. Each SQLVAR occurrence describes a column of the result table.

DESCRIBE TABLE
With the exception of SQLN, DB2 sets fields of the SQLDA to provide information to an application program about the columns of a table or view. Each SQLVAR occurrence describes a column of the specified table or view.

DESCRIBE CURSOR
With the exception of SQLN, DB2 sets fields of the SQLDA to provide information to an application program about the result set that is associated with the specified cursor. Each SQLVAR occurrence describes a column of the result set.

DESCRIBE INPUT
With the exception of SQLN, DB2 sets fields of the SQLDA to provide information to an application program about the input parameter markers of a prepared statement. Each SQLVAR occurrence describes an input parameter marker.

DESCRIBE PROCEDURE
With the exception of SQLN, DB2 sets fields of the SQLDA to provide information to an application program about the result sets returned by the specified stored procedure. Each SQLVAR occurrence describes a returned result set.

OPEN, EXECUTE, FETCH, and CALL
The application program sets fields of the SQLDA to provide information about host variables or output buffers in the application program to DB2. Each SQLVAR occurrence describes a host variable or output buffer.

- For OPEN and EXECUTE, each SQLVAR occurrence describes an input value that is substituted for a parameter marker in the associated SQL statement that was previously prepared.
- For FETCH, each SQLVAR occurrence describes a host variable or buffer in the application program that is to be used to contain an output value from a row of the result.
- For CALL, each SQLVAR occurrence describes a host variable that corresponds to a parameter in the parameter list for the stored procedure.

For information on the way to use the SQLDA, see *DB2 Application Programming and SQL Guide*.

Description of SQLDA fields

An SQLDA consists of four variables, a header, and an arbitrary number of occurrences of a sequence of variables collectively named SQLVAR.

In DESCRIBE and PREPARE INTO, each occurrence of the SQLVAR describes the column of a table. In FETCH, OPEN, EXECUTE, and CALL, each occurrence describes a host variable.

The order of the SQLVAR entries matches the order of the columns in the table or the order of the parameter markers in the SQL statement.

The SQLDA Header

The fields in the SQLDA header have different usage depending on whether the SQLDA is being used in a DESCRIBE or PREPARE INTO statement or the SQLDA is being used in a FETCH, INSERT, OPEN, EXECUTE, or CALL statement.

The following table describes the fields in the SQLDA header.

Table 165. Fields of the SQLDA header

C name assembler, COBOL or PL/I name	Data type	Usage in DESCRIBE[1] and PREPARE INTO	Usage in FETCH,INSERT, OPEN, EXECUTE, and CALL
sqldaid SQLDAID	CHAR(8)	An "eye catcher" for storage dumps, containing the text 'SQLDA '. The 7th byte of the field is a flag that can be used to determine if more than one SQLVAR entry is needed for each column. For details, see "Determining how many SQLVAR occurrences are needed" on page 2084. For DESCRIBE CURSOR, the field is set to 'SQLRS'. If the cursor is declared WITH HOLD in a stored procedure, the high-order bit of the 8th byte is set to 1. For DESCRIBE PROCEDURE, it is set to 'SQLPR'.	A plus sign (+) in the 6th byte indicates that SQLNAME contains an overriding CCSID. A '2' in the 7th byte indicates the two SQLVAR entries were allocated for each column or parameter. A '3' in the 7th byte indicates that three SQLVAR entries were allocated for each column or parameter. Although three entries are never needed on input to DB2, an SQLDA with three entries might be used when the SQLDA was initialized by a DESCRIBE or PREPARE INTO with a USING BOTH clause. Otherwise, SQLDAID is not used.
sqldabc SQLDABC	INTEGER	Length of the SQLDA, equal to `SQLNx * 44+16`.	Length of the SQLDA, greater than or equal to `SQLNx * 44+16`.

Table 165. Fields of the SQLDA header (continued)

C name assembler, COBOL or PL/I name	Data type	Usage in DESCRIBE[1] and PREPARE INTO	Usage in FETCH,INSERT, OPEN, EXECUTE, and CALL
sqln SQLN	SMALLINT	Unchanged by DB2. The field must be set to a value greater than or equal to zero before the statement is executed. The field indicates the total number of occurrences of SQLVAR. At the very least, the number should be: • For DESCRIBE INPUT, the number of parameter markers to be described. • For other DESCRIBEs or PREPARE INTO: the number of columns of the result, or a multiple of the columns of the result when there are multiple sets of SQLVAR entries because column labels are returned in addition to column names.	Total number of occurrences of SQLVAR provided in the SQLDA. SQLN must be set to a value greater than or equal to zero.
sqld SQLD	SMALLINT	The number of columns described by occurrences of SQLVAR. Double that number if USING BOTH appears in the DESCRIBE or PREPARE INTO statement. Contains a 0 if the statement string is not a query. For DESCRIBE PROCEDURE, the number of result sets returned by the stored procedure. Contains a 0 if no result sets are returned.	The number of host variables described by occurrences of SQLVAR.

Note:

1. The third column of this table represents several forms of the DESCRIBE statement:
   - For DESCRIBE *output* and PREPARE INTO, the column pertains to columns of the result table.
   - For DESCRIBE CURSOR, the column pertains to a result set associated with a cursor.
   - For DESCRIBE INPUT, the column pertains to parameter markers.
   - For DESCRIBE PROCEDURE, the column pertains to the result sets returned by the stored procedure.

SQLVAR entries

For each column or host variable described by the SQLDA, there are both base SQLVAR entries and extended SQLVAR entries.

Base SQLVAR entry

The base SQLVAR entry is always present. The fields of this entry contain the base information about the column or host variable such as data type code, length attribute (except for LOBs), column name (or label), host variable address, and indicator variable address.

Extended SQLVAR entry

The extended SQLVAR entry is needed (for each column) if the result

includes any LOB or distinct type[38] columns. For distinct types, the extended SQLVAR contains the distinct type name. For LOBs, the extended SQLVAR contains the length attribute of the host variable and a pointer to the buffer that contains the actual length. If locators are used to represent LOBs, an extended SQLVAR is not necessary.

The extended SQLVAR entry is also needed for each column when the USING BOTH clause was specified, which indicates that both columns names and labels are returned. (**DESCRIBE** *output* is the only statement with the **USING BOTH** clause).

The fields in the extended SQLVAR that return LOB and distinct type information do not overlap, and the fields that return LOB and label information do not overlap. Depending on the combination of labels, LOBs and distinct types, more than one extended SQLVAR entry per column may be required to return the information. See "Determining how many SQLVAR occurrences are needed" on page 2084.

The following table shows how to map the base and extended SQLVAR entries. For an SQLDA that contains both base and extended SQLVAR entries, the base SQLVAR entries are in the first block, followed by a block of extended SQLVAR entries, which if necessary, are followed by a second block of extended SQLVAR entries. In each block, the number of occurrences of the SQLVAR entry is equal to the value in SQLD[39] even though many of the extended SQLVAR entries might be unused.

Table 166. Contents of SQLVAR arrays

					Set of SQLVAR entries		
LOBs	**Distinct types[1]**	**7th byte of SQLDAID**	**SQLD**	**Minimum for SQLN[2]**	**First set (Base)**	**Second set (Extended)**	**Third set (Extended)**
USING BOTH clause not specified:							
No	No	Space	*n*	*n*	Column names, labels	Not Used	Not Used
Yes[3]	Yes[3]	2	*n*	*2n*	Column names, labels	LOBs, distinct types, or both	Not used
USING BOTH clause was specified:							
No	No	Space	*2n*	*2n*	Column names	Labels	Not used
Yes	No	2	*n*	*2n*	Column names	LOBs and labels	Not used
No	Yes	3	*n*	*3n*	Column names	Distinct types	Labels
Yes	Yes	3	*n*	*3n*	Column names	LOBs and distinct types	Labels

38. DESCRIBE INPUT does not return information about distinct types.

39. When an extended SQLVAR entry is present for each column for *labels* (and there are no LOB or distinct type columns in the result),

Table 166. Contents of SQLVAR arrays (continued)

					Set of SQLVAR entries		
LOBs	**Distinct types[1]**	**7th byte of SQLDAID**	**SQLD**	**Minimum for SQLN[2]**	**First set (Base)**	**Second set (Extended)**	**Third set (Extended)**

Notes:

1. DESCRIBE INPUT does not return information about distinct types.
2. The number of columns or host variables that the SQLDA describes.
3. Either LOBs, distinct types, or both are present.
4. Here, the 7th byte is set to a space and SQLD is set to two times the number of columns in the result. For all other values of the 7th byte for USING BOTH, SQLD is set to the number of columns in the result, and the 7th byte can be used to determine how many SQLVAR entries are needed for each column of the result.

Determining how many SQLVAR occurrences are needed:

The number of SQLVAR occurrences needed depends on the statement that the SQLDA was provided for and the data types of the columns or parameters being described.

If the USING BOTH clause was not specified for the statement and neither LOBs nor distinct types are present in the result, only one SQLVAR entry (a base entry) is needed for each column. The 7th byte of SQLDAID is set to a space. The SQLD is set to the number of columns in the result and represents the number of SQLVAR occurrences needed. If an insufficient number of SQLVAR occurrences were provided, DB2 returns a +236 warning in SQLCODE if the standards option was set. Otherwise, SQLCODE is zero.

If USING BOTH is specified and neither LOBs nor distinct types are present in the result, an extended SQLVAR entry per column is needed for the labels in addition to the base SQLVAR entry. The 7th byte of the SQLDAID is set to space. SQLD is set to the twice the number of columns in the result and represents the combined number of base and extended SQLVAR occurrences needed.

If LOBs, distinct types, or both are present in the results, one extended SQLVAR entry is needed per column in addition to the base SQLVAR entry with one exception. The exception is that when the USING BOTH clause is specified and distinct types are present in the results, two extended SQLVAR entries per column are needed. When a sufficient number of SQLVAR entries are provided in the SQLDA for both the base and extended SQLVARs, information for the LOBs and distinct types is returned. The 7th byte of SQLDAID is set to the number of SQLVAR entries that were used for each column:

2 Two SQLVAR entries per column (a base and an extended)

3 Three SQLVAR entries per column (a base and two extended)

SQLD is set to the number of columns in the result. Therefore, the value of the 7th byte of SQLDAID multiplied by the value of SQLD is the total number SQLVAR entries that were provided.

Otherwise, when an insufficient number of SQLVAR entries have been provided when LOBs or distinct types are present, DB2 indicates that by returning one of the following warnings in SQLCODE. DB2 also sets the 7th byte of SQLDAID to indicate how many SQLVAR entries are needed for each column of the result.

+237 There are insufficient SQLVAR entries to describe the data, and the data

includes distinct types. In this case, there were enough base SQLVAR entries to describe the data, so the base SQLVAR entries are set. However, sufficient extended SQLVAR entries were not provided so the distinct type names are not returned.

+238 There are insufficient SQLVAR entries to describe the data, and the data includes LOBs. In this case no information is returned in the SQLVAR entries.

+239 There are insufficient SQLVAR entries to describe the data, and the data includes distinct types. There weren't even enough base SQLVAR entries. In this case no information is returned in the SQLVAR entries.

Field descriptions of an occurrence of a base SQLVAR:

The fields of a base SQLVAR have different uses depending on the SQL statement.

The following table describes the contents of the fields of a base SQLVAR.

Table 167. Fields in an occurrence of a base SQLVAR

C name assembler COBOL, or PL/I name	Data type	Usage in DESCRIBE[1] and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
sqltype SQLTYPE	SMALLINT	Indicates the data type of the column or parameter and whether it can contain null values. For a description of the type codes, see Table 169 on page 2090. For a distinct type, the data type on which the distinct type was based is placed in this field. The base SQLVAR provides no indication that this is part of the description of a distinct type. For VARCHAR columns defined with CCSID 1208 in an EBCDIC table, SQLTYPE reflects VARCHAR, even though the column is recorded in the catalog as VARBINARY with CCSID 1208. For VARGRAPHIC columns defined with CCSID 1200 in an EBCDIC table, SQLTYPE reflects VARGRAPHIC, even though the column is recorded in the catalog as VARBINARY with CCSID 1200.	Indicates the data type of the host variable and whether an indicator variable is provided. Host variables for datetime values must be character string variables. For FETCH, a datetime type code means a fixed-length character string. For a description of the type codes, see "SQLTYPE and SQLLEN" on page 2090.

Table 167. Fields in an occurrence of a base SQLVAR (continued)

C name assembler COBOL, or PL/I name	Data type	Usage in DESCRIBE[1] and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
sqllen SQLLEN	SMALLINT	The length attribute of the column or parameter. For datetime data, the length of the string representation of the value. See "SQLTYPE and SQLLEN" on page 2090 for a description of allowable values. For LOBs, the value is 0 regardless of the length attribute of the LOB. For XML, the value is 0. Field SQLLONGLEN in the extended SQLVAR contains the length attribute.	The length attribute of the host variable. See "SQLTYPE and SQLLEN" on page 2090 for a description of allowable values. For LOBs, the value is 0 regardless of the length attribute of the LOB. Field SQLLONGLEN in the extended SQLVAR contains the length attribute. For XML AS BLOB, CLOB, or DBCLOB, sqllen is 0 as for LOB types.
sqldata SQLDATA	pointer	For string columns or parameters, SQLDATA contains `X'0000zzzz'`, where *zzzz* is the associated CCSID. For character strings, SQLDATA can alternatively contain X'FFFF', which indicates bit data. Not used for other types of data. For datetime columns, SQLDATA can contain the CCSID of the string representation of the datetime value. For DESCRIBE PROCEDURE, the result set locator value associated with the result set. For VARCHAR columns defined with CCSID 1208 in an EBCDIC table SQLDATA contains 1208, even though the column might be recorded in the catalog as VARBINARY with CCSID 1208. For VARGRAPHIC columns defined with CCSID 1200 in an EBCDIC table SQLTYPE contains 1200, even though the column might be recorded in the catalog as VARBINARY with CCSID 1200.	Contains the address of the host variable.
sqlind SQLIND	pointer	Reserved For DESCRIBE PROCEDURE, it is set to -1.	Contains the address of an associated indicator variable, if SQLTYPE is odd. Otherwise, the field is not used.

Table 167. Fields in an occurrence of a base SQLVAR (continued)

C name assembler COBOL, or PL/I name	Data type	Usage in DESCRIBE[1] and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
sqlname SQLNAME	VARCHAR(30)	Contains the unqualified name or label of the column, or a string of length zero if the name or label does not exist. If the name is longer than 30 bytes, it is truncated at a byte boundary. For more information about column names, see Names of result columns. For DESCRIBE PROCEDURE, SQLNAME contains the cursor name used by the stored procedure to return the result set. The values for SQLNAME appear in the order the cursors were opened by the stored procedure. For DESCRIBE INPUT, SQLNAME is not used.	Can contain CCSID and/or host-variable-array dimension information. DB2 interprets the third and fourth byte of the data portion of SQLNAME as the CCSID of the host variable if all of the following are true and the third and fourth byte are not X'0000': • The 6th byte of SQLDAID is '+' (x'4E') • SQLTYPE indicates the host variable is a string variable • The length of SQLNAME is 8 • The first two bytes of the data portion of SQLNAME are X'0000'. If the third and fourth byte of the data portion of SQLNAME are X'0000', DB2 uses the appropriate default CCSID. For FETCH, OPEN, INSERT, and EXECUTE, if the length of SQLNAME is 8, and the first two bytes of the data portion of SQLNAME are X'0000', DB2 interprets the fifth through eighth bytes of the data portion of the SQLNAME field as follows:

Table 167. Fields in an occurrence of a base SQLVAR (continued)

C name assembler COBOL, or PL/I name	Data type	Usage in DESCRIBE[1] and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
(cont.) sqlname SQLNAME			• **fifth and sixth bytes:** a flag field that indicates the type of host variable that is being described by the current SQLDA entry. The values of this field are as follows: – X'0000' - host variable – X'0100' - XML host variable (XML AS BLOB, XML AS CLOB, XML AS DBCLOB) – X'0001' - host variable array – X'0101' - XML host variable array – X'0002' - special host variable that represents the value for 'n' in a multiple-row INSERT statement. • **seventh and eighth bytes:** if the sixth byte is X'01', a binary small integer (halfword) that represents the dimension of the host-variable-array, and the corresponding indicator-array if one is specified.

Notes:

1. The third column of this table represents several forms of the DESCRIBE statement.
   - For DESCRIBE *output* and PREPARE INTO, the column pertains to columns of the result table.
   - For DESCRIBE CURSOR, the column pertains to a result set associated with a cursor.
   - For DESCRIBE INPUT, the column pertains to parameter markers.
   - For DESCRIBE PROCEDURE, the column pertains to the result sets returned by the stored procedure.

Field descriptions of an occurrence of an extended SQLVAR:

The fields of an extended SQLVAR have different uses depending on the SQL statement.

The following table describes the contents of the fields of an extended SQLVAR entry.

Table 168. Fields in an occurrence of an extended SQLVAR

C name assembler, COBOL, or PL/I name	Data type	Usage in DESCRIBE[1] and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
len.sqllonglen SQLLONGL SQLLONGLEN	INTEGER	The length attribute of a LOB (BLOB, CLOB, or DBCLOB) column.	The length attribute of a LOB (BLOB, CLOB, or DBCLOB) host variable. DB2 ignores the SQLLEN field in the base SQLVAR for these data types. The length attribute indicates the number of bytes for a BLOB or CLOB, and the number of characters for a DBCLOB.
*	INTEGER	Reserved.	Reserved.
sqldatalen SQLDATAL SQLDATALEN	pointer	Not used.	Used only for LOB (BLOB, CLOB, and DBCLOB) host variables. If the value of the field is null, the actual length of the LOB is stored in the 4 bytes immediately before the start of the data, and SQLDATA points to the first byte of the field length. The actual length indicates the number of bytes for a BLOB or CLOB, and the number of characters for a DBCLOB. If the value of the field is not null, the field contains a pointer to a 4-byte long buffer that contains the actual length *in bytes* (even for DBCLOBs) of the data in the buffer pointed to from the SQLDATA field in the matching base SQLVAR. Regardless of whether this field is used, field SQLLONGLEN must be set.

Table 168. Fields in an occurrence of an extended SQLVAR (continued)

C name assembler, COBOL, or PL/I name	Data type	Usage in DESCRIBE[1] and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
sqldatatype_name SQLTNAME SQLDATATYPE-NAME	VARCHAR(30)	A SQLTNAME field of the extended SQLVAR is set to one of the following: • For a distinct type column, the database manager sets this field to the fully qualified distinct type name. If the qualified name is longer than 30 bytes, it is truncated. • For a label, the database manager sets this field to label. In the case that both a distinct type name and a label need to be returned in extended SQLVAR entries (USING BOTH has been specified), the distinct type name is returned in the first extended SQLVAR entry and the label in the second extended SQLVAR entry.	Not used.

Note:

1. The third column of this table represents several forms of the DESCRIBE statement.
   - For DESCRIBE *output* and PREPARE INTO, the column pertains to columns of the result table.
   - For DESCRIBE CURSOR, the column pertains to a result set associated with a cursor.
   - For DESCRIBE INPUT, the column pertains to parameter markers.
   - For DESCRIBE PROCEDURE, the column pertains to the result sets returned by the stored procedure.

SQLTYPE and SQLLEN:

The contents of the SQLTYPE and SQLLEN fields of the SQLDA depends on the SQL statement that is returning the value.

The following table shows the values that can appear in the SQLTYPE and SQLLEN fields of the SQLDA. In DESCRIBE and PREPARE INTO, an even value of SQLTYPE means the column does not allow nulls, and an odd value means the column does allow nulls. In DESCRIBE INPUT statements, only odd values are returned for SQLTYPE. In FETCH, OPEN, EXECUTE, and CALL, an even value of SQLTYPE means no indicator variable is provided, and an odd value means that SQLIND contains the address of an indicator variable.

Table 169. SQLTYPE and SQLLEN values for DESCRIBE, PREPARE INTO, FETCH, OPEN, EXECUTE, and CALL

	For DESCRIBE and PREPARE INTO		For FETCH, OPEN, EXECUTE, and CALL	
SQLTYPE	Column or parameter data type	SQLLEN	Host variable data type	SQLLEN
384/385	date	10 [1]	fixed-length character string representation of a date	length attribute of the host variable

Table 169. SQLTYPE and SQLLEN values for DESCRIBE, PREPARE INTO, FETCH, OPEN, EXECUTE, and CALL (continued)

	For DESCRIBE and PREPARE INTO		For FETCH, OPEN, EXECUTE, and CALL	
SQLTYPE	**Column or parameter data type**	**SQLLEN**	**Host variable data type**	**SQLLEN**
388/389	time	8 [2]	fixed-length character string representation of a time	length attribute of the host variable
392/393	timestamp without time zone	19 for TIMESTAMP(0) otherwise 20+*p* for TIMESTAMP(*p*) [5]	fixed-length character string representation of a timestamp	length attribute of the host variable
400/401	N/A	N/A	NUL-terminated graphic string	length attribute of the host variable
404/405	BLOB	0 [3]	BLOB or XML AS BLOB	Not used. [3]
408/409	CLOB	0 [3]	CLOB or XML AS CLOB	Not used. [3]
412/413	DBCLOB	0 [3]	DBCLOB or XML AS DBCLOB	Not used. [3]
448/449	varying-length character string	length attribute of the column	varying-length character string	length attribute of the host variable
452/453	fixed-length character string	length attribute of the column	fixed-length character string	length attribute of the host variable
456/457	long varying-length character string SQLTYPE values 448/449 are returned instead of 456/457 for statements that are bound in Version 9 or later.	length attribute of the column	long varying-length character string	length attribute of the host variable
460/461	N/A	N/A	NUL-terminated character string	length attribute of the host variable
464/465	varying-length graphic string	length attribute of the column	varying-length graphic string	length attribute of the host variable
468/469	fixed-length graphic string	length attribute of the column	fixed-length graphic string	length attribute of the host variable
472/473	long graphic string SQLTYPE values 464/465 are returned instead of 472/473 for statements that are bound in Version 9 or later.	length attribute of the column	long graphic string	length attribute of the host variable
480/481	floating point	4 for single precision, 8 for double precision	floating point	4 for single precision, 8 for double precision
484/485	packed decimal	precision in byte 1; scale in byte 2	packed decimal	precision in byte 1; scale in byte 2
492/493	big integer[4]	8	big integer	8
496/497	large integer	4	large integer	4
500/501	small integer	2	small integer	2

Table 169. SQLTYPE and SQLLEN values for DESCRIBE, PREPARE INTO, FETCH, OPEN, EXECUTE, and CALL (continued)

	For DESCRIBE and PREPARE INTO		For FETCH, OPEN, EXECUTE, and CALL	
SQLTYPE	**Column or parameter data type**	**SQLLEN**	**Host variable data type**	**SQLLEN**
504/505	N/A	N/A	DISPLAY SIGN LEADING SEPARATE, NATIONAL SIGN LEADING SEPARATE	precision in byte 1; scale in byte 2
904/905	ROWID	40	ROWID	40
908/909	varying-length binary string	length attribute of the column	varying-length binary string	length attribute of the host variable
912/913	fixed-length binary string	length attribute of the column	fixed-length binary string	length attribute of the host variable
916/917	BLOB_FILE	267		
920/921	CLOB_FILE	267		
924/925	DBCLOB_FILE	267		
960/961	BLOB locator	4	BLOB_LOCATOR	4
964/965	CLOB locator	4	CLOB_LOCATOR	4
968/969	DBCLOB locator	4	DBCLOB_LOCATOR	4
988/989	XML	0	Invalid. Instead, use one of the following: XML AS BLOB, XML AS CLOB, XML AS DBCLOB	Not used
996/997	DECFLOAT(16) DECFLOAT(34)	8 16	DECFLOAT(16) DECFLOAT(34)	8 16
2448/2449	timestamp with time zone	147 for TIMESTAMP(0) WITH TIME ZONE otherwise 148+*p* for TIMESTAMP(*p*) WITH TIME ZONE [5]	varying-length character string representation of a timestamp with time zone	length attribute of the host variable

Note:

1. SQLLEN might be different if a date installation exit is specified.
2. SQLLEN might be different if a time installation exit is specified.
3. Field SQLLONGLEN in the extended SQLVAR contains the length attribute of the column.
4. BIGINT is supported by other DB2 platforms.
5. *p* is the timestamp precision.

SQLDATA:

Depending on the data type of the string column that the SQLVAR is describing, the SQLDATA field can contain different CCSID values.

The following table identifies the CCSID values that appear in the SQLDATA field when the SQLVAR element describes a string column.

Table 170. CCSID values for SQLDATA

Data type	Subtype	Bytes 1 and 2	Bytes 3 and 4
Character	SBCS data	X'0000'	CCSID
Character	mixed data	X'0000'	CCSID
Character	BIT data	X'0000'	X'FFFF'
Graphic	N/A	X'0000'	CCSID
Any other data type	N/A	N/A	N/A

Unrecognized and unsupported SQLTYPES

The values that appear in the SQLTYPE field of the SQLDA are dependent on the level of data type support available at the sender as well as at the receiver of the data. This support is particularly important as new data types are added to the product.

New data types might not be supported by the sender or receiver of the data and might not be recognized by the sender or receiver of the data. Depending on the situation, the new data type might be returned, a compatible data type that is agreed to by both the sender and the receiver of the data might be returned, or an error might occur.

When the sender and receiver agree to use a compatible data type, the following table indicates the mapping that takes place. This mapping takes place when at least one of the sender or receiver does not support the data type provided. The unsupported data type can be provided by either the application or the database manager.

Table 171. Compatible data types for unsupported data types

Data type	Compatible data type
ROWID	VARCHAR(40) FOR BIT DATA

No indication is given in the SQLDA that the data type is substituted.

The included SQLDA

Only assembler, C, C++, COBOL, and PL/I C are supported for the SQLDA that is given by INCLUDE SQLDA.

assembler:

         SQLSECT RESTORE
```

In the above declaration, SQLSECT SAVE is a macro invocation that remembers the current CSECT name. SQLSECT RESTORE is a macro invocation that continues that CSECT.

C and C++:

```

Identifying an SQLDA in C or C++

A *descriptor-name* can be specified in the CALL, DESCRIBE, EXECUTE, FETCH, and OPEN statements. When the host application is written in C or C++, *descriptor-name* can be a pointer variable with pointer notation.

For example, *descriptor-name* could be declared as

```
sqlda *outsqlda;
```

Afterwords, it could be used in a statement like the following:

```
EXEC SQL DESCRIBE STMT1 INTO DESCRIPTOR :*outsqlda;
```

The REXX SQLDA

A REXX SQLDA consists of a set of REXX variables with a common stem. The stem must be a REXX variable name that contains no periods and is the same as the value of *descriptor-name* that you specify when you use the SQLDA in an SQL statement. DB2 does not support the INCLUDE SQLDA statement in REXX.

The following table shows the variable names in a REXX SQLDA. The values in the second column of the table are values that DB2 inserts into the SQLDA when the statement executes. Except where noted otherwise, the values in the third column of the table are values that the application must put in the SQLDA before the statement executes.

Table 172. Fields of a REXX SQLDA

Variable name	Usage in DESCRIBE and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
stem.SQLD	The number of columns that are described in the SQLDA. Double that number if USING BOTH appears in the DESCRIBE or PREPARE INTO statement. Contains a 0 if the statement string is not a query. For DESCRIBE PROCEDURE, the number of result sets returned by the stored procedure. Contains a 0 if no result sets are returned.	The number of host variables that are used by the SQL statement.
Each SQLDA contains *stem*.SQLD of the following variables. Therefore, 1<=*n*<=*stem*.SQLD. There is one occurrence of each variable for each column of the result table or host variable that is described by the SQLDA. This set of variables is equivalent to the SQLVAR structure in the SQLDA for other languages.		
stem.n.SQLTYPE	Indicates the data type of the column or parameter and whether it can contain null values. For a description of the type codes, see "SQLTYPE and SQLLEN" on page 2090. For a distinct type, the data type on which the distinct type was based is placed in this field. The base SQLVAR provides no indication that this is part of the description of a distinct type.	Indicates the data type of the host variable and whether an indicator variable is provided. Host variables for datetime values must be character string variables. For FETCH, a datetime type code means a fixed-length character string. For a description of the type codes, see "SQLTYPE and SQLLEN" on page 2090.
stem.n.SQLLEN	For a column other than a DECIMAL or NUMERIC column, the length attribute of the column or parameter. For datetime data, the length of the string representation of the value. See "SQLTYPE and SQLLEN" on page 2090 for a description of allowable values.	For a host variable that does not have a decimal data type, the length attribute of the host variable. See "SQLTYPE and SQLLEN" on page 2090 for a description of allowable values.
stem.n.SQLLEN.SQLPRECISION	For a DECIMAL or NUMERIC column, the precision of the column or parameter.	For a host variable with a decimal data type, the precision of the host variable.
stem.n.SQLLEN.SQLSCALE	For a DECIMAL or NUMERIC column, the scale of the column or parameter.	For a host variable with a decimal data type, the scale of the host variable.

Table 172. Fields of a REXX SQLDA (continued)

Variable name	Usage in DESCRIBE and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
stem.n.SQLCCSID	For a string column or parameter, the CCSID of the column or parameter.	For a string host variable, the CCSID of the host variable.
stem.n.SQLUSECCSID	Not used.	Set to a new CCSID. If set, REXX will change the CCSID of the SQLDATA.
stem.n.SQLLOCATOR	For DESCRIBE PROCEDURE, the value of a result set locator.	Not used.
stem.n.SQLDATA	Not used.	Before EXECUTE or OPEN, contains the value of an input host variable. The application must supply this value. After FETCH, contains the values of an output host variable.
stem.n.SQLIND	Not used.	Before EXECUTE or OPEN, contains a negative number to indicate that the input host variable in *stem.n*.SQLDATA is null. The application must supply this value. After FETCH, contains a negative number if the value of the output host variable in *stem.n*.SQLDATA is null.
stem.n.SQLNAME	The name of the *n*th column in the result table. For DESCRIBE PROCEDURE, contains the cursor name that is used by the stored procedure to return the result set. The values for SQLNAME appear in the order that the cursors were opened by the stored procedure.	Not used.

DB2 catalog tables

DB2 for z/OS maintains a set of tables (in database DSNDB06) called the DB2 catalog.

About these topics

These topics describe that catalog by describing the columns of each catalog table.

The catalog tables describe such things as table spaces, tables, columns, indexes, privileges, application plans, and packages. Authorized users can query the catalog; however, it is primarily intended for use by DB2 and is therefore subject to change. All catalog tables are qualified by SYSIBM. Do not use this qualifier for user-defined tables.

The catalog tables are updated by DB2 during normal operations in response to certain SQL statements, commands, and utilities.

Additional information

Release dependency indicators: Some objects depend on functions in particular releases of DB2. If you are running on a release of DB2 and fall back to a previous release, an object that depends on the more recent release becomes frozen. The object is marked with a release dependency indicator and is unavailable until remigration.

The release dependency indicator, which is listed in the IBMREQD, RELCREATED, and RELBOUND columns of the catalog tables, shows the release of DB2 upon which the objects depend.

Important: The IBMREQD column is not a reliable indicator for indicating release dependencies. Where possible, the RELCREATED and RELBOUND columns should be used instead.

Release dependency indicators in IBMREQD, RELCREATED, and RELBOUND are defined by the following values:

Value	Meaning
B	Version 1R3 dependency indicator, not from the machine-readable material (MRM) tape
C	Version 2R1 dependency indicator, not from MRM tape
D	Version 2R2 dependency indicator, not from MRM tape
E	Version 2R3 dependency indicator, not from MRM tape
F	Version 3R1 dependency indicator, not from MRM tape
G	Version 4 dependency indicator, not from MRM tape
H	Version 5 dependency indicator, not from MRM tape
I	Version 6 dependency indicator, not from MRM tape
J	Version 6 dependency indicator, not from MRM tape
K	Version 7 dependency indicator, not from MRM tape
L	Version 8 dependency indicator, not from MRM tape

M Version 9 dependency indicator, not from MRM tape

O Version 10 dependency indicator, not from MRM tape

N Not from MRM tape, no dependency

Programming interface information

Not all catalog table columns are part of the general-use programming interface. Whether a column is part of this interface is indicated in a column labeled "Use" in the table that describes the column. The values that "Use" can assume are as follows:

Value	Meaning
G	Column is part of the general-use programming interface
S	Column is part of the product-sensitive interface
I	Column is for internal use only
N	Column is not used

For columns for which "Use" is N or I, the name of the column and its description do not appear in the explanation of the column.

Table spaces and indexes

DB2 catalog tables are contained in certain table spaces and have indexes.

The following tables list the table space and indexes for each catalog table and lists the index fields for each index. The indexes are in ascending order, except where noted.

Table 173. Table spaces and indexes for the catalog tables

Note: 1. Index field is in descending order

SQL statements allowed on the catalog

Certain SQL statements can be used to change the value of certain options for existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables.

Table 174. SQL statements that can be used to change existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables

SQL statement	Index	Allowable clauses and usage notes
ALTER INDEX	IBM-defined	Only these clauses are allowed: CLOSE COPY FREEPAGE GBPCACHE NOT PADDED PADDED PCTFREE PIECESIZE You cannot alter the GBPCACHE value for indexes DSNDXX01, DSNDXX02, and DSNDXX03, which are on catalog table SYSIBM.SYSINDEXES.
ALTER INDEX	User-created	All clauses are allowed, except for the following: BUFFERPOOL REGENERATE COMPRESS YES Any partitioning clause
ALTER SEQUENCE		The only clause allowed is MAXVALUE. You can only change the MAXVALUE value of the catalog sequence DSNSEQ_IMPLICITDB. The only value specific must be an integer between 1 and 60000, inclusive.
ALTER TABLE		The only clause allowed is DATA CAPTURE CHANGES.

Table 174. SQL statements that can be used to change existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables (continued)

SQL statement	Index	Allowable clauses and usage notes
ALTER TABLESPACE		Only these clauses are allowed: CLOSE FREEPAGE GBPCACHE LOCKMAX MAXROWS PCTFREE TRACKMOD You cannot alter the GBPCACHE or MAXROWS value of some catalog table spaces. Do not specify GBPCACHE for the following table spaces: • DSNDB06.SYSTSCOL • DSNDB06.SYSTSDBA • DSNDB06.SYSTSDBR • DSNDB06.SYSTSDBU • DSNDB06.SYSTSFAU • DSNDB06.SYSTSFLD • DSNDB06.SYSTSFOR • DSNDB06.SYSTSIPT • DSNDB06.SYSTSIXR • DSNDB06.SYSTSIXS • DSNDB06.SYSTSIXT • DSNDB06.SYSTSKEY • DSNDB06.SYSTSPKA • DSNDB06.SYSTSPKD • DSNDB06.SYSTSPKG • DSNDB06.SYSTSPKL • DSNDB06.SYSTSPKS • DSNDB06.SYSTSPKX • DSNDB06.SYSTSPKY • DSNDB06.SYSTSPLA • DSNDB06.SYSTSPLD • DSNDB06.SYSTSPLN • DSNDB06.SYSTSPLY • DSNDB06.SYSTSPVR • DSNDB06.SYSTSREL • DSNDB06.SYSTSSTM • DSNDB06.SYSTSSYN • DSNDB06.SYSTSTAB • DSNDB06.SYSTSTAU • DSNDB06.SYSTSTPT • DSNDB06.SYSTSTSP For DSNDB06.SYSSEQ, MAXROW can be specified only with a value of 1. You can specify the LOCKSIZE keyword on the ALTER TABLESPACE statement for any catalog table spaces that are not LOB table spaces.

Table 174. SQL statements that can be used to change existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables (continued)

SQL statement	Index	Allowable clauses and usage notes
CREATE INDEX	User-created	All clauses are allowed, except for: CLOSE YES CLUSTER UNIQUE DEFER YES (only on tables SYSINDEXES, SYSINDEXPART, and SYSKEYS) COMPRESS YES Any partitioning clause Indexes that are created with *key-expressions* are not allowed on the catalog. The only value allowed for BUFFERPOOL is BP0. You can create up to 500 indexes on the catalog.
DROP INDEX	User-created	The statement has no clauses.

Reorganizing the catalog

The REORG TABLESPACE utility can be run on all the table spaces in the catalog database (DSNDB06) to reclaim unused or wasted space, which can affect performance.

The utility observes the PCTFREE and FREEPAGE values specified in the ALTER INDEX statement for all the catalog indexes and the following table spaces:

- DSNDB06.SYSDDF
- DSNDB06.SYSGPAUT
- DSNDB06.SYSGRTNS
- DSNDB06.SYSHIST
- DSNDB06.SYSJAVA
- DSNDB06.SYSJAUXA
- DSNDB06.SYSJAUXB
- DSNDB06.SYSSEQ
- DSNDB06.SYSSEQ2
- DSNDB06.SYSSTATS
- DSNDB06.SYSTSCHX
- DSNDB06.SYSTSCKD
- DSNDB06.SYSTSCKS
- DSNDB06.SYSTSCPY
- DSNDB06.SYSTSSRG
- DSNDB06.SYSTSUSR
- DSNDB01.SCT02
- DSNDB01.SPT01

For details on running REORG TABLESPACE, see *DB2 Utility Guide and Reference*.

New and changed catalog tables

This release of DB2 for z/OS includes many new catalog tables as well as many catalog tables that have new or changed content.

Descriptions of the following catalog tables have been added:

Table 175. New catalog tables

Catalog table name	Description
"SYSIBM.SYSINDEXCLEANUP table" on page 2210	The rows in the SYSIBM.SYSINDEXCLEANUP table specify time windows to control index cleanup processing. Each row specifies a time window to enable or disable the cleanup of pseudo-deleted index entries for specific database objects.
"SYSIBM.SYSQUERYPREDICATE table" on page 2332	The SYSIBM.SYSQUERYPREDICATE table contains information about predicates for queries in the SYSIBM.SYSQUERY table that have been identified for extended optimization. It correlates to the SYSIBM.SYSQUERY table by the QUERYID column.
"SYSIBM.SYSQUERYSEL table" on page 2337	The SYSIBM.SYSQUERYSEL table contains information about the selectivity of predicates for queries in the SYSIBM.SYSQUERY table that have been identified for extended optimization. It correlates to the SYSIBM.SYSQUERY table by the QUERYID column.
"SYSIBM.SYSSTATFEEDBACK table" on page 2370	The SYSIBM.SYSTATFEEDBACK table contains information about missing or conflicting catalog statistics for SQL statements.
"SYSIBM.SYSVARIABLEAUTH table" on page 2432	The SYSIBM.SYSVARIABLEAUTH table contains one row for each privilege of each authorization ID that has privileges on a global variable.
"SYSIBM.SYSVARIABLES_DESC table" on page 2434	The SYSIBM.SYSVARIABLES_DESC table is an auxiliary table for the SYSIBM.SYSVARIABLES table.
"SYSIBM.SYSVARIABLES table" on page 2429	The SYSIBM.SYSVARIABLES table contains one row for each global variable that is created.
"SYSIBM.SYSVARIABLES_TEXT table" on page 2435	The SYSIBM.SYSVARIABLES_TEXT table is an auxiliary table for the DEFAULTTEXT column of the SYSIBM.SYSVARIABLES table.

The catalog tables that are listed in the following table have new or revised columns, column values, or column descriptions to support the new function in this release of DB2 for z/OS.

Table 176. Summary of new and revised catalog table columns

Catalog table name	New column	Revised column
"SYSIBM.SYSCHECKS table" on page 2143		RBA
"SYSIBM.SYSCOPY table" on page 2176	MODECREATED	• PIT_RBA • START_RBA • ICTYPE • STYPE • TTYPE
"SYSIBM.SYSDATATYPES table" on page 2191	• ARRAYLENGTH • ARRAYINDEXTYPEID • ARRAYINDEXTYPELEN • ARRAYINDEXSUBTYPE	• LENGTH • METATYPE • SCALE • SUBTYPE

Table 176. Summary of new and revised catalog table columns (continued)

Catalog table name	New column	Revised column

"SYSIBM.SYSPLAN table" on page 2306	PROGAUTH	
"SYSIBM.SYSQUERY table" on page 2315	• ACCESS_PATH_HINT • OPTION_OVERRIDE • SELECTIVITY_VALID • SELECTVTY_OVERRIDE	
"SYSIBM.SYSQUERYPLAN table" on page 2321	EXPANSION_REASON	
"SYSIBM.SYSRESAUTH table" on page 2341		QUALIFIER
"SYSIBM.SYSROUTINES table" on page 2346		COMMIT_ON_RETURN
"SYSIBM.SYSSEQUENCES table" on page 2366	• SEQNAME • SEQSCHEMA	
"SYSIBM.SYSTABLEPART table" on page 2387	• PCTFREE_UDP • PCTRFREE_UPD_CALC • RBA_FORMAT	
"SYSIBM.SYSTABLES table" on page 2396	• ARCHIVING_SCHEMA • ARCHIVING_TABLE • STATS_FEEDBACK	• RBA1 • RBA2 • VERSION
"SYSIBM.SYSTABLESPACESTATS table" on page 2410	• UPDATESIZE • LASTDATACHANGE	COPYUPDATELRSN

SYSIBM.IPLIST table

The SYSIBM.IPLIST table allows multiple IP addresses to be specified for a given LOCATION.

Insert rows into this table when you want to define a remote DB2 data sharing group. The same value for the IPADDR column cannot appear in both the SYSIBM IPNAMES table and the SYSIBM.IPLIST table. Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
LINKNAME	VARCHAR(24) NOT NULL	This column is associated with the value specified in the LINKNAME column in the SYSIBM.LOCATIONS table and the SYSIBM.IPNAMES table. The values of the other columns in the SYSIBM.IPNAMES table apply to the server identified by the LINKNAME column in this row.	G
IPADDR	VARCHAR(254) NOT NULL	This column contains an IPv4 or IPv6 address, or domain name of a remote TCP/IP host of the server. If WLM Domain Name Server workload balancing is used, this column must contain the member specific domain name. If Dynamic VIPA workload balancing is used, this column must contain the member specific Dynamic VIPA address. The IPADDR column must be specified as follows: • An IPv4 address must be left justified and is represented as a dotted decimal address. For example, '123.456.78.912' would be interpreted as an IPv4 address. • An IPv6 address must be left justified and is represented as a colon hexadecimal address. An example of an IPv6 address is '2001:0DB8:0000:0000:0008:0800:200C:417A', which can also be expressed in compressed form as '2001:DB8::8:800:200C:417A'. • A domain name is converted to an IP address by the domain name server where a resulting IPv4 or IPv6 address is determined. An example of a domain name is 'stlmvs1.svl.ibm.com'.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.IPNAMES table

The SYSIBM.IPNAMES table defines the remote DRDA servers DB2 can access using TCP/IP.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
LINKNAME	VARCHAR(24) NOT NULL	The value specified in this column must match the value specified in the LINKNAME column of the associated row in SYSIBM.LOCATIONS.	G
SECURITY_OUT	CHAR(1) NOT NULL WITH DEFAULT 'A'	This column defines the DRDA security option that is used when local DB2 SQL applications connect to any remote server associated with this TCP/IP host: **A** The option is “already verified”. Outbound connection requests contain an authorization ID and no password. The authorization ID used for an outbound request is either the DB2 user's authorization ID or a translated ID, depending upon the value of the USERNAMES column. The authorization ID is not encrypted when it is sent to the partner. For encryption, refer to 'D'. **D** The option is “userid and security-sensitive data encryption”. Outbound connection requests contain an authorization ID and no password. The authorization ID used for an outbound request is either the DB2 user's authorization ID or a translated ID, depending upon the value of the USERNAMES column. This option indicates that the userid and security-sensitive data are to be encrypted. For non-encryption, refer to 'A'. **E** The option is “userid, password, and security-sensitive data encryption”. Outbound connection requests contain an authorization ID and a password. The password is obtained from the SYSIBM.USERNAMES table. The USERNAMES column must specify 'O'. This option indicates that the userid, password, and security-sensitive data are to be encrypted. For non-security-sensitive data encryption, refer to 'P'. If the applications connect to any remote server as trusted, the USERNAMES column must specify 'O' or 'S'.	G

Column name	Data type	Description		Use
SECURITY_OUT (continued)		**P**	The option is “password”. Outbound connection requests contain an authorization ID and a password. The password is obtained from the SYSIBM.USERNAMES table. The USERNAMES column must specify 'O'. This option indicates that the userid and the password are to be encrypted if cryptographic services are available at the requester and if the server supports encryption. Otherwise, the userid and the password are sent to the partner in clear text. For security-sensitive data encryption, see 'E'. If the applications connect to any remote server as trusted, the USERNAMES column must specify 'O' or 'S'.	
		R	The option is “RACF PassTicket”. Outbound connection requests contain a userid and a RACF PassTicket. The value specified in the LINKNAME column is used as the RACF PassTicket application name for the remote server. The authorization ID used for an outbound request is either the DB2 user's authorization ID or a translated ID, depending upon the value of the USERNAMES column. The authorization ID is not encrypted when it is sent to the partner.	
USERNAMES	CHAR(1) NOT NULL WITH DEFAULT	This column controls outbound authorization ID translation. Outbound translation is performed when an authorization ID is sent by DB2 to a remote server.		G
		O	An outbound ID is subject to translation. Rows in the SYSIBM.USERNAMES table are used to perform ID translation. No translation or “come from” checking is performed on inbound IDs.	
		S	Row in the SYSIBM.USERNAMES table is used to obtain the system AUTHID used to establish a trusted connection.	
		blank	No translation occurs.	
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.		G

Column name	Data type	Description	Use
IPADDR	VARCHAR(254) NOT NULL WITH DEFAULT	This column contains an IPv4 or IPv6 address, or domain name of a remote TCP/IP host. The IPADDR column must be specified as follows: • An IPv4 address must be left justified and is represented as a dotted decimal address. For example, '123.456.78.91' would be interpreted as an IPv4 address. • An IPv6 address must be left justified and is represented as a colon hexadecimal address. An example of an IPv6 address is '2001:0DB8:0000:0000:0008:0800:200C:417A', which can also be expressed in compressed form as '2001:DB8::8:800:200C:417A'. • A domain name is converted to an IP address by the domain name server where a resulting IPv4 or IPv6 address is determined. An example of a domain name is 'stlmvs1.svl.ibm.com'.	G

SYSIBM.LOCATIONS table

The SYSIBM.LOCATIONS table contains a row for every accessible remote server. The row associates a LOCATION name with the TCP/IP or SNA network attributes for the remote server. Requesters are not defined in this table.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
LOCATION	VARCHAR(128) NOT NULL	A unique location name for the accessible server. This is the name by which the remote server is known to local DB2 SQL applications.	G
LINKNAME	VARCHAR(24) NOT NULL	Identifies the VTAM® or TCP/IP attributes associated with this location. For any LINKNAME specified, one or both of the following statements must be true: • A row exists in SYSIBM.LUNAMES whose LUNAME matches the value specified in the SYSIBM.LOCATIONS LINKNAME column. This row specifies the VTAM communication attributes for the remote location. • A row exists in SYSIBM.IPNAMES whose LINKNAME matches the value specified in the SYSIBM.LOCATIONS LINKNAME column. This row specifies the TCP/IP communication attributes for the remote location.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
PORT	VARCHAR(96) NOT NULL WITH DEFAULT	TCP/IP is used for outbound DRDA connections when the following statement is true: • A row exists in SYSIBM.IPNAMES, where the LINKNAME column matches the value specified in the SYSIBM.LOCATIONS LINKNAME column. If the above mentioned row is found, the value of the PORT column is interpreted as follows: • If PORT is blank, the default DRDA port (446) is used. • If PORT is nonblank, the value specified for PORT can take one of two forms: – If the value in PORT is left justified with 1-5 numeric characters, the value is assumed to be the TCP/IP port number of the remote database server. – Any other value is assumed to be a TCP/IP service name, which can be converted to a TCP/IP port number using the TCP/IP `getservbyname` socket call. TCP/IP service names are not case sensitive.	G

Column name	Data type	Description	Use
TPN	VARCHAR(192) NOT NULL WITH DEFAULT	Used only when the local DB2 begins an SNA conversation with another server. When used, TPN indicates the SNA LU 6.2 transaction program name (TPN) that will allocate the conversation. A length of zero for the column indicates the default TPN. For DRDA conversations, this is the DRDA default, which is X'07F6C4C2'. For DB2 private protocol conversations, this column is not used. When the server is DB2 Server for VSE & VM, TPN should contain the resource ID of that machine.	G
DBALIAS	VARCHAR(128) NOT NULL	Database alias. The name associated with the server. This name is used to access a remote database server. If DBALIAS is blank, the location name is used to access the remote database server. This column does not change the name of any database objects sent to the remote site that contains the location qualifier. This column applies only to DRDA connections.	G
TRUSTED	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates whether the connection to the remote server can be trusted. This is restricted to TCP/IP only. This column is ignored for connections using SNA. **Y** Location is trusted. Access to the remote location requires trusted context defined at the remote location. **N** Location is not trusted.	G
SECURE	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates the use of the Secure Socket Layer (SSL) protocol for outbound DRDA connections when local DB2 applications connects to the remote database server using TCP/IP. **Y** Indicates a secure connection using SSL is required for the outbound DRDA connection. **N** Indicates a secure connection is not required for the outbound DRDA connection.	G

SYSIBM.LULIST table

The SYSIBM.LULIST table allows multiple LU names to be specified for a given LOCATION.

Insert rows into this table when you want to define a remote DB2 data sharing group. The same value for LUNAME column cannot appear in both the SYSIBM.LUNAMES table and the SYSIBM.LULIST table. Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
LINKNAME	VARCHAR(24) NOT NULL	The value of the LINKNAME column in the SYSIBM.LOCATIONS table with which this row is associated. This is also the value of the LUNAME column in the SYSIBM.LUNAMES table. The values of the other columns in the SYSIBM.LUNAMES row apply to the LU identified by the LUNAME column in this row of SYSIBM.LULIST.	G
LUNAME	VARCHAR(24) NOT NULL	The VTAM logical unit name (LUNAME) of the remote database system. This LUNAME must not exist in the LUNAME column of SYSIBM.LUNAMES.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.LUMODES table

Each row of the SYSIBM.LUMODES table provides VTAM with conversation limits for a specific combination of LUNAME and MODENAME. The table is accessed only during the initial conversation limit negotiation between DB2 and a remote LU. This negotiation is called *change-number-of-sessions* (CNOS) processing.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
LUNAME	VARCHAR(24) NOT NULL	LU name of the server involved in the CNOS processing.	G
MODENAME	VARCHAR(24) NOT NULL	Name of a logon mode description in the VTAM logon mode table.	G
CONVLIMIT	SMALLINT NOT NULL	Maximum number of active conversations between the local DB2 and the other system for this mode. Used to override the number in the DSESLIM parameter of the VTAM APPL definition statement for this mode.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.LUNAMES table

The SYSIBM.LUNAMES table must contain a row for each remote SNA client or server that communicates with DB2.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
LUNAME	VARCHAR(24) NOT NULL	Name of the LU for one or more accessible systems. A blank string indicates the row applies to clients whose LU name is not specifically defined in this table. All other column values for a given row in this table are for clients and servers associated with the row's LU name.	G
SYSMODENAME	VARCHAR(24) NOT NULL WITH DEFAULT	Mode used to establish inter-system conversations. A blank indicates the default mode IBMDB2LM (DB2 private protocol access and for collecting sysplex balancing information from remote data sharing groups). If private protocols are used to access a remote DB2 LU or if the remote LU is a member of a DB2 data sharing group, use a separate mode other than the default mode.	G
SECURITY_IN	CHAR(1) NOT NULL WITH DEFAULT 'A'	This column defines the security options that are accepted by this DB2 when an SNA client connects to DB2: **V** The option is “verify”. An incoming connection request must include one of the following: a userid and password, a userid and RACF PassTicket, or a Kerberos security ticket. **A** The option is “already verified”. A request does not need a password, although a password is checked if it is sent. With this option, an incoming connection request is accepted if it includes any of the following: a userid, a userid and password, a userid and RACF PassTicket, or a Kerberos security ticket. If the USERNAMES column contains 'I' or 'B', RACF is not invoked to validate incoming connection requests that contain only a userid unless one of the following situations is true: • The RACF access control authorization exit (DSNX@XAC) is enabled • The IBM supplied RACF SECLABEL resource class is active.	G

Column name	Data type	Description	Use
SECURITY_OUT	CHAR(1) NOT NULL WITH DEFAULT 'A'	This column defines the security option that is used when local DB2 SQL applications connect to any remote server associated with this LUNAME: **A** The option is “already verified”. Outbound connection requests contain an authorization ID and no password. The authorization ID used for an outbound request is either the DB2 user's authorization ID or a translated ID, depending upon the value of the USERNAMES column. **R** The option is “RACF PassTicket”. Outbound connection requests contain a userid and a RACF PassTicket. The server's LU name is used as the RACF PassTicket application name. The authorization ID used for an outbound request is either the DB2 user's authorization ID or a translated ID, depending upon the value of the USERNAMES column. **P** The option is “password”. Outbound connection requests contain an authorization ID and a password. The password is obtained from the SYSIBM.USERNAMES table or RACF, depending upon the value specified in the ENCRYPTPSWDS column. The USERNAMES column must specify 'B' or 'O'.	G
ENCRYPTPSWDS	CHAR(1) NOT NULL WITH DEFAULT 'N'	This column only applies to DB2 for z/OS partners. It is provided to support connectivity to prior releases of DB2 that are unable to support RACF PassTickets. For connections between DB2 Version 5 and later, use the SECURITY_OUT='R' option instead of the ENCRYPTPSWDS='Y' option. **N** No, passwords are not in internal RACF encrypted format. This is the default. **Y** Yes for outbound requests, the encrypted password is extracted from RACF and sent to the server. For inbound requests, the password is treated as encrypted.	G
MODESELECT	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether to use the SYBIBM.MODESELECT table: **N** Use default modes: IBMDB2LM (for DB2 private protocol) and IBMRDB (for DRDA). **Y** Searches SYSIBM.MODESELECT for appropriate mode name.	G

Column name	Data type	Description	Use
USERNAMES	CHAR(1) NOT NULL WITH DEFAULT	This column controls inbound and outbound authorization ID translation, and "come from" checking. Inbound translation and "come from" checking are performed when an authorization ID is received from a remote client. Outbound translation is performed when an authorization ID is sent by DB2 to a remote server. When 'I', 'O', or 'B' is specified in this column, rows in the SYSIBM.USERNAMES table are used to perform ID translation. **I** An inbound ID is subject to translation and "come from" checking. No translation is performed on outbound IDs. **O** No translation or "come from" checking is performed on inbound IDs. An outbound ID is subject to translation. **B** An inbound ID is subject to translation and "come from" checking. An outbound ID is subject to translation. **blank** No translation occurs.	G
GENERIC	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates whether DB2 should use its real LU name or generic LU name to identify itself to the partner LU, which is identified by this row. **N** The real VTAM LU name of this DB2 subsystem **Y** The VTAM generic LU name of this DB2 subsystem	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.MODESELECT table

The SYSIBM.MODESELECT table associates a mode name with any conversation created to support an outgoing SQL request. Each row represents one or more combinations of LUNAME, authorization ID, and application plan name.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
AUTHID	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the SQL request. Blank (the default) indicates that the MODENAME specified for the row is to apply to all authorization IDs.	G
PLANNAME	VARCHAR(24) NOT NULL WITH DEFAULT	Plan name associated with the SQL request. Blank (the default) indicates that the MODENAME specified for the row is to apply to all plan names.	G
LUNAME	VARCHAR(24) NOT NULL	LU name associated with the SQL request.	G
MODENAME	VARCHAR(24) NOT NULL	Name of the logon mode in the VTAM logon mode table to be used in support of the outgoing SQL request. If blank, IBMDB2LM is used for DB2 private protocol connections and IBMRDB is used for DRDA connections.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSAUDITPOLICIES table

The SYSIBM.SYSAUDITPOLICIES table contains one row for each audit policy.

A user with SECADM authority has the privilege to select from, insert, update, or delete from this catalog table. A user with SQLADM, system DBADM, DATAACCESS, ACCESSCTRL, SYSCTRL or SYSADM authority has the privilege to select from this catalog table.

Column name	Data type	Description	Use
AUDITPOLICYNAME	VARCHAR(128) NOT NULL	Name of the audit policy. The name must be an identifier of 1 to 128 characters and must begin with a letter. Any other values result in an error being returned when audit policy is started.	G
OBJECTSCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	Schema of the audited object. The object schema only applies to categories, OBJMAINT and EXECUTE.	G
OBJECTNAME	VARCHAR(128) NOT NULL WITH DEFAULT	Name of the object. The object name only applies to categories, OBJMAINT and EXECUTE. Object name can be specified using an SQL LIKE predicate. If the object name is specified using an SQL LIKE predicate, it has to be specified as a delimited identifier. The escape character to be used for the SQL LIKE predicate is obtained from RGFESCP subsystem parameter. If not specified, the default escape character is '+'.	G
OBJECTTYPE	CHAR(1) NOT NULL WITH DEFAULT	Type of the object. **C** Clone table **P** Implicit table created for XML columns **T** Table **blank** All of the above object types **All other values** Error when audit policy is started The object type only applies to categories, OBJMAINT and EXECUTE	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	The time when the row was inserted.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	The time when the row was last updated.	G
CHECKING	CHAR(1) NOT NULL WITH DEFAULT	Indicates if authorization and authentication failures are audited: **A** Audit all failures (Authorization and authentication failures) **blank** Audit none **All other values** Error when audit policy is started	G

Column name	Data type	Description	Use
VALIDATE	CHAR(1) NOT NULL WITH DEFAULT	Indicates if auditing is enabled for when a trusted connection is established or used by a different user: **A** Audit all **blank** Audit none **All other values** Error when audit policy is started	G
OBJMAINT	CHAR(1) NOT NULL WITH DEFAULT	Indicates if auditing is enabled for when the table that is identified by OBJECTSCHEMA, OBJECTNAME, and OBJECTTYPE columns is altered or dropped: **A** Audit when the specified table is altered or dropped **blank** Audit none **All other values** Error when audit policy is started	G
EXECUTE	CHAR(1) NOT NULL WITH DEFAULT	Indicates if auditing is enabled for when the table identified that is by the OBJECTSCHEMA, OBJECTNAME, and OBJECTTYPE columns is accessed during the first operation performed by each unit of work. Also, records bind time information about SQL statements that involve tables that are identified by the OBJECTSCHEMA, OBJECTNAME, and OBJECTTYPE. **A** Audit when the specified table is accessed during the first operation of any kind performed by each unit of work of a utility or application process. **C** Audit when the specified table is accessed during the first insert, update, or delete operation performed by each unit of work. **blank** Audit none **All other values** Error when audit policy is started	G
CONTEXT	CHAR(1) NOT NULL WITH DEFAULT	Indicates if auditing is enabled for the start of a utility, a change to a utility object or phase, and the end of utility: **A** Audit all utilities **blank** Audit none **All other values** Error when audit policy is started	G
SECMAINT	CHAR(1) NOT NULL WITH DEFAULT	Indicates if auditing is enabled for when a grant or revoke is made or a trusted context is created or altered: **A** Audit all **blank** Audit none **All other values** Error when audit policy is started	G

Column name	Data type	Description	Use
SYSADMIN	VARCHAR(128) NOT NULL WITH DEFAULT	Indicates if auditing is enabled for when an operation is performed using an administrative authority to perform system administration tasks: **blank** Audit none * Audit all the authorities **I** Installation SYSADM **L** SYSCTRL **O** SYSOPR **R** Installation SYSOPR **S** SYSADM **All other values** Error when audit policy is started The value of SYSADMIN can be a concatenated string of all supported values. For example, 'LOS' would indicate auditing of any operation that is performed using the administrative authorities: SYSCTRL, SYSOPR, and SYSADM. Multiple occurrences of a value are ignored.	G
DBADMIN	VARCHAR(128) NOT NULL WITH DEFAULT	Indicates if auditing is enabled for when an operation is performed using an administrative authority to perform database administration tasks: **blank** Audit none * Audit all the authorities **B** System DBADM **C** DBCTRL **D** DBADM **E** SECADM **G** ACCESSCTRL **K** SQLADM **M** DBMAINT **P** PACKADM **T** DATAACCESS **All other values** Error when audit policy is started The value of DBADMIN can be a concatenated string of all supported values. For example, 'BMP' would indicate auditing of any operation that is performed using the administrative authorities: System DBADM, DBMAINT, and PACKADM. Multiple occurrences of a value are ignored.	G
DBNAME	VARCHAR(24) NOT NULL WITH DEFAULT	Database name. The database name can be used to specify the database for auditing DBADM, DBCTRL, and DBMAINT authorities. If the database name is not specified, then all the databases, including implicit databases are audited. If the database name is specified, it only applies to DBADM, DBCTRL, and DBMAINT authorities in category, DBADMIN.	G

Column name	Data type	Description	Use
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	Name of the package collection. The package collection can be used to specify the collection name for auditing PACKADM authority. If specified, all packages in that collection are audited. If the collection name is not specified, packages in all collections are audited. If the package collection is specified, it only applies to PACKADM authority in category, DBADMIN.	G
DB2START	CHAR(1) NOT NULL WITH DEFAULT	ndicates if audit policies are to be started automatically during DB2 start up. Up to 8 audit policies can be specified. **Y** Audit policy will be started automatically during DB2 startup. **S** Audit policy will be started automatically during DB2 startup. The audit policy can be stopped only by a user with SECADM authority. **N** Audit policy will not be started automatically during DB2 startup.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSAUTOALERTS table

The SYSIBM.SYSAUTOALERTS table contains one row for each recommendation from autonomic procedures.

Column name	Data type	Description	Use
ALERT_ID	BIGINT NOT NULL GENERATED ALWAYS AS IDENTITY	The ID of the alert described in this row.	G
HISTORY_ENTRY_ID	BIGINT NOT NULL	The ID of the entry in the ADMIN_UTLPROCEDURES_HIST procedure that produced this alert.	G
ACTION	VARCHAR(32) NOT NULL	The type of action requested by this alert.	G
TARGET_QUALIFIER	VARCHAR(128) NOT NULL	The qualifier name of the DB2 object (the database name) to which this alert applies.	G
TARGET_OBJECT	VARCHAR(128) NOT NULL	The name of the DB2 object (the table space name) to which this alert applies.	G
TARGET_PARTITION	SMALLINT NOT NULL	The partition number of the DB2 object to which this alert applies. Zero, if this alert applies to all partitions or if the object is not partitioned.	G
OPTIONS	VARCHAR(4000)	The options that should be specified when the corresponding action is run: **USE PROFILE** Use the options specified in the profile **TABLE** Options only apply for this table **COLUMNS** Options only apply for these columns **SAMPLE** The table space is too big and sampling is allowed	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	The timestamp when the alert was issued.	G
DURATION	INTEGER	An estimate of the time, in seconds, that would be needed to run the corresponding action. If this column contains NULL, the execution plan might overwrite the time window.	G
STATUS	VARCHAR(32)	The status of the actual planned task. Valid values are: **OPEN** The alert is not yet resolved **INPROGRESS** The alert execution is in progress **COMPLETED** The alert execution is complete	G
STARTTS	TIMESTAMP	The timestamp for when the alert execution started. This column contains NULL if the task execution has not yet started.	G
ENDTS	TIMESTAMP	The timestamp for when the alert execution ended. This column contains NULL if the task execution has not yet ended.	G

Column name	Data type	Description	Use
RETURN_CODE	INTEGER	The return code that is written directly by the autonomic stored procedure that resolved the alert. This column contains NULL if the alert is not yet resolved, if the autonomic stored procedure failed, or if the autonomic stored procedure does not write any return code. A RETURN_CODE of 0 is expected in case of a successful execution.	G
ERROR_MESSAGE	VARCHAR(1331)	An error message that indicates why the alert was not resolved successfully. This column contains NULL if the alert is not yet resolved, or if the autonomic stored procedure that executes the alert does not write any error message. No ERROR_MESSAGE text is expected in case of a successful execution.	G
OUTPUT	CLOB(2M)	The output that is written directly by the autonomic stored procedure that executes the planned task. This column contains NULL if the task is not yet executed, if the execution failed, or if the autonomic stored procedure does not write any output.	G
ROWID	ROWID NOT NULL GENERATED ALWAYS	The ROWID value for the CLOB column of this table.	G

SYSIBM.SYSAUTOALERTS_OUT table

The SYSIBM.SYSAUTOALERTS_OUT table is an auxiliary table for the OUTPUT column of the SYSIBM.SYSAUTOALERTS table.

Column name	Data type	Description	Use
OUTPUT	CLOB(2M)	The output of the autonomic stored procedure.	G

SYSIBM.SYSAUTORUNS_HIST table

The SYSIBM.SYSAUTORUNS_HIST table contains one row for each time an autonomic procedures has been run.

Column name	Data type	Description	Use
HISTORY_ENTRY_ID	BIGINT NOT NULL GENERATED ALWAYS AS IDENTITY	The ID of the entry in the history table.	G
PROC_NAME	VARCHAR(128) NOT NULL	The name of the autonomic stored procedure that produced this entry.	G
STARTTS	TIMESTAMP	The timestamp when the autonomic stored procedure started.	G
ENDTS	TIMESTAMP	The timestamp when the autonomic stored procedure ended.	G
OUTPUT	CLOB(2M)	The output of the autonomic stored procedure.	G
ERROR_MESSAGE	VARCHAR(1331)	An error message that indicates why the autonomic stored procedure was not successful. No ERROR_MESSAGE text is expected in case of a successful execution.	G
RETURN_CODE	INTEGER	The return code written directly by the autonomic stored procedure. This column contains NULL if the autonomic stored procedure execution failed, or if the autonomic stored procedure does not write any return code. A RETURN_CODE of 0 is expected in case of a successful execution.	G
ROWID	ROWID NOT NULL GENERATED ALWAYS	The ROWID value for the OUTPUT column of this table.	G

SYSIBM.SYSAUTORUNS_HISTOU table

The SYSIBM.SYSAUTORUNS_HISTOU table is an auxiliary table for the OUTPUT column of the SYSIBM.SYSAUTORUNS_HIST table.

Column name	Data type	Description	Use
OUTPUT	CLOB(2M)	The output of the autonomic stored procedure.	G

SYSIBM.SYSAUTOTIMEWINDOWS table

The SYSIBM.SYSAUTOTIMEWINDOWS table contains one row for each time period during which autonomic procedures can be run.

Column name	Data type	Description	Use
WINDOW_ID	BIGINT NOT NULL GENERATED ALWAYS AS IDENTITY	The ID of the time window described in this row.	G
DB2_SSID	CHAR(4)	The DB2 member name on which the planned tasks have to be run. If this column contains NULL, the tasks in this time window can be run on any DB2 member.	G
MONTH_WEEK	CHAR(1) NOT NULL	Indicates how the value of the DAY column is interpreted: **M** The value of the DAY column is interpreted as a day of the month **W** The value of the DAY column is interpreted as a day of the week	G
MONTH	INTEGER	Month in which the time window applies. The value will be from 1 (January) to 12 (December). If this column contains NULL, the time window applies to all months. If MONTH_WEEK is 'W', this column must be NULL.	G
DAY	INTEGER	Day of the month or day of the week for which the time window applies. If this column contains NULL, the time window applies to every day of the month or to every day of the week (depending on the value of the MONTH_WEEK column).	G
FROM_TIME	TIME	The time of day at which the time window begins. If this column contains NULL, no limitation on the time exists. This column will contain NULL if the TO_TIME column contains NULL.	G
TO_TIME	TIME	The time of day at which the time window ends. If this column contains NULL, no limitation on the time exists. This column will contain NULL if the FROM_TIME column contains NULL.	G
ACTION	VARCHAR(256)	The comma-separated list of actions that are allowed during this time window. If this column contains NULL, all actions are allowed.	G
MAX_TASKS	INTEGER	The number of concurrent actions that are allowed during this time window. If this column contains NULL, any number of actions are allowed concurrently.	G

SYSIBM.SYSAUXRELS table

The SYSIBM.SYSAUXRELS table contains one row for each auxiliary table created for a LOB column. A base table space that is partitioned must have one auxiliary table for each partition of each LOB column.

Column name	Data type	Description	Use
TBOWNER	VARCHAR(128) NOT NULL	The schema of the base table.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the base table.	G
COLNAME	VARCHAR(128) NOT NULL	Name of the LOB column in the base table.	G
PARTITION	SMALLINT NOT NULL	Partition number if the base table space is partitioned. Otherwise, the value is 0.	G
AUXTBOWNER	VARCHAR(128) NOT NULL	The schema of the auxiliary table.	G
AUXTBNAME	VARCHAR(128) NOT NULL	Name of the auxiliary table.	G
AUXRELOBID	INTEGER NOT NULL	Internal identifier of the relationship between the base table and the auxiliary table.	S
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G

SYSIBM.SYSCHECKDEP table

The SYSIBM.SYSCHECKDEP table contains one row for each reference to a column in a check constraint.

Column name	Data type	Description	Use
TBOWNER	VARCHAR(128) NOT NULL	The schema of the table on which the check constraint is defined.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table on which the check constraint is defined.	G
CHECKNAME	VARCHAR(128) NOT NULL	Name of the check constraint.	G
COLNAME	VARCHAR(128) NOT NULL	Name of the column that the check constraint refers to.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSCHECKS table

The SYSIBM.SYSCHECKS table contains one row for each check constraint.

Column name	Data type	Description	Use
TBOWNER	VARCHAR(128) NOT NULL	The schema of the table on which the check constraint is defined.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the creator of the check constraint.	G
DBID	SMALLINT NOT NULL	Internal identifier of the database for the check constraint.	S
OBID	SMALLINT NOT NULL	Internal identifier of the check constraint.	S
TIMESTAMP	TIMESTAMP NOT NULL	Time when the check constraint was created.	G
RBA	CHAR(10) NOT NULL FOR BIT DATA	The log RBA when the check constraint was created.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table on which the check constraint is defined.	G
CHECKNAME	VARCHAR(128) NOT NULL	Check constraint name.	G
CHECKCONDITION	VARCHAR(7400) NOT NULL	Text of the check constraint.	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
ENVID	INTEGER NOT NULL WITH DEFAULT	Internal environment identifier.	G
PERIOD	CHAR(1) NOT NULL WITH DEFAULT	The type of period associated with the check constraint: **B** BUSINESS_TIME check constraint **S** SYSTEM_TIME check constraint **blank** Not applicable	G

SYSIBM.SYSCHECKS2 table

The SYSIBM.SYSCHECKS2 table contains one row for each check constraint for catalog tables created in or after Version 7. Check constraints for catalog tables created before Version 7 are not included in this table.

Column name	Data type	Description	Use
TBOWNER	VARCHAR(128) NOT NULL	The schema of the table on which the check constraint is defined.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table on which the check constraint is defined.	G
CHECKNAME	VARCHAR(128) NOT NULL	Check constraint name.	G
PATHSCHEMAS	VARCHAR(2048) NOT NULL	SQL path at the time the check constraint was created. The path is used to resolve unqualified cast function names that are used in the constraint definition.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G

SYSIBM.SYSCOLAUTH table

The SYSIBM.SYSCOLAUTH table records the UPDATE or REFERENCES privileges that are held by users on individual columns of a table or view.

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID or role of the user who granted the privileges. Could also be PUBLIC .	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID or role of the user who holds the privilege or the name of an application plan or package that uses the privilege. PUBLIC for a grant to PUBLIC.	G
GRANTEETYPE	CHAR(1) NOT NULL	Type of grantee: **blank** An authorization ID **L** Role **P** An application plan or a package. The grantee is a package if COLLID is not blank.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the table or view on which the update privilege is held.	G
TNAME	VARCHAR(128) NOT NULL	Name of the table or view.	G
	CHAR(12) NOT NULL	Internal use only	I
	CHAR(6) NOT NULL	Not used	N
	CHAR(8) NOT NULL	Not used	N
COLNAME	VARCHAR(128) NOT NULL	Name of the column to which the UPDATE privilege applies.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
	VARCHAR(128) NOT NULL WITH DEFAULT	Not used	N
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	If GRANTEE is a package, its collection name. Otherwise, the value is blank.	G
CONTOKEN	CHAR(8) NOT NULL WITH DEFAULT FOR BIT DATA	If GRANTEE is a package, the consistency token of the DBRM from which the package was derived. Otherwise, the value is blank.	S

Column name	Data type	Description	Use
PRIVILEGE	CHAR(1) NOT NULL WITH DEFAULT	Indicates which privilege this row describes: **R** Row pertains to the REFERENCES privilege. **blank** Row pertains to the UPDATE privilege.	G
GRANTEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the GRANT statement was executed.	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: **L** Role **blank** Authorization ID that is not a role	G

SYSIBM.SYSCOLDIST table

The SYSIBM.SYSCOLDIST table contains one or more rows for the cardinality, frequency, and histogram statistics for a single column or a column group.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
	SMALLINT NOT NULL	Not used	N
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
TBOWNER	VARCHAR(128) NOT NULL	The schema of the table that contains the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table that contains the column.	G
NAME	VARCHAR(128) NOT NULL	Name of the column. If NUMCOLUMNS is greater than 1, this name identifies the first column name of the set of columns associated with the statistics.	G
COLVALUE	VARCHAR(2000) NOT NULL OR BIT DATA	Contains the data of a frequently occurring value. Statistics are not collected for an index on a ROWID column. If the value has a non-character data type, the data might not be printable.	S
TYPE	CHAR(1) NOT NULL WITH DEFAULT 'F'	The type of statistics gathered: **C** Cardinality **F** Frequent value **H** Histogram Statistics **N** Non-padded frequent value	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	For TYPE='C', the number of distinct values for the column group. For TYPE='H', the number of distinct values for the column group in a quantile indicated by QUANTILENO.	S
COLGROUPCOLNO	VARCHAR(254) NOT NULL WITH DEFAULT FOR BIT DATA	Identifies the set of columns associated with the statistics. If the statistics are only associated with a single column, the field contains a zero length. Otherwise, the field is an array of SMALLINT column numbers with a dimension equal to the value in NUMCOLUMNS. This is an updatable column.	S
NUMCOLUMNS	SMALLINT NOT NULL WITH DEFAULT 1	Identifies the number of columns associated with the statistics.	G

Column name	Data type	Description	Use
FREQUENCYF	FLOAT NOT NULL WITH DEFAULT -1	Gives the percentage of rows in the table with the value specified in COLVALUE when the number is multiplied by 100. For example, a value of '1' indicates 100%. A value of '.153' indicates 15.3%. When TYPE='H', this is the percentage of rows in table which falls at the quantile indicated by QUANTILENO whose range is limited by [LOWVALUE, HIGHVALUE]. Statistics are not collected for an index on a ROWID column.	G
QUANTILENO	SMALLINT NOT NULL WITH DEFAULT -1	Ordinary sequence number of a quantile in the whole consecutive value range, from low to high. This column is not updatable.	G
LOWVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	For TYPE='H', this is the lower bound for the quantile indicated by QUANTILENO. Not used if TYPE is not 'H'. This column is not updatable.	G
HIGHVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	For TYPE='H', this is the higher bound for the quantile indicated by QUANTILENO. Not used if TYPE is not 'H'. This column is not updatable.	G

SYSIBM.SYSCOLDISTSTATS table

The SYSIBM.SYSCOLDISTSTATS table contains zero or more rows per partition for the cardinality, frequency, and histogram statistics for a single column or a column group.

No row is inserted if the index is a non-partitioned index. Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
	SMALLINT NOT NULL	Not used	N
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
PARTITION	SMALLINT NOT NULL	Partition number for the table space that contains the table in which the column is defined.	G
TBOWNER	VARCHAR(128) NOT NULL	The schema of the table that contains the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table that contains the column.	G
NAME	VARCHAR(128) NOT NULL	Name of the column. If NUMCOLUMNS is greater than 1, this name identifies the first column name of the set of columns associated with the statistics.	G
COLVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	Contains the data of a frequently occurring value. Statistics are not collected for an index on a ROWID column. If the value has a non-character data type, the data might not be printable.	S
TYPE	CHAR(1) NOT NULL WITH DEFAULT 'F'	The type of statistics gathered: **C** Cardinality **F** Frequent value **H** Histogram statistics **N** Non-padded frequent value	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	If TYPE is C, the value is the number of distinct values for the column group. If TYPE is N or TYPE is F, the value is the number of rows or keys in the partition for which the FREQUENCYF value applies. If TYPE is H, the number of distinct values for the column group in a quantile indicated by QUANTILENO.	S

Column name	Data type	Description	Use
COLGROUPCOLNO	VARCHAR(254) NOT NULL WITH DEFAULT FOR BIT DATA	Identifies the set of columns associated with the statistics. If the statistics are only associated with a single column, the field contains a zero length. Otherwise, the field is an array of SMALLINT column numbers with a dimension equal to the value in NUMCOLUMNS. This is an updatable column.	S
NUMCOLUMNS	SMALLINT NOT NULL WITH DEFAULT 1	Identifies the number of columns associated with the statistics.	G
FREQUENCYF	FLOAT NOT NULL WITH DEFAULT -1	Gives the percentage of rows in the table with the value specified in COLVALUE when the number is multiplied by 100. For example, a value of '1' indicates 100%. A value of '.153' indicates 15.3%. When TYPE='H', this is the percentage of rows in table which falls in the quantile indicated by QUANTILENO whose range is limited by [LOWVALUE, HIGHVALUE]. Statistics are not collected for an index on a ROWID column.	G
	VARCHAR(1000) NOT NULL WITH DEFAULT FOR BIT DATA	Internal use only	I
QUANTILENO	SMALLINT NOT NULL WITH DEFAULT -1	Ordinary sequence number of a quantile in the whole consecutive value range, from low to high. This column is not updatable.	G
LOWVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	For TYPE='H', this is the lower bound for the quantile indicated by QUANTILENO. Not used if TYPE is not 'H'. This column is not updatable.	G
HIGHVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	For TYPE='H', this is the higher bound for the quantile indicated by QUANTILENO. Not used if TYPE is not 'H'. This column is not updatable.	G

SYSIBM.SYSCOLDIST_HIST table

The SYSIBM.SYSCOLDIST_HIST table contains rows from SYSCOLDIST.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics.	G
TBOWNER	VARCHAR(128) NOT NULL	The schema of the table that contains the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table that contains the column.	G
NAME	VARCHAR(128) NOT NULL	Name of the column. If NUMCOLUMNS is greater than 1, this name identifies the first column name of the set of columns associated with the statistics.	G
COLVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	Contains the data of a frequently occurring value. Statistics are not collected for an index on a ROWID column. If the value has a non-character data type, the data might not be printable.	S
TYPE	CHAR(1) NOT NULL WITH DEFAULT 'F'	The type of statistics gathered: **C** Cardinality **F** Frequent value **H** Histogram Statistics **N** Non-padded frequent value	G
CARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	When TYPE='C', this is the number of distinct values for the column group. When TYPE='H', this is he number of distinct values for the column group in a quantile indicated by QUANTILENO. The value is -1 if statistics have not been gathered.	S
COLGROUPCOLNO	VARCHAR(254) NOT NULL FOR BIT DATA	Identifies the set of columns associated with the statistics. If the statistics are only associated with a single column, the field contains a zero length. Otherwise, the field is an array of SMALLINT column numbers with a dimension equal to the value in NUMCOLUMNS.	S
NUMCOLUMNS	SMALLINT NOT NULL WITH DEFAULT 1	Identifies the number of columns associated with the statistics.	G

Column name	Data type	Description	Use
FREQUENCYF	FLOAT(8) NOT NULL DEFAULT -1	Gives the percentage of rows in the table with the value specified in COLVALUE when the number is multiplied by 100. For example, a value of '1' indicates 100%. A value of '.153' indicates 15.3%. When TYPE='H', this is the percentage of rows in table which falls in the quantile indicated by QUANTILENO whose range is limited by [LOWVALUE, HIGHVALUE]. Statistics are not collected for an index on a ROWID column. The value is -1 if statistics have not been gathered.	G
IBMREQD	CHAR(1) NOT NULL DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
QUANTILENO	SMALLINT NOT NULL WITH DEFAULT -1	Ordinary sequence number of a quantile in the whole consecutive value range, from low to high. This column is not updatable.	G
LOWVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	For TYPE='H', this is the lower bound for the quantile indicated by QUANTILENO. Not used if TYPE is not 'H'. This column is not updatable.	G
HIGHVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	For TYPE='H', this is the higher bound for the quantile indicated by QUANTILENO. Not used if TYPE is not 'H'. This column is not updatable.	G

SYSIBM.SYSCOLSTATS table

The SYSIBM.SYSCOLSTATS table contains partition statistics for selected columns. For each column, a row exists for each partition in the table.

Rows are inserted when RUNSTATS collects either indexed column statistics or non-indexed column statistics for a partitioned table space. No row is inserted if the table space is nonpartitioned. Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
HIGHKEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Highest value of the column within the partition. Blank if statistics have not been gathered or the column is an indicator column, a node ID column, or a column of an XML table. If the column has a non-character data type, the data might not be printable. If the partition is empty, the value is a string of length 0.	S
HIGH2KEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Second highest value of the column within the partition. Blank if statistics have not been gathered or the column is an indicator column, a node ID column, or a column of an XML table. If the column has a non-character data type, the data might not be printable. If the partition is empty, the value is a string of length 0.	S
LOWKEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Lowest value of the column within the partition. Blank if statistics have not been gathered or the column is an indicator column, a node ID column, or a column of an XML table. If the column has a non-character data type, the data might not be printable. If the partition is empty, the value is a string of length 0.	S
LOW2KEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Second lowest value of the column within the partition. Blank if statistics have not been gathered or the column is an indicator column, a node ID column, or a column of an XML table. If the column has a non-character data type, the data might not be printable. If the partition is empty, the value is a string of length 0.	S
COLCARD	INTEGER NOT NULL	Number of distinct column values in the partition.	S
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics. If the value is '0001-01-02.00.00.00.000000', which indicates that an ALTER TABLE statement was executed to change the length of a VARCHAR column, RUNSTATS should be run to update the statistics before they are used.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
PARTITION	SMALLINT NOT NULL	Partition number for the table space that contains the table in which the column is defined.	G

Column name	Data type	Description	Use
TBOWNER	VARCHAR(128) NOT NULL	Schema or qualifier of the table that contains the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table that contains the column.	G
NAME	VARCHAR(128) NOT NULL	Name of the column.	G
	VARCHAR(1000) NOT NULL FOR BIT DATA	Internal use only	I
STATS_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The type of statistics gathered: **blank** Statistics have not been collected or varchar column statistical values are padded. **N** Varchar column statistical values are not padded. This is an updatable column.	G

SYSIBM.SYSCOLUMNS table

The SYSIBM.SYSCOLUMNS table contains one row for every column of each table and view.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table or view which contains the column.	G
TBCREATOR	VARCHAR(128) NOT NULL	The schema of the table or view that contains the column.	G
COLNO	SMALLINT NOT NULL	Numeric place of the column in the table or view; for example 4 (out of 10).	G

Column name	Data type	Description	Use
COLTYPE	CHAR(8) NOT NULL	The type of the column specified in the definition of the column: **INTEGER** Large integer **SMALLINT** Small integer **FLOAT** Floating-point **CHAR** Fixed-length character string **VARCHAR** Varying-length character string **LONGVAR** Varying-length character string (for columns that were added before Version 9) **DECIMAL** Decimal **GRAPHIC** Fixed-length graphic string **VARG** Varying-length graphic string **LONGVARG** Varying-length graphic string (for columns that were added before Version 9) **DATE** Date **TIME** Time **TIMESTMP** Timestamp **TIMESTZ** Timestamp with time zone **BLOB** Binary large object **CLOB** Character large object **DBCLOB** Double-byte character large object **ROWID** Row ID data type **DISTINCT** Distinct type **XML** XML data type **BIGINT** Big integer **BINARY** Fixed-length binary string **VARBIN** Varying-length binary string **DECFLOAT** Decimal floating point	G

Column name	Data type	Description	Use
LENGTH	SMALLINT NOT NULL	Length attribute of the column or, in the case of a decimal column, its precision. The number does not include the internal prefixes that are used to record the actual length and null state, where applicable. **INTEGER** 4 **SMALLINT** 2 **BIGINT** 8 **FLOAT** 4 or 8 **CHAR** Length of string **VARCHAR** Maximum length of string **LONGVAR** Maximum length of string (for columns that were added before Version 9) **DECIMAL** Precision of number **DECFLOAT** 8 or 16 **GRAPHIC** Number of DBCS characters **VARGRAPHIC** Maximum number of DBCS characters **LONGVARG** Maximum number of DBCS characters (for columns that were added before Version 9) **BINARY** Length of string **VARBINARY** Maximum length of string **DATE** 4 **TIME** 3 **TIMESTAMP WITHOUT TIME ZONE** The integral part of ((p+1)/2) + 7 where p is the precision of the timestamp **TIMESTAMP WITH TIME ZONE** The integral part of ((p+1)/2) + 9 where p is the precision of the timestamp	G

Column name	Data type	Description	Use
LENGTH (continued)	SMALLINT NOT NULL	**LOB** 4 - For a table, a field of length of 4 is stored in the base table. The maximum length of the LOB column is found in LENGTH2. **INLINE LOB** Greater than 4 - For a table, a field of length 4 plus the inline length (in byte) is stored in the base table. The maximum length of the LOB column is found in LENGTH2. **BLOB** 4 - For a table, a field of length of 4 is stored in the base table. The maximum length of the LOB column is found in LENGTH2. **CLOB** 4 - For a table, a field of length of 4 is stored in the base table. The maximum length of the CLOB column is found in LENGTH2. **DBCLOB** 4 - For a table, a field of length of 4 is stored in the base table. The maximum length of the DBCLOB column is found in LENGTH2. **ROWID** 17 - The maximum length of the stored portion of the identifier. **XML** 6 **DISTINCT** The length of the source data type.	G
SCALE	SMALLINT NOT NULL	If the column type is DECIMAL, this value represents the scale. If the column type is timestamp or timestamp with time zone, this value represents the number of fractional second digits. Otherwise the value is 0. If the column is a timestamp type, the LENGTH is 10 and the SCALE is 0, the number of fractional second digits is 6.	G
NULLS	CHAR(1) NOT NULL	Whether the column can contain null values: **N** No **Y** Yes The value can be N for a view column that is derived from an expression that is not a simple column name or constant, or from a function. Nevertheless, such a column allows nulls when an outer select list refers to it.	G
COLCARD	INTEGER NOT NULL	Not used	N
HIGH2KEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Second highest value of the column. Blank if statistics have not been gathered, or the column is an indicator column or a column of an auxiliary table. If the column has a non-character data type, the data might not be printable. If the table is empty, the value is a string of length 0. This is an updatable column.	S

Column name	Data type	Description	Use
LOW2KEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Second lowest value of the column. Blank if statistics have not been gathered, or the column is an indicator column or a column of an auxiliary table. If the column has a non-character data type, the data might not be printable. If the table is empty, the value is a string of length 0. This is an updatable column.	S
UPDATES	CHAR(1) NOT NULL	Whether the column can be updated: **N** No **Y** Yes The value is N if the column is: • Derived from a function or expression • A column with a row ID data type (or a distinct type based on a row ID type) • A read-only view	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
REMARKS	VARCHAR(762) NOT NULL	A character string provided by the user with the COMMENT statement.	G

Column name	Data type	Description	Use
DEFAULT	CHAR(1) NOT NULL	The contents of this column are meaningful only if the TYPE column for the associated SYSTABLES row indicates that this is for a table (T) or a created temporary table (G). Default indicator: **A** The column has a row ID data type (COLTYPE='ROWID') and the GENERATED ALWAYS attribute. **B** The column has a default value that depends on the data type of the column. **Data type** **Default Value** **Numeric** 0 **Fixed-length character or graphic string** Blanks **Fixed-length binary string** Hexadecimal zeros **Varying-length string** A string length of 0 **Date** The current date **Time** The current time **Timestamp** The current timestamp **Timestamp with time zone** The current timestamp with time zone **D** The column has a row ID data type (COLTYPE='ROWID') and the GENERATED BY DEFAULT attribute. **E** The column is defined with the FOR EACH ROW ON UPDATE and GENERATED ALWAYS attributes. **F** The column is defined with the FOR EACH ROW ON UPDATE and GENERATED BY DEFAULT attributes. **I** The column is defined with the AS IDENTITY and GENERATED ALWAYS attributes. **J** The column is defined with the AS IDENTITY and GENERATED BY DEFAULT attributes. **K** The column is defined for the implicit DOCID column for a base table that contains XML data. **L** The column is defined with the AS SECURITY LABEL attribute. **N** The column has no default value. **Q** The column is defined with the AS ROW BEGIN attribute. **R** The column is defined with the AS ROW END attribute.	G

Column name	Data type	Description	Use
DEFAULT (continued)	CHAR(1) NOT NULL	Default indicator: **S** The column has a default value that is the value of the SQL authorization ID of the process at the time a default value is used. **U** The column has a default value that is the value of the SESSION_USER special register at the time a default value is used. **Y** If the NULLS column is Y, the column has a default value of null. If the NULLS column is N, the default value depends on the data type of the column. **Data type** — **Default Value** **Numeric** — 0 **Fixed-length character string** — Blanks **Fixed-length graphic string** — Blanks **Fixed-length binary string** — Hexadecimal blanks **Varying-length string** — A string length of 0 **Date** — The current date **Time** — The current time **Timestamp** — The current timestamp **Timestamp with time zone** — The current timestamp with time zone **X** The column is defined with the AS TRANSACTION START ID attribute. **1** The column has a default value that is the string constant found in the DEFAULTVALUE column of this table row. The column has a graphic data type and has a default value that is the graphic string found in the DEFAULTVALUE column of this table row. **2** The column has a default value that is the floating-point constant found in the DEFAULTVALUE column of this table row. **3** The column has a default value that is the decimal constant found in the DEFAULTVALUE column of this table row. **4** The column has a default value that is the integer constant found in the DEFAULTVALUE column of this table row. **5** The column has a default value that is the hexadecimal character string found in the DEFAULTVALUE column of this table row.	G

Column name	Data type	Description	Use
DEFAULT (continued)	CHAR(1) NOT NULL	Default indicator: **6** The column has a default value that is the UX string found in the DEFAULTVALUE column of this table row. **7** The column has a graphic data type and has a default value that is the character string constant found in the DEFAULTVALUE column of this table row. **8** The column has a character data type and has a default value that is the graphic string constant found in the DEFAULTVALUE column of this table row. **9** The column has a default value that is the DECFLOAT constant found in the DEFAULTVALUE column of this table row.	G
KEYSEQ	SMALLINT NOT NULL	The numeric position of the column within the primary key of the table. The value is 0 if it is not part of a primary key.	G
FOREIGNKEY	CHAR(1) NOT NULL	Applies to character or CLOB columns, where it indicates the subtype of the data: **B** BIT data **M** MIXED data **S** SBCS data **blank** Indicates one of the following subtypes: • MIXED data if the encoding scheme is UNICODE, or if the encoding scheme is not UNICODE and the value of MIXED DATA on installation panel DSNTIPS is YES • SBCS data if the encoding scheme is not UNICODE and the value of MIXED DATA on the installation panel DSNTIPS is NO. For views defined prior to Version 7, subtype information is not available and the default (MIXED or SBCS) is used.	G
FLDPROC	CHAR(1) NOT NULL	Whether the column has a field procedure: **N** No **Y** Yes **blank** The column is for a view defined prior to Version 7. Views defined after Version 7 contain Y or N.	G
LABEL	VARCHAR(90) NOT NULL	The column label provided by the user with a LABEL statement; otherwise, the value is an empty string.	G
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics. The default value is '0001-01-01.00.00.00.000000'. If the value is '0001-01-02.00.00.00.000000', which indicates that an ALTER TABLE statement was executed to change the length of a VARCHAR column, RUNSTATS should be run to update the statistics before they are used. This is an updatable column.	G

Column name	Data type	Description	Use
DEFAULTVALUE	VARCHAR(1536) NOT NULL WITH DEFAULT	This field is meaningful only if the column being described is for a table (the TYPE column of the associated SYSTABLES row is T for table or G for created temporary table). When the DEFAULT column is 1, 2, 3, 4, 5, 6, 7, 8, or 9, this field contains the default value of the column. If the default value is a string constant or a hexadecimal constant (DEFAULT is 1, 5, 6, 7, or 8 respectively), the value is stored without delimiters. If the default value is a numeric constant (DEFAULT is 2, 3, 4, or 9), the value is stored as specified by the user, including sign and decimal point representation, or special constant values, as appropriate for the constant. When the DEFAULT column is S or U and the default value was specified when a new column was defined with the ALTER TABLE statement, this field contains the value of the CURRENT SQLID or SESSION_USER special register at the time the ALTER TABLE statement was executed. Remember that this default value applies only to rows that existed before the ALTER TABLE statement was executed. When the DEFAULT column is L and the column was added as a new column with the ALTER TABLE statement, this field contains the security label of the user at the time the ALTER TABLE statement was executed. Remember that this default value applies only to rows that existed before the ALTER TABLE statement was executed.	G
COLCARDF	FLOAT NOT NULL WITH DEFAULT	Estimated number of distinct values in the column. For an indicator column, this is the number of LOBs that are not null and have a length greater than zero. The value is -1 if statistics have not been gathered. The value is -2 if the column is a LOB column. This is an updatable column.	S
COLSTATUS	CHAR(1) NOT NULL WITH DEFAULT	Indicates the status of the definition of a column: **I** The definition is incomplete because a LOB table space, auxiliary table, or index on an auxiliary table has not been created for the column. **blank** The definition is complete.	G
LENGTH2	INTEGER NOT NULL WITH DEFAULT	Maximum length of the data retrieved from the column. Possible values are: **0** Column is not a LOB or ROWID column **40** For a ROWID column, the length of the returned value **1 to 2,147,483,647 bytes** For a LOB column, the maximum length	G
DATATYPEID	INTEGER NOT NULL WITH DEFAULT	For a built-in data type, the internal ID of the built-in type. For a distinct type, the internal ID of the distinct type. If the column was created prior to Version 6, the value is 0.	S

Column name	Data type	Description	Use
SOURCETYPEID	INTEGER NOT NULL WITH DEFAULT	For a built-in data type, 0. For a distinct type, the internal ID of the built-in data type upon which the distinct type is based. If the column was created prior to Version 6, the value is 0.	S
TYPESCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT 'SYSIBM'	If COLTYPE is 'DISTINCT', the schema of the distinct type. Otherwise, the value is 'SYSIBM'.	G
TYPENAME	VARCHAR(128) NOT NULL WITH DEFAULT	If COLTYPE is 'DISTINCT', the name of the distinct type. Otherwise, the value is the same as the value of the COLTYPE column. TYPENAME is set only for columns created in Version 6 or later. The value for columns created earlier is not filled in.	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Timestamp when the column was created. The value is '0001-01-01.00.00.00.000000' if the column was created prior to migration to Version 6 or if the column is in a catalog table.	G
STATS_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The type of statistics gathered: **blank** Statistics have not been collected or varchar column statistical values are padded. **N** Varchar column statistical values are not padded. This is an updatable column.	G
PARTKEY_COLSEQ	SMALLINT NOT NULL WITH DEFAULT	The numeric position of the column within the partitioning key of the table. The value is 0 if it is not part of the partitioning key. This column is applicable only if the table uses table-controlled partitioning.	G
PARTKEY_ORDERING	CHAR(1) NOT NULL WITH DEFAULT	Order of the column in the partitioning key: **A** Ascending **D** Descending **blank** Column is not used as part of a partitioning key This column is applicable only if the table uses table-controlled partitioning.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	Timestamp when alter occurred.	G
CCSID	INTEGER NOT NULL WITH DEFAULT	CCSID of the column. 0 if the object was created prior to Version 8 or is not a string column. The value is also 0 if the object is not a VARBINARY column defined as a Unicode column.	G
HIDDEN	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates whether the column is implicitly hidden: **P** Partially hidden. The column is implicitly hidden from SELECT *. **N** Not hidden. The column is visible to all SQL statements.	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. See Release dependency indicators for the values.	G

Column name	Data type	Description	Use
HASHKEY_COLSEQ	SMALLINT NOT NULL WITH DEFAULT	The column's numeric position within the table's hash key. The value is 0 if the column is not part of the hash key. This column is applicable only if the table that use hash organization.	G
CONTROL_ID	INTEGER NOT NULL WITH DEFAULT	Internal identifier of the column access control mask defined for this column. 0 if no column access control mask is defined for the column.	S
XML_TYPEMOD_ID	INTEGER NOT NULL WITH DEFAULT	The ID of the XML type modifier. It is set to 0 if the column is not an XML column or has no XML type modifier.	G
PERIOD	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the column is the start or the end of the period for a SYSTEM_TIME or BUSINESS_TIME period: **B** Column is the start of period BUSINESS_TIME. **C** Column is the end of period BUSINESS_TIME. **S** Column is the start of period SYSTEM_TIME. **T** Column is the end of period SYSTEM_TIME. **blank** Column is not used as either the start or the end of a period.	G
GENERATED_ ATTRIBUTE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the columns generated attribute: **A** Column is defined as GENERATED_ALWAYS. **D** Column is defined as GENERATED BY DEFAULT. **blank** Not applicable or the value of the DEFAULT column is A, D, E, F, I, or J or defined from a prior release of DB2.	G

SYSIBM.SYSCOLUMNS_HIST table

The SYSIBM.SYSCOLUMNS_HIST table contains rows from SYSCOLUMNS.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table or view that contains the column.	G
TBCREATOR	VARCHAR(128) NOT NULL	Schema or qualifier of the table or view that contains the column.	G
COLNO	SMALLINT NOT NULL	Numeric place of the column in the table or view. For example 4 (out of 10).	G

Column name	Data type	Description	Use
COLTYPE	CHAR(8) NOT NULL	The type of the column specified in the definition of the column: **INTEGER** Large integer **SMALLINT** Small integer **FLOAT** Floating-point **CHAR** Fixed-length character string **VARCHAR** Varying-length character string **LONGVAR** Varying-length character string (for columns that were added before Version 9) **DECIMAL** Decimal **GRAPHIC** Fixed-length graphic string **VARG** Varying-length graphic string **LONGVARG** Varying-length graphic string (for columns that were added before Version 9) **DATE** Date **TIME** Time **TIMESTAMP** Timestamp **TIMESTZ** Timestamp with time zone **BLOB** Binary large object **CLOB** Character large object **DBCLOB** Double-byte character large object **ROWID** Row ID data type **DISTINCT** Distinct type **XML** XML data type **BIGINT** Big integer **BINARY** Fixed-length binary string **VARBIN** Varying-length binary string **DECFLOAT** Decimal floating point	G

Column name	Data type	Description	Use
LENGTH	SMALLINT NOT NULL	Length attribute of the column or, in the case of a decimal column, its precision. The number does not include the internal prefixes that are used to record the actual length and null state, where applicable. **INTEGER** 4 **SMALLINT** 2 **FLOAT** 4 or 8 **CHAR** Length of string **VARCHAR** Maximum length of string **LONGVAR** Maximum length of string (for columns that were added before Version 9) **DECIMAL** Precision of number **GRAPHIC** Number of DBCS characters **VARGRAPHIC** Maximum number of DBCS characters **LONGVARG** Maximum number of DBCS characters (for columns that were added before Version 9) **DATE** 4 **TIME** 3 **TIMESTAMP WITHOUT TIME ZONE** The integral part of ((p+1)/2) + 7 where p is the precision of the timestamp **TIMESTAMP WITH TIME ZONE** The integral part of ((p+1)/2) + 9 where p is the precision of the timestamp **BLOB** 4 - The length of the field that is stored in the base table. The maximum length of the LOB column is found in LENGTH2. **CLOB** 4 - The length of the field that is stored in the base table. The maximum length of the CLOB **DBCLOB** 4 - The length of the field that is stored in the base table. The maximum length of the DBCLOB column is found in LENGTH2. **ROWID** 17 - The maximum length of the stored portion of the identifier. **DISTINCT** The length of the source data type. **XML** 6 **BIGINT** 8 **BINARY** The length of the string **VARBINARY** The maximum length of string **DECFLOAT** 8 or 16	G

Column name	Data type	Description	Use
LENGTH2	INTEGER NOT NULL	Maximum length of the data retrieved from the column. Possible values are: **0** Column is not a LOB or ROWID column **40** For a ROWID column, the length of the returned value **1 to 2 147 483 647 bytes** For a LOB column, the maximum length	G
NULLS	CHAR(1) NOT NULL	Whether the column can contain null values: **N** No **Y** Yes	G
HIGH2KEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Second highest value of the column. Blank if statistics have not been gathered, or the column is an indicator column or a column of an auxiliary table. If the column has a non-character data type, the data might not be printable.	S
LOW2KEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Second lowest value of the column. Blank if statistics have not been gathered, or the column is an indicator column or a column of an auxiliary table. If the column has a non-character data type, the data might not be printable.	S
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics. The default value is '0001-01-01.00.00.00.000000'. If the value is '0001-01-02.00.00.00.000000', which indicates that an ALTER TABLE statement was executed to change the length of a VARCHAR column, RUNSTATS should be run to update the statistics before they are used.	G
COLCARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	Estimated number of distinct values in the column. For an indicator column, this is the number of LOBs that are not null and have a length greater than zero. The value is -1 if statistics have not been gathered. The value is -2 if the column is a LOB column.	S
IBMREQD	CHAR(1) NOT NULL DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
STATS_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The type of statistics gathered: **blank** Statistics have not been collected or varchar column statistical values are padded. **N** Varchar column statistical values are not padded. This is an updatable column.	G

SYSIBM.SYSCONSTDEP table

The SYSIBM.SYSCONSTDEP table records dependencies on check constraints or user-defined defaults for a column.

Column name	Data type	Description	Use
BNAME	VARCHAR(128) NOT NULL	Name of the object on which the dependency exists.	G
BSCHEMA	VARCHAR(128) NOT NULL	Schema of the object on which the dependency exists.	G
BTYPE	CHAR(1) NOT NULL	Type of object on which the dependency exists: **F** Function instance	G
DTBNAME	VARCHAR(128) NOT NULL	Name of the table to which the dependency applies.	G
DTBCREATOR	VARCHAR(128) NOT NULL	The schema of the table to which the dependency applies.	G
DCONSTNAME	VARCHAR(128) NOT NULL	If DTYPE = 'C', the unqualified name of the check constraint. If DTYPE = 'D', a column name.	G
DTYPE	CHAR(1) NOT NULL	Type of object: **C** Check constraint **D** User-defined default constant	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
DTBOWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the owner of the table or a zero length string for tables that were created in a DB2 release prior to Version 9.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: **blank** Authorization ID **R** Role	G

SYSIBM.SYSCONTEXT table

The SYSIBM.SYSCONTEXT table contains one row for each trusted context.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the trusted context.	G
CONTEXTID	INTEGER NOT NULL GENERATED ALWAYS AS IDENTITY	Internal context ID.	G
DEFINER	VARCHAR(128) NOT NULL	Authorization ID or role that defined the trusted context.	G
DEFINERTYPE	CHAR(1) NOT NULL	The type of the definer: **L** Role **blank** Authorization ID	G
SYSTEMAUTHID	VARCHAR(128) NOT NULL	The DB2 primary authorization ID that is used to establish the connection. For remote requests, SYSTEMAUTHID is derived from the system user ID that is provided by an external entity, such as a middleware server. For local requests, SYSTEMAUTHID depends on one of the following sources of the address space: **BATCH** USER parameter on JOB statement **RRSAF** USER parameter on JOB statement or RACF user **TSO** TSO logon ID	G
DEFAULTROLE	VARCHAR(128) NOT NULL	Name of the trusted context default role.	G
OBJECTOWNERTYPE	CHAR(1) NOT NULL	Whether the ROLE AS OBJECT OWNER AND QUALIFIER clause is specified in the definition of this trusted context: **L** ROLE AS OBJECT OWNER AND QUALIFIER is specified. A role owns any object created in the trusted context. The role is used as the default for the CURRENT SCHEMA special register. The role is included in the SQL PATH. **blank** ROLE AS OBJECT OWNER is not specified. An authorization ID owns any object created in the trusted context.	G
CREATEDTS	TIMESTAMP NOT NULL	The time when the trusted context is created.	G
ALTEREDTS	TIMESTAMP NOT NULL	The time when the trusted context is last altered.	G

Column name	Data type	Description	Use
ENABLED	CHAR(1) NOT NULL	The status of the trusted context: **Y** Enabled **N** Disabled	G
ALLOWPUBLIC	CHAR(1) NOT NULL	Whether the connection is allowed to be reused for PUBLIC: **Y** Connection reuse is allowed **N** Connection reuse is not allowed	G
AUTHENTICATE-PUBLIC	CHAR(1) NOT NULL	Whether authentication is required for PUBLIC when ALLOWPUBLIC is Y: **Y** Authentication token is required for PUBLIC. For local requests, the token is the password. For remote requests, the token can be a password, a RACF passticket, or a KERBEROS token **N** Authentication is not required	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. See Release dependency indicators for the values.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
REMARKS	VARCHAR(762) NOT NULL	A character string that is provided using the COMMENT statement.	G
DEFAULT-SECURITYLABEL	VARCHAR(24) NOT NULL	Name of the context default RACF security label.	G

SYSIBM.SYSCONTEXTAUTHIDS table

The SYSIBM.SYSCONTEXTAUTHIDS table contains one row for each authorization ID with which the trusted context can be used.

Column name	Data type	Description	Use
CONTEXTID	INTEGER NOT NULL	The internal trusted context ID.	G
AUTHID	VARCHAR(128) NOT NULL	The primary authorization ID that can reuse a connection. When using RACF, this is a RACF profile name that contains the primary authorization IDs that are permitted to use the connection in the identified trusted context.	G
AUTHENTICATE	CHAR(1) NOT NULL	Whether authentication is required for the authorization ID in the AUTHID column: **Y** Authentication token is required for the authorization ID. For local requests, the token is the password. For remote requests, the token can be a password, a RACF passticket, or a Kerberos token **N** Authentication is not required	G
ROLE	VARCHAR(128) NOT NULL	The role for the authorization ID in the AUTHID column. The role supersedes the default role that is defined for the trusted context.	G
CREATEDTS	TIMESTAMP NOT NULL	The time when the authorization ID is added to the trusted context.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
SECURITYLABEL	VARCHAR(24) NOT NULL	RACF security label for AUTHID. The security label supersedes the default security label, if any, that is defined for the context.	G

SYSIBM.SYSCONTROLS table

The SYSIBM.SYSCONTROLS table contains one row for each row permission and column mask.

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	Schema of the row permission or column mask.	G
NAME	VARCHAR(128) NOT NULL	Name of the row permission or column mask.	G
OWNER	VARCHAR(128) NOT NULL	Owner of the row permission or column mask.	G
OWNERTYPE	CHAR(1) NOT NULL	Indicates the type of the owner: **blank** An authorization ID **L** Role	G
TBSCHEMA	VARCHAR(128) NOT NULL	Schema of the table for which the row permission or column mask is defined.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table for which the row permission or column mask is defined.	G
TBCORRELATION	VARCHAR(128) NOT NULL WITH DEFAILT	If specified, the correlation name of the table for which the row permission or column mask is defined. Otherwise, the value is an empty string.	G
COLNAME	VARCHAR(128) NOT NULL	Column name for which the column mask is defined. Blank if this is a row permission.	G
COLNO	SMALLINT NOT NULL	Column number for which the column mask is defined. 0 if this is a row permission.	G
CONTROL_ID	INTEGER NOT NULL GENERATED ALWAYS AS IDENTITY	Internal access control ID.	S
CONTROL_TYPE	CHAR(1) NUT NULL	Indicates the type of the access control object: **R** Row permission **M** Column mask	G
ENFORCED	CHAR(1) NUT NULL	Indicates the type of the access enforced by the row permission. Column mask always has a value of 'A'. **A** All access	G
IMPLICIT	CHAR(1) NUT NULL	Indicates whether the row permission was implicitly created: **N** The row permission was explicitly created or this is a column mask **Y** The row permission was implicitly created	G

Column name	Data type	Description	Use
ENABLE	CHAR(1) NUT NULL	Indicates whether the row permission or the column mask is enabled for access control: **N** Not enabled **Y** Enabled	G
STATUS	CHAR(1) NUT NULL	Indicates the status of the row permission or column mask definition: **blank** The definition of the row permission or column mask is complete. **R** An error occurred when an attempt was made to regenerate the row permission or column mask.	G
CREATEDTS	TIMESTAMP NOT NULL	The timestamp when the row permission or column mask was created.	G
RELCREATED	CHAR(1) NUT NULL	The release of DB2 in which the row permission or column mask was created. See Release dependency indicators for values.	G
ALTEREDTS	TIMESTAMP NOT NULL	The timestamp when the row permission or column mask was last changed.	G
REMARKS	VARCHAR(762) NOT NULL	A character string provided by using the COMMENT ON statement.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
ENVID	INTEGER NOT NULL	Internal identifier of the environment.	G
ROWID	ROWID	Row identifier to support LOB columns in the table.	G
RULETEXT	CLOB(2MB) NOT NULL	The source text of the search condition or expression portion of the CREATE PERMISSION or CREATE MASK statement. **Note:** The lowercase letters in ordinary tokens are folded to uppercase in the text. However, lowercase letters in ordinary tokens are folded to uppercase in a C or Java program only if the appropriate precompiler option is specified.	G
DESCRIPTOR	BLOB(2MB) NOT NULL	Internal description of the row permission or column mask	S

SYSIBM.SYSCOPY table

The SYSIBM.SYSCOPY table contains information needed for recovery.

Column name	Data type	Description	Use
DBNAME	CHAR(8) NOT NULL	Name of the database.	G
TSNAME	CHAR(8) NOT NULL	Name of the target table space or index space.	G
DSNUM	INTEGER NOT NULL	Data set number within the table space. For partitioned table spaces, this value corresponds to the partition number for a single partition copy, or 0 for a copy of an entire partitioned table space or index space.	G
ICTYPE	CHAR(1) NOT NULL	Type of operation: **A** ALTER **B** REBUILD INDEX **C** CREATE **D** CHECK DATA LOG(NO) (no log records for the range are available for RECOVER utility) **E** RECOVER (to current point) **F** COPY FULL YES **I** COPY FULL NO **J** REORG TABLESPACE or LOAD REPLACE compression dictionary write to log **L** SQL (type of operation) **M** MODIFY RECOVERY utility **P** RECOVER TOCOPY or RECOVER TORBA (partial recovery point) **Q** QUIESCE **R** LOAD REPLACE LOG(YES) **S** LOAD REPLACE LOG(NO) **T** TERM UTILITY command **V** REPAIR VERSIONS utility **W** REORG LOG(NO) **X** REORG LOG(YES) **Y** LOAD LOG(NO) **Z** LOAD LOG(YES)	G
	CHAR(6) NOT NULL	Not used	N

Column name	Data type	Description	Use
START_RBA	CHAR(10) NOT NULL FOR BIT DATA	An 80-bit positive integer that contains the RBA/LRSN of a point in the DB2 recovery log. (The LRSN is the RBA in a data-sharing environment.) • For ICTYPE I or F, the starting point for all updates since the image copy was taken • For ICTYPE J, the RBA/LRSN of the compression dictionary • For ICTYPE M, the RBA of the highest deleted SYSCOPY or SYSLGRNX record • For ICTYPE P, the point after the log-apply phase of point-in-time recovery • For ICTYPE Q, the point after all data sets have been successfully quiesced • For ICTYPE R or S, the end of the log before the start of the LOAD utility and before any data is changed • For ICTYPE T, the end of the log when the utility is terminated • For other values of ICTYPE, the end of the log before the start of the RELOAD phase of the LOAD or REORG utility. A SELECT from SYSIBM.SYSCOPY displays the START_RBA and PIT_RBA columns in either 6-byte or 10-byte format. Before CATENFM of SYSCOPY, the data and the display are in 6-byte format but in all migration modes in utility-output, SYSCOPY columns are displayed in 10-byte format. After CATENFM of SYSCOPY the data and the display are in 10-byte format with non-zero digits in low order 3 bytes. Digits in the low order 3 bytes are unrelated to the conversion of the BSDS or conversion of individual objects to EXTENDED format.	G
FILESEQNO	INTEGER NOT NULL	Tape file sequence number of the copy.	G
DEVTYPE	CHAR(8) NOT NULL	Device type the copy is on.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
DSNAME	CHAR(44) NOT NULL	For ICTYPE='P' (RECOVER TOCOPY only), "I", or 'F', DSNAME contains the data set name. Otherwise, DSNAME contains the name of the database and table space or index space in the form, *database-name.space-name*, or DSNAME is blank for any row migrated from a DB2 release prior to Version 4.	G
	CHAR(6) NOT NULL	Not used	N

Column name	Data type	Description	Use
SHRLEVEL	CHAR(1) NOT NULL	SHRLEVEL parameter on COPY (for ICTYPE F or I only): **C** Change **R** Reference **blank** Does not describe an image copy or was migrated from Version 1 Release 1 of DB2.	G
DSVOLSER	VARCHAR(1784) NOT NULL	One of the following values: • If the operation is not an image copy operation that creates a FlashCopy® image copy with consistency (an image copy operation with the FLASHCOPY CONSISTENT option), this value is: – A comma-separated list of 6-byte volume serial numbers of the data set, if the data set is not catalogued. – Blank if the data set is cataloged. • If the operation is an image copy operation that creates a FlashCopy image copy with consistency (an image copy operation with the FLASHCOPY CONSISTENT option), this value is a comma-separated list of values of the following form: *memberID-ckptrba* *memberID* is a 3-digit ID for a member of a data sharing group. *ckptrba* is the 12-byte hexadecimal checkpoint RBA for the member.	G
TIMESTAMP	TIMESTAMP NOT NULL WITH DEFAULT	The date and time when the row was inserted. For the COPYTOCOPY utility, this value is the date and time when the row was inserted for the primary local site or primary recovery site copy. For an EXCHANGE DATA statement, this is the time that the statement is run.	G
ICBACKUP	CHAR(2) NOT NULL WITH DEFAULT	Specifies the type of image copy contained in the data set: **blank** LOCALSITE primary copy (first data set named with COPYDDN) **FC** FlashCopy copy **LB** LOCALSITE backup copy (second data set named with COPYDDN) **RP** RECOVERYSITE primary copy (first data set named with RECOVERYDDN) **RB** RECOVERYSITE backup copy (second data set named with RECOVERYDDN)	G
ICUNIT	CHAR(1) NOT NULL WITH DEFAULT	Indicates the media that the image copy data set is stored on: **D** DASD **T** Tape **blank** Medium is neither tape nor DASD, the image copy is from a DB2 release prior to Version 2 Release 3, or ICTYPE is not 'I' or 'F'.	G

Column name	Data type	Description	Use
STYPE	CHAR(1) NOT NULL WITH DEFAULT	When **ICTYPE=A**, the values are: **A** A partition was added to a table. **B** The MEMBER CLUSTER value was changed. **C** A column was added to a table and an index in different commit scopes, or a column was dropped from a table. **D** Either the DSSIZE attribute of the table space was altered or the default value of a column of a table was altered. **E** The data set numbers of a base table and its associated clone table are exchanged. **F** The page size attribute of the table space or index was altered. **G** An index was regenerated **H** The table was altered to hash organization, the size of the hash space was changed, or the hash organization was dropped. The value of the TTYPE column indicates the action taken. **I** The inline length attribute of the LOB column was altered by REORG. **L** The logging attribute of the table space was altered to LOGGED. **M** The MAXPARTITIONS attribute of the table space was altered. **N** An index was altered to not padded **O** The logging attribute of the table space was altered to NOT LOGGED. **P** An index was altered to padded **R** A table was altered to rotate partitions. **S** The SEGSIZE attribute of the table space was altered. **V** A column in a table was altered for a numeric data type change and the column is in an index. **X** A REORG dropped one or more empty partitions from the related table space. **Y** An index was altered to COPY YES **Z** A column that is in the key of an index that was versioned prior to DB2 Version 8 was altered. When **ICTYPE=C**, the values are: **L** The logging attribute of the table space was LOGGED. **O** The logging attribute of the table space was NOT LOGGED. When **ICTYPE=E**, the values are: **B** RECOVER utility with the BACKOUT keyword. **blank** RECOVER utility without the BACKOUT keyword. When **ICTYPE=F**, the values are: **C** DFSMS concurrent copy ("I" instance of the table space) **J** DFSMS concurrent copy ("J" instance of the table space) **N** A FlashCopy copy is not consistent. **Q** Sequential copy is consistent **R** LOAD REPLACE(YES) Values for STYPE continue on next page.	G

Column name	Data type	Description	Use
STYPE (continued)		When **ICTYPE=F**, the values are (continued): **S** LOAD REPLACE(NO) **T** FlashCopy copy is consistent. **U** Sequential copy is not consistent **V** ALTER INDEX NOT PADDED **W** REORG LOG(NO) **X** REORG LOG(YES) **blank** DB2 image copy When **ICTYPE=L**, the value is: **M** Mass DELETE, TRUNCATE TABLE, DROP TABLE, or ALTER TABLE ROTATE PARTITION. The LOWDSNUM column contains the table OBID of the affected table. The MERGECOPY utility, when used to merge an embedded copy with subsequent incremental copies, also produces a record that contains ICTYPE=F and the STYPE of the original image copy (R, S, W, or X). When **ICTYPE = M** and the MODIFY RECOVERY utility was executed to delete SYSCOPY and/or SYSLGRNX records, the value is R. When **ICTYPE=O**, the values are: **B** A table space or partition that was in reordered row format was recovered to a point in time when it was in basic row format. **R** A table space or partition was converted to reordered row format as a result of REORG or LOAD REPLACE. When **ICTYPE=P**, the values are: **B** Recover to a point in time with the BACKOUT YES option was run. **C** Recover to a point in time without using logonly with consistency. **L** Recover to a point in time using logonly without consistency. **M** Recover to a point in time using logonly with consistency. **blank** Recover to a point in time without using logonly without consistency. When **ICTYPE=Q** and option WRITE(YES) is in effect when the quiesce point is taken, the value is W. When **ICTYPE=R or S**, the values are: **A** Resetting REORG pending status **T** First materializing the default value for a row change timestamp column When **ICTYPE=T**, this field indicates which COPY utility was terminated by the TERM UTILITY command or the START DATABASE command with the ACCESS(FORCE) option. The values are: **F** COPY FULL YES **I** COPY FULL NO	

Column name	Data type	Description	Use
STYPE (continued)		When **ICTYPE=W or X**, the values are: **A** Resetting REORG pending status or REBALANCE **T** First materializing the default value for a row change timestamp column For other values of ICTYPE, the value is blank.	
PIT_RBA	CHAR(10) NOT NULL WITH DEFAULT FOR BIT DATA	The meaning of the value depends on the value of the ICTYPE column: **ICTYPE='P'** The LRSN for the point in the DB2 log. (The LRSN is the RBA in a non-data-sharing environment) The value indicates the stop location of a point-in-time recovery. If a record contains ICTYPE='P' and PIT_RBA=X'000000000000', the copy pending status is active and a full image copy is required. If such a record is encountered during fallback processing of RECOVER, the recover job fails, and a point-in-time recovery is required. PIT_RBA can be zero if the point-in-time recovery is completed by the fall-back processing of RECOVER, or if ICTYPE=P from a prior release of DB2. **ICTYPE='F' or 'I' and SHRLEVEL='C'** The current RBA or LRSN that corresponds to the point in the DB2 log when the SHRLEVEL CHANGE copy completes. **ICTYPE=J** The RBA where the compression dictionary is written to the log. In data sharing environments, it is the RBA of the of the member writing to the log. **ICTYPE='M'** The RBA/LRSN for the end of the log when the utility completes. For other all other ICTYPE values, this field contains X'00000000000000000000'. A SELECT from SYSIBM.SYSCOPY displays the START_RBA and PIT_RBA columns in either 6-byte or 10-byte format. Before CATENFM of SYSCOPY, the data and the display are in 6-byte format but in all migration modes in utility-output, SYSCOPY columns are displayed in 10-byte format. After CATENFM of SYSCOPY the data and the display are in 10-byte format with non-zero digits in low order 3 bytes. Digits in the low order 3 bytes are unrelated to the conversion of the BSDS or conversion of individual objects to EXTENDED format.	G
GROUP_MEMBER	CHAR(8) NOT NULL WITH DEFAULT	The DB2 data sharing member name of the DB2 subsystem that performed the operation. This column is blank if the DB2 subsystem was not in a DB2 data sharing environment at the time the operation was performed.	G

Column name	Data type	Description	Use
OTYPE	CHAR(1) NOT NULL WITH DEFAULT 'T'	Type of object that the recovery information is for: **I** Index space **T** Table space	G
LOWDSNUM	INTEGER NOT NULL WITH DEFAULT	Partition number of the lowest partition in the range for SYSCOPY records created for REORG and LOAD REPLACE for resetting a REORG pending status. Version number of an index for SYSCOPY records created for a COPY (ICTYPE=F) of an index space (OTYPE=I). (An index is versioned when a VARCHAR column in the index key is lengthened.) When ICTYPE = F or I, DSNUM = 0 and OTYPE is not equal to I, LOWDSNUM = 1.	G
HIGHDSNUM	INTEGER NOT NULL WITH DEFAULT	Partition number of the highest partition in the range. This column is valid only for SYSCOPY records created for REORG and LOAD REPLACE for resetting REORG pending status.When ICTYPE = F or I, DSNUM = 0 and OTYPE is not equal to I, HIGHDSNUM is the number of the highest partition that is copied.	G
COPYPAGESF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of pages written to the copy data set. For inline copies, this number might include pages appearing more than once in the copy data set.	G
NPAGESF	FLOAT(8) NOT NULL WITH DEFAULT -1	The number of pages in the table space or index at the time of COPY. This number might include pre-formatted pages that are not actually copied. When **ICTYPE=A, SYTPE=H, and TTYPE=S or D**, this column contains the previous HASHDATAPAGES value. When **ICTYPE=A, SYTPE=H, and TTYPE=A** this column contains zero.	G
CPAGESF	FLOAT(8) NOT NULL WITH DEFAULT -1	Total number of changed pages.	G
JOBNAME	CHAR(8) NOT NULL WITH DEFAULT	Job name of the utility. For changes that cause pending definition changes to object, this column might not be accurate.	G
AUTHID	CHAR(8) NOT NULL WITH DEFAULT	Authorization ID of the utility.For changes that cause pending definition changes to object, this column might not be accurate.	G
OLDEST_VERSION	SMALLINT NOT NULL WITH DEFAULT	When ICTYPE= B, F, I, S, W, or X, the version number of the oldest format of data for an object. For other values of ICTYPE, the value is 0.	G
LOGICAL_PART	INTEGER NOT NULL WITH DEFAULT	Logical partition number.	G

Column name	Data type	Description	Use
LOGGED	CHAR(1) NOT NULL WITH DEFAULT	Indicates the logging attribute of the table space at the time the SYSCOPY record is written: • Y — indicates that the logging attribute of the table space is LOGGED • N — indicates that the logging attribute of the table spaces is NOT LOGGED • blank — indicates that the row was inserted prior to Version 9 or is not specified. For non-LOB table spaces or an index space, blank indicates that the logging attribute is LOGGED.	G

Column name	Data type	Description	Use
TTYPE	CHAR(8) NOT NULL WITH DEFAULT	When **ICTYPE=A and STYPE=B**, this column indicates if the previous value for the MEMBER CLUSTER attribute is being used: **Y** The previous member cluster attribute of the table space is being used. **N** The previous member cluster attribute of the table space is not being used. When **ICTYPE=A and STYPE=C**, this column indicates if a column is added or dropped from a table: **blank** A column was added to a table. **D** A column was dropped from a table. When **ICTYPE=A and STYPE=D**, this column contains the previous DSSIZE attribute value for the table space in units of G, M, or K when the DSSIZE attribute is altered. This column is blank if the default value of a column of a table was altered. When **ICTYPE=A and STYPE=F**, this column indicates the previous page size attribute value for the table space in units of K. When **ICTYPE=A and STYPE=H** this column indicates a change that was applied to the hash organization of the table: **A** Hash organization was added. The record is written when the hash space is materialized at REORG. **D** Hash organization was dropped. The record is written immediately when the ALTER statement is issued. **S** The size of the hash space was changed. The value of the NAPGESF column contains the previous HASHDATAPAGES value. The record is written when the hash space is materialized at REORG. When **ICTYPE=A and STYPE=I**, this column indicates that the inline length of a LOB column was altered: **D** Indicates that REORG decremented the inline length of the LOB column **I** Indicates that REORG incremented the inline length of the LOB column When **ICTYPE=A and STYPE=M**, this column indicates either the previous value of the MAXPARTITIONS attribute for the table space or the type of table space conversion that was performed on the table space. **I** The table space was converted from a single-table simple table space to a partition-by-growth universal table space. **n** The previous value of the MAXPARTITIONS attribute for the table space. **S** The table space was converted from single-table segmented table space to a partition-by-growth universal table space.	G

Column name	Data type	Description	Use
TTYPE (cont)		When **ICTYPE=A and STYPE=S**, this column indicates either the previous value of the SEGSIZE attribute for the table space or the type of table space conversion that was performed on the table space. **n** The previous value of the SEGSIZE attribute for the table space. **P** The table space was converted from a partitioned table space to a range-partitioned universal table space. When **ICTYPE=E**, this column indicates if the full recovery reset the object: **blank** The full recovery reset the object **N** The full recovery did not reset the object When **ICTYPE=F and STYPE=N, Q, T, or U**, this column indicates the utility that made the FlashCopy: **A** LOAD RESUME LOG NO **B** REBUILD **C** COPY **D** LOAD RESUME LOG YES **E** LOAD SHRLEVEL CHANGE **L** LOAD **P** REPAIR **R** LOAD REPLACE LOG YES **S** LOAD REPLACE LOG NO **T** COPYTOCOPY **W** REORG TABLESPACE LOG NO **X** REORG TABLESPACE LOG YES When **ICTYPE=I**, TTYPE of S indicates that the directory pages for the index image copy are at the front of each partition and are indicated with a 'V' or '8'. When **ICTYPE=P, R, S, W, X**, this column provides additional diagnostic information: **B** Indicates that the RBA or LRSN format changed to basic 6-byte format. **BRF** Indicates that the row format is the basic row format. **BRF I** Indicates that the row format is the basic row format, and the FORMAT INTERNAL option was specified. **E** Indicates that the RBA or LRSN format changed to extended 10-byte format. **F** Indicates that the REORG utility was run with the FASTSWITCH YES option. **RRF** Indicates that the row format is the reordered row format. **RRF I** Indicates that the row format is the reordered row format, and the FORMAT INTERNAL option was specified. **S** Indicates that the REORG utility was run with the FASTSWITCH NO option.	

Column name	Data type	Description	Use
TTYPE (cont)		When **ICTYPE=M and STYPE=R**, this column indicates whether the MODIFY RECOVERY utility deleted rows from SYSIBM.SYSLGRNX. **blank** MODIFY RECOVERY deleted rows from SYSIBM.SYSLGRNX. **N** MODIFY RECOVERY did not delete rows from SYSIBM.SYSLGRNX. When **ICTYPE=T**, TTYPE of B indicates that a broken page was detected during copy. When **ICTYPE=W or X and STYPE=H**, this column indicates the prior value of HASHDATAPAGES. When **ICTYPE=Y or Z**, this column indicates whether the object was loaded when the FORMAT INTERNAL option was specified. **blank** Indicates that the FORMAT INTERNAL option was not specified during LOAD. **I** Indicates that the FORMAT INTERNAL option was specified during LOAD. When **ICTYPE=A-A, A-R, B, C, P, R, S, W, or X** and the page format was changed by the ALTER ADD PARTITION, ALTER ROTATE PARTITION, CREATE, LOAD REPLACE, REBUILD, REORG, or RECOVER utilities: **B** Indicates that the page format was converted to basic page format with 6-byte RBA or LRSN values. **E** Indicates that the page format was converted to extended page format with 10-byte RBA or LRSN values. When **ICTYPE=A and STYPE=A or R:** **B** Indicates that the page format was converted to basic page format with 6-byte RBA or LRSN values. **E** Indicates that the page format was converted to extended page format with 10-byte RBA or LRSN values.	
INSTANCE	SMALLINT NOT NULL WITH DEFAULT 1	When STYPE = E and ICTYPE = A, INSTANCE indicates the data set instance number of a base object after an EXCHANGE statement completes. The value of the INSTANCE column for the last data exchange will match the value of the INSTANCE column for the SYSIBM.SYSTABLESPACE table. For an image copy, INSTANCE indicates the instance number of the current base objects (table and index).	G
RELCREATED	CHAR(1) NOT NULL WITH DEFAULT	The release of DB2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G

Column name	Data type	Description	Use
MODECREATED	CHAR(2) NOT NULL WITH DEFAULT	The latest mode to which the DB2 subsystem had been migrated when the SYSCOPY record was written: **C** Conversion mode **E** Enabling-new-function mode **N** New-function mode	

SYSIBM.SYSCTXTTRUSTATTRS table

The SYSIBM.SYSCTXTTRUSTATTRS table contains one row for each list of attributes for a given trusted context.

Column name	Data type	Description	Use
CONTEXTID	INTEGER NOT NULL	The internal trusted context ID.	G
NAME	VARCHAR(128) NOT NULL	Name of the trust attribute. Possible values including the following attributes: • An IPv4 address is represented as a dotted decimal IP address. An example of an IPv4 address is '9.112.46.111'. • An IPv6 address is represented as a colon hexadecimal address. An example of an IPv6 address is '2001:0DB8:0000:0000:0008:0800:200C:417A', which can also be expressed in a compressed form as '2001:DB8::8:800:200C:417A'. • A domain name which is converted to an IP address by the domain name server where a resulting IPv4 or IPv6 address is determined. • A job or started task name for local applications. If the job name ends with *, any job name that matches the characters prior to * in the specified job name are considered for establishing the trusted connection. • A network access security zone name in the RACF SERVAUTH class.	G
VALUE	VARCHAR(254) NOT NULL	The value of the trust attribute.	G
CREATEDTS	TIMESTAMP NOT NULL	The time when the attribute is created.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSDATABASE table

The SYSIBM.SYSDATABASE table contains one row for each database, except for database DSNDB01.

Column name	Data type	Description	Use
NAME	VARCHAR(24) NOT NULL	Database name.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the database.	G
STGROUP	VARCHAR(128) NOT NULL	Name of the default storage group of the database; blank for a system database.	G
BPOOL	CHAR(8) NOT NULL	Name of the default buffer pool of the table space; blank for a system table space.	G
DBID	SMALLINT NOT NULL	Internal identifier of the database. If there were 32511 databases or more when this database was created, the DBID is a negative number.	S
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
CREATEDBY	VARCHAR(128) NOT NULL WITH DEFAULT	Primary authorization ID of the user who created the database.	G
	CHAR(1) NOT NULL WITH DEFAULT	Not used	N
	TIMESTAMP NOT NULL WITH DEFAULT	Not used	N
TYPE	CHAR(1) NOT NULL WITH DEFAULT	Type of database: **blank** Not a work file database or a TEMP database. **T** A TEMP file database. **W** A work file database. The database is DSNDB07, or it was created with the WORKFILE clause and used as a work file database by a member of a DB2 data sharing group.	G
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The DB2 data sharing member name of the DB2 subsystem that uses this work file database. This column is blank if the work file database was not created in a DB2 data sharing environment, or if the database is not a work file database as indicated by the TYPE column.	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the CREATE statement was executed for the database. For DSNDB04 and DSNDB06, the value is '1985-04-01.00.00.00.000000'.	G

Column name	Data type	Description	Use
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the most recent ALTER DATABASE statement was applied. If no ALTER DATABASE statement has been applied, ALTEREDTS has the value of CREATEDTS.	G
ENCODING_SCHEME	CHAR(1) NOT NULL WITH DEFAULT 'E'	Default encoding scheme for the database: **E** EBCDIC **A** ASCII **U** UNICODE **blank** For DSNDB04, a work file database, and a TEMP database.	G
SBCS_CCSID	INTEGER NOT NULL WITH DEFAULT	Default SBCS CCSID for the database. For a TEMP database, a work file database, or a database created in a DB2 release prior to Version 5, the value is 0.	G
DBCS_CCSID	INTEGER NOT NULL WITH DEFAULT	Default DBCS CCSID for the database. If mixed data is not used and the CCSID for the database is defined as EBCDIC or ASCII, the default value is 0. For a TEMP database, a work file database, or a database created in a DB2 release prior to Version 5, the value is 0.	G
MIXED_CCSID	INTEGER NOT NULL WITH DEFAULT	Default mixed CCSID for the database. If mixed data is not used and the CCSID for the database is defined as EBCDIC or ASCII, the default value is 0. For a TEMP database, a work file database, or a database created in a DB2 release prior to Version 5, the value is 0.	G
INDEXBP	CHAR(8) NOT NULL WITH DEFAULT 'BP0'	Name of the default buffer pool for indexes.	G
IMPLICIT	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates whether the database was implicitly created: **Y** The database was implicitly created **N** The database was explicitly created	G
CREATORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: **blank** Authorization ID **L** Role	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. See Release dependency indicators for the values.	G

SYSIBM.SYSDATATYPES table

The SYSIBM.SYSDATATYPES table contains one row for each user-defined type defined to the system.

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	Schema of the data type.	G
OWNER	VARCHAR(128) NOT NULL	Owner of the data type.	G
NAME	VARCHAR(128) NOT NULL	Name of the data type.	G
CREATEDBY	VARCHAR(128) NOT NULL	Primary authorization ID of the user who created the data type.	G
SOURCESCHEMA	VARCHAR(128) NOT NULL	Schema of the source data type.	G
SOURCETYPE	VARCHAR(128) NOT NULL	Name of the source type.	G
METATYPE	CHAR(1) NOT NULL	The class of data type: **A** User-defined ordinary array type **L** User-defined associative array type **T** Distinct type	G
DATATYPEID	INTEGER NOT NULL	Internal identifier of the data type.	S
SOURCETYPEID	INTEGER NOT NULL	Internal ID of the built-in data type on which the distinct type or array elements are based.	S
LENGTH	INTEGER NOT NULL	Maximum length or precision for a data type that is based on the IBM-defined DECIMAL data type. The data type can be a distinct type or an array type.	G
SCALE	SMALLINT NOT NULL	One of the following values: • For a data type that is based on the IBM-defined DECIMAL data type, the scale. The data type can be a distinct type or an array type. Number of fractional second digits for a data type that is based on the IBM-defined timestamp or timestamp with time zone type. • For a data type that is based on the IBM-defined TIMESTAMP or TIMESTAMP WITH TIME ZONE type, the number of fractional-second digits. • For any other data type, the value is 0. If the value is a timestamp, the LENGTH is 10 and the SCALE is 0, the number of fractional second digits is 6.	G

Column name	Data type	Description	Use
SUBTYPE	CHAR(1) NOT NULL	Subtype of the data type, if the source type is one of the character types. The data type can be a distinct type or an array type. Possible values are: **B** The subtype is FOR BIT DATA. **S** The subtype is FOR SBCS DATA. **M** The subtype is FOR MIXED DATA. **blank** The source type is not a character type.	G
CREATEDTS	TIMESTAMP NOT NULL	Time when the data type was created.	G
ENCODING_SCHEME	CHAR(1) NOT NULL	Encoding scheme of the data type: **A** ASCII **E** EBCDIC **U** UNICODE	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
REMARKS	VARCHAR(762) NOT NULL	A character string provided by the user with the COMMENT statement.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: **blank** Authorization ID **L** Role	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. See Release dependency indicators for the values.	G
INLINE_LENGTH	INTEGER NOT NULL WITH DEFAULT -1	The inline length attribute of the type if it is based on a LOB source type: **-1** This type does not specify INLINE LENGTH **greater than or equal to 0** The inline length attribute (in byte) of the type if it is based on a LOB source type	G
ARRAYLENGTH	BIGINT NOT NULL WITH DEFAULT	Maximum cardinality, if the data type is an array type. For all other data types, the value is 0.	G
ARRAYINDEXTYPEID	INTEGER NOT NULL WITH DEFAULT	Data type of the index, if the data types is an associative array type. For all other data types, the value is 0.	G
ARRAYINDEX- TYPELEN	BIGINT NOT NULL WITH DEFAULT	Maximum length of the array index, if the data types is an associative array type. For all other data types, the value is 0.	G
ARRAYINDEX- SUBTYPE	CHAR(1) NOT NULL WITH DEFAULT	Subtype of the array index: **B** The subtype is FOR BIT DATA. **S** The subtype is FOR SBCS DATA. **M** The subtype is FOR MIXED DATA. **blank** The array index is not a character type.	G

SYSIBM.SYSDBAUTH table

The SYSIBM.SYSDBAUTH table records the privileges that are held by users over databases.

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID or role of the user who granted the privileges. Could also be PUBLIC.	G
GRANTEE	VARCHAR(128) NOT NULL	Application ID of the user who holds the privilege. Could also be PUBLIC for a grant to PUBLIC.	G
NAME	VARCHAR(24) NOT NULL	Database name.	G
	CHAR(12) NOT NULL	Internal use only	I
	CHAR(6) NOT NULL	Not used	N
	CHAR(8) NOT NULL	Not used	N
GRANTEETYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantee: **blank** Authorization ID **L** Role	G
	CHAR(1) NOT NULL	Not used	N
AUTHHOWGOT	CHAR(1) NOT NULL	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. **blank** Not applicable **C** DBCTRL **D** DBADM **E** SECADM **G** ACCESSCTRL **L** SYSCTRL **M** DBMAINT **S** SYSADM	G
CREATETABAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can create tables within the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
CREATETSAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can create table spaces within the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G

Column name	Data type	Description	Use
DBADMAUTH	CHAR(1) NOT NULL	Whether the GRANTEE has DBADM authority over the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
DBCTRLAUTH	CHAR(1) NOT NULL	Whether the GRANTEE has DBCTRL authority over the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
DBMAINTAUTH	CHAR(1) NOT NULL	Whether the GRANTEE has DBMAINT authority over the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
DISPLAYDBAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can issue the DISPLAY command for the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
DROPAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can issue the ALTER DATABASE and DROP DATABASE statement: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
IMAGCOPYAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the COPY, MERGECOPY, MODIFY, and QUIESCE utilities on the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
LOADAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the LOAD utility to load tables in the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
REORGAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the REORG utility to reorganize table spaces and indexes in the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
RECOVERDBAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the RECOVER and REPORT utilities on table spaces in the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
REPAIRAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the DIAGNOSE and REPAIR utilities on table spaces and indexes in the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G

Column name	Data type	Description	Use
STARTDBAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the START command against the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
STATSAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the CHECK and RUNSTATS utilities against the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
STOPAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can issue the STOP command against the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
GRANTEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the GRANT statement was executed.	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: **blank** Authorization ID **L** Role	G

SYSIBM.SYSDBRM table

The SYSIBM.SYSDBRM table contains one row for each DBRM of each application plan.

Column name	Data type	Description	Use
NAME	VARCHAR(24) NOT NULL	Name of the DBRM.	G
TIMESTAMP	CHAR(8) NOT NULL FOR BIT DATA	Consistency token.	S
PDSNAME	VARCHAR(132) NOT NULL	Name of the partitioned data set of which the DBRM is a member.	G
PLNAME	VARCHAR(24) NOT NULL	Name of the application plan of which this DBRM is a part.	G
PLCREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the application plan.	G
	CHAR(8) NOT NULL	Not used	N
	CHAR(6) NOT NULL	Not used	N
QUOTE	CHAR(1) NOT NULL	SQL string delimiter for the SQL statements in the DBRM: **N** Apostrophe **Y** Quotation mark	G
COMMA	CHAR(1) NOT NULL	Decimal point representation for SQL statements in the DBRM: **N** Period **Y** Comma	G
HOSTLANG	CHAR(1) NOT NULL	The host language used: **B** Assembler language **C** OS/VS COBOL **D** C **F** Fortran **P** PL/I **2** VS COBOL II or IBM COBOL Release 1 (formerly called COBOL/370) **3** IBM COBOL (Release 2 or subsequent releases) **4** C++	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
CHARSET	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the system CCSID for SBCS data was 290 (Katakana) when the program was precompiled: **A** No **K** Yes	G

Column name	Data type	Description	Use
MIXED	CHAR(1) NOT NULL WITH DEFAULT	Indicates if mixed data was in effect when the application program was precompiled (for more on when mixed data is in effect, see "Character strings" on page 84): **N** No **Y** Yes	G
DEC31	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether DEC31 was in effect when the program was precompiled (for more on when DEC31 is in effect, see "Arithmetic with two decimal operands" on page 244): **blank** No **Y** Yes	G
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	Version identifier for the DBRM.	G
PRECOMPTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the DBRM was precompiled.	G
PLCREATORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: **blank** Authorization ID **L** Role	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. See Release dependency indicators for the values.	G

SYSIBM.SYSDEPENDENCIES table

The SYSIBM.SYSDEPENDENCIES table records the dependencies between objects.

Column name	Data type	Description	Use
BNAME	VARCHAR(128) NOT NULL	Name of the object on which another object is dependent. If BTYPE is F, the name is the specific name of the function. If BTYPE is W or Z, the name is the name of the table for which the period is defined.	G
BSCHEMA	VARCHAR(128) NOT NULL	Schema or qualifier of the object on which another object is dependent.	G
BCOLNAME	VARCHAR(128) NOT NULL WITH DEFAULT	Column name of the object on which another object is dependent.	G
BCOLNO	SMALLINT NOT NULL WITH DEFAULT	Column number of the object on which another object is dependent.	G
BTYPE	CHAR(1) NOT NULL	The type of object that is identified by BNAME, BSCHEMA, and BCOLNAME: **C** Column **E** INSTEAD OF trigger **F** Function **G** Global temporary table **I** Index **M** Materialized query table **O** Procedure **P** Partitioned table space **Q** Sequence **R** Table space **S** Synonym **T** Table **U** Distinct type **V** View **W** SYSTEM_TIME period **Z** BUSINESS_TIME period **0 (zero)** Alias	G
BOWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the owner of the object on which another object is dependent.	G

Column name	Data type	Description	Use
BOWNERTYPE	CHAR(1) NOT NULL	Type of creator of the object on which another object is dependent: **L** Role **blank** Authorization ID that is not a role	G
DNAME	VARCHAR(128) NOT NULL	Name of the object that has dependencies on another object.	G
DSCHEMA	VARCHAR(128) NOT NULL	Schema or qualifier of the object that has dependencies on another object.	G
DVERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier of the object that is identified by DSCHEMA and DNAME if the object has a version. This column contains a zero length string for the objects that are created prior to Version 10 and for the rows that correspond to objects without versions.	G
DCOLNAME	VARCHAR(128) NOT NULL	Column name of the object that has dependencies on another object.	G
DCOLNO	SMALLINT NOT NULL WITH DEFAULT	Column number of the object that has dependencies on another object.	G
DTYPE	CHAR(1) NOT NULL	The type of the object that is identified by DSCHEMA, DNAME, DCOLNAME, and DVERSION: **B** Trigger **C** Generated column **F** Function **I** Index **M** Materialized query table **O** Procedure **V** View **X** Row permission **Y** Column mask	G
DOWNER	VARCHAR(128) NOT NULL	Authorization ID of the owner of the object that has dependencies on another object.	G
DOWNERTYPE	CHAR(1) NOT NULL	Type of creator of the object that has dependencies on another object: **L** Role **blank** Authorization ID if not a role	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

Column name	Data type	Description	Use
BAUTH	SMALLINT NOT NULL WITH DEFAULT	The privilege that is held on the object on which another object is dependent.	G

SYSIBM.SYSDUMMY1 table

The SYSIBM.SYSDUMMY1 table contains one row. The table is used for SQL statements in which a table reference is required, but the contents of the table are not important.

Unlike the other catalog tables, which reside in Unicode table spaces, SYSIBM.SYSDUMMY1 resides in table space SYSEBCDC, which is an EBCDIC table space.

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSDUMMYA table

The SYSIBM.SYSDUMMYA table contains one row. The table is used for SQL statements in which a table reference is required, but the contents of the table are not important.

SYSIBM.SYSDUMMYA resides in table space SYSTSASC, which is a ASCII table space.

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSDUMMYE table

The SYSIBM.SYSDUMMYE table contains one row. The table is used for SQL statements in which a table reference is required, but the contents of the table are not important.

SYSIBM.SYSDUMMYE resides in table space SYSEBCDC, which is a EBCDIC table space.

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSDUMMYU table

The SYSIBM.SYSDUMMYU table contains one row. The table is used for SQL statements in which a table reference is required, but the contents of the table are not important.

SYSIBM.SYSDUMMYU resides in table space SYSTSUNI, which is a UNICODE table space.

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSENVIRONMENT table

The SYSIBM.SYSENVIRONMENT table records the environment variables when an object is created.

Column name	Data type	Description	Use
ENVID	INTEGER NOT NULL	Internal identifier of the environment.	G
CURRENT_SCHEMA	VARCHAR(128) NOT NULL	The current schema.	G
RELCREATED	CHAR(1) NOT NULL	The release when the environment information is created. SeeRelease dependency indicators for values.	G
PATHSCHEMAS	VARCHAR(2048) NOT NULL	The schema path.	G
APPLICATION_ ENCODING_CCSID	INTEGER NOT NULL	The CCSID of the application environment.	G
ORIGINAL_ ENCODING_CCSID	INTEGER NOT NULL	The original CCSID of the statement text string.	G
DECIMAL_POINT	CHAR(1) NOT NULL	The decimal point indicator: **C** Comma **P** Period	G
MIN_DIVIDE_SCALE	CHAR(1) NOT NULL	The minimum divide scale: **N** The usual rules apply for decimal division in SQL **Y** Retain at lease three digits to the right of the decimal point after any decimal division.	G
STRING_DELIMITER	CHAR(1) NOT NULL	The string delimiter that is used in COBOL string constants: **A** Apostrophe (') **Q** Quote (")	G
SQL_STRING_ DELIMITER	CHAR(1) NOT NULL	The SQL string delimiter that is used in string constants: **A** Apostrophe (') **Q** Quote (")	G
MIXED_DATA	CHAR(1) NOT NULL	Uses mixed DBCS data: **N** No mixed data **Y** Mixed data	G
DECIMAL_ ARITHMETIC	CHAR(1) NOT NULL	The rules that are to be used for CURRENT PRECISION and when both operands in a decimal operation have a precision of 15 or less: **1** DEC15 specifies that the rules do not allow a precision greater than 15 digits **2** DEC31 specifies that the rules allow a precision of up to 31 digits	G

Column name	Data type	Description	Use
DATE_FORMAT	CHAR(1) NOT NULL	The date format: **I** ISO - yyyy-mm-dd **J** JIS - yyyy-mm-dd **U** USA - mm/dd/yyyy **E** EUR - dd.mm.yyyy **L** Locally defined by an installation exit routine	G
TIME_FORMAT	CHAR(1) NOT NULL	The time format: **I** ISO - hh.mm.ss **J** JIS - hh.mm.ss **U** USA - hh:mm AM or hh:mm PM **E** EUR - hh.mm.ss **L** Locally defined by an installation exit routine	G
FLOAT_FORMAT	CHAR(1) NOT NULL	The floating point format: **I** IEEE floating point format **S** System/390 floating point format	G
HOST_LANGUAGE	CHAR(8) NOT NULL	The host language: • ASM • C • CPP • IBMCOB • PLI • FORTRAN	G
CHARSET	CHAR(1) NOT NULL	The character set: **A** Alphanumeric	G
FOLD	CHAR(1) NOT NULL	FOLD is only applicable when HOST_LANGUAGE is C or CPP. Otherwise FOLD is blank. **N** Lower case letters in SBCS ordinary identifiers are not folded to uppercase **Y** Lower case letters in SBCS ordinary identifiers are folded to uppercase **blank** Not applicable	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
ROUNDING	CHAR(1) NOT NULL WITH DEFAULT	The rounding mode that is used when arithmetic and casting operations are performed on DECFLOAT data: **C** ROUND_CEILING **D** ROUND_DOWN **F** ROUND_FLOOR **G** ROUND_HALF_DOWN **E** ROUND_HALF_EVEN **H** ROUND_HALF_UP **U** ROUND_UP	G

SYSIBM.SYSFIELDS table

The SYSIBM.SYSFIELDS table contains one row for every column that has a field procedure.

Column name	Data type	Description	Use
TBCREATOR	VARCHAR(128) NOT NULL	Schema or qualifier of the table that contains the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table that contains the column.	G
COLNO	SMALLINT NOT NULL	Numeric place of this column in the table.	G
NAME	VARCHAR(128) NOT NULL	Name of the column.	G
FLDTYPE	VARCHAR(24) NOT NULL	Data type of the encoded values in the field (This columns might contain statistical values from a prior release.): **INTEGER** Large integer **SMALLINT** Small integer **FLOAT** Floating-point **CHAR** Fixed-length character string **VARCHAR** Varying-length character string **DECIMAL** Decimal **GRAPHIC** Fixed-length graphic string **VARG** Varying-length graphic string	G
LENGTH	SMALLINT NOT NULL	The length attribute of the field; or, for a decimal field, its precision.(This columns might contain statistical values from a prior release.) The number does not include the internal prefixes that can be used to record actual length and null state. **INTEGER** 4 **SMALLINT** 2 **FLOAT** 8 **CHAR** Length of string **VARCHAR** Maximum length of string **DECIMAL** Precision of number **GRAPHIC** Number of DBCS characters **VARG** Maximum number of DBCS characters	G
SCALE	SMALLINT NOT NULL	Scale if FLDTYPE is DECIMAL; otherwise, the value is 0.	G

Column name	Data type	Description	Use
FLDPROC	VARCHAR(24) NOT NULL	For a row describing a field procedure, the name of the procedure. (This columns might contain statistical values from a prior release.)	G
WORKAREA	SMALLINT NOT NULL	For a row describing a field procedure, the size, in bytes, of the work area required for the encoding and decoding of the procedure. (This columns might contain statistical values from a prior release.)	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
EXITPARML	SMALLINT NOT NULL	For a row describing a field procedure, the length of the field procedure parameter value block. (This columns might contain statistical values from a prior release.)	G
PARMLIST	VARCHAR(735) NOT NULL	For a row describing a field procedure, the parameter list following FIELDPROC in the statement that created the column, with insignificant blanks removed. (This columns might contain statistical values from a prior release.)	G
EXITPARM	VARCHAR(1530) NOT NULL FOR BIT DATA	For a row describing a field procedure, the parameter value block of the field procedure (the control block passed to the field procedure when it is invoked). (This columns might contain statistical values from a prior release.)	G

SYSIBM.SYSFOREIGNKEYS table

The SYSIBM.SYSFOREIGNKEYS table contains one row for every column of every foreign key.

Column name	Data type	Description	Use
CREATOR	VARCHAR(128) NOT NULL	Schema or qualifier of the table that contains the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table that contains the column.	G
RELNAME	VARCHAR(128) NOT NULL	Constraint name for the constraint for which the column is part of the foreign key.	G
COLNAME	VARCHAR(128) NOT NULL	Name of the column.	G
COLNO	SMALLINT NOT NULL	Numeric place of the column in its table.	G
COLSEQ	SMALLINT NOT NULL	Numeric place of the column in the foreign key.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSINDEXCLEANUP table

The rows in the SYSIBM.SYSINDEXCLEANUP table specify time windows to control index cleanup processing. Each row specifies a time window to enable or disable the cleanup of pseudo-deleted index entries for specific database objects.

Column name	Data type	Description	Use
DBNAME	VARCHAR(24)	The name of the database that contains the index space.	G
INDEXSPACE	VARCHAR(24)	The name of the index space.	G
ENABLE_DISABLE	CHAR(1) NOT NULL	Specifies whether the row enables or disables cleanup for the specified index space. **'E'** Enabled **'D'** Disabled	G
MONTH_WEEK	CHAR(1) NOT NULL	Indicates the meaning of the value of the DAY column: **'M'** The value indicates the day of the month. **'W'** The value indicates a day of the week.	G
MONTH	SMALLINT	The month in which the time window applies. For example a 1 value indicates January and a 12 value indicates December. If this column contains NULL, the time window applies to all months. If the value of the MONTH_WEEK column is 'W', this value must be NULL.	G
DAY	SMALLINT	The day of the month or the day of the week for which the time window applies, as specified by the value of the MONTH_WEEK column. For example, if MONTH_WEEK='W', a 1 value indicates Monday and 7 indicates Sunday. If the value of this column is NULL, the time window applies to every day of the month or every day of the week.	G
START_TIME	TIME	The local time at the beginning of the time window specified by the row. When this column contains a null value, the row applies at all times on the specified days. This column must contain NULL if the END_TIME column contains NULL.	G
END_TIME	TIME	The local time at the end of the time window specified by the row. When this column contains a null value, the row applies at all times on the specified days. This column must contain NULL if the START_TIME column contains NULL.	G

SYSIBM.SYSINDEXES table

The SYSIBM.SYSINDEXES table contains one row for every index.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the index.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the index.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table on which the index is defined.	G
TBCREATOR	VARCHAR(128) NOT NULL	The schema of the table.	G
UNIQUERULE	CHAR(1) NOT NULL	Whether the index is unique: **C** Yes, and it is used to enforce the uniqueness of a UNIQUE constraint or hash key columns. **D** No (duplicates are allowed) **U** Yes **P** Yes, and it is a primary index (As in prior releases of DB2, a value of P is used for primary keys that are used to enforce a referential constraint.) **N** Yes, and it is defined with UNIQUE WHERE NOT NULL **R** Yes, and it is an index used to enforce the uniqueness of a non-primary parent key **G** Yes, and it is an index used to enforce the uniqueness of values in a column defined as ROWID GENERATED BY DEFAULT **X** Yes, and it is an index used to enforce the uniqueness of values in a column that is used to identify or find XML values associated with a specific row.	G
COLCOUNT	SMALLINT NOT NULL	The number of columns in the key.	G
CLUSTERING	CHAR(1) NOT NULL	Whether CLUSTER was specified for the index: **N** No **Y** Yes	G
CLUSTERED	CHAR(1) NOT NULL	Whether the table is actually clustered by the index: **N** A significant number of rows are not in clustering order, or statistics have not been gathered. **Y** Most of the rows are in clustering order. **blank** Not applicable. This is an updatable column that can also be changed by the RUNSTATS utility. For a sparse index, the statistic is based on the actual contents of the index.	G

Column name	Data type	Description	Use
DBID	SMALLINT NOT NULL	Internal identifier of the database.	S
OBID	SMALLINT NOT NULL	Internal identifier of the index fan set descriptor.	S
ISOBID	SMALLINT NOT NULL	Internal identifier of the index page set descriptor.	S
DBNAME	VARCHAR(24) NOT NULL	Name of the database that contains the index.	G
INDEXSPACE	VARCHAR(24) NOT NULL	Name of the index space.	G
FIRSTKEYCARD	INTEGER NOT NULL	Not used	N
FULLKEYCARD	INTEGER NOT NULL	Not used	N
NLEAF	INTEGER NOT NULL	Number of active leaf pages in the index. The value is -1 if statistics have not been gathered. This is an updatable column.	S
NLEVELS	SMALLINT NOT NULL	Number of levels in the index tree. If the index is partitioned, it is the maximum of the number of levels in the index tree for all the partitions. The value is -1 if statistics have not been gathered. This is an updatable column.	S
BPOOL	CHAR(8) NOT NULL	Name of the buffer pool used for the index.	G
PGSIZE	SMALLINT NOT NULL	Contains the value 4, 8, 16, or 32 which indicates the size, in KB, of the leaf pages in the index. If the index was created prior to Version 9, the value will be 4096 for a 4 KB page size.	G
ERASERULE	CHAR(1) NOT NULL	Whether the data sets are erased when dropped. The value is meaningless if the index is partitioned: **N** No **Y** Yes	G
	VARCHAR(24) NOT NULL	Not used	N
CLOSERULE	CHAR(1) NOT NULL	Whether the data sets are candidates for closure when the limit on the number of open data sets is reached: **N** No **Y** Yes	G

Column name	Data type	Description	Use
SPACE	INTEGER NOT NULL	Number of kilobytes of DASD storage allocated to the index, as determined by the last execution of the STOSPACE utility. The value is 0 if the index is not related to a storage group, or if STOSPACE has not been run. If the index space is partitioned, the value is the total kilobytes of DASD storage allocated to all partitions that are defined in a storage group.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
CLUSTERRATIO	SMALLINT NOT NULL WITH DEFAULT	Percentage of rows that are in clustering order. For a partitioning index, it is the weighted average of all index partitions in terms of the number of rows in the partition. The value is 0 if statistics have not been gathered. The value is -2 if the index is for an auxiliary table. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	S
CREATEDBY	VARCHAR(128) NOT NULL WITH DEFAULT	Primary authorization ID of the user who created the index.	G
	SMALLINT NOT NULL	Internal use only	I
	SMALLINT NOT NULL	Not used	N
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics. The default value is '0001-01-01.00.00.00.000000'. This is an updatable column.	G
INDEXTYPE	CHAR(1) NOT NULL WITH DEFAULT	The index type: **2** Type 2 index or a hash overflow index on non-partitioned tables. **blank** Type 1 index **D** Data-partitioned secondary index **P** An index that is both partitioned and is a partitioning index (index that is on a table that uses table-controlled partitioning).	G
FIRSTKEYCARDF	FLOAT NOT NULL WITH DEFAULT -1	Number of distinct values of the first key column. This number is an estimate if updated while collecting statistics on a single partition. The value is -1 if statistics have not been gathered. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	S

Column name	Data type	Description	Use
FULLKEYCARDF	FLOAT NOT NULL WITH DEFAULT -1	Number of distinct values of the key. The value is -1 if statistics have not been gathered. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	S
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the CREATE statement was executed for the index. If the index was created in a DB2 release prior to Version 5, the value is '0001-01-01.00.00.00.000000'.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the most recent ALTER INDEX statement was executed for the index. If no ALTER INDEX statement has been applied, ALTEREDTS has the value of CREATEDTS. If the index was created in a DB2 release prior to Version 5, the value is '0001-01-01.00.00.00.000000'.	G
PIECESIZE	INTEGER NOT NULL WITH DEFAULT	Maximum size of a data set in kilobytes for secondary indexes. A value of zero (0) indicates that the index is a partitioning index or that the index was created in a DB2 release prior to Version 5.	G
COPY	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether COPY YES was specified for the index, which indicates if the index can be copied and if SYSIBM.SYSLGRNX recording is enabled for the index. **N** No **Y** Yes	G
COPYLRSN	CHAR(10) NOT NULL WITH DEFAULT X'000000000000000000' FOR BIT DATA	The value can be either an RBA or LRSN. (LRSN is only for data sharing.) If the index is currently defined as COPY YES, the value is the RBA or LRSN when the index was created with COPY YES or altered to COPY YES, not the current RBA or LRSN. If the index is currently defined as COPY NO, the value is set to X'000000000000' if the index was created with COPY NO; otherwise, if the index was altered to COPY NO, the value in COPYLRSN is not changed when the index is altered to COPY NO.	G
CLUSTERRATIOF	FLOAT NOT NULL WITH DEFAULT	When multiplied by 100, the value of the column is the percentage of rows that are in clustering order. For example, a value of '.9125' indicates 91.25%. For a partitioning index, it is the weighted average of all index partitions in terms of the number of rows in the partition. The value is 0 if statistics have not been gathered. The value is -2 if the index is for an auxiliary table, a node ID index or an XML index. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	G
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Kilobytes of DASD storage. The value is -1 if statistics have not been gathered. This is an updatable column.	G
REMARKS	VARCHAR(762) NOT NULL WITH DEFAULT	A character field string provided by the user with the COMMENT statement.	G

Column name	Data type	Description	Use
PADDED	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether keys within the index are padded for varying-length column data: **Y** The index contains varying-length character or graphic data and is PADDED (the varying-length columns are padded to their maximum length). **N** The index contains varying-length character or graphic data and is NOT PADDED (the varying-length columns are not padded to their maximum length). Index-only access to all column data is possible. **blank** The index does not contain varying-length character or graphic data. The value is blank for indexes that have been created or altered prior to Version 8.	G
VERSION	SMALLINT NOT NULL WITH DEFAULT	The version of the data row format for this index. A value of zero indicates that a version-creating alter has never occurred against this index.	G
OLDEST_VERSION	SMALLINT NOT NULL WITH DEFAULT	The version number describing the oldest format of data in the index space and any image copies of the index.	G
CURRENT_VERSION	SMALLINT NOT NULL WITH DEFAULT	The version number describing the newest format of data in the index space. A zero indicates that the index space has never had been versioned. After the version number reaches the maximum value, the number will wrap back to one.	G
RELCREATED	CHAR(1) NOT NULL WITH DEFAULT	Release of DB2 that was used to create the object, blank for indexes created before Version 8. For all other values, see Release dependency indicators.	G
AVGKEYLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of keys within the index. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	G
	CHAR(1) NOT NULL	Not used	N
KEYTARGET_COUNT	SMALLINT NOT NULL WITH DEFAULT	The number of key-targets for an extended index. The value is 0 for a simple index.	G
UNIQUE_COUNT	SMALLINT NOT NULL WITH DEFAULT	The number of columns or key-targets that make up the unique constraint of an index, when other non-constraint enforcing columns or key-targets exist. Otherwise the value is 0.	G
IX_EXTENSION_TYPE	CHAR(1) NOT NULL WITH DEFAULT	Identifies the type of extended index: **N** Node ID index **S** Index on a scalar expression **T** Spatial index **V** XML index **blank** Simple index	G

Column name	Data type	Description	Use
COMPRESS	CHAR(1) NOT NULL WITH DEFAULT ' N'	Indicates whether index compression is active: **N** Index compression is not active **Y** Index compression is active	G
OWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the owner of the index, empty string for indexes created in a DB2 release prior to Version 9.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: **blank** Authorization ID **L** Role	G
DATAREPEAT-FACTORF	FLOAT NOT NULL WITH DEFAULT -1	The anticipated number of data pages that will be touched following an index key order. This number is -1 if statistics have not been collected. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	G
ENVID	INTEGER NOT NULL WITH DEFAULT	Internal environment identifier.	G
HASH	CHAR(1) NOT NULL WITH DEFAULT N	Whether the index is the hash overflow index for a hash table. **N** No. N is the default. **Y** Yes	G
SPARSE	CHAR(1) NOT NULL WITH DEFAULT N	Whether the index is sparse or not. **N** No. N is the default. Every data row has an index entry. **Y** Yes. This index might not have an entry for each data row in the table. **X** Excluded. This index will not have an index entry when every data row for a key column contains the NULL value.	G
ROWID	ROWID NOT NULL GENERATED ALWAYS	ROWID column, created for the lob columns in this table.	G
	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only	I
	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only	I

SYSIBM.SYSINDEXES_HIST table

The SYSIBM.SYSINDEXES_HIST table contains rows from SYSINDEXES.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the index.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the index.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table on which the index is defined.	G
TBCREATOR	VARCHAR(128) NOT NULL	The schema of the table.	G
CLUSTERING	CHAR(1) NOT NULL	Whether CLUSTER was specified when the index was created: **N** No **Y** Yes	G
NLEAF	INTEGER NOT NULL WITH DEFAULT -1	Number of active leaf pages in the index. The value is -1 if statistics have not been gathered.	S
NLEVELS	SMALLINT NOT NULL WITH DEFAULT -1	Number of levels in the index tree. If the index is partitioned, it is the maximum of the number of levels in the index tree for all the partitions. The value is -1 if statistics have not been gathered.	S
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics. The default value is '0001-01-01.00.00.00.000000'.	G
FIRSTKEYCARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of distinct values of the first key column. This number is an estimate if updated while collecting statistics on a single partition. The value is -1 if statistics have not been gathered.	S
FULLKEYCARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of distinct values of the key. The value is -1 if statistics have not been gathered.	S
CLUSTERRATIOF	FLOAT(8) NOT NULL	Percentage of rows that are in clustering order. For a partitioning index, it is the weighted average of all index partitions in terms of the number of rows in the partition. The value is 0 if statistics have not been gathered. The value is -2 if the index is for an auxiliary table. For a sparse index, the statistic is based on the actual contents of the index.	G
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of kilobytes of DASD storage allocated to the index space partition. The value is -1 if statistics have not been gathered.	G

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
AVGKEYLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of keys within the index. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	G
DATAREPEAT-FACTORF	FLOAT NOT NULL WITH DEFAULT -1	The anticipated number of data pages that will be touched following an index key order. This number is -1 if statistics have not been collected. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	G

SYSIBM.SYSINDEXES_RTSECT table

The SYSIBM.SYSINDEXES_RTSECT table is an auxiliary table for the RTSECTION column of the SYSIBM.SYSINDEXES table and is required to hold LOB data.

Column name	Data type	Description	Use
	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only.	I

SYSIBM.SYSINDEXES_TREE table

The SYSIBM.SYSINDEXES_TREE table is an auxiliary table for the PARSETREE column of the SYSIBM.SYSINDEXES table and is required to hold LOB data.

Column name	Data type	Description	Use
	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only.	I

SYSIBM.SYSINDEXPART table

The SYSIBM.SYSINDEXPART table contains one row for each nonpartitioned secondary index (NPSI) and one row for each partition of a partitioning index or a data-partitioned secondary index.

Column name	Data type	Description	Use
PARTITION	SMALLINT NOT NULL	Partition number; Zero if index is not partitioned.	G
IXNAME	VARCHAR(128) NOT NULL	Name of the index.	G
IXCREATOR	VARCHAR(128) NOT NULL	The schema of the index.	G
PQTY	INTEGER NOT NULL	For user-managed data sets, the value is the primary space allocation in units of 4KB storage blocks or -1. PQTY is based on a value of PRIQTY in the appropriate CREATE or ALTER INDEX statement. Unlike PQTY, however, PRIQTY asks for space in 1KB units. A value of -1 indicates that either of the following cases is true: • PRIQTY was not specified for a CREATE INDEX statement or for any subsequent ALTER INDEX statements. • -1 was the most recently specified value for PRIQTY, either on the CREATE INDEX statement or a subsequent ALTER INDEX statement.	G
SQTY	SMALLINT NOT NULL	For user-managed data sets, the value is the secondary space allocation in units of 4KB storage blocks or -1. SQTY is based on a value of SECQTY in the appropriate CREATE or ALTER INDEX statement. Unlike SQTY, however, SECQTY asks for space in 1KB units. A value of -1 indicates that either of the following cases is true: • SECQTY was not specified for a CREATE INDEX statement or for any subsequent ALTER INDEX statements. • -1 was the most recently specified value for SECQTY, either on the CREATE INDEX statement or a subsequent ALTER INDEX statement. If the value does not fit into the column, the value of the column is 32767. See the description of column SECQTYI.	G
STORTYPE	CHAR(1) NOT NULL	Type of storage allocation: **E** Explicit, and STORNAME names an integrated catalog facility catalog **I** Implicit, and STORNAME names a storage group	G
STORNAME	VARCHAR(128) NOT NULL	Name of storage group or integrated catalog facility catalog used for space allocation.Blank for the catalog indexes.	G

Column name	Data type	Description	Use
VCATNAME	VARCHAR(24) NOT NULL	Name of integrated catalog facility catalog used for space allocation.	G
CARD	INTEGER NOT NULL	Not used	N
FAROFFPOS	INTEGER NOT NULL	Not used	N
LEAFDIST	INTEGER NOT NULL	100 times the average number of leaf pages between successive active leaf pages of the index. The value is -1 if statistics have not been gathered. The value is -2 if the index is an auxiliary index, a node ID index, or an XML index.	S
NEAROFFPOS	INTEGER NOT NULL	Not used	S
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
LIMITKEY	VARCHAR(512) NOT NULL FOR BIT DATA	The high value of the limit key of the partition in an internal format. An empty string if the index is not partitioned or for a data-partitioned secondary index (DPSI). If any column of the key has a field procedure, the internal format is the encoded form of the value.	S
FREEPAGE	SMALLINT NOT NULL	Number of pages that are loaded before a page is left as free space.	G
PCTFREE	SMALLINT NOT NULL	Percentage of each leaf or nonleaf page that is left as free space.	G

Column name	Data type	Description	Use
SPACE	INTEGER NOT NULL WITH DEFAULT	Number of kilobytes of DASD storage allocated to the index space partition, as determined by the last execution of the STOSPACE utility. **0** The STOSPACE or RUNSTATS utility has not been run or the data set for the index has been created during the first insert operation or when the LOAD utility was run. **-1** The index was defined with the DEFINE NO clause, which defers the physical creation of the data sets until data is first inserted into the index, and data has yet to be inserted into the index. **A non-negative value** Indicates that the data sets for the index space are defined with the underlying data sets allocated. The value is updated by STOSPACE if the index is related to a storage group. The value is updated by RUNSTATS if the utility is executed as RUNSTATS INDEX with UPDATE(ALL) or UPDATE(SPACE).	G
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics. The default value is '0001-01-01.00.00.00.000000'.	G
	CHAR(1) NOT NULL	Not used	N
GBPCACHE	CHAR(1) NOT NULL WITH DEFAULT	Group buffer pool cache option specified for this index or index partition. **blank** Only changed pages are cached in the group buffer pool. **A** Changed and unchanged pages are cached in the group buffer pool. **N** No data is cached in the group buffer pool.	G
FAROFFPOSF	FLOAT NOT NULL WITH DEFAULT -1	Number of referred to rows far from optimal position because of an insert into a full page. The value is -1 if statistics have not been gathered. The value is -2 if the index is an auxiliary index, a node ID index, or an XML index. The column is not applicable for an index on an auxiliary table. For a sparse index, the statistic is based on the actual contents of the index.	S
NEAROFFPOSF	FLOAT NOT NULL WITH DEFAULT -1	Number of referred to rows near, but not at optimal position, because of an insert into a full page. The value is -2 if the index is an auxiliary index, a node ID index, or an XML index. Not applicable for an index on an auxiliary table. For a sparse index, the statistic is based on the actual contents of the index.	S

Column name	Data type	Description	Use
CARDF	FLOAT NOT NULL WITH DEFAULT -1	Number of RIDs in the index that refer to data rows or LOBs. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	S
SECQTYI	INTEGER NOT NULL WITH DEFAULT	Secondary space allocation in units of 4KB storage. For user-managed data sets, the value is the secondary space allocation in units of 4KB blocks.	G
IPREFIX	CHAR(1) NOT NULL WITH DEFAULT 'I'	The first character of the instance qualifier for this index's data set name. 'I' or 'J' are the only valid characters for this field. The default is 'I'.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the most recent ALTER INDEX statement was executed for the index. If no ALTER INDEX statement has been applied, the value is '0001-01-01.00.00.00.000000'.	G
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Kilobytes of DASD storage. The value is -1 if statistics have not been gathered. This is an updatable column.	G
DSNUM	INTEGER NOT NULL WITH DEFAULT -1	Number of data sets. The value is -1 if statistics have not been gathered. This is an updatable column.	G
EXTENTS	INTEGER NOT NULL WITH DEFAULT -1	Number of data set extents. The value is -1 if statistics have not been gathered. This is an updatable column. This value is only for the last DSNUM for the object.	G
PSEUDO_DEL_ ENTRIES	INTEGER NOT NULL WITH DEFAULT -1	Number of pseudo deleted entries (entries that are logically deleted but still physically present in the index). For a non-unique index, value is the number of RIDs that are pseudo deleted. For a unique index, the value is the number of keys and RIDs that are pseudo deleted. The value is -1 if statistics have not been gathered. This is an updatable column.	G
LEAFNEAR	INTEGER NOT NULL WITH DEFAULT -1	Number of leaf pages physically near previous leaf page for successive active leaf pages. The value is -1 if statistics have not been gathered. This is an updatable column.	S
LEAFFAR	INTEGER NOT NULL WITH DEFAULT -1	Number of leaf pages located physically far away from previous leaf pages for successive (active leaf) pages accessed in an index scan. The value is -1 if statistics have not been gathered. This is an updatable column.	S
OLDEST_VERSION	SMALLINT NOT NULL WITH DEFAULT	The version number describing the oldest format of data in the index part and any image copies of the index part.	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT -1	Time when the partition was created.	G

Column name	Data type	Description		Use
AVGKEYLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of keys within the index. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.		G
RBA_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	Indicates the format of the RBA/LRSN.		G
		B	Basic, 6-byte RBA/LRSN format.	
		E	Extended, 10-byte RBA/LRSN format.	
		U	Undefined. DEFINE NO was specified when creating the table space.	
		blank	For migrated objects.	

SYSIBM.SYSINDEXPART_HIST table

The SYSIBM.SYSINDEXPART_HIST table contains rows from SYSINDEXPART.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Column name	Data type	Description	Use
PARTITION	SMALLINT NOT NULL	Partition number. Zero if index is not partitioned.	G
IXNAME	VARCHAR(128) NOT NULL	Name of the index.	G
IXCREATOR	VARCHAR(128) NOT NULL	The schema of the index.	G
PQTY	INTEGER NOT NULL	For user-managed data sets, the value is the primary space allocation in units of 4KB storage blocks or -1. For user-specified values of PRIQTY other than -1, the value is set to the primary space allocation only if RUNSTATS INDEX with UPDATE(ALL) or UPDATE(SPACE) is executed; otherwise, the value is zero. PQTY is based on a value of PRIQTY in the appropriate CREATE or ALTER INDEX statement. Unlike PQTY, however, PRIQTY asks for space in 1KB units. A value of -1 indicates that either of the following cases is true: • PRIQTY was not specified for a CREATE INDEX statement or for any subsequent ALTER INDEX statements. • -1 was the most recently specified value for PRIQTY, either on the CREATE INDEX statement or a subsequent ALTER INDEX statement. If a storage group is not used, the value is 0.	G
SECQTYI	INTEGER NOT NULL	For user-managed data sets, the value is the secondary space allocation in units of 4KB storage blocks or -1. For user-specified values of SECQTY other than -1, the value is set to the secondary space allocation only if RUNSTATS INDEX with UPDATE(ALL) or UPDATE(SPACE) is executed; otherwise, the value is zero. SQTY is based on a value of SECQTY in the appropriate CREATE or ALTER INDEX statement. Unlike SQTY, however, SECQTY asks for space in 1KB units. A value of -1 indicates that either of the following cases is true: • SECQTY was not specified for a CREATE INDEX statement or for any subsequent ALTER INDEX statements. • -1 was the most recently specified value for SECQTY, either on the CREATE INDEX statement or a subsequent ALTER INDEX statement. If a storage group is not used, the value is 0.	G

Column name	Data type	Description	Use
LEAFDIST	INTEGER NOT NULL WITH DEFAULT -1	100 times the average number of leaf pages between successive active leaf pages of the index. The value is -1 if statistics have not been gathered.	S
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of kilobytes of DASD storage allocated to the index space partition. The value is -1 if statistics have not been gathered.	G
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics. The default value is '0001-01-01.00.00.00.000000'.	G
FAROFFPOSF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of referred to rows far from optimal position because of an insert into a full page. The value is -1 if statistics have not been gathered. The column is not applicable for an index on an auxiliary table. For a sparse index, the statistic is based on the actual contents of the index.	S
NEAROFFPOSF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of referred to rows near, but not at optimal position, because of an insert into a full page. Not applicable for an index on an auxiliary table. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	S
CARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of RIDs in the index that refer to data rows or LOBs. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	S
EXTENTS	INTEGER NOT NULL WITH DEFAULT -1	Number of data set extents. The value is -1 if statistics have not been gathered. This value is only for the last DSNUM for the object.	G
PSEUDO_DEL_ ENTRIES	INTEGER NOT NULL WITH DEFAULT -1	Number of pseudo deleted entries. The value is -1 if statistics have not been gathered.	G
DSNUM	INTEGER NOT NULL WITH DEFAULT -1	Data set number within the table space. For partitioned index spaces, this value corresponds to the partition number for a single partition copy, or 0 for a copy of an entire partitioned index space. The value is -1 if statistics have not been gathered.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
LEAFNEAR	INTEGER NOT NULL WITH DEFAULT -1	Number of leaf pages physically near previous leaf page for successive active leaf pages. The value is -1 if statistics have not been gathered. This is an updatable column.	S

Column name	Data type	Description	Use
LEAFFAR	INTEGER NOT NULL WITH DEFAULT -1	Number of leaf pages located physically far away from previous leaf pages for successive (active leaf) pages accessed in an index scan. The value is -1 if statistics have not been gathered. This is an updatable column.	S
AVGKEYLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of keys within the index. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	G

SYSIBM.SYSINDEXSPACESTATS table

The SYSIBM.SYSINDEXSPACESTATS table contains real time statistics for index spaces.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
UPDATESTATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	The timestamp that the row in the SYSINDEXSPACESTATS table is inserted or last updated.	G
NLEVELS	SMALLINT	The number of levels in the index tree. A null value indicates that the number of levels is unknown.	G
NPAGES	INTEGER	The number of pages in the index tree that contain only pseudo-deleted index entries. This is an updatable column.	G
NLEAF	INTEGER	The number of leaf pages in the index. This is an updatable column.	G
NACTIVE	INTEGER	The number of active pages in the index space or partition. This value is equivalent to the number of pre-formatted pages. A null value indicates that the number of active pages is unknown.	G
SPACE	INTEGER	The amount of space, in KB, that is allocated to the index space or partition. For multi-piece, linear page sets, this value is the amount of space in all data sets. A null value indicates the amount of space is unknown.	G
EXTENTS	SMALLINT	The number of extents in the index space or partition. For multi-piece index spaces, this value is the number of extents for the last data sets. For a data set that is stripped across multiple volumes, the value is the number of logical extents. A null value indicates the number of extents is unknown.	G
LOADRLASTTIME	TIMESTAMP	The timestamp that the LOAD REPLACE utility was last run on the index space or partition. A null value indicates that the LOAD REPLACE utility has never been run on the index space or partition or that the timestamp is unknown.	G
REBUILDLASTTIME	TIMESTAMP	The timestamp that the REBUILD INDEX utility was last run on the index space or partition. A null value indicates that the timestamp that the REBUILD INDEX was last run is unknown.	G
REORGLASTTIME	TIMESTAMP	The timestamp when the REORG INDEX utility was last run on the index space or partition, or if the REORG INDEX utility has not been run, the time when the index space or partition was created. A null value indicates that the timestamp is unknown.	G

Column name	Data type	Description	Use
REORGINSERTS	INTEGER	The number of index entries that have been inserted into the index space or partition since the last time the REORG, REBUILD INDEX, or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of inserted index entries is unknown.	G
REORGDELETES	INTEGER	The number of index entries that have been deleted from the index space or partition since the last time the REORG, REBUILD INDEX, or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of deleted index entries is unknown.	G
REORGAPPEND-INSERT	INTEGER	The number of index entries that have a key value that is greater than the maximum key value in the index or partition that have been inserted into the index space or partition since the last time the REORG, REBUILD INDEX, or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of inserted index entries is unknown.	G
REORGPSEUDO-DELETES	INTEGER	The number of pseudo-deleted index entries stored in the index space or partition. A pseudo-delete is a RID entry that has been marked as deleted. A null value indicates that the number of pseudo-deleted index entries is unknown.	G
REORGMASSDELETE	INTEGER	The number of mass deletes from a segmented or LOB table space, or the number of dropped tables from a segmented table space since the last time the REORG or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of mass deletes is unknown.	G

Column name	Data type	Description	Use
REORGLEAFNEAR	INTEGER	The net number of leaf pages located physically near previous pages for successive active leaf pages that occurred since the last REORG, REBUILD INDEX, or LOAD REPLACE, or since the object was created. The distance between leaf pages is optimal if the difference is 1 and considered near if the distance is 2-16. An index page is added during a page split and the distance between the predecessor and successor pages can lower this count if the distance between the two was near. The distance between the predecessor and new page increase the count if they are near. The distance between the new page and successor increment the count if they are near. If a leaf page is deleted the distance between the new predecessor and successor pages can increment this count if the distance between the two is near. The distance between the predecessor and the deleted page decrement the count if it was near. The distance between the successor and the deleted page decrement the count if it was near. A null value means that the value is unknown. A negative value is possible in some cases.	G
REORGLEAFFAR	INTEGER	The net number of leaf pages located physically far away from previous leaf pages for successive active leaf pages that occurred since the last REORG, REBUILD INDEX, or LOAD REPLACE, or since the object was created. The distance between leaf pages is optimal if the difference is 1 and considered far if the distance is greater than 16. An index page is added during a page split and the distance between the predecessor and successor pages can decrement this count if the distance between the two was far. The distance between the predecessor and new page increment the count if they are far. The distance between the new page and successor increment the count if they are far. If a leaf page is deleted the distance between the new predecessor and successor pages can increment this count if the distance between the two is far. The distance between the predecessor and the deleted page decrement the count if it was far. The distance between the successor and the deleted page decrement the count if it was far. A null value means that the value is unknown.	G
REORGNUMLEVELS	INTEGER	The number of levels in the index tree that were added or removed since the last REORG, REBUILD INDEX, or LOAD REPLACE, or the object was created. A null value means that the number of added or deleted levels is unknown.	G

Column name	Data type	Description	Use
STATSLASTTIME	TIMESTAMP	The timestamp of the last time that the RUNSTATS utility is run on the table space or partition. A null value means that RUNSTATS has never been run on the index space or partition, or that the timestamp of the last RUNSTATS is unknown.	G
STATSINSERTS	INTEGER	The number of index entries that have been inserted into the index space or partition since the last time that the RUNSTATS utility was run, or since the object was created. A null value indicates that the number of inserted records or LOBs is unknown.	G
STATSDELETES	INTEGER	The number of index entries that have been deleted since the last RUNSTATS on the index space or partition, or since the object was created. A null value means that the number of deleted index entries is unknown.	G
STATSMASSDELETE	INTEGER	The number of times that the index or index space partition was mass deleted since the last RUNSTATS, or the object was created. A null value indicates that the number of mass deletes is unknown.	G
COPYLASTTIME	TIMESTAMP	The timestamp of the last full image copy on the index space or partition. A null value means that COPY has never been run on the index space or partition, or that the timestamp of the last full image copy is unknown.	G
COPYUPDATED-PAGES	INTEGER	The number of distinct pages that have been updated since the last time that the COPY utility was run, or since the object was created. A null value indicates that the number of updated pages is unknown.	G
COPYCHANGES	INTEGER	The number of insert, update, and delete operations since the last time that the COPY utility was run, or since the object was created. A null value indicates that the number of insert, update, and delete operations is unknown.	G
COPYUPDATELRSN	CHAR(10) FOR BIT DATA	The LRSN or RBA of the first update that occurs after the last time the COPY utility was run. A null value indicates that the LRSN or RBA is unknown.	G
COPYUPDATETIME	TIMESTAMP	The timestamp of the first update that occurs after the last time that the COPY utility was run. A null value indicates that the timestamp is unknown.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

Column name	Data type	Description	Use
DBID	SMALLINT NOT NULL	The internal identifier of the database.	G
ISOBID	SMALLINT NOT NULL	The internal identifier of the index space page set descriptor.	I
PSID	SMALLINT NOT NULL	The internal identifier of the table space page set descriptor for the table space that is associated with the index.	G
PARTITION	SMALLINT NOT NULL	The data set number within the index space. For partitioned index spaces, this value corresponds to the partition number for a single partition. For non-partitioned table spaces, this value is 0.	G
INSTANCE	SMALLINT NOT NULL WITH DEFAULT 1	Indicates if the object is associated with data set 1 or 2. This is an updatable column.	G
TOTALENTRIES	BIGINT	The number of entries, including duplicate entries, in the index space or partition. A null value indicates that the number of entries is unknown.	G
DBNAME	VARCHAR(24) NOT NULL	The name of the database.	G
NAME	VARCHAR(128) NOT NULL	The name of the index.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the index.	G
INDEXSPACE	VARCHAR(24) NOT NULL	The name of the index space.	G
LASTUSED	DATE	The date when the index is used for SELECT, FETCH, searched UPDATE, searched DELETE, or used to enforce referential integrity constraints. For a data-partitioned secondary index, this column is only updated for one partition, even though more than one partition is accessed. The default value is NULL.	G
REORGINDEXACCESS	BIGINT	The number of times the index was used for SELECT, FETCH, searched UPDATE, searched DELETE, or used to enforce referential integrity constraints, or since the object was created. For hash overflow indexes, this is the number of times DB2 has used the hash overflow index. A null value indicates that the number of times the index has been used is unknown.	G

Column name	Data type	Description	Use
DRIVETYPE	CHAR(3) NOT NULL WITH DEFAULT	The drive type on which the index or index partition data set is defined. **HDD** Hard Disk Drive **SSD** Solid State Drive For multi-volume data sets, the drive type is set to SSD if any volume is SSD. For multi-piece linear page sets, the drive type of the first data set is used.	G
	BIGINT	Reserved for future IBM use.	R

In data sharing environments, the values in SYSIBM.SYSINDEXSPACESTATS can be negative for short periods of time for certain situations.

SYSIBM.SYSINDEXSTATS table

The SYSIBM.SYSINDEXSTATS table contains one row for each partition of a partitioning index or a data-partitioned secondary index.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
FIRSTKEYCARD	INTEGER NOT NULL	For the index partition, number of distinct values of the first key column. For a sparse index, the statistic is based on the actual contents of the index.	S
FULLKEYCARD	INTEGER NOT NULL	For the index partition, number of distinct values of the key. For a sparse index, the statistic is based on the actual contents of the index.	S
NLEAF	INTEGER NOT NULL	Number of active leaf pages in the index partition.	S
NLEVELS	SMALLINT NOT NULL	Number of levels in the index tree.	S
	SMALLINT NOT NULL	Not used	N
	SMALLINT NOT NULL	Not used	N
CLUSTERRATIO	SMALLINT NOT NULL	For the index partition, the percentage of rows that are in clustering order. The value is 0 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	N
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics. The default value is '0001-01-01.00.00.00.000000'.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
PARTITION	SMALLINT NOT NULL	Partition number of the index.	G
OWNER	VARCHAR(128) NOT NULL	The schema of the index.	G
NAME	VARCHAR(128) NOT NULL	Name of the index.	G

Column name	Data type	Description	Use
KEYCOUNT	INTEGER NOT NULL	Total number of RIDs in the index partition. The value is -1 if statistics have not been gathered.Total number of rows in the partition. For a sparse index, the statistic is based on the actual contents of the index.	S
FIRSTKEYCARDF	FLOAT NOT NULL WITH DEFAULT -1	For the index partition, number of distinct values of the first key column. For a sparse index, the statistic is based on the actual contents of the index.	S
FULLKEYCARDF	FLOAT NOT NULL WITH DEFAULT -1	For the index partition, number of distinct values of the key. For a sparse index, the statistic is based on the actual contents of the index.	S
KEYCOUNTF	FLOAT WITH DEFAULT -1	Total number of RIDs in the index partition. The value is -1 if statistics have not been gathered.Total number of rows in the partition. For a sparse index, the statistic is based on the actual contents of the index.	S
CLUSTERRATIOF	FLOAT NOT NULL WITH DEFAULT	For the index partition, the value, when multiplied by 100, is the percentage of rows that are in clustering order. For example, a value of '.9125' indicates 91.25%. The value is 0 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	G
	VARCHAR(1000) NOT NULL WITH DEFAULT FOR BIT DATA	Internal use only	I
DATAREPEAT-FACTORF	FLOAT NOT NULL WITH DEFAULT -1	The anticipated number of data pages that will be touched following an index key order. This number is -1 if statistics have not been collected. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	G

SYSIBM.SYSINDEXSTATS_HIST table

The SYSIBM.SYSINDEXSTATS_HIST table contains rows from SYSINDEXSTATS.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Column name	Data type	Description	Use
NLEAF	INTEGER NOT NULL WITH DEFAULT -1	Number of active leaf pages in the index partition. The value is -1 if statistics have not been gathered.	S
NLEVELS	SMALLINT NOT NULL WITH DEFAULT -1	Number of levels in the index tree. The value is -1 if statistics have not been gathered.	S
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics. The default value is '0001-01-01.00.00.00.000000'.	G
PARTITION	SMALLINT NOT NULL	Partition number of the index.	G
OWNER	VARCHAR(128) NOT NULL	The schema of the index.	G
NAME	VARCHAR(128) NOT NULL	Name of the index.	G
FIRSTKEYCARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	For the index partition, number of distinct values of the first key column. The value is -1 if statistics have not been gathered.	S
FULLKEYCARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	For the index partition, number of distinct values of the key. The value is -1 if statistics have not been gathered.	S
KEYCOUNTF	FLOAT(8) NOT NULL WITH DEFAULT -1	Total number of RIDs in the index partition. The value is -1 if statistics have not been gathered.Total number of rows in the partition. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	S
CLUSTERRATIOF	FLOAT(8) NOT NULL	For the index partition, the value, when multiplied by 100, is the percentage of rows that are in clustering order. For example, a value of '0.9125' indicates 91.25%. The value is 0 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

Column name	Data type	Description	Use
DATAREPEAT-FACTORF	FLOAT NOT NULL WITH DEFAULT -1	The anticipated number of data pages that will be touched following an index key order. This number is -1 if statistics have not been collected. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	G

SYSIBM.SYSJARCLASS_SOURCE table

The SYSIBM.SYSJARCLASS_SOURCE table is an auxiliary table for SYSIBM.SYSJARCONTENTS.

Column name	Data type	Description	Use
CLASS_SOURCE	CLOB(10M) NOT NULL	The contents of the class in the JAR file.	G

SYSIBM.SYSJARCONTENTS table

The SYSIBM.SYSJARCONTENTS table contains Java class source for an installed JAR file.

Column name	Data type	Description	Use
JARSCHEMA	VARCHAR(128) NOT NULL	The schema of the JAR file.	G
JAR_ID	VARCHAR(128) NOT NULL	The name of the JAR file.	G
CLASS	VARCHAR(384) NOT NULL	The class name contained in the JAR file.	G
CLASS_SOURCE_ROWID	ROWID NOT NULL GENERATED ALWAYS	ID used to support CLOB data type.	G
CLASS_SOURCE	CLOB(10M) NOT NULL	The contents of the class in the JAR file.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSJARDATA table

The SYSIBM.SYSJARDATA table is an auxiliary table for SYSIBM.SYSJAROBJECTS.

Column name	Data type	Description	Use
JAR_DATA	BLOB(100M) NOT NULL	The contents of the JAR file.	G

SYSIBM.SYSJAROBJECTS table

The SYSIBM.SYSJAROBJECTS table contains binary large object representing the installed JAR file.

Column name	Data type	Description	Use
JARSCHEMA	VARCHAR(128) NOT NULL	The schema of the JAR file.	G
JAR_ID	VARCHAR(128) NOT NULL	The name of the JAR file.	G
OWNER	VARCHAR(128) NOT NULL	Authorization ID of the owner of the JAR object.	G
JAR_DATA_ROWID	ROWID NOT NULL GENERATED ALWAYS	ID used to support BLOB data type.	G
JAR_DATA	BLOB(100M) NOT NULL	The contents of the JAR file. This is an updatable column.	G
PATH	VARCHAR(2048) NOT NULL	The class resolution path of the JAR file. This is an updatable column.	G
CREATEDTS	TIMESTAMP NOT NULL	Time when the JAR object was created.	G
ALTEREDTS	TIMESTAMP NOT NULL	Time when the JAR object was altered.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: **blank** Authorization ID **L** Role	G

SYSIBM.SYSJAVAOPTS table

The SYSIBM.SYSJAVAOPTS table contains build options used during INSTALL_JAR.

Column name	Data type	Description	Use
JARSCHEMA	VARCHAR(128) NOT NULL	The schema of the JAR file.	G
JAR_ID	VARCHAR(128) NOT NULL	The name of the JAR file.	G
BUILDSCHEMA	VARCHAR(128) NOT NULL	Schema name for BUILDNAME.	G
BUILDNAME	VARCHAR(128) NOT NULL	Procedure used to create the routine.	G
BUILDOWNER	VARCHAR(128) NOT NULL	Authorization ID used to create the routine.	G
DBRMLIB	VARCHAR(256) NOT NULL	PDS name where DBRM is located.	G
HPJCOMPILE_OPTS	VARCHAR(512) NOT NULL	HPJ compile options used to install the routine.	G
BIND_OPTS	VARCHAR(2048) NOT NULL	Bind options used to install the routine.	G
POBJECT_LIB	VARCHAR(256) NOT NULL	PDSE name where program object is located.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSJAVAPATHS table

The SYSIBM.SYSJAVAPATHS table contains the complete class resolution path of a JAR file, and records the dependencies that one JAR file has on the JAR files in its Java path.

Column name	Data type	Description	Use
JARSCHEMA	VARCHAR(128) NOT NULL	The schema of the JAR file.	G
JAR_ID	VARCHAR(128) NOT NULL	The name of the JAR file.	G
OWNER	VARCHAR(128) NOT NULL	Authorization ID of the owner of the JAR object.	G
ORDINAL	SMALLINT NOT NULL	The ordinal number of the path element within the JAR file's Java path.	G
PE_CLASS_PATTERN	VARCHAR(2048) NOT NULL	The pattern for the names of the classes that are to be searched for in this path element's JAR file.	G
PE_JARSCHEMA	VARCHAR(128) NOT NULL	The schema of this path element's JAR file.	G
PE_JAR_ID	VARCHAR(128) NOT NULL	The name of this path element's JAR file.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSKEYCOLUSE table

The SYSIBM.SYSKEYCOLUSE table contains a row for every column in a unique constraint (primary key or unique key) from the SYSIBM.SYSTABCONST table.

Column name	Data type	Description	Use
CONSTNAME	VARCHAR(128) NOT NULL	Name of the constraint.	G
TBCREATOR	VARCHAR(128) NOT NULL	Schema or qualifier of the table on which the constraint is defined.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table on which the constraint is defined.	G
COLNAME	VARCHAR(128) NOT NULL	Name of the column	G
COLSEQ	SMALLINT NOT NULL	Numeric position of the column in the key (the first position in the key is 1).	G
COLNO	SMALLINT NOT NULL	Numeric position of the column in the table on which the constraint is defined.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
PERIOD	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the column is the start or end column for the BUSINESS_TIME period: **B** The column is the start of the period BUSINESS_TIME. **C** The column is the end of the period BUSINESS_TIME. **blank** Column is not used as either the start or the end of a BUSINESS_TIME period.	G

SYSIBM.SYSKEYS table

The SYSIBM.SYSKEYS table contains one row for each column of an index key.

Column name	Data type	Description	Use
IXNAME	VARCHAR(128) NOT NULL	Name of the index.	G
IXCREATOR	VARCHAR(128) NOT NULL	Schema or qualifier of the index.	G
COLNAME	VARCHAR(128) NOT NULL	Name of the column of the key.	G
COLNO	SMALLINT NOT NULL	Numeric position of the column in the table. For example, 4 (out of 10).	G
COLSEQ	SMALLINT NOT NULL	Numeric position of the column in the key for an index on columns. For example, 4 (out of 4). The value is meaningless for an expression-based indexes.	G
ORDERING	CHAR(1) NOT NULL	Order of the column in the key: **blank** Index is an expression-based index or the column is specified for the index using the INCLUDE clause **A** Ascending order **D** Descending order **R** Random order	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
PERIOD	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the column is the start or end column for the BUSINESS_TIME period: **B** The column is the start of the period BUSINESS_TIME. **C** The column is the end of the period BUSINESS_TIME. **blank** Column is not used as either the start or the end of a BUSINESS_TIME period.	G

Related concepts:

Index keys (Introduction to DB2 for z/OS)

SYSIBM.SYSKEYTARGETS table

The SYSIBM.SYSKEYTARGETS table contains one row for each key-target that is participating in an extended index definition.

Column name	Data type	Description	Use
IXNAME	VARCHAR(128) NOT NULL	Name of the index.	G
IXSCHEMA	VARCHAR(128) NOT NULL	Qualifier of the index.	G
KEYSEQ	SMALLINT NOT NULL	Numeric position of the key-target in the index.	G
COLNO	SMALLINT NOT NULL	Numeric position of the column in the table if the expression is a single column. Otherwise the value is 0. For XML indexes, this field is also 0.	G
ORDERING	CHAR(1) NOT NULL	Order of the key: **A** Ascending	G
TYPESCHEMA	VARCHAR(128) NOT NULL	Schema of the data type.	G
TYPENAME	VARCHAR(128) NOT NULL	Name of the data type.	G
DATATYPEID	INTEGER NOT NULL	The internal ID of the data type.	G
SOURCETYPEID	INTEGER NOT NULL	For a built-in data type, this column contains 0. For a distinct type, this column contains the internal ID of the built-in type on which the distinct type is based.	G

Column name	Data type	Description	Use
LENGTH	SMALLINT NOT NULL	The length attribute of the key-target or its precision for a decimal key-target. The number does not include the internal prefixes that are used to record the actual length and null states, when applicable. **data type** **value of the LENGTH column** **INTEGER** 4 **SMALLINT** 2 **FLOAT** 4 or 8 **CHAR** The length of the string **VARCHAR** The maximum length of the string **DECIMAL** The precision of the number **GRAPHIC** The number of DBCS characters **VARGRAPHIC** The maximum number of DBCS characters **DATE** 4 **TIME** 3 **TIMESTAMP WITHOUT TIME ZONE** The integral part of ((p+1)/2) + 7 where p is the precision of the timestamp **TIMESTAMP WITH TIME ZONE** The integral part of ((p+1)/2) + 9 where p is the precision of the timestamp **BIGINT** 8 **BINARY** The length of the string **VARBINARY** The maximum length of the string **DECFLOAT** 8 or 16	G
LENGTH2	INTEGER NOT NULL	The maximum length of the data that is retrieved from the column. Possible values include the following values: **0** Not a ROWID column **40** For a ROWID column, the length of the value that is returned	G
SCALE	SMALLINT NOT NULL	The scale of decimal data or number of fractional second digits of timestamp or timestamp with time zone data. Otherwise the value is 0. If the column is a timestamp type, the LENGTH is 10 and the SCALE is 0, the number of fractional second digits is 6.	G
NULLS	CHAR(1) NOT NULL	Whether the key can contain null values: **N** No **Y** Yes. Y also indicates that the index is an XML index.	G
CCSID	INTEGER NOT NULL	The CCSID of the key. CCSID contains 0 if the key is a non-character type key.	G

Column name	Data type	Description	Use
SUBTYPE	CHAR(1) NOT NULL	SUBTYPE applies to character keys only and indicated the subtype of the data: **B** BIT data **M** MIXED data **S** SBCS data **blank** non-character data	G
	VARCHAR(512) NOT NULL FOR BIT DATA	Internal use.	I
CREATEDTS	TIMESTAMP NOT NULL	The timestamp for when the key-target is created.	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 in which the key-target is created. SeeRelease dependency indicators for values.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
DERIVED_FROM	VARCHAR(4000) NOT NULL	For an index on a scalar expression, DERIVED_FROM contains the text of the scalar expression that is used to generated the key-target value. For an XML index, this is the XML pattern that is used to generate the key-target value. Otherwise DERIVED_FROM contains an empty string.	G
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	The timestamp of the most recent RUNSTATS. The default value is '0001-01-01.00.00.00.000000'. STATSTIME is an updatable column.	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	The estimated number of distinct values for the key-target. The value is -2 if the index is a node ID index. For an XML value index, the statistic is collected for the second key target (the DOCID column). For all other key targets of the XML value index, a value of -2 is set.	G
HIGH2KEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The second highest key-value. HIGH2KEY is an updatable column.	G
LOW2KEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The second lowest key-value. LOW2KEY is an updatable column.	G

Column name	Data type	Description	Use
STATS_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The type of statistics that are gathered: **N** VARCHAR column statistical values are not padded **blank** Statistics have not been collects or VARCHAR column statistical values are padded STATS_FORMAT is an updatable column.	G

SYSIBM.SYSKEYTARGETSTATS table

The SYSIBM.SYSKEYTARGETSTATS table contains partition statistics for selected key-targets. For each key-target, a row exists for each partition in the table.

Rows are inserted when RUNSTATS collects indexed key statistics or non-indexed key statistics for a partitioned table space. No row is inserted if the table space is nonpartitioned. Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
IXSCHEMA	VARCHAR(128) NOT NULL	The qualifier of the index.	G
IXNAME	VARCHAR(128) NOT NULL	The name of the index.	G
KEYSEQ	SMALLINT NOT NULL	Numeric position of the key-target in the index.	G
HIGHKEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The highest key value.	S
HIGH2KEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The second highest key-value.	S
LOWKEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The lowest key value.	S
LOW2KEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The second lowest key-value.	S
PARTITION	SMALLINT NOT NULL	The partition number of the table space.	G
	VARCHAR(1000) NOT NULL WITH DEFAULT FOR BIT DATA	Internal use only.	I
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	The timestamp of the most recent RUNSTATS. The default value is '0001-01-01.00.00.00.000000'.	G

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
STATS_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The type of statistics that are gathered: **N** VARCHAR column statistical values are not padded **blank** Statistics have not been collects or VARCHAR column statistical values are padded	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	Number of distinct values for the key target.	G

SYSIBM.SYSKEYTARGETS_HIST table

The SYSIBM.SYSKEYTARGETS_HIST table contains rows from the SYSKEYTARGETS table.

Whenever rows are added or changed in SYSKEYTARGETS, the rows are also written to this table. Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
IXNAME	VARCHAR(128) NOT NULL	Name of the index.	G
IXSCHEMA	VARCHAR(128) NOT NULL	Qualifier of the index.	G
KEYSEQ	SMALLINT NOT NULL	Numeric position of the key-target in the index.	G
TYPESCHEMA	VARCHAR(128) NOT NULL	Schema of the data type.	G
TYPENAME	VARCHAR(128) NOT NULL	Name of the data type.	G
DATATYPEID	INTEGER NOT NULL	The internal ID of the data type.	G
SOURCETYPEID	INTEGER NOT NULL	For a built-in data type, this field contains 0. For a distinct type, this field contains the internal ID of the built-in type on which the distinct type is based.	G

Column name	Data type	Description	Use
LENGTH	SMALLINT NOT NULL	The length attribute of the key-target or its precision for a decimal key-target. The number does not include the internal prefixes that are used to record the actual length and null states, when applicable. **data type** **value of the LENGTH column** **INTEGER** 4 **SMALLINT** 2 **FLOAT** 4 or 8 **CHAR** The length of the string **VARCHAR** The maximum length of the string **DECIMAL** The precision of the number **GRAPHIC** The number of DBCS characters **VARGRAPHIC** The maximum number of DBCS characters **DATE** 4 **TIME** 3 **TIMESTAMP WITHOUT TIME ZONE** The integral part of ((p+1)/2) + 7 where p is the precision of the timestamp **TIMESTAMP WITH TIME ZONE** The integral part of ((p+1)/2) + 9 where p is the precision of the timestamp **BIGINT** 8 **BINARY** The length of the string **VARBINARY** The maximum length of the string **DECFLOAT** 8 or 16	G
LENGTH2	INTEGER NOT NULL	The maximum length of the data that is retrieved from the column. Possible values include the following values: **0** Not a ROWID column **40** For a ROWID column, the length of the value that is returned	G
SCALE	SMALLINT NOT NULL	The scale of decimal data or number of fractional second digits of timestamp or timestamp with time zone data. Otherwise the value is 0. If the column is a timestamp type, the LENGTH is 10 and the SCALE is 0, the number of fractional second digits is 6.	G
NULLS	CHAR(1) NOT NULL	Whether the key can contain null values: **N** No **Y** Yes	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	The timestamp of the most recent RUNSTATS. The default value is '0001-01-01.00.00.00.000000'. STATSTIME is an updatable column.	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	The estimated number of distinct values for the key-target. The value is -2 if the index is a node ID index. For an XML value index, the statistic is collected for the second key target (the DOCID column). For all other key targets of the XML value index, a value of -2 is set.	G
HIGH2KEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The second highest key-value.	G
LOW2KEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The second lowest key-value.	G
STATS_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The type of statistics that are gathered: **N** VARCHAR column statistical values are not padded **blank** Statistics have not been collects or VARCHAR column statistical values are padded	G

SYSIBM.SYSKEYTGTDIST table

The SYSIBM.SYSKEYTGTDIST table contains one or more rows for the first key-target of an extended index key.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If the RUNSTATS utility updated the statistics, this column contains the date and time when the last invocation of RUNSTATS updated the statistics. The default value is '0001-01-01.00.00.00.000000'.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
IXSCHEMA	VARCHAR(128) NOT NULL	The qualifier of the index.	G
IXNAME	VARCHAR(128) NOT NULL	The name of the index.	G
KEYSEQ	SMALLINT NOT NULL	The numeric position of the key-target in the index.	G
KEYVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	KEYVALUE contains the data of a frequently occurring value. If the value has a non-character data type, the data might not be printable.	G
TYPE	CHAR(1) NOT NULL WITH DEFAULT 'F'	The type of statistics that are gathered: **C** Cardinality **F** Frequent value **N** Non-padded frequent value **H** Histogram statistics	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	When TYPE='C', CARDF contains the number of distinct values for the key group. When TYPE='H', CARDF contains the number of distinct values for the key group in a quantile indicated by QUANTILENO.	G
KEYGROUPKEYNO	VARCHAR(254) NOT NULL WITH DEFAULT FOR BIT DATA	KEYGROUPKEYNO contains a value that identifies the set of keys that are associated with the statistics. KEYGROUPKEYNO contains 0 if the statistics are only associated with a single key. If the statistics are associated with more than a single key, KEYGROUPKEYNO contains an array of SMALLINT key numbers with a dimension that is equal to the value in NUMKEYS.	G

Column name	Data type	Description	Use
NUMKEYS	SMALLINT NOT NULL WITH DEFAULT -1	The number of keys that are associated with the statistics.	G
FREQUENCYF	FLOAT NOT NULL WITH DEFAULT -1	When TYPE='F' or 'N', FREQUENCYF contains a value that indicates the percentage of entries in the index that have the value that is contained in the KEYVALUE column. When TYPE='H', FREQUENCYF contains a value that indicates the percentage of entries in the index that have a value that is in the range of the quantile that is indicated in the QUALTILENO column. To determine the percentage from the value of FREQUENCYF, multiply the value by 100. For example, a value of '1' indicates 100 percent. A value of '.153' indicates '15.3' percent.	G
QUANTILENO	SMALLINT NOT NULL WITH DEFAULT -1	QUANTILENO contains an ordinary sequence number of a quantile in the whole consecutive value range, from low to high.	G
LOWVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	When TYPE='H', LOWVALUE contains the lower bound for the quantile that is in QUANTILENO. LOWVALUE is not used if TYPE does not equal 'H'.	G
HIGHVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	When TYPE='H', HIGHVALUE contains the upper bound for the quantile that is in QUANTILENO. HIGHVALUE is not used if TYPE does not equal 'H'.	G

SYSIBM.SYSKEYTGTDISTSTATS table

The SYSIBM.SYSKEYTGTDISTSTATS table contains zero or more rows per partition for the first key-target of a data-partitioned secondary index.

Rows are inserted when RUNSTATS scans a data-partitioned secondary index. No row is inserted if the index is a secondary index. Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS updated the statistics, STATSTIME contains the timestamp of the most recent RUNSTATS. The default value is '0001-01-01.00.00.00.000000'.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
PARTITION	SMALLINT NOT NULL	The partition number of the table space that contains the index in which the key is defined.	G
IXSCHEMA	VARCHAR(128) NOT NULL	The qualifier of the index.	G
IXNAME	VARCHAR(128) NOT NULL	The name of the index.	G
KEYSEQ	SMALLINT NOT NULL	Numeric position of the key-target in the index.	G
KEYVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	KEYVALUE contains the data of a frequently occurring value. If the value has a non-character data type, the data might not be printable.	G
TYPE	CHAR(1) NOT NULL WITH DEFAULT 'F'	The type of statistics that are gathered: **C** Cardinality **F** Frequent value **N** Non-padded frequent value **H** Histogram statistics	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	When TYPE='C', CARDF contains the number of distinct values for the key group. When TYPE='H', CARDF contains the number of distinct values for the key group in the quantile that is in QUANTILENO.	G
KEYGROUPKEYNO	VARCHAR(254) NOT NULL WITH DEFAULT	Identifies the set of keys that are associated with the statistics. If the statistics are only associated with a single key, KEYGROUPKEYNO contains a zero length value. Otherwise, KEYGROUPKEYNO contains an array of SMALLINT key numbers that have a dimension that is equal to the value in NUMKEYS.	G

Column name	Data type	Description	Use
NUMKEYS	SMALLINT NOT NULL WITH DEFAULT	Identifies the number of keys that are associated with the statistics.	G
FREQUENCYF	FLOAT NOT NULL WITH DEFAULT -1	When TYPE='F' or 'N', FREQUENCYF contains the percentage of entries in the index that have the value that is specified in KEYVALUE when the number of entries is multiplied by 100. For example, a value of '1' indicates 100 percent. A value of '.153' indicates 15.3 percent. When TYPE='H', FREQUENCYF contains the percentage of entries in the index that have a value that is in the range of the quantile that is indicated in QUALTILENO.	G
QUANTILENO	SMALLINT NOT NULL WITH DEFAULT -1	QUANTILENO contains an ordinary sequence number of a quantile in the whole consecutive value range, from low to high.	G
LOWVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	When TYPE='H', LOWVALUE is the lower bound for the quantile that is indicated in QUANTILENO. LOWVALUE is not used if TYPE does not equal 'H'.	G
HIGHVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	When TYPE='H', HIGHVALUE is the upper bound for the quantile that is indicated in QUANTILENO. HIGHVALUE is not used if TYPE does not equal 'H'.	G
	VARCHAR(1000)	Internal use only	I

SYSIBM.SYSKEYTGTDIST_HIST table

The SYSIBM.SYSKEYTGTDIST_HIST table contains rows from the SYSKEYTGTDIST table. Whenever rows are added or changed in SYSKEYTGTDIST, the rows are also written to this table.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If the RUNSTATS utility updated the statistics, this column contains the date and time when the last invocation of RUNSTATS updated the statistics. The default value is '0001-01-01.00.00.00.000000'.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
IXSCHEMA	VARCHAR(128) NOT NULL	The qualifier of the index.	G
IXNAME	VARCHAR(128) NOT NULL	The name of the index.	G
KEYSEQ	SMALLINT NOT NULL	The numeric position of the key-target in the index.	G
KEYVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	KEYVALUE contains the data of a frequently occurring value. If the value has a non-character data type, the data might not be printable.	G
TYPE	CHAR(1) NOT NULL WITH DEFAULT 'F'	The type of statistics that are gathered: **C** Cardinality **F** Frequent value **N** Non-padded frequent value **H** Histogram statistics	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	When TYPE='C', CARDF contains the number of distinct values for the key group. When TYPE='H', CARDF contains the number of distinct values for the key group in a quantile indicated by QUANTILENO.	G
KEYGROUPKEYNO	VARCHAR(254) NOT NULL WITH DEFAULT FOR BIT DATA	KEYGROUPKEYNO contains a value that identifies the set of keys that are associated with the statistics. KEYGROUPKEYNO contains 0 if the statistics are only associated with a single key. If the statistics are associated with more than a single key, KEYGROUPKEYNO contains an array of SMALLINT key numbers with a dimension that is equal to the value in NUMKEYS.	G

Column name	Data type	Description	Use
NUMKEYS	SMALLINT NOT NULL WITH DEFAULT -1	The number of keys that are associated with the statistics.	G
FREQUENCYF	FLOAT NOT NULL WITH DEFAULT -1	When TYPE='F' or 'N', FREQUENCYF contains the percentage of entries in the index that have the value that is specified in KEYVALUE when the number of entries is multiplied by 100. For example, a value of '1' indicates 100 percent. A value of '.153' indicates 15.3 percent. When TYPE='H', FREQUENCYF contains the percentage of entries in the index that have a value that is in the range of the quantile that is indicated in QUALTILENO.	G
QUANTILENO	SMALLINT NOT NULL WITH DEFAULT -1	QUANTILENO contains an ordinary sequence number of a quantile in the whole consecutive value range, from low to high.	G
LOWVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	When TYPE='H', LOWVALUE contains the lower bound for the quantile that is in QUANTILENO. LOWVALUE is not used if TYPE does not equal 'H'.	G
HIGHVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	When TYPE='H', HIGHVALUE contains the upper bound for the quantile that is in QUANTILENO. HIGHVALUE is not used if TYPE does not equal 'H'.	G

SYSIBM.SYSLOBSTATS table

The SYSIBM.SYSLOBSTATS table contains one row for each LOB table space.

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL	Timestamp of RUNSTATS statistics update.	G
AVGSIZE	INTEGER NOT NULL	Average size of a LOB, measured in bytes, in the LOB table space.	S
FREESPACE	INTEGER NOT NULL	Number of kilobytes of available space in the LOB table space.	S
ORGRATIO	DECIMAL(5,2) NOT NULL	The percentage of organization in the LOB table space. A value of '100' indicates perfect organization of the LOB table space. A value of '1' indicates that the LOB table space is disorganized. A value of '0' indicates that the LOB table space is totally disorganized.	S
DBNAME	VARCHAR(24) NOT NULL	Name of the database that contains the LOB table space named in NAME.	G
NAME	VARCHAR(24) NOT NULL	Name of the LOB table space.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSLOBSTATS_HIST table

The SYSIBM.SYSLOBSTATS_HIST table contains rows from SYSIBM.SYSLOBSTATS.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL	Timestamp of RUNSTATS statistics update.	G
FREESPACE	INTEGER NOT NULL	Number of pages of free space in the LOB table space.	S
ORGRATIO	DECIMAL(5,2) NOT NULL	The percentage of organization in the LOB table space. A value of '100' indicates perfect organization of the LOB table space. A value of '1' indicates that the LOB table space is disorganized. A value of '0' indicates that the LOB table space is totally disorganized.	S
DBNAME	VARCHAR(24) NOT NULL	Name of the database that contains the LOB table space named in NAME.	G
NAME	VARCHAR(24) NOT NULL	Name of the LOB table space.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSOBJROLEDEP table

The SYSIBM.SYSOBJROLEDEP table lists the dependent objects for each role.

Column name	Data type	Description	Use
DEFINER	VARCHAR(128) NOT NULL	The authorization ID or role that created the object.	G
DEFINERTYPE	CHAR(1) NOT NULL	The type of definer: **L** Role **blank** Authorization ID	G
ROLENAME	VARCHAR(128) NOT NULL	Name of the role on which there is a dependency.	G
DSCHEMA	VARCHAR(128) NOT NULL	Name of the schema of the dependent object.	G
DNAME	VARCHAR(762) NOT NULL	Name of the dependent object.	G
DTYPE	CHAR(1) NOT NULL	The type of the dependent object in DNAME: **B** Trigger **D** Database **E** Distinct type **F** User-defined function **I** Index **J** JAR file **L** Role **M** Materialized query table **N** Trusted context **O** Stored procedure **Q** Sequence **R** Table space **S** Storage group **T** Table **V** View **X** Row permission **Y** Column mask **0 (zero)** Alias	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSPACKAGE table

The SYSIBM.SYSPACKAGE table contains a row for every package.

Column name	Data type	Description	Use
LOCATION	VARCHAR(128) NOT NULL	Always contains blanks	S
COLLID	VARCHAR(128) NOT NULL	Name of the package collection. For a trigger package, it is the schema name of the trigger.	G
NAME	VARCHAR(128) NOT NULL	Name of the package.	G
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	Consistency token for the package. For a package derived from a DB2 DBRM, this is either: • The "level" as specified by the LEVEL option when the package's program was precompiled • The timestamp indicating when the package's program was precompiled, in an internal format.	S
OWNER	VARCHAR(128) NOT NULL	Authorization ID of the package owner. For a trigger package, the value is the authorization ID of the owner of the trigger, which is set to the current authorization ID (the plan or package owner for static CREATE TRIGGER statement; the CURRENT SQLID for a dynamic CREATE TRIGGER statement).	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the creator of the package version. For a trigger package, the value is determined differently. For dynamic SQL, it is the primary authorization ID of the user who issued the CREATE TRIGGER statement. For static SQL, it is the authorization ID of the plan or package owner.	G
TIMESTAMP	TIMESTAMP NOT NULL	Timestamp indicating when the package was created.	G
BINDTIME	TIMESTAMP NOT NULL	Timestamp indicating when the package was last bound.	G
QUALIFIER	VARCHAR(128) NOT NULL	Implicit qualifier for the unqualified table, view, index, and alias names in the static SQL statements of the package.	G
PKSIZE	INTEGER NOT NULL	Size of the base section[40] of the package, in bytes.	G
AVGSIZE	INTEGER NOT NULL	Average size, in bytes, of those sections[40] of the plan that contain SQL statements processed at bind time.	G
SYSENTRIES	SMALLINT NOT NULL	Number of enabled or disabled entries for this package in SYSIBM.SYSPKSYSTEM. A value of 0 if all types of connections are enabled.	G

40. Packages are divided into *sections*. The base section of the package must be in the EDM pool during the entire time the package is executing. Other sections of the package, corresponding roughly to sets of related SQL statements, are brought into the pool as needed.

Column name	Data type	Description	Use
VALID	CHAR(1) NOT NULL	Whether the package is valid: **A** An ALTER statement changed the description of the table or base table of a view referred to by the package. For a CREATE INDEX statement involving data sharing, VALID is also marked as "A". The changes do not invalidate the package. **H** An ALTER TABLE statement changed the description of the table or base table of a view referred to by the package. For releases of DB2 prior to Version 5, the change invalidates the package. **N** No **Y** Yes	G
OPERATIVE	CHAR(1) NOT NULL	Whether the package can be allocated: **N** No; an explicit BIND or REBIND is required before the package can be allocated. **Y** Yes	G
VALIDATE	CHAR(1) NOT NULL	Whether validity checking can be deferred until run time: **B** All checking must be performed at bind time. **R** Validation is done at run time for tables, views, and privileges that do not exist at bind time.	G
ISOLATION	CHAR(1) NOT NULL	Isolation level when the package was last bound or rebound **R** RR (repeatable read) **S** CS (cursor stability) **T** RS (read stability) **U** UR (uncommitted read) **blank** Not specified, and therefore at the level specified for the plan executing the package	G
RELEASE	CHAR(1) NOT NULL	The value used for RELEASE when the package was last bound or rebound: **C** Value used was COMMIT. **D** Value used was DEALLOCATE. **I** The local package is inheriting the value from the plan **blank** Not specified, and therefore the value specified for the plan executing the package.	G
EXPLAIN	CHAR(1) NOT NULL	EXPLAIN option specified for the package; that is, whether information on the package's statements was added to the owner of the PLAN_TABLE table: **N** No **Y** Yes	G
QUOTE	CHAR(1) NOT NULL	SQL string delimiter for SQL statements in the package: **N** Apostrophe **Y** Quotation mark	G
COMMA	CHAR(1) NOT NULL	Decimal point representation for SQL statements in package: **N** Period **Y** Comma	G

Column name	Data type	Description	Use
HOSTLANG	CHAR(1) NOT NULL	Host language for the package's DBRM: **B** Assembler language **C** OS/VS COBOL **D** C **F** Fortran **P** PL/I **2** VS COBOL II or IBM COBOL Release 1 (formerly called COBOL/370) **3** IBM COBOL (Release 2 or subsequent releases) **4** C++ **blank** For remotely bound packages, trigger packages (TYPE='T'), SQL procedure packages (TYPE='N'), or non-inline SQL scalar function packages (TYPE='F').	G
CHARSET	CHAR(1) NOT NULL	Indicates whether the system CCSID for SBCS data was 290 (Katakana) when the program was precompiled: **K** Yes **A** No	G
MIXED	CHAR(1) NOT NULL	Indicates if mixed data was in effect when the package's program was precompiled (for more on when mixed data is in effect, see “Character strings” on page 84): **N** No **Y** Yes	G
DEC31	CHAR(1) NOT NULL	Indicates whether DEC31 was in effect when the package's program was precompiled (for more on when DEC31 is in effect, see “Arithmetic with two decimal operands” on page 244): **N** No **Y** Yes	G
DEFERPREP	CHAR(1) NOT NULL	Indicates the CURRENTDATA option when the package was bound or rebound: **A** Data currency is required for all cursors. Inhibit blocking for all cursors. **B** Data currency is not required for ambiguous cursors. **C** Data currency is required for ambiguous cursors. **blank** The package was created before the CURRENTDATA option was available.	G
SQLERROR	CHAR(1) NOT NULL	Indicates the SQLERROR option on the most recent subcommand that bound or rebound the package: **C** CONTINUE **N** NOPACKAGE	G
REMOTE	CHAR(1) NOT NULL	Source of the package: **C** Package was created by BIND COPY. **D** Package was created by BIND COPY with the OPTIONS(COMMAND) option. **K** The package was copied from a package that was originally bound on behalf of a remote requester. **L** The package was copied with the OPTIONS(COMMAND) option from a package that was originally bound on behalf of a remote requester. **N** Package was locally bound from a DBRM. **Y** Package was bound on behalf of a remote requester.	G

Column name	Data type	Description	Use
PCTIMESTAMP	TIMESTAMP NOT NULL	Date and time the application program was precompiled, or '0001-01-01-00.00.00.000000' if the LEVEL precompiler option was used, or if the package came from a non-DB2 location.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELBOUND should be used instead.	G
VERSION	VARCHAR(122) NOT NULL	Version identifier for the package. The value is blank for a trigger package (TYPE='T') and when the package is created using the BIND PACKAGE command (the initial version of the package)(TYPE='blank').	G
PDSNAME	VARCHAR(132) NOT NULL	For a locally bound package, the name of the PDS (library) in which the package's DBRM is a member. For a locally copied package, the value in SYSPACKAGE.PDSNAME for the source package. Otherwise, the product signature of the bind requester followed by one of the following: • For DB2 for z/OS remote requesters, the requester's location name, or IP address, or LU name enclosed in angle brackets (for example, "<LUSQLDS>"). • For non-DB2 for z/OS remote requesters, the requester's IP address or LU name enclosed in angle brackets.	G
DEGREE	CHAR(3) NOT NULL WITH DEFAULT	The DEGREE option used when the package was last bound: **ANY** DEGREE(ANY) **1 or blank** DEGREE(1). Blank if the package was migrated.	G
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The DB2 data sharing member name of the DB2 subsystem that performed the most recent bind. This column is blank if the DB2 subsystem was not in a DB2 data sharing environment when the bind was performed.	G

Column name	Data type	Description	Use
DYNAMICRULES	CHAR(1) NOT NULL WITH DEFAULT	The DYNAMICRULES option used when the package was last bound: **B** BIND. Dynamic SQL statements are executed with DYNAMICRULES bind behavior. **D** DEFINEBIND. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES define behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES bind behavior. **E** DEFINERUN. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES define behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES run behavior. **H** INVOKEBIND. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES invoke behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES bind behavior. **I** INVOKERUN. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES invoke behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES run behavior. **R** RUN. Dynamic SQL statements are executed with DYNAMICRULES run behavior. **blank** DYNAMICRULES is not specified for the package. The package uses the DYNAMICRULES value of the plan to which the package is appended at execution time. For a description of the DYNAMICRULES behaviors, see "Authorization IDs and dynamic SQL" on page 75.	G

Column name	Data type	Description	Use
REOPTVAR	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether the access path is determined again at execution time using input variable values: **A** Bind option REOPT(AUTO) indicates that the access path is determined multiple times at execution time depending on the parameter value. **N** Bind option REOPT(NONE) indicates that the access path is determined at bind time. **Y** Bind option REOPT(ALWAYS) indicates that the access path is determined at execution time for SQL statements with variable values. **1** Bind option REOPT(ONCE) indicates that the access path is determined only once at execution time, using the first set of input variable values, regardless of how many times the same statement is executed.	G
DEFERPREPARE	CHAR(1) NOT NULL WITH DEFAULT	Whether PREPARE processing is deferred until OPEN is executed: **N** Bind option NODEFER(PREPARE) indicates that PREPARE processing is not deferred until OPEN is executed. **Y** Bind option DEFER(PREPARE) indicates that PREPARE processing is deferred until OPEN is executed. **I** The local package is inheriting the value from the plan **blank** Bind option not specified for the package. It is inherited from the plan.	G
KEEPDYNAMIC	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether prepared dynamic statements are to be purged at each commit point: **N** The bind option is KEEPDYNAMIC(NO). Prepared dynamic SQL statements are destroyed at commit. **Y** The bind option is KEEPDYNAMIC(YES). Prepared dynamic SQL statements are kept past commit.	G
PATHSCHEMAS	VARCHAR(2048) NOT NULL WITH DEFAULT	SQL path specified on the BIND or REBIND command that bound the package. The path is used to resolve unqualified data type, function, and stored procedure names used in certain contexts. If the PATH bind option was not specified, the value in the column is a zero length string; however, DB2 uses the default SQL path.	G

Column name	Data type	Description	Use
TYPE	CHAR(1) NOT NULL WITH DEFAULT	Type of package. Identifies how the package is created: **F** CREATE FUNCTION or ALTER FUNCTION statement, or a BIND PACKAGE DEPLOY command created the package, and this package is a non-inline SQL scalar function package. **N** CREATE PROCEDURE or ALTER PROCEDURE statement, or BIND PACKAGE DEPLOY command created the package, and this package is a native SQL routine package. **R** CREATE TRIGGER or ALTER TRIGGER statement created the package, and the package is a trigger package that has been created or regenerated in Version 11 New Function Mode or later. **T** CREATE TRIGGER statement prior to Version 11 New Function Mode has created the package, and the package is a trigger package. CREATE TRIGGER statement created the package, and the package is a trigger package. **blank** BIND PACKAGE command created the package.	G
DBPROTOCOL	CHAR(1) NOT NULL WITH DEFAULT 'D'	Whether remote access for SQL is implemented with DRDA access or DRDA access with the capability for package-based continuous block fetch: **D** DRDA **C** DRDA access with package-based continuous block fetch enabled.	G
FUNCTIONTS	TIMESTAMP NOT NULL WITH DEFAULT	Timestamp when the function was resolved. Set by the BIND and REBIND commands, but not by AUTOBIND.	G
OPTHINT	VARCHAR(128) NOT NULL WITH DEFAULT	Value of the OPTHINT bind option. Identifies rows in owner.PLAN_TABLE that are to be used as input to DB2. Refer to the ACCESSPATH column in the "SYSIBM.SYSPACKSTMT table" on page 2290 for information about which statements are using the specified hints.	G
ENCODING_CCSID	INTEGER NOT NULL WITH DEFAULT	The CCSID corresponding to the encoding scheme or CCSID as specified for the bind option ENCODING. The Encoding Scheme specified on the bind command: **ccsid** The specified or derived CCSID. **0** The default CCSID as specified on panel DSNTIPF at installation time. Used when the package was bound prior to Version 7.	G
IMMEDWRITE	CHAR(1) NOT NULL WITH DEFAULT	Indicates when writes of updated group buffer pool dependent pages are to be done. This option is only applicable for data sharing environments. **I** The local package is inheriting the value from the plan **N** Bind option IMMEDWRITE(NO) indicates normal write activity is done. **Y** Bind option IMMEDWRITE(YES) indicates that immediate writes are done for updated group buffer pool dependent pages. **1** Bind option IMMEDWRITE(PH1) indicates that updated group buffer pool dependent pages are written at or before phase 1 commit. **blank** A migrated package.	G

Column name	Data type	Description	Use
RELBOUND	CHAR(1) NOT NULL WITH DEFAULT	The release when the package was bound or rebound. **blank** Bound prior to Version 7 For all other values, see Release dependency indicators	G
	CHAR(1)	Not used.	N
REMARKS	VARCHAR(550) NOT NULL WITH DEFAULT	A character string provided by the user with the COMMENT statement.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner **blank** Authorization ID **L** Role	G
ROUNDING	CHAR(1) NOT NULL WITH DEFAULT	The ROUNDING option used when the package was last bound: **C** ROUND_CEILING **D** ROUND_DOWN **F** ROUND_FLOOR **G** ROUND_HALF_DOWN **E** ROUND_HALF_EVEN **H** ROUND_HALF_UP **U** ROUND_UP **blank** The package created in a DB2 release prior to Version 9.	G
DISTRIBUTE	CHAR(1) NOT NULL WITH DEFAULT 'N'	Determines if DB2 should gather location names from SQL statements, and create remote packages for the user (This only has effect during local bind): **A** DB2 will collect remote location names from SQL statements during local bind, and automatically create remote packages at those sites. The site names are gathered from object names in static SQL statements and literals on CONNECT statements. The sites at which the package is remotely bound can be determined by the location (BTYPE='X') records in SYSIBM.SYSPACKDEP for this package. **L** DB2 will automatically create remote packages at the sites specified in the list of location-names. The sites at which the package is remotely bound can be determined by the location (BTYPE='X') records in SYSIBM.SYSPACKDEP for this package.	G
LASTUSED	DATE NOT NULL WITH DEFAULT	The last date that the corresponding objects are used.	G
CONCUR_ACC_RES	CHAR(1) NOT NULL	Indicates the CONCURRENTACCESSRESOLUTION option when the package was bound or rebound: **blank** Not specified **U** USECURRENTLYCOMMITTED **W** WAITFOROUTCOME	G

Column name	Data type	Description		Use
EXTENDED-INDICATOR	CHAR(1) NOT NULL WITH DEFAULT	The value of the EXTENDEDINDICATOR bind option:		G
		blank	Not specified	
		N	EXTENDEDINDICATOR NO	
		Y	EXTENDEDINDICATOR YES	
	INTEGER NOT NULL	Not used.		N
PLANMGMT	CHAR(1) NOT NULL WITH DEFAULT	The value of the PLANMGMT bind option:		G
		B	PLANMGMT BASIC	
		E	PLANMGMT EXTENDED	
		blank	PLANMGMT OFF	
PLANMGMTSCOPE	CHAR(1) NOT NULL WITH DEFAULT	The value of the PLANMGMTSCOPE bind option:		G
		S	PLANMGMTSCOPE STATIC	
APREUSE	CHAR(1) NOT NULL WITH DEFAULT	The value of the APREUSE bind option:		G
		N	NO or NONE: Access paths are not reused.	
		W	WARN: DB2 tries to reuse access paths. Processing continues when an access path cannot be reused.	
		E	ERROR: DB2 tries to reuse access paths. Processing ends when an access path cannot be reused.	
APRETAINDUP	CHAR(1) NOT NULL WITH DEFAULT	The value of the APRETAINDUP bind option:		G
		Y	APRETAINDUP YES specified. All copies were retained.	
		0	APRETAINDUP NO specified; however, the previous or original package copy is still retained due to access path differences.	
		1	APRETAINDUP NO specified, and the previous package copy is not retained as the access paths are identical to the current copy.	
		2	APRETAINDUP NO specified, and the previous and original package copies are not retained as the access paths are identical to the current copy.	
SYSTIMESENSITIVE	CHAR(1) NOT NULL WITH DEFAULT 'N'	The value of the SYSTIMESENSITIVE bind option:		G
		Y	References to system-period temporal tables are affected by the value of the CURRENT TEMPORAL SYSTEM_TIME special register.	
		N	References to system-period temporal tables are not affected by the value of the CURRENT TEMPORAL SYSTEM_TIME special register.	
	CHAR(1) NOT NULL WITH DEFAULT 'Y'	Not used.		N

Column name	Data type	Description		Use
BUSTIMESENSITIVE	CHAR(1) NOT NULL WITH DEFAULT 'N'	The value of the BUSTIMESENSITIVE bind option:		G
		Y	References to application-period temporal tables are affected by the value of the CURRENT TEMPORAL BUSINESS_TIME special register.	
		N	References to application-period temporal tables are not affected by the value of the CURRENT TEMPORAL BUSINESS_TIME special register.	
APPLCOMPAT	VARCHAR(10) NOT NULL WITH DEFAULT	The value of the APPLCOMPAT bind option:		G
		V10R1	SQL statements in the package have V10R1 compatibility behavior.	
		V11R1	SQL statements in the package have V11R1 compatibility behavior.	
ARCHIVESENSITIVE	CHAR(1) NOT NULL WITH DEFAULT 'N'	The value of the ARCHIVESENSITIVE bind option.		G
		Y	References to archive-enabled tables are affected by the value of the SYSIBMADM.GET_ARCHIVE built-in global variable. Y is the default value.	
		N	References to archive-enabled tables are not affected by the value of the SYSIBMADM.GET_ARCHIVE built-in global variable.	
EXTSEQNO	INTEGER NOT NULL WITH DEFAULT 0	For internal use.		I
DESCSTAT	CHAR(1) NOT NULL WITH DEFAULT	The value of the DESCSTAT bind option.		G
		Y	The DB2 database manager generates a DESCRIBE SQLDA at bind time so that DESCRIBE requests for static SQL can be satisfied during execution.	
		N	The DB2 database manager does not generate a DESCRIBE SQLDA at bind time for static SQL statements.	

SYSIBM.SYSPACKCOPY table

The SYSIBM.SYSPACKCOPY table contains one row for the previous version of each package and one row for the original version of each package.

Column name	Data type	Description	Use
LOCATION	VARCHAR(128) NOT NULL	Always contains blanks	S
COLLID	VARCHAR(128) NOT NULL	Name of the package collection. For a trigger package, it is the schema name of the trigger.	G
NAME	VARCHAR(128) NOT NULL	Name of the package.	G
CONTOKEN	CHAR(8) NOT NULL WITH DEFAULT FOR BIT DATA	Consistency token for the package. For a package derived from a DB2 DBRM, this is either: • The "level" as specified by the LEVEL option when the package's program was precompiled • The timestamp indicating when the package's program was precompiled, in an internal format.	S
OWNER	VARCHAR(128) NOT NULL	Authorization ID of the package owner. For a trigger package, the value is the authorization ID of the owner of the trigger, which is set to the current authorization ID (the plan or package owner for static CREATE TRIGGER statement; the CURRENT SQLID for a dynamic CREATE TRIGGER statement).	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the creator of the package version. For a trigger package, the value is determined differently. For dynamic SQL, it is the primary authorization ID of the user who issued the CREATE TRIGGER statement. For static SQL, it is the authorization ID of the plan or package owner.	G
TIMESTAMP	TIMESTAMP NOT NULL	Timestamp indicating when the package was created.	G
BINDTIME	TIMESTAMP NOT NULL	Timestamp indicating when the package was last bound.	G
QUALIFIER	VARCHAR(128) NOT NULL	Implicit qualifier for the unqualified table, view, index, and alias names in the static SQL statements of the package.	G
PKSIZE	INTEGER NOT NULL	Size of the base section[41] of the package, in bytes.	G
AVGSIZE	INTEGER NOT NULL	Average size, in bytes, of those sections[41] of the plan that contain SQL statements processed at bind time.	G

41. Packages are divided into *sections*. The base section of the package must be in the EDM pool during the entire time the package is executing. Other sections of the package, corresponding roughly to sets of related SQL statements, are brought into the pool as needed.

Column name	Data type	Description	Use
SYSENTRIES	SMALLINT NOT NULL	Number of enabled or disabled entries for this package in SYSIBM.SYSPKSYSTEM. A value of 0 if all types of connections are enabled.	G
VALID	CHAR(1) NOT NULL	Whether the package is valid: **A** An ALTER statement changed the description of the table or base table of a view referred to by the package. For a CREATE INDEX statement involving data sharing, VALID is also marked as "A". The changes do not invalidate the package. **H** An ALTER TABLE statement changed the description of the table or base table of a view referred to by the package. For releases of DB2 prior to Version 5, the change invalidates the package. **N** No **Y** Yes	G
OPERATIVE	CHAR(1) NOT NULL	Whether the package can be allocated: **N** No; an explicit BIND or REBIND is required before the package can be allocated. **Y** Yes	G
VALIDATE	CHAR(1) NOT NULL	Whether validity checking can be deferred until run time: **B** All checking must be performed at bind time. **R** Validation is done at run time for tables, views, and privileges that do not exist at bind time.	G
ISOLATION	CHAR(1) NOT NULL	Isolation level when the package was last bound or rebound **R** RR (repeatable read) **S** CS (cursor stability) **T** RS (read stability) **U** UR (uncommitted read) **blank** Not specified, and therefore at the level specified for the plan executing the package	G
RELEASE	CHAR(1) NOT NULL	The value used for RELEASE when the package was last bound or rebound: **C** Value used was COMMIT. **D** Value used was DEALLOCATE. **blank** Not specified, and therefore the value specified for the plan executing the package.	G
EXPLAIN	CHAR(1) NOT NULL	EXPLAIN option specified for the package; that is, whether information on the package's statements was added to the owner of the PLAN_TABLE table: **N** No **Y** Yes	G
QUOTE	CHAR(1) NOT NULL	SQL string delimiter for SQL statements in the package: **N** Apostrophe **Y** Quotation mark	G
COMMA	CHAR(1) NOT NULL	Decimal point representation for SQL statements in package: **N** Period **Y** Comma	G

Column name	Data type	Description	Use
HOSTLANG	CHAR(1) NOT NULL	Host language for the package's DBRM: **B** Assembler language **C** OS/VS COBOL **D** C **F** Fortran **P** PL/I **2** VS COBOL II or IBM COBOL Release 1 (formerly called COBOL/370) **3** IBM COBOL (Release 2 or subsequent releases) **4** C++ **blank** For remotely bound packages, trigger packages (TYPE='T'), SQL procedure packages (TYPE='N'), or non-inline SQL scalar function packages (TYPE='F').	G
CHARSET	CHAR(1) NOT NULL	Indicates whether the system CCSID for SBCS data was 290 (Katakana) when the program was precompiled: **K** Yes **A** No	G
MIXED	CHAR(1) NOT NULL	Indicates if mixed data was in effect when the package's program was precompiled (for more on when mixed data is in effect, see “Character strings” on page 84): **N** No **Y** Yes	G
DEC31	CHAR(1) NOT NULL	Indicates whether DEC31 was in effect when the package's program was precompiled (for more on when DEC31 is in effect, see “Arithmetic with two decimal operands” on page 244): **N** No **Y** Yes	G
DEFERPREP	CHAR(1) NOT NULL	Indicates the CURRENTDATA option when the package was bound or rebound: **A** Data currency is required for all cursors. Inhibit blocking for all cursors. **B** Data currency is not required for ambiguous cursors. **C** Data currency is required for ambiguous cursors. **blank** The package was created before the CURRENTDATA option was available.	G
SQLERROR	CHAR(1) NOT NULL	Indicates the SQLERROR option on the most recent subcommand that bound or rebound the package: **C** CONTINUE **N** NOPACKAGE	G
REMOTE	CHAR(1) NOT NULL	Source of the package: **C** Package was created by BIND COPY. **D** Package was created by BIND COPY with the OPTIONS(COMMAND) option. **K** The package was copied from a package that was originally bound on behalf of a remote requester. **L** The package was copied with the OPTIONS(COMMAND) option from a package that was originally bound on behalf of a remote requester. **N** Package was locally bound from a DBRM. **Y** Package was bound on behalf of a remote requester.	G

Column name	Data type	Description	Use
PCTIMESTAMP	TIMESTAMP NOT NULL	Date and time the application program was precompiled, or '0001-01-01-00.00.00.000000' if the LEVEL precompiler option was used, or if the package came from a non-DB2 location.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELBOUND should be used instead.	G
VERSION	VARCHAR(122) NOT NULL	Version identifier for the package. The value is blank for a trigger package (TYPE='T').	G
PDSNAME	VARCHAR(132) NOT NULL	For a locally bound package, the name of the PDS (library) in which the package's DBRM is a member. For a locally copied package, the value in SYSPACKAGE.PDSNAME for the source package. Otherwise, the product signature of the bind requester followed by one of the following: • For DB2 for z/OS remote requesters, the requester's location name, or IP address, or LU name enclosed in angle brackets (for example, “<LUSQLDS>”). • For non-DB2 for z/OS remote requesters, the requester's IP address or LU name enclosed in angle brackets.	G
DEGREE	CHAR(3) NOT NULL WITH DEFAULT	The DEGREE option used when the package was last bound: **ANY** DEGREE(ANY) **1 or blank** DEGREE(1). Blank if the package was migrated.	G
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The DB2 data sharing member name of the DB2 subsystem that performed the most recent bind. This column is blank if the DB2 subsystem was not in a DB2 data sharing environment when the bind was performed.	G

Column name	Data type	Description	Use
DYNAMICRULES	CHAR(1) NOT NULL WITH DEFAULT	The DYNAMICRULES option used when the package was last bound: **B** BIND. Dynamic SQL statements are executed with DYNAMICRULES bind behavior. **D** DEFINEBIND. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES define behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES bind behavior. **E** DEFINERUN. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES define behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES run behavior. **H** INVOKEBIND. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES invoke behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES bind behavior. **I** INVOKERUN. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES invoke behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES run behavior. **R** RUN. Dynamic SQL statements are executed with DYNAMICRULES run behavior. **blank** DYNAMICRULES is not specified for the package. The package uses the DYNAMICRULES value of the plan to which the package is appended at execution time. For a description of the DYNAMICRULES behaviors, see "Authorization IDs and dynamic SQL" on page 75.	G

Column name	Data type	Description	Use
REOPTVAR	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether the access path is determined again at execution time using input variable values: **A** Bind option REOPT(AUTO) indicates that the access path is determined multiple times at execution time depending on the parameter value. **N** Bind option REOPT(NONE) indicates that the access path is determined at bind time. **Y** Bind option REOPT(ALWAYS) indicates that the access path is determined at execution time for SQL statements with variable values. **1** Bind option REOPT(ONCE) indicates that the access path is determined only once at execution time, using the first set of input variable values, regardless of how many times the same statement is executed.	G
DEFERPREPARE	CHAR(1) NOT NULL WITH DEFAULT	Whether PREPARE processing is deferred until OPEN is executed: **N** Bind option NODEFER(PREPARE) indicates that PREPARE processing is not deferred until OPEN is executed. **Y** Bind option DEFER(PREPARE) indicates that PREPARE processing is deferred until OPEN is executed. **blank** Bind option not specified for the package. It is inherited from the plan.	G
KEEPDYNAMIC	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether prepared dynamic statements are to be purged at each commit point: **N** The bind option is KEEPDYNAMIC(NO). Prepared dynamic SQL statements are destroyed at commit. **Y** The bind option is KEEPDYNAMIC(YES). Prepared dynamic SQL statements are kept past commit.	G
PATHSCHEMAS	VARCHAR(2048) NOT NULL WITH DEFAULT	SQL path specified on the BIND or REBIND command that bound the package. The path is used to resolve unqualified data type, function, and stored procedure names used in certain contexts. If the PATH bind option was not specified, the value in the column is a zero length string; however, DB2 uses the default SQL path.	G

Column name	Data type	Description	Use
TYPE	CHAR(1) NOT NULL WITH DEFAULT	Type of package. Identifies how the package is created: **F** CREATE FUNCTION or ALTER FUNCTION statement, or a BIND PACKAGE DEPLOY command created the package, and this package is a non-inline SQL scalar function package. **N** CREATE PROCEDURE or ALTER PROCEDURE statement, or BIND PACKAGE DEPLOY command created the package, and this package is a native SQL routine package. **R** CREATE TRIGGER or ALTER TRIGGER statement created the package, and the package is a trigger package that has been created or regenerated in Version 11 New Function Mode or later. **T** CREATE TRIGGER statement prior to Version 11 New Function Mode has created the package, and the package is a trigger package. CREATE TRIGGER statement created the package, and the package is a trigger package. **blank** BIND PACKAGE command created the package.	G
DBPROTOCOL	CHAR(1) NOT NULL WITH DEFAULT 'P'	Whether remote access for SQL is implemented with DRDA access or DRDA access with the capability for package-based continuous block fetch: **D** DRDA **C** DRDA access with the capability for package-based continuous block fetch.	G
FUNCTIONTS	TIMESTAMP NOT NULL WITH DEFAULT	Timestamp when the function was resolved. Set by the BIND and REBIND commands, but not by AUTOBIND.	G
OPTHINT	VARCHAR(128) NOT NULL WITH DEFAULT	Value of the OPTHINT bind option. Identifies rows in owner.PLAN_TABLE that are to be used as input to DB2. Refer to the ACCESSPATH column in the "SYSIBM.SYSPACKSTMT table" on page 2290 for information about which statements are using the specified hints.	G
ENCODING_CCSID	INTEGER NOT NULL WITH DEFAULT	The CCSID corresponding to the encoding scheme or CCSID as specified for the bind option ENCODING. The Encoding Scheme specified on the bind command: **ccsid** The specified or derived CCSID. **0** The default CCSID as specified on panel DSNTIPF at installation time. Used when the package was bound prior to Version 7.	G
IMMEDWRITE	CHAR(1) NOT NULL WITH DEFAULT	Indicates when writes of updated group buffer pool dependent pages are to be done. This option is only applicable for data sharing environments. **N** Bind option IMMEDWRITE(NO) indicates normal write activity is done. **Y** Bind option IMMEDWRITE(YES) indicates that immediate writes are done for updated group buffer pool dependent pages. **1** Bind option IMMEDWRITE(PH1) indicates that updated group buffer pool dependent pages are written at or before phase 1 commit. **blank** A migrated package.	G

Column name	Data type	Description	Use
RELBOUND	CHAR(1) NOT NULL WITH DEFAULT	The release when the package was bound or rebound. **blank** Bound prior to Version 7 For all other values, see Release dependency indicators	G
	CHAR(1)	Not used.	N
REMARKS	VARCHAR(550) NOT NULL WITH DEFAULT	A character string provided by the user with the COMMENT statement.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner **blank** Authorization ID **L** Role	G
ROUNDING	CHAR(1) NOT NULL WITH DEFAULT	The ROUNDING option used when the package was last bound: **C** ROUND_CEILING **D** ROUND_DOWN **F** ROUND_FLOOR **G** ROUND_HALF_DOWN **E** ROUND_HALF_EVEN **H** ROUND_HALF_UP **U** ROUND_UP **blank** The package created in a DB2 release prior to Version 9.	G
DISTRIBUTE	CHAR(1) NOT NULL WITH DEFAULT 'N'	Determines if DB2 should gather location names from SQL statements, and create remote packages for the user (This only has effect during local bind): **A** DB2 will collect remote location names from SQL statements during local bind, and automatically create remote packages at those sites. The site names are gathered from object names in static SQL statements and literals on CONNECT statements. The sites at which the package is remotely bound can be determined by the location (BTYPE='X') records in SYSIBM.SYSPACKDEP for this package. **L** DB2 will automatically create remote packages at the sites specified in the list of location-names. The sites at which the package is remotely bound can be determined by the location (BTYPE='X') records in SYSIBM.SYSPACKDEP for this package.	G
LASTUSED	DATE NOT NULL WITH DEFAULT	The last date that the corresponding objects are used.	G
CONCUR_ACC_RES	CHAR(1) NOT NULL'	Indicates the CONCURRENTACCESSRESOLUTION option when the package was bound or rebound: **blank** Not specified **U** USECURRENTLYCOMMITTED **W** WAITFOROUTCOME	G

Column name	Data type	Description		Use
EXTENDED-INDICATOR	CHAR(1) NOT NULL WITH DEFAULT	The value of the EXTENDEDINDICATOR bind option:		G
		N	EXTENDEDINDICATOR NO	
		Y	EXTENDEDINDICATOR YES	
COPYID	INTEGER NOT NULL	The version of the copy of the package that this row explains:		G
		1	The previous copy of the package	
		2	The original copy of the package	
PLANMGMT	CHAR(1) NOT NULL WITH DEFAULT	The value of the PLANMGMT bind option:		G
		B	PLANMGMT BASIC	
		E	PLANMGMT EXTENDED	
		F	PLANMGMT OFF	
		O	PLANMGMT ON	
PLANMGMTSCOPE	CHAR(1) NOT NULL WITH DEFAULT	The value of the PLANMGMTSCOPE bind option:		G
		S	PLANMGMTSCOPE STATIC	
APREUSE	CHAR(1) NOT NULL WITH DEFAULT	The value of the APREUSE bind option:		I
		N	NO or NONE: Access paths are not reused.	
		E	ERROR: DB2 tries to reuse access paths. Processing ends when an access path cannot be reused.	
APRETAINDUP	CHAR(1) NOT NULL WITH DEFAULT	The value of the APRETAINDUP bind option:		G
		Y	APRETAINDUP YES specified. All copies were retained.	
		0	APRETAINDUP NO specified; however, the previous or original package copy is still retained due to access path differences.	
		1	APRETAINDUP NO specified, and the previous package copy is not retained as the access paths are identical to the current copy.	
		2	APRETAINDUP NO specified, and the previous and original package copies are not retained as the access paths are identical to the current copy.	
SYSTIMESENSITIVE	CHAR(1) NOT NULL WITH DEFAULT 'N'	The value of the SYSTIMESENSITIVE bind option:		G
		Y	References to system-period temporal tables are affected by the value of the CURRENT TEMPORAL SYSTEM_TIME special register.	
		N	References to system-period temporal tables are not affected by the value of the CURRENT TEMPORAL SYSTEM_TIME special register.	
	CHAR(1) NOT NULL WITH DEFAULT 'Y'	Not used.		N

Column name	Data type	Description	Use
BUSTIMESENSITIVE	CHAR(1) NOT NULL WITH DEFAULT 'N'	The value of the BUSTIMESENSITIVE bind option: **Y** References to application-period temporal tables are affected by the value of the CURRENT TEMPORAL BUSINESS_TIME special register. **N** References to application-period temporal tables are not affected by the value of the CURRENT TEMPORAL BUSINESS_TIME special register.	G
APPLCOMPAT	VARCHAR(10) NOT NULL WITH DEFAULT 'Y'	The value of the APPLCOMPAT bind option: **V10R1** SQL statements in the package have V10R1 compatibility behavior. **V11R1** SQL statements in the package have V11R1 compatibility behavior.	G
ARCHIVESENSITIVE	CHAR(1) NOT NULL WITH DEFAULT 'N	The value of the ARCHIVESENSITIVE bind option. **Y** References to archive-enabled tables are affected by the value of the SYSIBMADM.GET_ARCHIVE built-in global variable. Y is the default value. **N** References to archive-enabled tables are not affected by the value of the SYSIBMADM.GET_ARCHIVE built-in global variable.	G
EXTSEQNO	INTEGER NOT NULL WITH DEFAULT 0	For internal use.	I
DESCSTAT	CHAR(1) NOT NULL WITH DEFAULT	The value of the DESCSTAT bind option. **Y** The DB2 database manager generates a DESCRIBE SQLDA at bind time so that DESCRIBE requests for static SQL can be satisfied during execution. **N** The DB2 database manager does not generate a DESCRIBE SQLDA at bind time for static SQL statements.	G

SYSIBM.SYSPACKAUTH table

The SYSIBM.SYSPACKAUTH table records the privileges that are held by users over packages.

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privilege. Could also be PUBLIC.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID of the user who holds the privileges, the name of a plan that uses the privileges or PUBLIC for a grant to PUBLIC.	G
LOCATION	VARCHAR(128) NOT NULL	Always contains blanks	S
COLLID	VARCHAR(128) NOT NULL	Collection name for the package or packages on which the privilege was granted.	G
NAME	VARCHAR(128) NOT NULL	Name of the package on which the privileges are held. An asterisk (*) if the privileges are held on all packages in a collection.	G
	CHAR(8) NOT NULL FOR BIT DATA	Not used	N
TIMESTAMP	TIMESTAMP NOT NULL	Timestamp indicating when the privilege was granted.	G
GRANTEETYPE	CHAR(1) NOT NULL	Type of grantee: **blank** An authorization ID **L** Role **P** An application plan	G
AUTHHOWGOT	CHAR(1) NOT NULL	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. **blank** Not applicable **A** PACKADM (on collection *) **C** DBCTRL **D** DBADM **E** SECADM **G** ACCESSCTRL **L** SYSCTRL **M** DBMAINT **P** PACKADM (on a specific collection) **S** SYSADM **T** DATAACCESS	G
BINDAUTH	CHAR(1) NOT NULL	Whether GRANTEE can use the BIND and REBIND subcommands on the package: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G

42. PUBLIC followed by an asterisk (PUBLIC*) denotes PUBLIC AT ALL LOCATIONS. For the conditions where GRANTOR can be PUBLIC or PUBLIC*, see *DB2 Administration Guide*.

Column name	Data type	Description	Use
COPYAUTH	CHAR(1) NOT NULL	Whether GRANTEE can COPY the package: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
EXECUTEAUTH	CHAR(1) NOT NULL	Whether GRANTEE can execute the package: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: **blank** Authorization ID **L** Role	G

SYSIBM.SYSPACKDEP table

The SYSIBM.SYSPACKDEP table records the dependencies of packages on local tables, views, synonyms, table spaces, indexes, aliases, functions, and stored procedures.

Column name	Data type	Description	Use
BNAME	VARCHAR(128) NOT NULL	The name of an object that a package depends on. If BTYPE is B or C, the value is the name of the table on which the period is defined.	G
BQUALIFIER	VARCHAR(128) NOT NULL	The value of the column depends on the type of object: • If BNAME identifies a table space (BTYPE is R), the value is the name of its database. • If BNAME identifies a table on which a period is defined (BTYPE is B or C), the value is the qualifier of that table. • If BNAME identifies user-defined function, a cast function, a stored procedure, or a sequence (BTYPE is F, O, or Q), the value is the schema name. • If BNAME identifies a role, the value is blank. • Otherwise, the value is the schema of BNAME.	G
BTYPE	CHAR(1) NOT NULL	Type of object identified by BNAME and BQUALIFIER: **B** BUSINESS_TIME **C** SYSTEM_TIME **E** INSTEAD OF trigger **F** User-defined function or cast function **G** Global temporary table **I** Index **M** Materialized query table **O** Stored procedure **P** Partitioned table space if it is defined as LARGE or with the DSSIZE parm **Q** Sequence object **R** Table space **S** Synonym **T** Table **U** Distinct type **V** View **W** SYSTEM_TIME period **Z** BUSINESS_TIME period **0 (zero)** Alias	G
DLOCATION	VARCHAR(128) NOT NULL	Always contains blanks	S
DCOLLID	VARCHAR(128) NOT NULL	Name of the package collection.	G
DNAME	VARCHAR(128) NOT NULL	Name of the package.	G

Column name	Data type	Description	Use
DCONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	Consistency token for the package. This is either: • The "level" as specified by the LEVEL option when the package's program was precompiled • The timestamp indicating when the package's program was precompiled, in an internal format.	S
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
DOWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Owner of the package:	G
DTYPE	CHAR(1) NOT NULL WITH DEFAULT	Type of package: **F** Non-inline SQL scalar function **N** Native SQL routine package **O** Original copy of a package **P** Previous copy of a package **R** Reserved for IBM use **T** Trigger package **blank** Not a trigger package or a native SQL routine package	G
DOWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner of the package: **blank** Authorization ID **L** Role	G

SYSIBM.SYSPACKLIST table

The SYSIBM.SYSPACKLIST table contains one or more rows for every local application plan bound with a package list. Each row represents a unique entry in the plan's package list.

Column name	Data type	Description	Use
PLANNAME	VARCHAR(24) NOT NULL	Name of the application plan.	G
SEQNO	SMALLINT NOT NULL	Sequence number of the entry in the package list.	G
LOCATION	VARCHAR(128) NOT NULL	Location of the package. Blank if this is local. An asterisk (*) indicates location to be determined at run time.	G
COLLID	VARCHAR(128) NOT NULL	Collection name for the package. An asterisk (*) indicates that the collection name is determined at run time.	G
NAME	VARCHAR(128) NOT NULL	Name of the package. An asterisk (*) indicates an entire collection.	G
TIMESTAMP	TIMESTAMP NOT NULL	Timestamp indicating when the row was created.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSPACKSTMT table

The SYSIBM.SYSPACKSTMT table contains one or more rows for each statement in a package.

Column name	Data type	Description	Use
LOCATION	VARCHAR(128) NOT NULL	Always contains blanks	S
COLLID	VARCHAR(128) NOT NULL	Name of the package collection.	G
NAME	VARCHAR(128) NOT NULL	Name of the package.	G
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	Consistency token for the package. This is either: • The "level" as specified by the LEVEL option when the package's program was precompiled • The timestamp indicating when the package's program was precompiled, in an internal format	S
SEQNO	INTEGER NOT NULL	Not used.	G
STMTNO	SMALLINT NOT NULL	The statement number of the statement in the source program. A statement number greater than 32767 is stored as zero[43] or as a negative number[44]. If the value is zero, see STMTNOI for the statement number.	G
SECTNO	SMALLINT NOT NULL	The section number of the statement.[44]	G
BINDERROR	CHAR(1) NOT NULL	Whether an SQL error was detected at bind time: **N** No **Y** Yes	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
VERSION	VARCHAR(122) NOT NULL	Version identifier for the package.	G
	VARCHAR(3500) NOT NULL WITH DEFAULT FOR BIT DATA	Internal use only.	I

43. Rows in which the value of SEQNO, STMTNO, and SECTNO are zero are for internal use.

44. To convert a negative STMTNO to a meaningful statement number that corresponds to your precompile output, add 65536 to it. For example, -26472 is equivalent to +39064 (-26472 + 65536).

Column name	Data type	Description	Use
ISOLATION	CHAR(1) NOT NULL WITH DEFAULT	Isolation level for the SQL statement: **R** RR (repeatable read) **T** RS (read stability) **S** CS (cursor stability) **U** UR (uncommitted read) **L** RS isolation, with a *lock-clause* **X** RR isolation, with a *lock-clause* **blank** The WITH clause was not specified on this statement. The isolation level is recorded in SYSPACKAGE.ISOLATION and in SYSPLAN.ISOLATION.	G
STATUS	CHAR(1) NOT NULL WITH DEFAULT	Status of binding the statement: **A** Distributed - statement uses DB2 private protocol access. The statement will be parsed and executed at the server using defaults for input variables during access path selection. **B** Distributed - statement uses DB2 private protocol access. The statement will be parsed and executed at the server using values for input variables during access path selection. **C** Compiled - statement was bound successfully using defaults for input variables during access path selection. **D** Distributed - statement references a remote object using a three-part name. DB2 will implicitly use DRDA access either because the DBPROTOCOL bind option was not specified (defaults to DRDA), or the bind option DBPROTOCOL(DRDA) was explicitly specified. This option allows the use of three-part names with DRDA access but it requires that the package be bound at the target remote site. **E** Explain - statement is an SQL EXPLAIN statement. The explain is done at bind time using defaults for input variables during access path selection. **F** Parsed - statement did not bind successfully and VALIDATE(RUN) was used. The statement will be rebound at execution time using values for input variables during access path selection. **G** Compiled - statement bound successfully, but REOPT is specified. The statement will be rebound at execution time using values for input variables during access path selection. **H** Parsed - statement is either a data definition statement or a statement that did not bind successfully and VALIDATE(RUN) was used. The statement will be rebound at execution time using defaults for input variables during access path selection. Data manipulation statements use defaults for input variables during access path selection. **I** Indefinite - statement is dynamic. The statement will be bound at execution time using defaults for input variables during access path selection.	S

Column name	Data type	Description	Use
STATUS (cont.)		**J** Indefinite - statement is dynamic. The statement will be bound at execution time using values for input variables during access path selection. **K** Control - CALL statement. **L** Bad - the statement has some allowable error. The bind continues but the statement cannot be executed. **M** Parsed - statement references a table that is qualified with SESSION and was not bound because the table reference could be for a declared temporary table that will not be defined until the package or plan is run. The SQL statement will be rebound at execution time using values for input variables during access path selection. **blank** The statement is non-executable, or was bound in a DB2 release prior to Version 5.	
ACCESSPATH	CHAR(1) NOT NULL WITH DEFAULT	For static statements, indicates if the access path for the statement is based on user-specified optimization hints: **H** Optimization hints were used. **A** The access path was reused because of the APREUSE bind option. **blank** One of the following situations: • The access path was determined without the use of hints, and a previous access path was not reused. • No access path is associated with the statement. • The statement is a dynamic SQL statement	G
STMTNOI	INTEGER NOT NULL WITH DEFAULT	If the value of STMTNO is zero, the column contains the statement number of the statement in the source program. If both STMTNO and STMTNOI are zero, the statement number is greater than 32767.	G
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement.	G
EXPLAINABLE	CHAR(1) NOT NULL WITH DEFAULT	Contains one of the following values: **Y** Indicates that the SQL statement can be used with the EXPLAIN function and might have rows describing its access path in the owner.PLAN_TABLE. **N** Indicates that the SQL statement does not have any rows describing its access path in the owner.PLAN_TABLE. **blank** Indicates that the SQL statement was bound prior to Version 7.	G

Column name	Data type	Description	Use
QUERYNO	INTEGER NOT NULL WITH DEFAULT –1	The query number of the SQL statement in the source program. SQL statements bound prior to Version 7 have a default value of –1. Statements bound in Version 7 or later use the value specified on the QUERYNO clause on SELECT, UPDATE, INSERT, DELETE, EXPLAIN, DECLARE CURSOR, or REFRESH TABLE statements. If the QUERYNO clause is not specified, the query number is set to the statement number.	G
ROWID	ROWID NULL GENERATED ALWAYS	ROWID column, created for the lob columns in this table.	G
STMT_ID	BIGINT NOT NULL	A unique statement identifier.	G
STATEMENT	CLOB(2M) NOT NULL WITH DEFAULT	The complete text for the SQL statement that the row represents.	G
	BLOB(2M) NOT NULL WITH DEFAULT	Internal use only.	I

Column name	Data type	Description	Use
EXPANSION_REASON	CHAR(2) NOT NULL	This column applies to only static statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. If one of these special registers or the global variable is set to Y and the corresponding bind option is set to YES, DB2 implicitly adds certain syntax to the statement. This column indicates whether this implicit query transformation occurred when the package was bound and why. For dynamic statements, this column is blank. For static statements, this column can have one of the following values: **A** The statement was bound with implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The statement was bound with implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The statement was bound with implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The statement was bound with implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** One of the following events occurred: • The statement did not bind successfully and the VALIDATE(RUN) bind option was used. • The statement was bound without implicit query transformation. If this column is not blank, you can see the resulting access path for the transformed statement by using EXPLAIN. **Related information:** "References to built-in global variables" on page 223 "CURRENT TEMPORAL BUSINESS_TIME" on page 194 "CURRENT TEMPORAL SYSTEM_TIME" on page 196 BIND and REBIND options (DB2 Commands)	G

SYSIBM.SYSPACKSTMT_STMB table

The SYSIBM.SYSPACKSTMT_STMB table is an auxiliary table for the STMTBLOB column of the SYSIBM.SYSPACKSTMT table and is required to hold LOB data.

Column name	Data type	Description	Use
	BLOB(2M) NOT NULL WITH DEFAULT	Internal use only.	I

SYSIBM.SYSPACKSTMT_STMT table

The SYSIBM.SYSPACKSTMT_STMT table is an auxiliary table for the STATEMENT column of the SYSIBM.SYSPACKSTMT table and is required to hold LOB data.

Column name	Data type	Description	Use
STATEMENT	CLOB(2M) NOT NULL WITH DEFAULT	The complete text for the SQL statement that the row represents.	G

SYSIBM.SYSPARMS table

The SYSIBM.SYSPARMS table contains a row for each parameter of a routine or multiple rows for table parameters (one for each column of the table).

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	Schema of the routine.	G
OWNER	VARCHAR(128) NOT NULL	Owner of the routine.	G
NAME	VARCHAR(128) NOT NULL	Name of the routine.	G
SPECIFICNAME	VARCHAR(128) NOT NULL	Specific name of the routine.	G
ROUTINETYPE	CHAR(1) NOT NULL	Type of routine: **F** User-defined function or cast function **P** Stored procedure	G
CAST_FUNCTION	CHAR(1) NOT NULL	Whether the routine is a cast function: **N** Not a cast function **Y** A cast function The only way to get a value of Y is if a user creates a distinct type when DB2 implicitly generates cast functions for the distinct type.	G
PARMNAME	VARCHAR(128) NOT NULL	Name of the parameter. For a table parameter, the parameter name in the row corresponding to the first column of the table is the parameter name specified on CREATE; an empty string or blanks are stored for the parameter name for the rows corresponding to the remaining columns.	G
ROUTINEID	INTEGER NOT NULL	Internal identifier of the routine.	S

Column name	Data type	Description	Use
ROWTYPE	CHAR(1) NOT NULL	The following values indicate the type of parameter described by this row: **P** Input parameter. **O** Output parameter; not applicable for functions **B** Both an input and an output parameter; not applicable for functions **R** Result before casting; not applicable for stored procedures **C** Result after casting; not applicable for stored procedures **S** Input parameter of the underlying built-in source function. For a sourced function and a given ORDINAL value: • The row with ROWTYPE = P describes the input parameter of the user-defined function (identified by ROUTINEID). • The row with ROWTYPE = S describes the corresponding input parameter of the built-in function that is the underlying source function (identified by the SOURCESCHEMA and SOURCESPECIFIC values). A value of 'X' indicates that the row is not used to describe a particular parameter of the routine. Instead, for a routine that was created prior to Version 9, the row is used to record a CCSID for the encoding scheme specified in a PARAMETER CCSID clause, or a DATATYPEID for the representation of the variable length character string parameters of a LANGUAGE C routine, as specified in a PARAMETER VARCHAR clause. For routines created with Version 8 (new function mode) or later releases, the CCSID is recorded in the PARAMETER_CCSID column of SYSROUTINES. For routines created with Version 9 or later releases, the DATATYPEID information to support PARAMETER VARCHAR is recorded in the PARAMETER_VARCHARFORM column of SYSIBM.SYSROUTINES.	G
ORDINAL	SMALLINT NOT NULL	If ROWTYPE is B, O, P, or S, the value is the ordinal number of the parameter within the routine signature. If ROWTYPE is C or R, the value depends on the type of function: • For a scalar function, the value is 0. • For a table function, the value is the ordinal number of the column of the output table. If ROWTYPE is X, the value is 0.	G
TYPESCHEMA	VARCHAR(128) NOT NULL	Schema of the data type of the parameter.	G
TYPENAME	VARCHAR(128) NOT NULL	Name of the data type of the parameter.	G

Column name	Data type	Description	Use
DATATYPEID	INTEGER NOT NULL	For a built-in data type, the internal ID of the built-in type. For a distinct type, the internal ID of the distinct type. When ROWTYPE is X and ORDINAL is 0, a non-zero DATATYPEID indicates that actual representation, for a LANGUAGE C routine, of any varying length string parameters that appear in the routine's parameter list ot in the RETURNS clause.	S
SOURCETYPEID	INTEGER NOT NULL	For a built-in data type, 0. For a distinct type, the internal ID of the built-in data type upon which the distinct type is based.	S
LOCATOR	CHAR(1) NOT NULL	Indicates whether a locator to a value, instead of the actual value, is to be passed or returned when the routine is called: **N** The actual value is to be passed. **Y** A locator to a value is to be passed	G
TABLE	CHAR(1) NOT NULL	The data type of a column for a table parameter: **N** This is not a table parameter. **Y** This is a table parameter.	G
TABLE_COLNO	SMALLINT NOT NULL	For table parameters, the column number of the table. Otherwise, the value is 0.	G
LENGTH	INTEGER NOT NULL	Length attribute of the parameter or result; If the parameter or result length is determined during function resolution, the length attribute can also be 0. In the case of a decimal parameter or result this is the precision. If the parameter is an array, the value is 0.	G
SCALE	SMALLINT NOT NULL	Scale of the data type of the parameter or number of fractional second digits of timestamp or timestamp with time zone parameter. If it is TIMESTAMP parameter where LENGTH is 10 and SCALE is 0, the number of fractional second digits is 6.	G
SUBTYPE	CHAR(1) NOT NULL	If the data type is a distinct type, the subtype of the distinct type, which is based on the subtype of its source type: **B** The subtype is FOR BIT DATA. **S** The subtype is FOR SBCS DATA. **M** The subtype is FOR MIXED DATA. **blank** The source type is not a character type. If the parameter is an array type, the value is blank.	G
CCSID	INTEGER NOT NULL	CCSID of the data type for a character, date, time, timestamp or graphic data type. If the parameter is a datetime array, the value is 0. (not null) When ROWTYPE is X and ORDINAL is 0, the CCSID column is the CCSID for all character and graphic string parameters.	G
CAST_FUNCTION_ID	INTEGER NOT NULL	Internal function ID of the function used to cast the argument, if this function is sourced on another function, or result. Otherwise, the value is 0. Not applicable for stored procedures.	S

Column name	Data type	Description	Use
ENCODING_SCHEME	CHAR(1) NOT NULL	Encoding scheme of the parameter: **A** ASCII **E** EBCDIC **U** UNICODE **blank** The source type is not a character, graphic, or datetime type. If the parameter is an array type, the value is blank.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the routine. The column is a zero-length string if the value of ORIGIN is not 'I' or if the rows were created prior to Version 9.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: **blank** Authorization ID **L** Role	G

SYSIBM.SYSPENDINGDDL table

The SYSIBM.SYSPENDINGDDL table contains information about which objects have pending definition changes. The entries only exist during the window between when the pending option is executed and when the utility applies these pending changes to the object.

Column name	Data type	Description	Use
DBNAME	VARCHAR(24) NOT NULL	Name of the database for the pending option.	G
TSNAME	VARCHAR(24) NOT NULL	Name of the table space for the pending option.	G
DBID	SMALLINT NOT NULL	Internal identifier of the database.	S
PSID	SMALLINT NOT NULL	Internal identifier of the table space page set descriptor.	S
OBJSCHEMA	VARCHAR(128) NOT NULL	The qualifier of the object that contains the pending option.	G
OBJNAME	VARCHAR(128) NOT NULL	Name of the object that contains the pending option.	G
OBJOBID	SMALLINT NOT NULL	Internal identifier of the object.	S
OBJTYPE	CHAR(1) NOT NULL	Type of object that is identified by OBJSCHEMA and OBJNAME. **I** The object is an index **S** The object is a table space **T** The object is a table	G
STATEMENT_TYPE	CHAR(1) NOT NULL	The type of the statement for the pending option. **A** An ALTER statement **R** A RECOVER statement	G
OPTION_ENVID	INTEGER NOT NULL	Internal identifier of the environment for the pending option.	G
OPTION_KEYWORD	VARCHAR(128) NOT NULL	If the row is inserted into this table during execution of a data definition statement, this value is the name of the pending option. If the row is inserted into this table during recovery to a prior point in time, this value is the name of the RECOVER option.	G
OPTION_VALUE	VARCHAR(4000) NOT NULL	If the row is inserted into this table during execution of a data definition statement, this value is the value of the pending option. If the row is inserted into this table during recovery to a prior point in time, this value is the value of the RECOVER option.	G
OPTION_SEQNO	SMALLINT NOT NULL	The sequence of the pending option within the statement.	G
CREATEDTS	TIMESTAMP(12) NOT NULL	Timestamp when the pending option was created.	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. See Release dependency indicators for the values.	G

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine- readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
ROWID	ROWID	ID to support LOB columns for source text	G
STATEMENT_TEXT	CLOB(2M) NOT NULL	The source text of the original statement for the pending option.	G
COLNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the column with a pending definition change.	G
PARTITION	SMALLINT NOT NULL	The partition number for the partition with a pending definition change. The value is 0 if the pending definition change is for the entire table space or index space.	G
PARTITION_ KEYWORD	VARCHAR(18) NOT NULL WITH DEFAULT	This column is populated if the PARTITION column has a non-zero value. The keyword that is associated with the PARTITION clause of the ALTER TABLE statement. For example, suppose that you issued the following statement: `ALTER TABLE ALTER PARTITION` In that case, this column contains ALTER.	G
COLUMN_ KEYWORD	VARCHAR(18) NOT NULL WITH DEFAULT	This column contains the keyword that corresponds to the column that is listed in COLNAME.	G

SYSIBM.SYSPENDINGOBJECTS table

The SYSIBM.SYSPENDINGOBJECTS table contains the name of and OBID information about objects that are the pending creation. The data sets for these objects are created but the object definition have not been materialized to the catalog. The entries in this table only exist during the time between when the names of the new objects are generated and when the catalog definition of the new objects are materialized.

Column name	Data type	Description	Use
DBNAME	VARCHAR(24) NOT NULL	Name of the database.	G
TSNAME	VARCHAR(24) NOT NULL	Name of the base table space.	G
DBID	SMALLINT NOT NULL	Internal identifier of the database.	S
PSID	SMALLINT NOT NULL	Internal identifier of the base table space page set descriptor.	S
PARTITION	SMALLINT NOT NULL	Partition number with which the object is associated.	G
COLNAME	VARCHAR(128) NOT NULL	Name of the column contained in the base table space with which the object is associated.	G
OBJSCHEMA	VARCHAR(128) NOT NULL	The qualifier of the object.	G
OBJNAME	VARCHAR(128) NOT NULL	Name of the object.	G
OBJTYPE	CHAR(1) NOT NULL	Type of object identified by OBJSCHEMA and OBJNAME. **I** The object is an index **S** The object is a table space **T** The object is a table	G
INDEXSPACE	VARCHAR(24) NOT NULL	Name of the index space. An empty string if the object is not an index.	G
OBJOBD	SMALLINT NOT NULL	Internal identifier of the object.	S
OBJPSID	SMALLINT NOT NULL	Internal identifier of the object page set descriptor, or 0 if the object does not have a page set descriptor.	S

SYSIBM.SYSPKSYSTEM table

The SYSIBM.SYSPKSYSTEM table contains zero or more rows for every package. Each row for a given package represents one or more connections to an environment in which the package could be executed.

Column name	Data type	Description	Use
LOCATION	VARCHAR(128) NOT NULL	Always contains blanks	S
COLLID	VARCHAR(128) NOT NULL	Name of the package collection.	G
NAME	VARCHAR(128) NOT NULL	Name of the package.	G
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	Consistency token for the package. This is either: • The "level" as specified by the LEVEL option when the package's program was precompiled • The timestamp indicating when the package's program was precompiled, in an internal format.	S
SYSTEM	VARCHAR(24) NOT NULL	Environment. Values can be: **BATCH** TSO batch **CICS** Customer Information Control System **DB2CALL** DB2 call attachment facility **DLIBATCH** DLI batch support facility **IMSBMP** IMS BMP region **IMSMPP** IMS MPP and IFP region **REMOTE** remote server	G
ENABLE	CHAR(1) NOT NULL	Indicates whether the connections represented by the row are enabled or disabled: **N** Disabled **Y** Enabled	G
CNAME	VARCHAR(60) NOT NULL	Identifies the connection or connections to which the row applies. Interpretation depends on the environment specified by SYSTEM. Values can be: • Blank if SYSTEM=BATCH or SYSTEM=DB2CALL • The LU name for a database server if SYSTEM=REMOTE • Either the requester's location (if the product is DB2) or the requester's LU name enclosed in angle brackets if SYSTEM=REMOTE. • The name of a single connection if SYSTEM has any other value. CNAME can also be blank when SYSTEM is not equal to BATCH or DB2CALL. When this is so, the row applies to all servers or connections for the indicated environment.	G

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSPLAN table

The SYSIBM.SYSPLAN table contains one row for each application plan.

Column name	Data type	Description	Use
NAME	VARCHAR(24) NOT NULL	Name of the application plan.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the application plan.	G
	CHAR(6) NOT NULL	Not used	N
VALIDATE	CHAR(1) NOT NULL	Whether validity checking can be deferred until run time: **B** All checking must be performed during BIND. **R** Validation is done at run time for tables, views, and privileges that do not exist at bind time.	G
ISOLATION	CHAR(1) NOT NULL	Isolation level for the plan: **R** RR (repeatable read) **T** RS (read stability) **S** CS (cursor stability) **U** UR (uncommitted read)	G
VALID	CHAR(1) NOT NULL	Whether the application plan is valid: **A** An ALTER TABLE statement changed the description of the table or base table of a view that is referred to by the application plan. For a CREATE INDEX statement involving data sharing, VALID is also marked as "A". **H** An ALTER TABLE statement changed the description of the table or base table of a view that is referred to by the application plan. **N** No **Y** Yes	G
OPERATIVE	CHAR(1) NOT NULL	Whether the application plan can be allocated: **N** No; an explicit BIND or REBIND is required before the plan can be allocated **Y** Yes	G
	CHAR(8) NOT NULL	Not used	N
PLSIZE	INTEGER NOT NULL	Size of the base section [45] of the plan, in bytes.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELBOUND should be used instead.	G

45. Plans are divided into *sections*. The base section of the plan must be in the EDM pool during the entire time the application program is executing. Other sections of the plan, corresponding roughly to sets of related SQL statements, are brought into the pool as needed.

Column name	Data type	Description	Use
AVGSIZE	INTEGER NOT NULL	Average size, in bytes, of those sections[45] of the plan that contain SQL statements processed at bind time.	G
ACQUIRE	CHAR(1) NOT NULL	When resources are acquired: **A** At allocation **U** At first use	G
RELEASE	CHAR(1) NOT NULL	When resources are released: **C** At commit **D** At deallocation	G
	CHAR(1) NOT NULL	Not used	N
	CHAR(1) NOT NULL	Not used	N
	CHAR(1) NOT NULL	Not used	N
EXPLAN	CHAR(1) NOT NULL	EXPLAIN option specified for the plan; that is, whether information on the plan's statements was added to the owner's PLAN_TABLE table: **N** No **Y** Yes	G
EXPREDICATE	CHAR(1) NOT NULL	Indicates the CURRENTDATA option when the plan was bound or rebound: **B** Data currency is not required for ambiguous cursors. Allow blocking for ambiguous cursors. **C** Data currency is required for ambiguous cursors. Inhibit blocking for ambiguous cursors. **N** Blocking is inhibited for ambiguous cursors, but the plan was created before the CURRENTDATA option was available.	G
BOUNDBY	VARCHAR(128) NOT NULL WITH DEFAULT	Primary authorization ID of the binder of the plan.	G
QUALIFIER	VARCHAR(128) NOT NULL WITH DEFAULT	Implicit qualifier for the unqualified table, view, index, and alias names in the static SQL statements of the plan.	G
CACHESIZE	SMALLINT NOT NULL WITH DEFAULT	Size, in bytes, of the cache to be acquired for the plan. A value of zero indicates that no cache is used.	G
PLENTRIES	SMALLINT NOT NULL WITH DEFAULT	Number of package list entries for the plan. The negative of that number if there are rows for the plan in SYSIBM.SYSPACKLIST but the plan was bound in a prior release after fall back.	G
DEFERPREP	CHAR(1) NOT NULL WITH DEFAULT	Whether the package was last bound with the DEFER(PREPARE) option: **N** No **Y** Yes	G

Column name	Data type	Description	Use
CURRENTSERVER	VARCHAR(128) NOT NULL WITH DEFAULT	Location name specified with the CURRENTSERVER option when the plan was last bound. Blank if none was specified, implying that the first server is the local DB2 subsystem.	G
SYSENTRIES	SMALLINT NOT NULL WITH DEFAULT	Number of rows associated with the plan in SYSIBM.SYSPLSYSTEM. The negative of that number if such rows exist but the plan was bound in a prior release after fall back. A negative value or zero means that all connections are enabled.	G
DEGREE	CHAR(3) NOT NULL WITH DEFAULT	The DEGREE option used when the plan was last bound: **ANY** DEGREE(ANY) **1 or blank** DEGREE(1). Blank if the plan was migrated.	G
SQLRULES	CHAR(1) NOT NULL WITH DEFAULT	The SQLRULES option used when the plan was last bound: **D or blank** SQLRULES(DB2) **S** SQLRULES(STD) **blank** A migrated plan	G
DISCONNECT	CHAR(1) NOT NULL WITH DEFAULT	The DISCONNECT option used when the plan was last bound: **E or blank** DISCONNECT(EXPLICIT) **A** DISCONNECT(AUTOMATIC) **C** DISCONNECT(CONDITIONAL) **blank** A migrated plan	G
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The DB2 data sharing member name of the DB2 subsystem that performed the most recent bind. This column is blank if the DB2 subsystem was not in a DB2 data sharing environment when the bind was performed.	G
DYNAMICRULES	CHAR(1) NOT NULL WITH DEFAULT	The DYNAMICRULES option used when the plan was last bound: **B** BIND. Dynamic SQL statements are executed with DYNAMICRULES bind behavior. **blank** RUN. Dynamic SQL statements in the plan are executed with DYNAMICRULES run behavior.	G
BOUNDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the plan was bound.	G

Column name	Data type	Description	Use
REOPTVAR	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether the access path is determined again at execution time using input variable values: **A** Bind option REOPT(AUTO) indicates that the access path is determined multiple times at execution time depending on the parameter value. **N** Bind option REOPT(NONE) indicates that the access path is determined at bind time. **Y** Bind option REOPT(ALWAYS) indicates that the access path is determined at execution time for SQL statements with variable values. **1** Bind option REOPT(ONCE) indicates that the access path is determined only once at execution time, using the first set of input variable values, regardless of how many times the same statement is executed.	G
KEEPDYNAMIC	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether prepared dynamic statements are to be purged at each commit point: **N** The bind option is KEEPDYNAMIC(NO). Prepared dynamic SQL statements are destroyed at commit or rollback. **Y** The bind option is KEEPDYNAMIC(YES). Prepared dynamic SQL statements are kept past commit or rollback.	G
PATHSCHEMAS	VARCHAR(2048) NOT NULL WITH DEFAULT	SQL path specified on the BIND or REBIND command that bound the plan. The path is used to resolve unqualified data type, function, and stored procedure names used in certain contexts. If the PATH bind option was not specified, the value in the column is a zero length string; however, DB2 uses a default SQL path of: SYSIBM, SYSFUN, SYSPROC, *plan qualifier*.	G
DBPROTOCOL	CHAR(1) NOT NULL WITH DEFAULT 'P'	Whether remote access for SQL with three-part names is implemented with DRDA or DB2 private protocol access: **D** DRDA **P** DB2 private protocol	G
FUNCTIONTS	TIMESTAMP NOT NULL WITH DEFAULT	Timestamp when the function was resolved. Set by the BIND and REBIND commands, but not by AUTOBIND.	G
OPTHINT	VARCHAR(128) NOT NULL WITH DEFAULT	Value of the OPTHINT bind option. Identifies rows in the owner.PLAN_TABLE to be used as input to DB2. Contains blanks if no rows in the owner.PLAN_TABLE are to be used as input.	G
ENCODING_CCSID	INTEGER NOT NULL WITH DEFAULT	The CCSID corresponding to the encoding scheme or CCSID as specified for the bind option ENCODING. The Encoding Scheme specified on the bind command: **ccsid** The specified or derived CCSID. **0** The default CCSID as specified on panel DSNTIPF at installation time. Used when the plan was bound prior to Version 7	G

Column name	Data type	Description	Use
IMMEDWRITE	CHAR(1) NOT NULL WITH DEFAULT	Indicates when writes of updated group buffer pool dependent pages are to be done. This option is only applicable for data sharing environments. **N** Bind option IMMEDWRITE(NO) indicates normal write activity is done. **Y** Bind option IMMEDWRITE(YES) indicates that immediate writes are done for updated group buffer pool dependent pages. **1** Bind option IMMEDWRITE(PH1) indicates that updated group buffer pool dependent pages are written at or before phase 1 commit. **blank** A migrated package.	G
RELBOUND	CHAR(1) NOT NULL WITH DEFAULT	The release when the package was bound or rebound. **blank** Bound prior to Version 7 **K** Bound on Version 7 **L** Bound on Version 8	G
	CHAR(1)	Not used.	N
REMARKS	VARCHAR(762) NOT NULL WITH DEFAULT	A character string provided by the user with the COMMENT statement.	G
CREATORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: **blank** Authorization ID **L** Role	G
ROUNDING	CHAR(1) NOT NULL WITH DEFAULT	The ROUNDING option used when the plan was last bound: **C** ROUND_CEILING **D** ROUND_DOWN **F** ROUND_FLOOR **G** ROUND_HALF_DOWN **E** ROUND_HALF_EVEN **H** ROUND_HALF_UP **U** ROUND_UP **blank** The plan was created in a DB2 release prior to Version 9.	G
	DATE NOT NULL WITH DEFAULT		N
CONCUR_ACC_RES	CHAR(1) NOT NULL	Indicates the CONCURRENTACCESSRESOLUTION option when the package was bound or rebound: **blank** Not specified **U** USECURRENTLYCOMMITTED **W** WAITFOROUTCOME	G
PROGAUTH	CHAR(1) NOT NULL WITH DEFAULT 'D'	Indicates whether DB2 checks if a program is authorized to run a plan: **D** DISABLE **E** ENABLE	G

SYSIBM.SYSPLANAUTH table

The SYSIBM.SYSPLANAUTH table records the privileges that are held by users over application plans.

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privileges.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID of the user who holds the privileges. Could also be PUBLIC for a grant to PUBLIC.	G
NAME	VARCHAR(24) NOT NULL	Name of the application plan on which the privileges are held.	G
	CHAR(12) NOT NULL	Internal use only	I
	CHAR(6) NOT NULL	Not used	N
	CHAR(8) NOT NULL	Not used	N
	CHAR(1) NOT NULL	Not used	N
AUTHHOWGOT	CHAR(1) NOT NULL	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. **blank** Not applicable **C** DBCTRL **D** DBADM **E** SECADM **G** ACCESSCTRL **L** SYSCTRL **M** DBMAINT **S** SYSADM	G
BINDAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the BIND, REBIND, or FREE subcommands against the plan: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
EXECUTEAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can run application programs that use the application plan: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

Column name	Data type	Description	Use
GRANTEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the GRANT statement was executed.	G
GRANTEETYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantee: **blank** Authorization ID **L** Role	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: **blank** Authorization ID **L** Role	G

SYSIBM.SYSPLANDEP table

The SYSIBM.SYSPLANDEP table records the dependencies of plans on tables, views, aliases, synonyms, table spaces, indexes, functions, and stored procedures.

Column name	Data type	Description	Use
BNAME	VARCHAR(128) NOT NULL	The name of an object the plan depends on.	G
BCREATOR	VARCHAR(128) NOT NULL	If BNAME is a table space, its database. Otherwise, the schema of BNAME. If BNAME is a role, the value is blank.	G
BTYPE	CHAR(1) NOT NULL	Type of object identified by BNAME: **A** Alias **E** INSTEAD OF trigger **F** User-defined function or cast function **G** Global temporary table **I** Index **M** Materialized query table **O** Stored procedure **P** Partitioned table space if it is defined as LARGE or with the DSSIZE parm **Q** Sequence object **R** Table space **S** Synonym **T** Table **V** View	G
DNAME	VARCHAR(24) NOT NULL	Name of the plan.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSPLSYSTEM table

The SYSIBM.SYSPLSYSTEM table contains zero or more rows for every plan. Each row for a given plan represents one or more connections to an environment in which the plan could be used.

Column name	Data type	Description	Use
NAME	VARCHAR(24) NOT NULL	Name of the plan.	G
SYSTEM	VARCHAR(24) NOT NULL	Environment. Values can be: **BATCH** TSO batch **DB2CALL** DB2 call attachment facility **CICS** Customer Information Control System **DLIBATCH** DLI batch support facility **IMSBMP** IMS BMP region **IMSMPP** IMS MPP or IFP region	G
ENABLE	CHAR(1) NOT NULL	Indicates whether the connections represented by the row are enabled or disabled: **N** Disabled **Y** Enabled	G
CNAME	VARCHAR(60) NOT NULL	Identifies the connection or connections to which the row applies. Interpretation depends on the environment specified by SYSTEM. Values can be: • Blank if SYSTEM=BATCH or SYSTEM=DB2CALL • The name of a single connection if SYSTEM has any other value CNAME can also be blank when SYSTEM is not equal to BATCH or DB2CALL. When this is so, the row applies to all connections for the indicated environment.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSQUERY table

Each SYSIBM.SYSQUERY table row identifies a SQL statement. The information is used to influence access path selection when matching statements are optimized.

Column name	Data type	Description	Use
QUERYID	BIGINT NOT NULL GENERATED BY DEFAULT AS IDENTITY	Unique identifier for the query.	G
QUERY_HASH	CHAR(16) NOT NULL FOR BIT DATA	The hash key generated by statement text.	G
SCHEMA	VARCHAR(128) NOT NULL	The default schema name for unqualified objects in the query or blank. If the query contains unqualified objects and access path hints exist for the query, the access path hints are applied only if the default schema matches the schema in the access path hint.	G
QUERY_SEC_HASH	CHAR(16) NOT NULL FOR BIT DATA	The hash key generated by the modified statement text.	G
QUERY_HASH_ VERSION	INTEGER NOT NULL	The version of the query hash.	G
SOURCE	SMALLINT NOT NULL	The source of the row: **0** Statement-level optimization hints.	G
USERFILTER	CHAR(8) NOT NULL	Filter name that is used to group a set of queries or blank.	G
	CHAR(128) NOT NULL	Internal use only.	I
PLAN_VALID	CHAR(1) NOT NULL	Whether plan hints are valid: **blank** No access path i specified for the statement, but optimization parameters exist in SYSQUERYOPTS **Y** An access path is specified in SYSQUERYPLAN for the statement. The access path is also valid if the statement has already been executed and the access path was used. **N** A an access path is specified in SYSQUERYPLAN, but the access path is invalid and not used.	G
INVALID_REASON	INTEGER NOT NULL	When PLAN_VALID is N, this column contains the reason that the access path is invalid. If PLAN_VALID is Y or blank, this column contains -1. For descriptions of the reason code values, see: +395 (DB2 Codes).	S
	VARCHAR(128) NOT NULL	Not used	N
COLLECTION	VARCHAR(128) NOT NULL	Name of the collection of the originating query or blank.	G

Column name	Data type	Description	Use
PACKAGE	VARCHAR(128) NOT NULL	Name of the package of the originating query or blank.	G
VERSION	VARCHAR(128) NOT NULL	Version of the package or blank.	G
AUTHID	VARCHAR(128) NOT NULL	Authorization ID this was in effect when the query was captured or blank.	G
BINDTIME	TIMESTAMP NOT NULL	Timestamp when the package was bound or when BIND QUERY was run	G
RELBOUND	VARCHAR(128) NOT NULL	The release of DB2 in which the package was bound, or blank. See Release dependency indicators for values.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELBOUND should be used instead.	G
STMTNO	INTEGER NOT NULL	The statement number in the package. -1 when not applicable.	G
SECTNO	INTEGER NOT NULL	The section number in the package. -1 when not applicable.	G
STMTTEXT	CLOB(2M) INLINE LENGTH 2048	The text of the matching SQL statement. The value is populated from the value of the QUERY_TEXT column of the DSN_USERQUERY_TABLE table, with the following items removed: • Blanks including leading and trailing blanks, and embedded blanks that are not within literal strings between pairs of quotation mark symbols • White space, including leading and trailing white space, and white space that is not within a literal string between a pair of quotation mark symbols • SQL comments • EXPLAIN clauses	G
QUERYNO	INTEGER NOT NULL WITH DEFAULT '-1'	The query number.	G
CLIENT_USERID	VARCHAR(255)	User ID of the client.	G
CLIENT_ WRKSTNNAME	VARCHAR(255)	Name of the client workstation.	G
CLIENT_APPLNAME	VARCHAR(255)	Name of the client application.	G
SELECTVTY_ OVERRIDE	CHAR(1) NOT NULL	Whether selectivity overrides are in effect for the query: **'Y'** Selectivtiy overrides are in effect **'N'** Selectivity overrides are not in effect.	G

Column name	Data type	Description	Use
ACCESSPATH_ HINT	CHAR(1) NOT NULL	Whether access paths are specified for the matching statements: **'Y'** An access paths is specified and in effect **'N'** An access path hints is specified and in effect **blank** An access path might be specified. When the value is blank you must query the SYSIBM.SYSQUERYPLAN catalog table to determine whether an access path is specified	G
OPTION_OVERRIDE	CHAR(1) NOT NULL	Whether optimization parameters are in effect for matching statements: **'Y'** Optimization parameters are not in effect. **'N'** Optimization parameters are not in effect. **blank** Optimization parameters might be in effect. When the value is blank you must query the SYSIBM.SYSQUERYOPTS catalog table to determine whether option overrides are in effect.	G
SELECTIVITY_VALID	CHAR(1) NOT NULL	Whether selectivity overrides are valid: **blank** No selectivity overrides exist for the statement. **'Y'** Selectivity overrides exist for the query. The overrides are valid if the statement has already been executed and the overrides were used. **'N'** Selectivity overrides exist but the overrides are invalid and not used.	G

SYSIBM.SYSQUERY_AUX table

The SYSIBM.SYSQUERY_AUX table is an auxiliary table for the STMTTEXT column of the SYSIBM.SYSQUERY table.

Column name	Data type	Description	Use
STMTTEXT	CLOB(2M)	The full text of the query.	G

SYSIBM.SYSQUERYOPTS table

The SYSIBM.SYSQUERYOPTS table contains optimization parameters for the queries that are in the SYSIBM.SYSQUERY table.

Column name	Data type	Description	Use
QUERYID	BIGINT NOT NULL ON DELETE CASCADE	Unique identifier for the query. This column corresponds to the QUERYID column in the SYSIBM.SYSQUERY table.	G
COPYID	SMALLINT NOT NULL	The version of the plan hints for the query in this row. **0** Current version of the plan hints. **1** Previous version of the plan hints used by PLAN STABILITY **2** Original version of the plan hints used by PLAN STABILITY	G
REOPT	CHAR(1) NOT NULL	The value of the REOPT bind option that is in effect for the plan: **1** REOPT(ONCE) **A** REOPT(AUTO) **N** REOPT(NONE) **Y** REOPT(ALWAYS) **blank** REOPT is not specified	G
STARJOIN	CHAR(1) NOT NULL	Whether star join is enabled: **Y** Star join is enabled **N** Star join is disabled **blank** Star join is not specified	G
MAX_PAR_DEGREE	INTEGER NOT NULL	The maximum parallel degree. This column will contain a value between 0 and 254. If the value of the column is -1, the maximum parallel degree is not specified.	G
DEF_CURR_DEGREE	CHAR(3) NOT NULL	Whether query parallelism is enabled: **ONE** Query parallelism is disabled **ANY** Query parallelism is enabled **blank** Query parallelism is disabled	G
SJTABLES	INTEGER NOT NULL	The number of tables specified in a query to qualify for star join processing. If this column contains -1, star join processing is not specified.	G
	VARCHAR(128) NOT NULL	For IBM internal use only	I
GROUP_MEMBER	VARCHAR(24) NOT NULL	The group member name to which the parameters are to be applied. This column contains blank if the group member name is not specified.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

DSN_USERQUERY_TABLE (DB2 Performance)

SYSIBM.SYSQUERYPLAN table

The SYSIBM.SYSQUERYPLAN table contains the plan hint information for the queries in the SYSIBM.SYSQUERY table. It correlates to the SYSIBM.SYSQUERY table by the QUERYID column. For a query, there can be up to 3 copies of plan hints stored in the SYSIBM.SYSQUERYPLAN table, distinguished by the value of the COPYID column.

Column name	Data type	Description	Use
QUERYID	BIGINT NOT NULL ON DELETE CASCADE	Unique identifier for the query. The value of QUERYID corresponds to the value of the QUERYID column in the SYSIBM.SYSQUERY column.	G
COPYID	SMALLINT NOT NULL	The version of the plan hints for the query in this row. **0** Current version of the plan hints. **1** Previous version of the plan hints used by PLAN STABILITY **2** Original version of the plan hints used by PLAN STABILITY	G
PLAN_VALID	CHAR(1) NOT NULL	Whether the plan hints are valid: **N** The plan hints are invalid **Y** The plan hints are valid	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.	G
PLANNO	SMALLINT NOT NULL	The number of the step in which the query that is indicated in QBLOCKNO was processed. This column indicates the order in which the steps were executed.	G

Column name	Data type	Description	Use
METHOD	SMALLINT NOT NULL	A number that indicates the join method that is used for the step: **0** The table in this step is the first table that is accessed, a continuation of a previous table that was accessed, or a table that is not used. **1** A nested loop join is used. For each row of the current composite table, matching rows of a new table are found and joined. **2** A merge scan join is used. The current composite table and the new table are scanned in the order of the join columns, and matching rows are joined. **3** Sorts are needed by ORDER BY, GROUP BY, SELECT DISTINCT, UNION, INTERSECT, EXCEPT, a quantified predicate, or an IN predicate. This step does not access a new table. **4** A hybrid join was used. The current composite table is scanned in the order of the join-column rows of the new table. The new table is accessed using list prefetch.	G
CREATOR	VARCHAR(128) NOT NULL	The creator of the new table that is accessed in this step, blank if METHOD is 3.	G
TNAME	VARCHAR(128) NOT NULL	The name of one of the following objects: • Materialized query table • Created or declared temporary table • Materialized view • materialized table expression The value is blank if METHOD is 3. The column can also contain the name of a table in the form DSNWFQB(*qblockno*). DSNWFQB(*qblockno*) is used to represent the intermediate result of a UNION ALL, INTERSECT ALL, EXCEPT ALL, or an outer join that is materialized. If a view is merged, the name of the view does not appear. DSN_DIM_TBLX(*qblockno*) is used to the represent the work file of a star join dimension table.	G
	SMALLINT NOT NULL	Values are for IBM use only.	I

Column name	Data type	Description	Use
ACCESSTYPE	CHAR(2) NOT NULL	The method of accessing the new table: **A** Accelerated query table access. **DI** By an intersection of multiple DOCID lists to return the final DOCID list **DU** By a union of multiple DOCID lists to return the final DOCID list **DX** By an XML index scan on the index that is named in ACCESSNAME to return a DOCID list **E** By direct row access using a row change timestamp column. **H** By hash overflow index (identified in ACCESSCREATOR and ACCESSNAME) **I** By an index (identified in ACCESSCREATOR and ACCESSNAME) **IN** By an index scan when the matching predicate contains an IN predicate and the IN-list is accessed through an in-memory table. **I1** By a one-fetch index scan **M** By a multiple index scan (followed by MX, MI, MU, or MH) **MH** By the hash overflow index named in ACCESSNAME **MI** By an intersection of multiple indexes **MU** By a union of multiple indexes **MX** By an index scan on the index named in ACCESSNAME. When the access method MX follows the access method DX, DI, or DU, the table is accessed by the DOCID index by using the DOCID list that is returned by DX, DI, or DU. **N** • By an index scan when the matching predicate contains the IN keyword • By an index scan when DB2 rewrites a query using the IN keyword • By hash access with the IN keyword • By hash access when DB2 rewrites a query using the IN keyword **NR** Range list access. **P** By a dynamic pair-wise index scan **R** By a table space scan **RW** By a work file scan of the result of a materialized user-defined table function **V** By buffers for an INSERT statement within a SELECT **blank** Not applicable to the current row	G
MATCHCOLS	SMALLINT NOT NULL	For ACCESSTYPE I, I1, N, NR, MX, or DX, the number of index keys that are used in an index scan; otherwise, 0.	G
ACCESSCREATOR	VARCHAR(128) NOT NULL	For ACCESSTYPE I, I1, N, NR, MX, or DX, the creator of the index; otherwise, blank.	G
ACCESSNAME	VARCHAR(128) NOT NULL	For ACCESSTYPE I, I1, H, MH, N, NR, MX, or DX, the name of the index; for ACCESSTYPE P, DSNPJW(*mixopseqno*) is the starting pair-wise join leg in MIXOPSEQNO; otherwise, blank.	G

Column name	Data type	Description	Use
INDEXONLY	CHAR(1) NOT NULL	Indication of whether access to an index alone is enough to perform the step, or Indication of whether data too must be accessed. **Y** Yes **N** No	G
SORTN_UNIQ	CHAR(1) NOT NULL	Indication of whether the new table is sorted to remove duplicate rows. **Y** Yes **N** No	G
SORTN_JOIN	CHAR(1) NOT NULL	Indication of whether the new table is sorted for join method 2 or 4. **Y** Yes **N** No	G
SORTN_ORDERBY	CHAR(1) NOT NULL	Indication of whether the new table is sorted for ORDER BY. **Y** Yes **N** No	G
SORTN_GROUPBY	CHAR(1) NOT NULL	Indication of whether the new table is sorted for GROUP BY. **Y** Yes **N** No	G
SORTC_UNIQ	CHAR(1) NOT NULL	Indication of whether the composite table is sorted to remove duplicate rows. **Y** Yes **N** No	G
SORTC_JOIN	CHAR(1) NOT NULL	Indication of whether the composite table is sorted for join method 1, 2 or 4. **Y** Yes **N** No	G
SORTC_ORDERBY	CHAR(1) NOT NULL	Indication of whether the composite table is sorted for an ORDER BY clause or a quantified predicate. **Y** Yes **N** No	G
SORTC_GROUPBY	CHAR(1) NOT NULL	Indication of whether the composite table is sorted for a GROUP BY clause. **Y** Yes **N** No	G

Column name	Data type	Description	Use
TSLOCKMOD	CHAR(3) NOT NULL	An indication of the mode of lock that is acquired on either the new table, or its table space or table space partitions. If the isolation can be determined at bind time, the values are: **IS** Intent share lock **IX** Intent exclusive lock **S** Share lock **U** Update lock **X** Exclusive lock **SIX** Share with intent exclusive lock **N** UR isolation; no lock If the isolation level cannot be determined at bind time, the lock mode is determined by the isolation level at run time is shown by the following values. **NS** For UR isolation, no lock; for CS, RS, or RR, an S lock. **NIS** For UR isolation, no lock; for CS, RS, or RR, an IS lock. **NSS** For UR isolation, no lock; for CS or RS, an IS lock; for RR, an S lock. **SS** For UR, CS, or RS isolation, an IS lock; for RR, an S lock. The data in this column is right justified. For example, IX appears as a blank, followed by I, followed by X. If the column contains a blank, then no lock is acquired. If the access method in the ACCESSTYPE column is DX, DI, or DU, no latches are acquired on the XML index page and no lock is acquired on the new base table data page or row, nor on the XML table and the corresponding table spaces. The value of TSLOCKMODE is a blank in this case.	G
PREFETCH	CHAR(1) NOT NULL	Indication of whether data pages are to be read in advance by prefetch: **D** Optimizer expects dynamic prefetch **S** Pure sequential prefetch **L** Prefetch through a page list **blank** Unknown or no prefetch	G
COLUMN_FN_EVAL	CHAR(1) NOT NULL	When an SQL aggregate function is evaluated: **R** While the data is being read from the table or index **S** While performing a sort to satisfy a GROUP BY clause **blank** After data retrieval and after any sorts	G
MIXOPSEQ	SMALLINT NOT NULL	The sequence number of a step in a multiple index operation. **1, 2, ...** *n* For the steps of the multiple index procedure (ACCESSTYPE is MX, MI, MU, DX, DI, or DU), or the sequence number of range list access (ACCESSTYPE is 'NR'). **0** For any other rows.	G

Column name	Data type	Description	Use
ACCESS_DEGREE	SMALLINT	The number of parallel tasks or operations that are activated by a query. This value is determined at bind time; the actual number of parallel operations that are used at execution time could be different. This column contains 0 if a host variable is used. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
ACCESS_PGROUP_ID	SMALLINT	The identifier of the parallel group for accessing the new table. A parallel group is a set of consecutive operations, executed in parallel, that have the same number of parallel tasks. This value is determined at bind time; it could change at execution time.This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
JOIN_DEGREE	SMALLINT	The number of parallel operations or tasks that are used in joining the composite table with the new table. This value is determined at bind time and can be 0 if a host variable is used. The actual number of parallel operations or tasks used at execution time could be different. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
JOIN_PGROUP_ID	SMALLINT	The identifier of the parallel group for joining the composite table with the new table. This value is determined at bind time; it could change at execution time. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
SORTC_PGROUP_ID	SMALLINT	The parallel group identifier for the parallel sort of the composite table. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
SORTN_PGROUP_ID	SMALLINT	The parallel group identifier for the parallel sort of the new table. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
PARALLELISM_ MODE	CHAR(1)	The kind of parallelism, if any, that is used at bind time: **I** Query I/O parallelism **C** Query CP parallelism This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
MERGE_ JOIN_ COLS	SMALLINT	The number of columns that are joined during a merge scan join (Method=2). This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G

Column name	Data type	Description	Use
CORRELATION_ NAME	VARCHAR(128)	The correlation name of a table or view that is specified in the statement. If no correlation name exists, then the column is null. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
PAGE_RANGE	CHAR(1) NOT NULL WITH DEFAULT	Indication of whether the table qualifies for page range screening, so that plans scan only the partitions that are needed. **Y** Yes **blank** No	G
JOIN_TYPE	CHAR(1) NOT NULL WITH DEFAULT	The type of join: **F** FULL OUTER JOIN **L** LEFT OUTER JOIN **P** Pair-wise join **S** Star join **blank** INNER JOIN or no join RIGHT OUTER JOIN converts to a LEFT OUTER JOIN when you use it, so that JOIN_TYPE contains L.	G

Column name	Data type	Description	Use
QBLOCK_TYPE	CHAR(6) NOT NULL WITH DEFAULT	For each query block, an indication of the type of SQL operation that is performed. For the outermost query, this column identifies the statement type. Possible values include: **SELECT** SELECT **INSERT** INSERT **UPDATE** UPDATE **MERGE** MERGE **DELETE** DELETE **SELUPD** SELECT with FOR UPDATE OF **DELCUR** DELETE WHERE CURRENT OF CURSOR **UPDCUR** UPDATE WHERE CURRENT OF CURSOR **CORSUB** Correlated subselect or fullselect **TRUNCA** TRUNCATE **NCOSUB** Noncorrelated subselect or fullselect **TABLEX** Table expression **TRIGGR** WHEN clause on CREATE TRIGGER **UNION** UNION **UNIONA** UNION ALL **INTERS** INTERSECT **INTERA** INTERSECT ALL **EXCEPT** EXCEPT **EXCEPTA** EXCEPT ALL	G

Column name	Data type	Description		Use
PRIMARY_ ACCESSTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates Indication of whether direct row access is attempted first:		G
		D	DB2 tries to use direct row access with a rowid column. If DB2 cannot use direct row access with a rowid column at run time, it uses the access path that is described in the ACCESSTYPE column of PLAN_TABLE.	
		T	The base table or result file is materialized into a work file, and the work file is accessed via sparse index access. If a base table is involved, then ACCESSTYPE indicates how the base table is accessed.	
		blank	DB2 does not try to use direct row access by using a rowid column or sparse index access for a work file. The value of the ACCESSTYPE column of PLAN_TABLE provides information on the method of accessing the table.	
PARENT_QBLOCKNO	SMALLINT NOT NULL	A number that indicates the QBLOCKNO of the parent query block.		G
TABLE_TYPE	CHAR(1)	The type of new table:		G
		B	Buffers for SELECT from INSERT, SELECT from UPDATE, SELECT from MERGE, or SELECT from DELETE statement.	
		C	Common table expression	
		F	Table function	
		I	The new table is generated from an IN-LIST predicate. If the IN-LIST predicate is selected as the matching predicate, it will be accessed as an in-memory table.	
		M	Materialized query table	
		Q	Temporary intermediate result table (not materialized). For the name of a view or nested table expression, a value of Q indicates that the materialization was virtual and not actual. Materialization can be virtual when the view or nested table expression definition contains a UNION ALL that is not distributed.	
		R	Recursive common table expression	
		S	Subquery (correlated or non-correlated)	
		T	Table	
		W	Work file	
		The value of the column is null if the query uses GROUP BY, ORDER BY, or DISTINCT, which requires an implicit sort.		

Column name	Data type	Description	Use
TABLE_ENCODE	CHAR(1)	The encoding scheme of the table. The possible values are: **A** ASCII **E** EBCDIC **U** Unicode **M** The table contains multiple CCSID sets	G
TABLE_SCCSID	SMALLINT NOT NULL WITH DEFAULT	The SBCS CCSID value of the table. If column TABLE_ENCODE is M, the value is 0.	G
TABLE_MCCSID	SMALLINT NOT NULL WITH DEFAULT	The mixed CCSID value of the table. If the value of the TABLE_ENCODE column is M, the value is 0. If MIXED=NO in the DSNHDECP module, the value is -2.	G
TABLE_DCCSID	SMALLINT NOT NULL WITH DEFAULT	The DBCS CCSID value of the table. If the value of the TABLE_ENCODE column is M, the value is 0. If MIXED=NO in the DSNHDECP module, the value is -2.	G
	INTEGER NOT NULL WITH DEFAULT	The values in this column are for IBM use only.	I
CTEREF	SMALLINT NOT NULL WITH DEFAULT	If the referenced table is a common table expression, the value is the top-level query block number.	G
PARENT_PLANNO	SMALLINT NOT NULL	Corresponds to the plan number in the parent query block where a correlated subquery is invoked. Or, for non-correlated subqueries, corresponds to the plan number in the parent query block that represents the work file for the subquery.	G

Column name	Data type	Description	Use
EXPANSION_REASON	CHAR(2) NOT NULL	This column applies to only static statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. If one of these special registers or the global variable is set to Y and the corresponding bind option is set to YES, DB2 implicitly adds certain syntax to the statement. This column indicates whether the query contains this implicit query transformation and why. This column can have one of the following values: **A** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation. **Related information:** "References to built-in global variables" on page 223 "CURRENT TEMPORAL BUSINESS_TIME" on page 194 "CURRENT TEMPORAL SYSTEM_TIME" on page 196 BIND and REBIND options (DB2 Commands)	G

SYSIBM.SYSQUERYPREDICATE table

The SYSIBM.SYSQUERYPREDICATE table contains information about predicates for queries in the SYSIBM.SYSQUERY table that have been identified for extended optimization. It correlates to the SYSIBM.SYSQUERY table by the QUERYID column.

Column name	Data type	Description	Use
QUERYID	BIGINT	Identifier of the query.	S
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.	S
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.	S
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.	S
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.	S
PREDNO	INTEGER NOT NULL	The predicate number, a number used to identify a predicate within a query.	S

Column name	Data type	Description	Use
TYPE	CHAR(8) NOT NULL	A string used to indicate the type or the operation of the predicate. The possible values are: • 'AND' • 'OR' • 'EQUAL' • 'RANGE' • 'BETWEEN' • 'IN' • 'LIKE' • 'NOT LIKE' • 'EXISTS • 'NOTEXIST' • 'SUBQUERY' • 'HAVING' • 'OTHERS'	S
LEFT_HAND_SIDE	VARCHAR(128) NOT NULL	If the LHS of the predicate is a table column (LHS_TABNO > 0), then this column indicates the column name. Other possible values are: • 'VALUE' • 'COLEXP' • 'NONCOLEXP' • 'CORSUB' • 'NONCORSUB' • 'SUBQUERY' • 'EXPRESSION' • Blanks	S
LEFT_HAND_PNO	INTEGER NOT NULL	If the LHS of the predicate is a table column (LHS_TABNO > 0), then this column indicates the column name. Other possible values are: • 'VALUE' • 'COLEXP' • 'NONCOLEXP' • 'CORSUB' • 'NONCORSUB' • 'SUBQUERY' • 'EXPRESSION' • Blanks	S
LHS_TABNO	SMALLINT NOT NULL	If the LHS of the predicate is a table column, then this column indicates a number which uniquely identifies the corresponding table reference within a query.	S
LHS_QBNO	SMALLINT NOT NULL	If the LHS of the predicate is a table column, then this column indicates a number which uniquely identifies the corresponding table reference within a query.	S

Column name	Data type	Description	Use
RIGHT_HAND_SIDE	VARCHAR(128) NOT NULL	If the RHS of the predicate is a table column (RHS_TABNO > 0), then this column indicates the column name. Other possible values are: • 'VALUE' • 'COLEXP' • 'NONCOLEXP' • 'CORSUB' • 'NONCORSUB' • 'SUBQUERY' • 'EXPRESSION' • Blanks	S
RIGHT_HAND_PNO	INTEGER NOT NULL	If the predicate is a compound predicate (AND/OR), then this column indicates the second child predicate. However, this column is not reliable when the predicate tree consolidation happens. Use PARENT_PNO instead to reconstruct the predicate tree.	S
RHS_TABNO	SMALLINT NOT NULL	If the RHS of the predicate is a table column, then this column indicates a number which uniquely identifies the corresponding table reference within a query.	S
RHS_QBNO	SMALLINT NOT NULL	If the RHS of the predicate is a subquery, then this column indicates a number which uniquely identifies the corresponding query block within a query.	S
FILTER_FACTOR	FLOAT NOT NULL	The estimated filter factor.	S
BOOLEAN_TERM	CHAR(1) NOT NULL	Whether this predicate can be used to determine the truth value of the whole WHERE clause.	S
SEARCHARG	CHAR(1) NOT NULL	Whether this predicate can be processed by data manager (DM). If it is not, then the relational data service (RDS) needs to be used to take care of it, which is more costly.	S
JOIN	CHAR(1) NOT NULL	Whether the predicate can be used as a simple join predicate between two tables.	S
AFTER_JOIN	CHAR(1) NOT NULL	Indicates the predicate evaluation phase: **'A'** After join **'D'** During join **blank** Not applicable	S
ADDED_PRED	CHAR(1) NOT NULL	Whether it is generated by transitive closure, which means DB2 can generate additional predicates to provide more information for access path selection, when the set of predicates that belong to a query logically imply other predicates.	S
REDUNDANT_PRED	CHAR(1) NOT NULL	Whether it is a redundant predicate, which means evaluation of other predicates in the query already determines the result that the predicate provides.	S
DIRECT_ACCESS	CHAR(1) NOT NULL	Whether the predicate is direct access, which means one can navigate directly to the row through ROWID.	S
KEYFIELD	CHAR(1) NOT NULL	Whether the predicate includes the index key column of the involved table for all applicable indexes considered by DB2.	S

Column name	Data type	Description	Use
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.	S
CATEGORY	SMALLINT NOT NULL,	IBM internal use only.	S
CATEGORY_B	SMALLINT NOT NULL	IBM internal use only.	S
TEXT	VARCHAR(2000) NOT NULL	The transformed predicate text; truncated if exceeds 2000 characters.	S
PRED_ENCODE	CHAR(1) NOT NULL WITH DEFAULT	IBM internal use only.	S
PRED_CCSID	SMALLINT NOT NULL WITH DEFAULT	IBM internal use only.	S
PRED_MCCSID	SMALLINT NOT NULL WITH DEFAULT	IBM internal use only.	S
MARKER	CHAR(1) NOT NULL WITH DEFAULT	Whether this predicate includes host variables, parameter markers, or special registers.	S
PARENT_PNO	INTEGER NOT NULL	The parent predicate number. If this predicate is a root predicate within a query block, then this column is 0.	S
NEGATION	CHAR(1) NOT NULL	Whether this predicate is negated via NOT.	S
LITERALS	VARCHAR(128) NOT NULL	This column indicates the literal value or literal values separated by colon symbols.	S
CLAUSE	CHAR(8) NOT NULL	The clause where the predicate exists: **'HAVING '** The HAVING clause **'ON '** The ON clause **'WHERE '** The WHERE clause **SELECT** The SELECT clause	S
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.	S

Column name	Data type	Description	Use
ORIGIN	CHAR(1) NOT NULL WITH DEFAULT	Indicates the origin of the predicate. **Blank** Generated by DB2 **C** Column mask **R** Row permission **U** Specified by the user	S
UNCERTAINTY	FLOAT(4) NOT NULL WITH DEFAULT	Describes the uncertainty factor of a predicate's estimated filter factor. A bigger value indicates a higher degree of uncertainty. Value zero indicates no uncertainty or uncertainty not considered.	S
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements.	S
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register.	S
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable.	S

SYSIBM.SYSQUERYSEL table

The SYSIBM.SYSQUERYSEL table contains information about the selectivity of predicates for queries in the SYSIBM.SYSQUERY table that have been identified for extended optimization. It correlates to the SYSIBM.SYSQUERY table by the QUERYID column.

Column name	Data type	Description	Use
QUERYID	BIGINT	The identifier of the query.	S
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.	S
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.	S
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.	S
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.	S
PREDNO	INTEGER NOT NULL	Identifies the predicate	S
INSTANCE	SMALLINT NOT NULL	The selectivity instance, which is used to group related selectivities.	S
SELECTIVITY	FLOAT NOT NULL	The selectivity of the predicate.	S
WEIGHT	FLOAT (4) NOT NULL	The weight of the selectivity instance. For example, a value of .025 means that 25% of the time when a query is executed the predicate will have this selectivity.	S
ASSUMPTION	VARCHAR(128) NOT NULL	Indicates how the selectivity was estimated, or will be used: One of the following values: **'NORMAL'** Estimated using the normal selectivity assumptions. **'OVERRIDE'** To be used as input to the Optimizer and override it's selectivity estimation.	S

Column name	Data type	Description	Use
INSERT_TIME	TIMESTAMP NOT NULL GENERATED ALWAYS AS ROW CHANGE TIMESTAMP	The time when the row was inserted.	S
EXPLAIN_TIME	TIMESTAMP	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.	S
REMARKS	VARCHAR(762)	IBM internal use only.	S

SYSIBM.SYSRELS table

The SYSIBM.SYSRELS table contains one row for every referential constraint.

Column name	Data type	Description	Use
CREATOR	VARCHAR(128) NOT NULL	The schema of the dependent table of the referential constraint.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the dependent table of the referential constraint.	G
RELNAME	VARCHAR(128) NOT NULL	Constraint name.	G
REFTBNAME	VARCHAR(128) NOT NULL	Name of the parent table of the referential constraint.	G
REFTBCREATOR	VARCHAR(128) NOT NULL	The schema of the parent table.	G
COLCOUNT	SMALLINT NOT NULL	Number of columns in the foreign key.	G
DELETERULE	CHAR(1) NOT NULL	Type of delete rule for the referential constraint: **A** NO ACTION **C** CASCADE **N** SET NULL **R** RESTRICT	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
RELOBID1	SMALLINT NOT NULL WITH DEFAULT	Internal identifier of the constraint with respect to the database that contains the parent table.	S
RELOBID2	SMALLINT NOT NULL WITH DEFAULT	Internal identifier of the constraint with respect to the database that contains the dependent table.	S
TIMESTAMP	TIMESTAMP NOT NULL WITH DEFAULT	Date and time the constraint was defined. If the constraint is between catalog tables prior to DB2 Version 2 Release 3, the value is '1985-04-01-00.00.00.000000.'.	G
IXOWNER	VARCHAR(128) NOT NULL WITH DEFAULT	The schema of unique non-primary index used for the parent key. '99999999' if the enforcing index has been dropped. Blank if the enforcing index is a primary index.	G
IXNAME	VARCHAR(128) NOT NULL WITH DEFAULT	Name of unique non-primary index used for a parent key. '99999999' if the enforcing index has been dropped. Blank if the enforcing index is a primary index.	G

Column name	Data type	Description	Use
ENFORCED	CHAR(1) NOT NULL WITH DEFAULT 'Y'	Enforced by the system or not: **Y** Enforced by the system **N** Not enforced by the system (trusted)	G
CHECKEXISTING-DATA	CHAR(1) NOT NULL WITH DEFAULT	Option for checking existing data: **I** Immediately check existing data. If ENFORCED = 'Y', this column will have a value of 'I'. **N** Never check existing data. If ENFORECED = 'N', this column will have a value of 'N'.	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. See Release dependency indicators for the values.	G

SYSIBM.SYSRESAUTH table

The SYSIBM.SYSRESAUTH table records CREATE IN and PACKADM ON privileges for collections; USAGE privileges for distinct types; and USE privileges for buffer pools, storage groups, and table spaces.

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privilege.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID of the user who holds the privilege. Could also be PUBLIC for a grant to PUBLIC.	G
QUALIFIER	VARCHAR(128) NOT NULL	Qualifier of the table space (the database name) if the privilege is for a table space (OBTYPE='R'). The schema name of the user-defined data type if the privilege is for a distinct type (OBTYPE='D'). The schema name of the JAR file if the privilege is for a JAR file (OBTYPE='J'). The value is PACKADM if the privilege is for a collection (OBTYPE='C') and the authority held is PACKADM. Otherwise, the value is blank.	G
NAME	VARCHAR(128) NOT NULL	Name of the buffer pool, collection, DB2 storage group, distinct type, or table space. Could also be ALL when USE OF ALL BUFFERPOOLS is granted.	G
	CHAR(1) NOT NULL	Internal use only	I
AUTHHOWGOT	CHAR(1) NOT NULL	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. **blank** Not applicable **A** PACKADM (on collection *) **C** DBCTRL **D** DBADM **E** SECADM **G** ACCESSCTRL **L** SYSCTRL **M** DBMAINT **P** PACKADM (on a specific collection) **S** SYSADM **T** DATAACCESS	G
OBTYPE	CHAR(1) NOT NULL	Type of object: **B** Buffer pool **C** Collection **D** Distinct type **R** Table space **S** Storage group **J** JAR file (Java archive file)	G
	CHAR(12) NOT NULL	Internal use only	I
	CHAR(6) NOT NULL	Not used	N

Column name	Data type	Description	Use
	CHAR(8) NOT NULL	Not used	N
USEAUTH	CHAR(1) NOT NULL	Whether the privilege is held with the GRANT option: **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option The authority held is PACKADM when the OBTYPE is C (a collection) and QUALIFIER is PACKADM. The authority held is CREATE IN when the OBTYPE is C and QUALIFIER is blank.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
GRANTEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the GRANT statement was executed.	G
GRANTEETYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantee: **blank** Authorization ID **L** Role	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: **blank** Authorization ID **L** Role	G

SYSIBM.SYSROLES table

The SYSIBM.SYSROLES table contains one row for each role.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	The name of the role.	G
DEFINER	VARCHAR(128) NOT NULL	The authorization ID or role that defined this role listed in the NAME column.	G
DEFINERTYPE	CHAR(1) NOT NULL	The type of definer: **L** Role **blank** Authorization ID	G
CREATEDTS	TIMESTAMP NOT NULL	The time when the role is created.	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the role. See Release dependency indicators for the values.	G
REMARKS	VARCHAR(762) NOT NULL	A character string that is provided using the COMMENT statement.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G

SYSIBM.SYSROUTINEAUTH table

The SYSIBM.SYSROUTINEAUTH table records the privileges that are held by users on routines. (A routine can be a user-defined function, cast function, or stored procedure.)

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privilege.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID of the user who holds the privilege or the name of a plan or package that uses the privilege. Can also be PUBLIC for a grant to PUBLIC.	G
SCHEMA	VARCHAR(128) NOT NULL	Schema of the routine	G
SPECIFICNAME	VARCHAR(128) NOT NULL	Specific name of the routine. An asterisk (*) if the privilege is held on all routines in the schema.	G
GRANTEDTS	TIMESTAMP NOT NULL	Time when the GRANT statement was executed.	G
ROUTINETYPE	CHAR(1) NOT NULL	Type of routine: **F** User-defined function or cast function **P** Stored procedure	G
GRANTEETYPE	CHAR(1) NOT NULL	Type of grantee: **blank** An authorization ID **L** Role **P** An application plan or package. The grantee is a package if COLLID is not blank. **R** Internal use only	G
AUTHHOWGOT	CHAR(1) NOT NULL	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. This field is also used to indicate that the privilege was held on all schemas by the grantor. **blank** Not applicable **1** Grantor had privilege on schema.* at time of grant **E** SECADM **G** ACCESSCTRL **L** SYSCTRL **S** SYSADM **T** DATAACCESS	G
EXECUTEAUTH	CHAR(1) NOT NULL	Whether GRANTEE can execute the routine: **Y** Privilege is held without GRANT option. **G** Privilege is held with GRANT option.	G
COLLID	VARCHAR(128) NOT NULL	If the GRANTEE is a package, its collection name. Otherwise, the value is blank.	G
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	If the GRANTEE is a package, the consistency token of the DBRM from which the package was derived. Otherwise, the value is blank.	G

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: **blank** Authorization ID **L** Role	G

SYSIBM.SYSROUTINES table

The SYSIBM.SYSROUTINES table contains a row for every routine. (A routine can be a user-defined function, cast function, or stored procedure.)

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	Schema of the routine.	G
OWNER	VARCHAR(128) NOT NULL	Owner of the routine.	G
NAME	VARCHAR(128) NOT NULL	Name of the routine.	G
ROUTINETYPE	CHAR(1) NOT NULL	Type of routine: **F** User-defined function or cast function **P** Stored procedure	G
CREATEDBY	VARCHAR(128) NOT NULL	Primary authorization ID of the user who created the routine.	G
SPECIFICNAME	VARCHAR(128) NOT NULL	Specific name of the routine.	G
ROUTINEID	INTEGER NOT NULL	Internal identifier of the routine.	S
RETURN_TYPE	INTEGER NOT NULL	Internal identifier of the result data type of the function. The column contains a -2 if the function is a table function.	S
ORIGIN	CHAR(1) NOT NULL	Origin of the routine: **E** External routine or external SQL procedure **N** Native SQL procedure **Q** SQL function **S** System-generated function **U** Sourced on user-defined function or built-in function	G
FUNCTION_TYPE	CHAR(1) NOT NULL	Type of function: **C** Aggregate function **S** Scalar function **T** Table function **blank** For a stored procedure (ROUTINETYPE = 'P')	G
PARM_COUNT	SMALLINT NOT NULL	Number of parameters for the routine.	G

Column name	Data type	Description	Use
LANGUAGE	VARCHAR(24) NOT NULL	Implementation language of the routine: • ASSEMBLE • C • COBOL • COMPJAVA • JAVA • PLI • REXX • SQL The value is blank if ROUTINETYPE = 'F' and ORIGIN is not 'E' or not 'Q'.	G
COLLID	VARCHAR(128) NOT NULL	Name of the package collection to be used when the routine is executed. A blank value indicates the package collection is the same as the package collection of the program that invoked the routine.	G
SOURCESCHEMA	VARCHAR(128) NOT NULL	If ORIGIN is 'U' and ROUTINETYPE is 'F', the schema of the source user-defined function ('SYSIBM' for a source built-in function). Otherwise, the value is blank.	G
SOURCESPECIFIC	VARCHAR(128) NOT NULL	If ORIGIN is 'U' and ROUTINETYPE is 'F', the specific name of the source user-defined function or source built-in function name. Otherwise, the value is blank.	G
DETERMINISTIC	CHAR(1) NOT NULL	The deterministic option of an external function or a stored procedure: **N** Indeterminate (results might differ with a given set of input values). **Y** Deterministic (results are consistent). **blank** ROUTINETYPE='F' and ORIGIN is not 'E' or not 'Q' (the routine is a function, but not an external function or an SQL function).	G
EXTERNAL_ACTION	CHAR(1) NOT NULL	The external action option of an external function or SQL function: **N** Function has no side effects. **E** Function has external side effects so that the number of invocations is important. **blank** ORIGIN is not 'E' or 'Q' for the function (ROUTINETYPE='F'), or it is a stored procedure (ROUTINETYPE='P').	G
NULL_CALL	CHAR(1) NOT NULL	The CALLED ON NOT NULL INPUT option of an external function or stored procedure: **N** The routine is not called if any parameter has a NULL value. **Y** The routine is called if any parameter has a NULL value. **blank** ROUTINETYPE='F' and ORIGIN is not 'E' (the routine is a function, but not an external function).	G
CAST_FUNCTION	CHAR(1) NOT NULL	Whether the routine is a cast function: **N** The routine is not a cast function. **Y** The routine is a cast function. **blank** ORIGIN is not 'E' for the function (ROUTINETYPE='F'), or it is a stored procedure (ROUTINETYPE='P'). A cast function is generated by DB2 for a CREATE TYPE statement.	G

Column name	Data type	Description	Use
SCRATCHPAD	CHAR(1) NOT NULL	The SCRATCHPAD option of an external function: **N** This function does not have a SCRATCHPAD. **Y** This function has a SCRATCHPAD. **blank** ORIGIN is not 'E' for the function (ROUTINETYPE='F'), or it is a stored procedure (ROUTINETYPE='P').	G
SCRATCHPAD_LENGTH	INTEGER NOT NULL	Length of the scratchpad if the ORIGIN is 'E' for the function (ROUTINETYPE='F') and NO SCRATCHPAD is not specified. Otherwise, the value is 0.	G
FINAL_CALL	CHAR(1) NOT NULL	The FINAL CALL option of an external function: **N** A final call will not be made to the function. **Y** A final call will be made to the function. **blank** ORIGIN is not 'E' for the function (ROUTINETYPE='F'), or it is a stored procedure (ROUTINETYPE='P').	G
PARALLEL	CHAR(1) NOT NULL	The PARALLEL option of an external function: **A** This function can be invoked by parallel tasks. **D** This function cannot be invoked by parallel tasks. **blank** ORIGIN is not 'E' for the function (ROUTINETYPE='F'), or it is a stored procedure (ROUTINETYPE='P').	G
PARAMETER_STYLE	CHAR(1) NOT NULL	The PARAMETER STYLE option of an external function or stored procedure: **D** DB2SQL. All parameters are passed to the external function or stored procedure according to the DB2SQL standard convention. **G** GENERAL. All parameters are passed to the stored procedure according to the GENERAL standard convention. **N** GENERAL CALL WITH NULLS. All parameters are passed to the stored procedure according to the GENERAL WITH NULLS convention. **J** JAVA. All parameters are passed to the function or procedure according to the conventions for JAVA and SQLJ specifications. **blank** The column is blank if the ORIGIN is not 'E' or if LANGUAGE is SQL.	G
FENCED	CHAR(1) NOT NULL	**Y** Indicates that this routine runs separately from the DB2 address space in a WLM managed DB2 address space. All user-defined routines that are not marked with Y in this column run in the DB2 address space. **blank** ORIGIN is 'Q' or ORIGIN is 'N'.	G
SQL_DATA_ACCESS	CHAR(1) NOT NULL	The SQL statements that are allowed in an external function, SQL function, or stored procedure: **C** CONTAINS SQL - Only SQL that does not read or modify data is allowed. **M** MODIFIES SQL DATA - All SQL is allowed, including SQL that reads or modifies data. **N** NO SQL - SQL is not allowed. **R** READS SQL DATA - Only SQL that reads data is allowed. **blank** Not applicable.	G

Column name	Data type	Description	Use
DBINFO	CHAR(1) NOT NULL	The DBINFO option of an external function or stored procedure: **N** No, the DBINFO parameter will not be passed to the external function or stored procedure. **Y** Yes, the DBINFO parameter will be passed to the external function or stored procedure. **blank** ORIGIN is not 'E'.	G
STAYRESIDENT	CHAR(1) NOT NULL	The STAYRESIDENT option of the routine, which determines whether the routine is to be deleted from memory when the routine ends. **N** The load module is to be deleted from memory after the routine terminates. **Y** The load module is to remain resident in memory after the routine terminates. **blank** ORIGIN is not 'E'.	G
ASUTIME	INTEGER NOT NULL	Number of CPU service units permitted for any single invocation of this routine. If ASUTIME is zero, the number of CPU service units is unlimited. The value is 0 if ROUTINETYPE = 'F' and ORIGIN is not 'E'. If a routine consumes more CPU service units than the ASUTIME value allows, DB2 cancels the routine.	G
WLM_ENVIRONMENT	VARCHAR(96) NOT NULL	Name of the WLM environment to be used to run this routine. When ORIGIN = 'N', this is the name of the WLM ENVIRONMENT FOR DEBUG MODE that is to be used when debugging a native SQL procedure. The column is blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'. If the ROUTINETYPE = 'P', the value might be blank. If this value is blank the stored procedure cannot be run.	G
WLM_ENV_FOR_ NESTED	CHAR(1) NOT NULL	For nested routine calls, indicates whether the address space of the calling stored procedure or user-defined function is used to run the nested stored procedure or user-defined function: **N** The nested stored procedure or user-defined function runs in an address space other than the specified WLM environment if the calling stored procedure or user-defined function is not running in the specified WLM environment. 'WLM ENVIRONMENT name' was specified. **Y** The nested stored procedure or user-defined function runs in the environment used by the calling stored procedure or user-defined function. 'WLM ENVIRONMENT(name,*)' was specified. **blank** WLM_ENVIRONMENT is blank. The column is blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'.	G
PROGRAM_TYPE	CHAR(1) NOT NULL	Indicates whether the routine runs as a Language Environment main routine or a subroutine: **M** The routine runs as a main routine. **S** The routine runs as a subroutine. **blank** ORIGIN is not 'E'.	G

Column name	Data type	Description	Use
EXTERNAL_SECURITY	CHAR(1) NOT NULL	Specifies the authorization ID to be used if the routine accesses resources protected by an external security product: **D** DB2 - The authorization ID associated with the WLM-established stored procedure address space. **U** SESSION_USER - The authorization ID of the SQL user that invoked the routine. **C** DEFINER - The authorization ID of the owner of the routine. **blank** ORIGIN is not 'E'.	G
COMMIT_ON_RETURN	CHAR(1) NOT NULL	If ROUTINETYPE = 'P', whether the transaction is always to be committed immediately on successful return (non-negative SQLCODE) from this stored procedure: **N** The unit of work is to continue. **Y** The unit of work is to be committed immediately. **A** The unit of work of the autonomous procedure is committed immediately, but other work of the calling application is not committed. If ROUTINETYPE = 'F', the value is blank.	G
RESULT_SETS	SMALLINT NOT NULL	If ROUTINETYPE = 'P', the maximum number of ad hoc result sets that this stored procedure can return. If no ad hoc result sets exist or ROUTINETYPE = 'F', the value is zero.	G
LOBCOLUMNS	SMALLINT NOT NULL	If ORIGIN = 'E' or 'Q', the number of LOB columns found in the parameter list for this user-defined function. If no LOB columns are found in the parameter list or ORIGIN is not 'E' or not 'Q', the value is 0.	S
CREATEDTS	TIMESTAMP NOT NULL	Time when the CREATE statement was executed for this routine.	G
ALTEREDTS	TIMESTAMP NOT NULL	Time when the last ALTER statement was executed for this routine.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
PARM1	SMALLINT NOT NULL	Internal use only	I
PARM2	SMALLINT NOT NULL	Internal use only	I
PARM3	SMALLINT NOT NULL	Internal use only	I

Column name	Data type	Description	Use
PARM4	SMALLINT NOT NULL	Internal use only	I
PARM5	SMALLINT NOT NULL	Internal use only	I
PARM6	SMALLINT NOT NULL	Internal use only	I
PARM7	SMALLINT NOT NULL	Internal use only	I
PARM8	SMALLINT NOT NULL	Internal use only	I
PARM9	SMALLINT NOT NULL	Internal use only	I
PARM10	SMALLINT NOT NULL	Internal use only	I
PARM11	SMALLINT NOT NULL	Internal use only	I
PARM12	SMALLINT NOT NULL	Internal use only	I
PARM13	SMALLINT NOT NULL	Internal use only	I
PARM14	SMALLINT NOT NULL	Internal use only	I
PARM15	SMALLINT NOT NULL	Internal use only	I
PARM16	SMALLINT NOT NULL	Internal use only	I
PARM17	SMALLINT NOT NULL	Internal use only	I
PARM18	SMALLINT NOT NULL	Internal use only	I
PARM19	SMALLINT NOT NULL	Internal use only	I

Column name	Data type	Description	Use
PARM20	SMALLINT NOT NULL	Internal use only	I
PARM21	SMALLINT NOT NULL	Internal use only	I
PARM22	SMALLINT NOT NULL	Internal use only	I
PARM23	SMALLINT NOT NULL	Internal use only	I
PARM24	SMALLINT NOT NULL	Internal use only	I
PARM25	SMALLINT NOT NULL	Internal use only	I
PARM26	SMALLINT NOT NULL	Internal use only	I
PARM27	SMALLINT NOT NULL	Internal use only	I
PARM28	SMALLINT NOT NULL	Internal use only	I
PARM29	SMALLINT NOT NULL	Internal use only	I
PARM30	SMALLINT NOT NULL	Internal use only	I
IOS_PER_INVOC	FLOAT NOT NULL WITH DEFAULT -1	Estimated number of I/Os that required to execute the routine. The value is -1 if the estimated number is not known.	S
INSTS_PER_INVOC	FLOAT NOT NULL WITH DEFAULT -1	Estimated number of machine instructions that required to execute the routine. The value is -1 if the estimated number is not known.	S
INITIAL_IOS	FLOAT NOT NULL WITH DEFAULT -1	Estimated number of I/O's that are performed the first time or the last time the routine is invoked. The value is -1 if the estimated number is not known.	S
INITIAL_INSTS	FLOAT NOT NULL WITH DEFAULT -1	Estimated number of machine instructions that are performed the first time or the last time the routine is invoked. The value is -1 if the estimated number is not known.	S

Column name	Data type	Description	Use
CARDINALITY	FLOAT NOT NULL WITH DEFAULT -1	The predicted cardinality of the routine, -1 to trigger the use of the default value (10,000).	S
RESULT_COLS	SMALLINT NOT NULL DEFAULT 1	For a table function, the number of columns in the result table. Otherwise, the value is 1.	S
EXTERNAL_NAME	VARCHAR(762) NOT NULL	The path/module/function that DB2 should load to execute the routine. The column is blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'.	G
	VARCHAR(150) NOT NULL FOR BIT DATA	Internal use only	I
RUNOPTS	VARCHAR(762) NOT NULL	The Language Environment run time options to be used for this routine. An empty string indicates that the installation default Language Environment run time options are to be used. The column is blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'.	G
REMARKS	VARCHAR(762) NOT NULL	A character string provided by the user with the COMMENT statement.	G
JAVA_SIGNATURE	VARCHAR(3072) NOT NULL WITH DEFAULT	The signature of the JAR file. **blank** When PARAMETER STYLE is not JAVA. The column is also blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'.	G
CLASS	VARCHAR(384) NOT NULL WITH DEFAULT	The class name contained in the JAR file. **blank** When PARAMETER STYLE is not JAVA. The column is also blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'.	G
JARSCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	The schema of the JAR file. **blank** When PARAMETER STYLE is not JAVA. The column is also blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'.	G
JAR_ID	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the JAR file. **blank** When PARAMETER STYLE is not JAVA. The column is also blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'.	G
SPECIAL_REGS	CHAR(1) NOT NULL WITH DEFAULT 'I'	The SPECIAL REGISTER option for a routine. **I** INHERIT SPECIAL REGISTERS **D** DEFAULT SPECIAL REGISTERS **blank** ROUTINETYPE = 'F' and ORIGIN is not 'E' or not 'Q'.	G
NUM_DEP_MQTS	SMALLINT NOT NULL WITH DEFAULT	Number of dependent materialized query tables. The value is 0 if the row does not describe a user-defined table function, or if no materialized query tables are defined on the table function.	G

Column name	Data type	Description	Use
MAX_FAILURE	SMALLINT NOT NULL WITH DEFAULT -1	Allowable failures for this routine (0-32767). If zero is specified, the routine will never be stopped. If no value is specified for this routine, the default will be -1 to indicate that the DB2 installation parameter (STORMXAB) will be used.	G
PARAMETER_CCSID	INTEGER NOT NULL WITH DEFAULT	A CCSID that specifies how character, graphic, date, time, and timestamp data types for system generated parameters to the routine such as message tokens and DBINFO should be passed. The value is dependent on the encoding scheme specified implicitly or explicitly for the PARAMETER CCSID clause defined at the system for that encoding scheme. The following list describes the CCSID for each encoding scheme: **ASCII** If mixed data is allowed, this CCSID is for mixed ASCII data, SBCS data uses the corresponding SBCS CCSID, and graphic data uses the corresponding DBCS CCSID. Otherwise, this CCSID is for SBCS ASCII data. **EBCDIC** If mixed data is allowed, this CCSID is for mixed EBCDIC data, SBCS data uses the corresponding SBCS CCSID, and graphic data uses the corresponding DBCS CCSID. Otherwise, this is the CCSID for SBCS EBCDIC data. **UNICODE** This CCSID is for mixed data (1208). A value of zero means that the CCSIDs used are those CCSIDs for the encoding scheme of other string or datetime parameters in the parameter list or RETURNS clause CCSID clauses, or the value in the DEF ENCODING SCHEME on installation panel DSNTIPF.	G
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for a native SQL procedure (indicated by the value 'N' in the column ORIGIN) or a non-inline SQL scalar function (indicated by the value 'Q' in the column ORIGIN and 'N' in the column INLINE). A zero length string for the rows that are created prior to Version 9 and for the rows that correspond to neither native SQL procedures or non-inline SQL scalar functions.	G
CONTOKEN	CHAR(8) NOT NULL WITH DEFAULT FOR BIT DATA	The consistency token for the routine. The column is set to X'20' if the value of ORIGIN is not 'N'	G
ACTIVE	CHAR(1) NOT NULL WITH DEFAULT	Identifies the active version of the routine: **Y** The routine is the active version. **N** The routine is not the active version. **blank** The value of ORIGIN is not 'N' or the row was created prior to Version 9.	G

Column name	Data type	Description	Use
DEBUG_MODE	CHAR(1) NOT NULL WITH DEFAULT	Identifies whether or not this routine is enabled for debugging: **1** This routine is enabled for debugging and can be debugged in a client debug session using the DB2 Unified Debugger. **0** This routine is not enabled for debugging. **N** This routine can never be enabled for debugging. **blank** The LANGUAGE is not specified as JAVA, the value of ORIGIN is not 'N', or the row was created prior to Version 9.	G
TEXT_ENVID	INTEGER NOT NULL WITH DEFAULT	Internal identifier of the environment. The column is 0 if the value of ORIGIN is not 'N' or if the row was created prior to Version 9.	G
TEXT_ROWID	ROWID NOT NULL GENERATED ALWAYS	ID to support LOB columns for source text.	G
TEXT	CLOB(2M) NOT NULL WITH DEFAULT	The source text of the CREATE statement or the ALTER statement with the body for the routine. The column is a zero-length string if the value of ORIGIN is not 'N' or if the row was created prior to Version 9.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: **blank** Authorization ID **L** Role	G
PARAMETER_ VARCHARFORM	INTEGER NOT NULL WITH DEFAULT	A non-zero value that indicates the actual representation, to a LANGUAGE C routine, of any varying length string parameter that appears in the parameter list or RETURNS clause for that routine.	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G
PACKAGEPATH	VARCHAR(4096)	The value of the PACKAGE PATH option of the CREATE FUNCTION, CREATE PROCEDURE, ALTER FUNCTION, or ALTER PROCEDURE statement that created or last changed the routine. PACKAGE PATH identifies the package path to use when the routine is executed. A blank value indicates the package path is the same as the package path of the program that invoked the routine.	G
SECURE	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates if the routine is secured: **N** The routine is not secured **Y** The routine is secured	G

Column name	Data type	Description		Use
INLINE	CHAR(1) NOT NULL WITH DEFAULT	Specifies if the SQL function is inline:		G
		Y	The SQL function is inline when referenced. No package is associated with this type of routine.	
		N	The SQL function has an associated package.	
		blank	Not an SQL function (the ORIGIN column has a value other than 'Q')	
	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only		I
SYSTEM_DEFINED	CHAR(1) NOT NULL WITH DEFAULT	Identifies whether this routine is system defined:		G
		blank	This routine is not system defined	
		S	This routine is system defined	

SYSIBM.SYSROUTINESTEXT table

The SYSIBM.SYSROUTINESTEXT is an auxiliary table for the TEXT column of SYSIBM.SYSROUTINES and is required to hold the LOB data.

Column name	Data type	Description	Use
TEXT	CLOB(2M) NOT NULL WITH DEFAULT	The source text of the CREATE PROCEDURE statement for the routine. TEXT can also hold the source text of the ALTER PROCEDURE statement for the routine if the routine is a native SQL procedure and the SQL procedure body is included in the ALTER PROCEDURE statement.	G

SYSIBM.SYSROUTINES_OPTS table

The SYSIBM.SYSROUTINES_OPTS table Contains a row for each generated routine, such as one created by DB2 for z/OS Procedure Processor DSNTPSMP, that records the build options for the routine.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	Schema of the routine.	G
ROUTINENAME	VARCHAR(128) NOT NULL	Name of the routine.	G
BUILDDATE	DATE NOT NULL WITH DEFAULT	Date the routine was built.	G
BUILDTIME	TIME NOT NULL WITH DEFAULT	Time the routine was built.	G
BUILDSTATUS	CHAR(1) NOT NULL WITH DEFAULT 'C'	Whether this version of the routine's options is the current version.	G
BUILDSCHEMA	VARCHAR(128) NOT NULL	Schema name for BUILDNAME.	G
BUILDNAME	VARCHAR(128) NOT NULL	Procedure used to create the routine.	G
BUILDOWNER	VARCHAR(128) NOT NULL	Authorization ID used to create the routine.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
PRECOMPILE_OPTS	VARCHAR(765) NOT NULL WITH DEFAULT	SQL processing (precompiler or coprocessor) options used to build the routine.	G
COMPILE_OPTS	VARCHAR(765) NOT NULL WITH DEFAULT	Compiler options used to build the routine.	G
PRELINK_OPTS	VARCHAR(765) NOT NULL WITH DEFAULT	Prelink-edit options used to build the routine.	G

Column name	Data type	Description	Use
LINK_OPTS	VARCHAR(765) NOT NULL WITH DEFAULT	Link-edit options used to build the routine.	G
BIND_OPTS	VARCHAR(3072) NOT NULL WITH DEFAULT	Bind options used to build the routine.	G
SOURCEDSN	VARCHAR(765) NOT NULL WITH DEFAULT	Name of the source data set.	G
DEBUG_MODE	CHAR(1) NOT NULL	Debugging is on or off for this object. **0** Debugging is off. Default and value on migration are both 0. **1** Debugging is on.	G

SYSIBM.SYSROUTINES_TREE table

The SYSIBM.SYSROUTINES_TREE table is an auxiliary table for the PTREE column of the SYSIBM.SYSROUTINES table.

Column name	Data type	Description	Use
PTREE	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only.	I

SYSIBM.SYSROUTINES_SRC table

The SYSIBM.SYSROUTINES_SRC table contains source for generated routines, such as those created by DB2 for z/OS Procedure Processor DSNTPSMP.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	Schema of the routine.	G
ROUTINENAME	VARCHAR(128) NOT NULL	Name of the routine.	G
BUILDDATE	DATE NOT NULL WITH DEFAULT	Date the routine was built.	G
BUILDTIME	TIME NOT NULL WITH DEFAULT	Time the routine was built.	G
BUILDSTATUS	CHAR(1) NOT NULL WITH DEFAULT 'C'	Whether this version of the routine's source is the current version.	G
SEQNO	INTEGER NOT NULL	Number of the source statement piece in CREATESTMT.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
CREATESTMT	VARCHAR(7500) NOT NULL	Routine source statement.	G

SYSIBM.SYSSCHEMAAUTH table

The SYSIBM.SYSSCHEMAAUTH table contains one or more rows for each user that is granted a privilege on a particular schema in the database.

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privileges or SYSADM.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID of the user or group who holds the privileges. Can also be PUBLIC for a grant to PUBLIC.	G
SCHEMANAME	VARCHAR(128) NOT NULL	Name of the schema or '*' for all schemas.	G
AUTHHOWGOT	CHAR(1) NOT NULL	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. This field is also used to indicate that the privilege was held on all schemas by the grantor. **1** Grantor had privilege on all schemas at time of grant **E** SECADM **G** ACCESSCTRL **L** SYSCTRL **S** SYSADM	G
CREATEINAUTH	CHAR(1) NOT NULL	Indicates whether grantee holds CREATEIN privilege on the schema: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
ALTERINAUTH	CHAR(1) NOT NULL	Indicates whether grantee holds ALTERIN privilege on the schema: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
DROPINAUTH	CHAR(1) NOT NULL	Indicates whether grantee holds DROPIN privilege on the schema: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
GRANTEDTS	TIMESTAMP NOT NULL	Time when the GRANT statement was executed.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
GRANTEETYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantee: **blank** Authorization ID **L** Role	G

Column name	Data type	Description	Use
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: **blank** Authorization ID **L** Role	G

SYSIBM.SYSSEQUENCEAUTH table

The SYSIBM.SYSSEQUENCEAUTH table records the privileges that are held by users over sequences.

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privileges.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID of the user or group that holds the privileges or the name of an application plan or package that uses the privileges. PUBLIC for a grant to PUBLIC.	G
SCHEMA	VARCHAR(128) NOT NULL	Schema of the sequence.	G
NAME	VARCHAR(128) NOT NULL	Name of the sequence.	G
GRANTEETYPE	CHAR(1) NOT NULL	Type of grantee: **blank** An authorization ID. **L** Role **P** An application plan or package. The grantee is a package if COLLID is not blank. **R** Internal use only.	G
AUTHHOWGOT	CHAR(1) NOT NULL	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor: **blank** Not applicable **E** SECADM **G** ACCESSCTRL **L** SYSCTRL **S** SYSADM **T** DATAACCESS	G
ALTERAUTH	CHAR(1) NOT NULL	Indicates whether grantee holds ALTER privilege on the sequence: **blank** Privilege is not held. **G** Privilege is held with the GRANT option. **Y** Privilege is held without the GRANT option.	G
USEAUTH	CHAR(1) NOT NULL	Indicates whether grantee holds USAGE privilege on the sequence: **blank** Privilege is not held. **G** Privilege is held with the GRANT option. **Y** Privilege is held without the GRANT option.	G
COLLID	VARCHAR(128) NOT NULL	If the GRANTEE is a package, its collection name. Otherwise, a string of length zero.	G
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	If the GRANTEE is a package, the consistency token of the DBRM from which the package was derived. Otherwise, blank.	G
GRANTEDTS	TIMESTAMP NOT NULL	Time when the GRANT statement was executed.	G

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: **blank** Authorization ID **L** Role	G

SYSIBM.SYSSEQUENCES table

The SYSIBM.SYSSEQUENCES table contains one row for each identity column or user-defined sequence.

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	Schema of the alias or sequence. For an identity column, the value of TBCREATOR from the SYSCOLUMNS entry for the column.	G
OWNER	VARCHAR(128) NOT NULL	Owner of the alias or sequence. For an identity column, the value of TBCREATOR from the SYSCOLUMNS entry for the column.	G
NAME	VARCHAR(128) NOT NULL	Name of the alias, identity column, or sequence. The name for an identity column is generated by DB2.	G
SEQTYPE	CHAR(1) NOT NULL	Type of sequence object: **A** Alias for a sequence **I** An identity column **S** A user-defined sequence **X** An implicitly created DOCID column for a base table that contains XML data.	G
SEQUENCEID	INTEGER NOT NULL	Internal identifier of the alias, identity column, or sequence.	G
CREATEDBY	VARCHAR(128) NOT NULL	Primary authorization ID of the user who created the alias, identity column, or sequence.	G
INCREMENT	DECIMAL(31,0) NOT NULL	Increment value (positive or negative, within INTEGER scope). The value is 0 if the row describes an alias.	G
START	DECIMAL(31,0) NOT NULL	Start value. The value is 0 if the row describes an alias.	G
MAXVALUE	DECIMAL(31,0) NOT NULL	Maximum value allowed for the identity column or sequence. The value is 0 if the row describes an alias.	G
MINVALUE	DECIMAL(31,0) NOT NULL	Minimum value allowed for the identity column or sequence. The value is 0 if the row describes an alias.	G
CYCLE	CHAR(1) NOT NULL	Whether cycling will occur when a boundary is reached: **N** No **Y** Yes, cycling will occur **blank** The row describes an alias	G
CACHE	INTEGER NOT NULL	Number of sequence values to preallocate in memory for faster access. A value of 0 indicates that values are not to be preallocated. The value is 0 if the row describes an alias.	G

Column name	Data type	Description	Use
ORDER	CHAR(1) NOT NULL	Whether the values must be generated in order: **Y** Yes **N** No **R** The values must be generated in pseudo-random order for an XML document ID column that was created when subsystem parameter XML_RANDOMIZE_DOCID was set to YES. **blank** The row describes an alias	G
DATATYPEID	INTEGER NOT NULL	For a built-in data type, the internal ID of the built-in type. For a distinct type, the internal ID of the distinct type. The value is 0 if the row describes an alias.	S
SOURCETYPEID	INTEGER NOT NULL	For a built-in data type, 0. For a distinct type, the internal ID of the built-in data type upon which the distinct type is based. The value is 0 if the row describes an alias.	S
CREATEDTS	TIMESTAMP NOT NULL	Timestamp of the creation of the alias, identity column, or sequence.	G
ALTEREDTS	TIMESTAMP NOT NULL	Timestamp when the last ALTER statement was executed for this alias, identity column, or sequence.	G
MAXASSIGNEDVAL	DECIMAL(31,0)	Last possible assigned value. Initialized to null when the object is created. Updated each time the next chunk of *n* values is cached, where *n* is the value for CACHE. The value is 0 if the row describes an alias.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
REMARKS	VARCHAR(762) NOT NULL	Character string provided by user with the COMMENT statement. The value is blank for an identity column.	G
PRECISION	SMALLINT NOT NULL WITH DEFAULT	The precision defined for a sequence with a decimal or numeric type. The value is 5 for SMALLINT, 10 for INTEGER, or the actual precision specified by the user for the decimal data type. The value is 0 for rows created prior to Version 8. The value is 0 if the row describes an alias.	G
RESTARTWITH	DECIMAL(31,0) NULLABLE WITH DEFAULT	The RESTART WITH value specified for a sequence during ALTER. The value is NULL for the following: • There have been no ALTER with RESTART WITH • The row describes an alias	G

Column name	Data type	Description	Use
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: **blank** Authorization ID **L** Role	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G
SEQSCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	The schema of the target sequence.	G
SEQNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the target sequence.	G

SYSIBM.SYSSEQUENCESDEP table

The SYSIBM.SYSSEQUENCESDEP table records the dependencies of identity columns and sequences.

Column name	Data type	Description	Use
BSEQUENCEID	INTEGER NOT NULL	Internal identifier of the identity column or sequence.	G
DCREATOR	VARCHAR(128) NOT NULL	The owner of the object that is dependent on this identity column or sequence.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
DNAME	VARCHAR(128) NOT NULL	Name of the object that is dependent on this identity column or sequence.	G
DCOLNAME	VARCHAR(128) NOT NULL	Name of the identity column. Blank for SQL function rows.	G
DTYPE	CHAR(1) NOT NULL WITH DEFAULT 'I'	The type of object that is dependent on this sequence: **F** SQL function **I** Identity column **X** Implicit DOCID column that is created on a base table with XML **blank** Represents an identity column created prior to Version 8	G
BSCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	The schema name of the sequence, will be a string of length zero for an object created prior to Version 8.	G
BNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The sequence name (generated by DB2 for an identity column), will be a string of length zero for an object created prior to Version 8.	G
DSCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	The qualifier of the object that is dependent on this sequence, will be a string of length zero for an object created prior to Version 8.	G
DOWNER	VARCHAR(128) NOT NULL WITH DEFAULT	The owner of the object that is dependent on this sequence. This will be a string of length zero for an object that was created prior to Version 9.	G
DOWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	The type of owner: **Blank** An authorization ID **L** A role	G

SYSIBM.SYSSTATFEEDBACK table

The SYSIBM.SYSTATFEEDBACK table contains information about missing or conflicting catalog statistics for SQL statements.

The following values control the collection of statistics feedback data in the SYSIBM.SYSSTATFEEDBACK catalog table:

- The STATFDBK_SCOPE subsystem parameter controls whether the data is collected, and whether it is collected only for static SQL statements, only for dynamic SQL statements, or for both.
- The STATSINT subsystem parameter controls when and how frequently the data is externalized.
- The STATS_FEEDBACK column of the SYSIBM.SYSTABLES catalog table controls whether the data is collected for a particular table.

The RUSNTATS utility removes data from the SYSIBM.SYSSTATFEEDBACK catalog table when the recommended statistics are collected.

Column name	Data type	Description	Use
TBCREATOR	VARCHAR(128)	The creator of the table.	S
TBNAME	VARCHAR(128)	The name of the table.	S
IXCREATOR	VARCHAR(128)	The creator of the index.	S
IXNAME	VARCHAR(128)	The name of the index.	S
COLNAME	VARCHAR(128)	The name of the column.	S
NUMCOLUMNS	SMALLINT	The number of columns in the column group.	S
COLGROUPCOLNO	VARCHAR(254) FOR BIT DATA	A hex representation that identifies the set of columns associated with the statistics. If the statistics are only associated with a single column, the field contains a zero length. Otherwise, the field is an array of SMALLINT column numbers with a dimension equal to the value in NUMCOLUMNS.	S
TYPE	CHAR(1)	The type of statistic to collect: **'C'** Cardinality. **'F'** Frequency. **'H'** Histogram. **'I'** Index. **'T'** Table.	I
DBNAME	VARCHAR(24)	The name of the database.	S
TSNAME	VARCHAR(24)	The name of the table space.	S

Column name	Data type	Description	Use
REASON	CHAR(8)	The reason that the statistic was recommend: **'BASIC'** A basic statistical value for a column table or index is missing. **'KEYCARD'** The cardinalities of index key columns are missing. **'LOWCARD'** The cardinality of the column is a low value, which indicates that data skew is likely. **'NULLABLE'** Distribution statistics are not available for a nullable column. **'DEFAULT'** A predicate references a value that is probably a default value. **'RANGEPRD'** Histogram statistics are not available for a range predicate. **'PARALLEL'** Parallelism could be improved by uniform partitioning of key ranges. **'CONFLICT'** Another statistic conflicts with this statistic. **'COMPFFIX'** Multi-column cardinality statistics are needed for an index compound filter factor.	S
BLOCK_RUNSTATS	CHAR(1)	Whether the row is used when optimization tools collect statistics based on the recommendations. DB2 inserts a blank value in this column for all new rows. DB2 does not refer to or change the value of this column. This is an updatable column.	S
REMARKS	VARCHAR(254)	Free form text for extensibility.	S
LASTDATE	DATE	The last date that this statistics recommendation was updated by DB2.	S

SYSIBM.SYSSTMT table

The SYSIBM.SYSSTMT table contains one or more rows for each SQL statement of each DBRM.

Column name	Data type	Description	Use
NAME	VARCHAR(24) NOT NULL	Name of the DBRM.	G
PLNAME	VARCHAR(24) NOT NULL	Name of the application plan.	G
PLCREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the application plan.	G
SEQNO	INTEGER NOT NULL	Sequence number of this row with respect to a statement of the plan. Rows in which the values of SEQNO, STMTNO, and SECTNO are zero are for internal use. The numbering starts with zero.	G
STMTNO	SMALLINT NOT NULL	The statement number of the statement in the source program. A statement number greater than 32767 is stored as zero. If the value is zero, see STMTNOI for the statement number. Rows in which the values of SEQNO, STMTNO, and SECTNO are zero are for internal use.	G
SECTNO	SMALLINT NOT NULL	The section number of the statement. Rows in which the values of SEQNO, STMTNO, and SECTNO are zero are for internal use.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
TEXT	VARCHAR(3800) NOT NULL FOR BIT DATA	Text or portion of the text of the SQL statement.	S
ISOLATION	CHAR(1) NOT NULL WITH DEFAULT	Isolation level for the SQL statement: **R** RR (repeatable read) **T** RS (read stability) **S** CS (cursor stability) **U** UR (uncommitted read) **L** RS isolation, with a *lock-clause* **X** RR isolation, with a *lock-clause* **blank** The WITH clause was not specified on this statement. The isolation level is recorded in SYSPACKAGE.ISOLATION and in SYSPLAN.ISOLATION.	G

Column name	Data type	Description	Use
STATUS	CHAR(1) NOT NULL WITH DEFAULT	Status of binding the statement: **A** Distributed - statement uses DB2 private protocol access. The statement will be parsed and executed at the server using defaults for input variables during access path selection. **B** Distributed - statement uses DB2 private protocol access. The statement will be parsed and executed at the server using values for input variables during access path selection. **C** Compiled - statement was bound successfully using defaults for input variables during access path selection. **D** Distributed - statement references a remote object using a three-part name. DB2 will implicitly use DRDA access either because the DBPROTOCOL bind option was not specified (defaults to DRDA), or the bind option DBPROTOCOL(DRDA) was explicitly specified. This option allows the use of three-part names with DRDA access but it requires that the package be bound at the target remote site. **E** Explain - statement is an SQL EXPLAIN statement. The explain is done at bind time using defaults for input variables during access path selection. **F** Parsed - statement did not bind successfully and VALIDATE(RUN) was used. The statement will be rebound at execution time using values for input variables during access path selection. **G** Compiled - statement bound successfully, but REOPT is specified. The statement will be rebound at execution time using values for input variables during access path selection. **H** Parsed - statement is either a data definition statement or a statement that did not bind successfully and VALIDATE(RUN) was used. The statement will be rebound at execution time using defaults for input variables during access path selection. Data manipulation statements use defaults for input variables during access path selection. **I** Indefinite - statement is dynamic. The statement will be bound at execution time using defaults for input variables during access path selection.	S

Column name	Data type	Description	Use
STATUS		**J** Indefinite - statement is dynamic. The statement will be bound at execution time using values for input variables during access path selection. **K** Control - CALL statement. **L** Bad - the statement has some allowable error. The bind continues but the statement cannot be executed. **M** Parsed - statement references a table that is qualified with SESSION and was not bound because the table reference could be for a declared temporary table that will not be defined until the package or plan is run. The SQL statement will be rebound at execution time using values for input variables during access path selection. **blank** The statement is non-executable, or was bound in a DB2 release prior to Version 5.	
ACCESSPATH	CHAR(1) NOT NULL WITH DEFAULT	For static statements, indicates if the access path for the statement is based on user-specified optimization hints. A value of 'H' indicates that optimization hints were used. A blank value indicates that the access path was determined without the use of optimization hints, or that there is no access path associated with the statement. For dynamic statements, the value is blank.	G
STMTNOI	INTEGER NOT NULL WITH DEFAULT	If the value of STMTNOI is not zero, the column contains the statement number of the statement in the source program.	G
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement.	G
EXPLAINABLE	CHAR(1) NOT NULL WITH DEFAULT	Contains one of the following values: **Y** Indicates that the SQL statement can be used with the EXPLAIN function and might have rows describing its access path in the owner.PLAN_TABLE. **N** Indicates that the SQL statement does not have any rows describing its access path in the owner.PLAN_TABLE. **blank** Indicates that the SQL statement was bound prior to Version 7.	G
QUERYNO	INTEGER NOT NULL WITH DEFAULT –1	The query number of the SQL statement in the source program. SQL statements bound prior to Version 7 have a default value of –1. Statements bound in Version 7 or later use the value specified on the QUERYNO clause on SELECT, UPDATE, INSERT, DELETE, EXPLAIN, and DECLARE CURSOR statements. If the QUERYNO clause is not specified, the query number is set to the statement number.	G

Column name	Data type	Description	Use
PLCREATORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: **blank** Authorization ID **L** Role	G

SYSIBM.SYSSTOGROUP table

The SYSIBM.SYSSTOGROUP table contains one row for each storage group.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the storage group.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the storage group.	G
VCATNAME	VARCHAR(24) NOT NULL	Name of the integrated catalog facility catalog.	G
	VARCHAR(24) NOT NULL	Not used	N
SPACE	INTEGER NOT NULL	Number of kilobytes of DASD storage allocated to the storage group as determined by the last execution of the STOSPACE utility.	G
	CHAR(5) NOT NULL	Not used	N
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
CREATEDBY	VARCHAR(128) NOT NULL WITH DEFAULT	Primary authorization ID of the user who created the storage group.	G
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If the STOSPACE utility was executed for the storage group, date and time when STOSPACE was last executed.	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the CREATE statement was executed for the storage group.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the most recent ALTER STOGROUP statement was executed for the storage group. If no ALTER STOGROUP statement has been applied, ALTEREDTS has the value of CREATEDTS.	G
SPACEF	FLOAT NOT NULL WITH DEFAULT	Kilobytes of DASD storage for the storage group. The value is -1 if statistics have not been gathered. This is an updatable column.	G
DATACLAS	VARCHAR(24) NOT NULL	Name of the SMS data class. Blank if data class is not used.	G

Column name	Data type	Description	Use
MGMTCLAS	VARCHAR(24) NOT NULL	Name of the SMS management class. Blank if management class is not used.	G
STORCLAS	VARCHAR(24) NOT NULL	Name of the SMS storage class. Blank if storage class is not used.	G
CREATORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: **blank** Authorization ID **L** Role	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G

SYSIBM.SYSSTRINGS table

The SYSIBM.SYSSTRINGS table contains information about character conversion. Each row describes a conversion from one coded character set to another.

Also refer to z/OS C/C++ Programming Guide for information on the additional conversions that are supported.

Each row in the table must have a unique combination of values for its INCCSID, OUTCCSID, and IBMREQD columns. Rows for which the value of IBMREQD is N can be deleted, inserted, and updated subject to this uniqueness constraint and to the constraints imposed by a VALIDPROC defined on the table. An inserted row could have values for the INCCSID and OUTCCSID columns that match those of a row for which the value of IBMREQD is Y. DB2 then uses the information in the inserted row instead of the information in the IBM-supplied row. Rows for which the value of IBMREQD is Y cannot be deleted, inserted, or updated. For information about the use of inserted rows for character conversion, see *DB2 Installation Guide*.

DB2 has two methods for character conversions and applies them in the following order:

1. Conversions specified by the various combinations of the INCCSID and OUTCCSID columns in the SYSIBM.SYSSTRINGS catalog table.
2. Conversions provided by z/OS support for Unicode. For more information, see z/OS Support for Unicode: Using Conversion Services.

If neither of these methods can be used for a particular character conversion, DB2 returns an error.

Column name	Data type	Description	Use
INCCSID	INTEGER NOT NULL	The source CCSID for the character conversion represented by this row. The value of the source CCSID must be in the range of 1 to 65533 and must not be the same as the value for the OUTCCSID column.	G
OUTCCSID	INTEGER NOT NULL	The target CCSID for the character conversion represented by this row. The value of the target CCSID must be in the range of 1 to 65533 and must not be the same as the value for the INCCSID column.	G
TRANSTYPE	CHAR(2) NOT NULL	Indicates the nature of the conversion. Values can be: **GG** GRAPHIC to GRAPHIC **MM** EBCDIC MIXED to EBCDIC MIXED **MS** EBCDIC MIXED to SBCS **PM** ASCII MIXED to EBCDIC MIXED **PS** ASCII MIXED to SBCS **SM** SBCS to EBCDIC MIXED **SS** SBCS to SBCS **MP** EBCDIC MIXED to ASCII MIXED **PP** ASCII MIXED to ASCII MIXED **SP** SBCS to ASCII MIXED	G
ERRORBYTE	CHAR(1) FOR BIT DATA (Nulls are allowed)	The byte used in the conversion table as an error byte. Any non-null value that is specified for the ERRORBYTE column must not be the same as the value that is specified for the SUBBYTE column. Null indicates the absence of an error byte.	S

Column name	Data type	Description	Use
SUBBYTE	CHAR(1) FOR BIT DATA (Nulls are allowed)	The byte used in the conversion table as a substitution character. Any non-null value that is specified for the SUBBYTE column must not be the same as the value that is specified for the ERRORBYTE column. Null indicates the absence of a substitution character.	S
TRANSPROC	VARCHAR(24) NOT NULL WITH DEFAULT	The name of a module or blanks. A nonblank value must conform to the rules for z/OS program names. If IBMREQD is 'N', a nonblank value is the name of a conversion procedure provided by the user. The first five characters of the name of a user-provided conversion procedure must not be 'DSNXV'; these characters are used to distinguish user-provided conversion procedures from DB2 modules that contain DBCS conversion tables. If IBMREQD is 'Y', a nonblank value is the name of a DB2 module that contains DBCS conversion tables.	G

Column name	Data type	Description		Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape.		G
		Value	**Meaning**	
		B	Version 1R3 dependency indicator, not from the machine-readable material (MRM) tape	
		C	Version 2R1 dependency indicator, not from MRM tape	
		D	Version 2R2 dependency indicator, not from MRM tape	
		E	Version 2R3 dependency indicator, not from MRM tape	
		F	Version 3R1 dependency indicator, not from MRM tape	
		G	Version 4 dependency indicator, not from MRM tape	
		H	Version 5 dependency indicator, not from MRM tape	
		I	Version 6 dependency indicator, not from MRM tape	
		J	Version 6 dependency indicator, not from MRM tape	
		K	Version 7 dependency indicator, not from MRM tape	
		L	Version 8 dependency indicator, not from MRM tape	
		M	Version 9 dependency indicator, not from MRM tape	
		O	Version 10 dependency indicator, not from MRM tape	
		N	Not from MRM tape, no dependency	
		The value in this field is not a reliable indicator of release dependencies.		
TRANSTAB	VARCHAR(256) FOR BIT DATA NOT NULL WITH DEFAULT	Either a 256-byte conversion table or an empty (0 length) string.		S

SYSIBM.SYSSYNONYMS table

The SYSIBM.SYSSYNONYMS table contains one row for each synonym of a table or view.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Synonym for the table or view.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the synonym.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table or view.	G
TBCREATOR	VARCHAR(128) NOT NULL	The schema of the table or view.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
CREATEDBY	VARCHAR(128) NOT NULL WITH DEFAULT	Primary authorization ID of the user who created the synonym.	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the CREATE statement was executed for the synonym. The value is '0001-01.01.00.00.00.000000' for synonyms created in a DB2 release prior to Version 5.	G
CREATORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: **blank** Authorization ID **L** Role	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G

SYSIBM.SYSTABAUTH table

The SYSIBM.SYSTABAUTH table records the privileges that users hold on tables and views.

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID or role of the user who granted the privileges. Could also be PUBLIC.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID or role of the user who holds the privileges or the name of an application plan or package that uses the privileges. PUBLIC for a grant to PUBLIC.	G
GRANTEETYPE	CHAR(1) NOT NULL	Type of grantee: **blank** An authorization ID **L** Role **P** An application plan or a package. The grantee is a package if COLLID is not blank.	G
DBNAME	VARCHAR(24) NOT NULL	If the privileges were received from a user with DBADM, DBCTRL, or DBMAINT authority, DBNAME is the name of the database on which the GRANTOR has that authority. Otherwise, DBNAME is blank.	G
SCREATOR	VARCHAR(128) NOT NULL	If the row of SYSIBM.SYSTABAUTH was created as a result of a CREATE VIEW statement, SCREATOR is the schema of a table or view referred to in the CREATE VIEW statement. Otherwise, SCREATOR is the same as TCREATOR.	G
STNAME	VARCHAR(128) NOT NULL	If the row of SYSIBM.SYSTABAUTH was created as a result of a CREATE TABLE statement or a materialized query table, STNAME is the name of a table or view referred to in the fullselect of the CREATE TABLE statement.	G
TCREATOR	VARCHAR(128) NOT NULL	The schema of the table or view.	G
TTNAME	VARCHAR(128) NOT NULL	Name of the table or view.	G
AUTHHOWGOT	CHAR(1) NOT NULL WITH DEFAULT	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. **blank** Not applicable **B** System DBADM **C** DBCTRL **D** DBADM **E** SECADM **G** ACCESSCTRL **K** SQLADM **L** SYSCTRL **M** DBMAINT **S** SYSADM **T** DATAACCESS	G

46. PUBLIC followed by an asterisk (PUBLIC*) denotes PUBLIC AT ALL LOCATIONS.

Column name	Data type	Description	Use
	CHAR(12) NOT NULL	Internal use only	I
	CHAR(6) NOT NULL	Not used	N
	CHAR(8) NOT NULL	Not used	N
UPDATECOLS	CHAR(1) NOT NULL	The value of this column is blank if the value of UPDATEAUTH applies uniformly to all columns of the table or view. The value is an asterisk (*) if the value of UPDATEAUTH applies to some columns but not to others. In this case, rows will exist in SYSIBM.SYSCOLAUTH with matching timestamps and PRIVILEGE = blank. These rows list the columns on which update privileges have been granted.	G
ALTERAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can alter the table: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
DELETEAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can delete rows from the table or view: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
INDEXAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can create indexes on the table: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
INSERTAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can insert rows into the table or view: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
SELECTAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can select rows from the table or view: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
UPDATEAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can update rows of the table or view: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

Column name	Data type	Description	Use
	VARCHAR(128) NOT NULL WITH DEFAULT	Not used	N
	VARCHAR(128) NOT NULL WITH DEFAULT	Not used	N
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	If the GRANTEE is a package, its collection name. Otherwise, the value is blank.	G
CONTOKEN	CHAR(8) NOT NULL WITH DEFAULT FOR BIT DATA	If the GRANTEE is a package, the consistency token of the DBRM from which the package was derived. Otherwise, the value is blank.	S
	CHAR(1) NOT NULL WITH DEFAULT	Not used	N
REFERENCESAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can create or drop referential constraints in which the table is a parent. **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege held without the GRANT option	G
REFCOLS	CHAR(1) NOT NULL WITH DEFAULT	The value of this column is blank if the value of REFERENCESAUTH applies uniformly to all columns of the table. The value is an asterisk(*) if the value of REFERENCESAUTH applies to some columns but not to others. In this case, rows will exist in SYSIBM.SYSCOLAUTH with PRIVILEGE = R and matching timestamps that list the columns on which reference privileges have been granted.	G
GRANTEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the GRANT statement was executed.	G
TRIGGERAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can create triggers in which the table is named as the subject table: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: **blank** Authorization ID **L** Role	G

SYSIBM.SYSTABCONST table

The SYSIBM.SYSTABCONST table contains one row for each unique constraint (primary key or unique key) created in DB2 Version 7 or later.

Column name	Data type	Description	Use
CONSTNAME	VARCHAR(128) NOT NULL	Name of the constraint.	G
TBCREATOR	VARCHAR(128) NOT NULL	The schema of the table on which the constraint is defined.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table on which the constraint is defined.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID under which the constraint was created.	G
TYPE	CHAR(1) NOT NULL	Type of constraint: **P** Primary key **U** Unique key	G
IXOWNER	VARCHAR(128) NOT NULL	The schema of the index enforcing the constraint or blank if index has not been created yet.	G
IXNAME	VARCHAR(128) NOT NULL	Name of the index enforcing the constraint or blank if index has not been created yet.	G
CREATEDTS	TIMESTAMP NOT NULL	Time when the statement to create the constraint was executed.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
COLCOUNT	SMALLINT NOT NULL	Number of columns in the constraint.	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G

SYSIBM.SYSTABLEPART table

The SYSIBM.SYSTABLEPART table contains one row for each nonpartitioned table space and one row for each partition of a partitioned table space.

Column name	Data type	Description	Use
PARTITION	SMALLINT NOT NULL	Partition number; 0 if table space is not partitioned.	G
TSNAME	VARCHAR(24) NOT NULL	Name of the table space.	G
DBNAME	VARCHAR(24) NOT NULL	Name of the database that contains the table space.	G
IXNAME	VARCHAR(128) NOT NULL	Name of the partitioning index. This column is blank unless this is a table that uses index-controlled partitioning.	G
IXCREATOR	VARCHAR(128) NOT NULL	The schema of the partitioning index. This column is blank unless this is a table that uses index-controlled partitioning.	G
PQTY	INTEGER NOT NULL	For user-managed data sets, the value is the primary space allocation in units of 4 KB storage blocks or -1. PQTY is based on a value of PRIQTY in the appropriate CREATE or ALTER TABLESPACE statement. Unlike PQTY, however, PRIQTY asks for space in 1 KB units. A value of -1 indicates that either of the following cases is true: • PRIQTY was not specified for a CREATE TABLESPACE statement or for any subsequent ALTER TABLESPACE statements. • -1 was the most recently specified value for PRIQTY, either on the CREATE TABLESPACE statement or a subsequent ALTER TABLESPACE statement.	G
SQTY	SMALLINT NOT NULL	For user-managed data sets, the value is the secondary space allocation in units of 4 KB storage blocks or -1. SQTY is based on a value of SECQTY in the appropriate CREATE or ALTER TABLESPACE statement. Unlike SQTY, however, SECQTY asks for space in 1 KB units. A value of -1 indicates that either of the following cases is true: • SECQTY was not specified for a CREATE TABLESPACE statement or for any subsequent ALTER TABLESPACE statements. • -1 was the most recently specified value for SECQTY, either on the CREATE TABLESPACE statement or a subsequent ALTER TABLESPACE statement. If the value does not fit into the column, the value of the column is 32767. See the description of column SECQTYI.	G
STORTYPE	CHAR(1) NOT NULL	Type of storage allocation: **E** Explicit (storage group not used) **I** Implicit (storage group used)	G

Column name	Data type	Description	Use
STORNAME	VARCHAR(128) NOT NULL	Name of storage group used for space allocation. Blank if storage group not usedor for the catalog table spaces.	G
VCATNAME	VARCHAR(24) NOT NULL	Name of integrated catalog facility catalog used for space allocation.	G
CARD	INTEGER NOT NULL	Number of rows in the table space or partition or, if the table space is a LOB table space, the number of LOBs in the table space. The value is '2 147 483 647' if the number of rows is greater than or equal to '2 147 483 647'. The value is -1 if statistics have not been gathered.	G
FARINDREF	INTEGER NOT NULL	Number of rows that have been relocated far from their original page. The value is -1 if statistics have not been gathered. Not applicable if the table space is a LOB table space.	S
NEARINDREF	INTEGER NOT NULL	Number of rows that have been relocated near their original page. The value is -1 if statistics have not been gathered. Not applicable if the table space is a LOB table space.	S
PERCACTIVE	SMALLINT NOT NULL	Percentage of space occupied by rows of data from active tables. The value is -1 if statistics have not been gathered. The value is -2 if the table space is a LOB table space. This value is not applicable for understanding data distribution in tables that are organized for hash access.	S
PERCDROP	SMALLINT NOT NULL	Percentage of space occupied by rows of dropped tables. The value is -1 if statistics have not been gathered. The value is 0 for segmented table spaces. Not applicable if the table is an auxiliary table.	S
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
LIMITKEY	VARCHAR(765) NOT NULL	The high value of the partition in external format. If the table space was converted from index-controlled partitioning to table-controlled partitioning, the value is the highest possible value for an ascending key, or the lowest possible value for a descending key. If the table space is not partitioned, the value is an empty string. Beginning in Version 11, date and time values in the LIMITKEY field are delimited by single quotation marks (for example, '2001-01-01'). However, values that were added by previous versions of DB2 are not delimited. Therefore, this column can contain a mixture of delimited and non-delimited values.	G
FREEPAGE	SMALLINT NOT NULL	Number of pages loaded before a page is left as free space.	G
PCTFREE	SMALLINT NOT NULL	Percentage of each page left as free space.	G

Column name	Data type	Description	Use
CHECKFLAG	CHAR(1) NOT NULL WITH DEFAULT	**blank** The table space is not a partition, or does not contain rows that might violate referential constraints, check constraints, or both. **C** The table space partition is in a check pending status and there are rows in the table that can violate referential constraints, check constraints, or both. **D** The inline length of the LOB column that is associated with this LOB table space was decremented when the inline length was altered. **I** The inline length of the LOB column that is associated with this LOB table space was incremented when the inline length was altered.	G
	CHAR(4) NOT NULL WITH DEFAULT FOR BIT DATA	Not used	N
SPACE	INTEGER NOT NULL WITH DEFAULT	Number of kilobytes of DASD storage allocated to the table space partition, as determined by the last execution of the STOSPACE utility or RUNSTATS utility. **0** The STOSPACE or RUNSTATS utility has not been run. **-1** The table space was defined with the DEFINE NO clause, which defers the physical creation of the data sets until data is first inserted into one of the partitions, and data has yet to be inserted. **non-zero or non-negative value** An auxiliary table in the LOB table space. The value is if The value is updated by STOSPACE if the table space is related to a storage group. The value is updated by RUNSTATS if the utility is executed as RUNSTATS TABLESPACE with UPDATE(ALL) or UPDATE(SPACE).	G
COMPRESS	CHAR(1) NOT NULL WITH DEFAULT	Indicates the following: • For a table space partition, whether the COMPRESS attribute for the partition is YES. • For a nonpartitioned table space, whether the COMPRESS attribute is YES for the table space. Values for the column can be: **Y** Compression is defined for the table space **blank** No compression	G

Column name	Data type	Description	Use
PAGESAVE	SMALLINT NOT NULL WITH DEFAULT	Percentage of pages saved in the table space or partition as a result of defining the table space with COMPRESS YES. For example, a value of 25 indicates a savings of 25 percent, so that the pages required are only 75 percent of what would be required without data compression. The calculation includes overhead bytes for each row, the bytes required for dictionary, and the bytes required for the current FREEPAGE and PCTFREE specification for the table space or partition. This calculation is based on an average row length, and the result varies depending on the actual lengths of the rows. The value is 0 if there are no savings from using data compression, or if statistics have not been gathered. The value can be negative, if for example, data compression causes an increase in the number of pages in the data set.	S
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics. The default value is '0001-01-01.00.00.00.000000'.	G
GBPCACHE	CHAR(1) NOT NULL WITH DEFAULT	Group buffer pool cache option specified for this table space or table space partition. **A** Changed and unchanged pages are cached in the group buffer pool. **N** No data is cached in the group buffer pool. **S** Only changed system pages, such as space map pages that do not contain actual data values, are cached in the group buffer pool. **blank** Only changed pages are cached in the group buffer pool.	G
CHECKRID5B	CHAR(5) NOT NULL WITH DEFAULT FOR BIT DATA	Blank if the table or partition is not in a check pending status (CHECKFLAG is blank), or if the table space is not partitioned. Otherwise, the RID of the first row of the table space partition that can violate referential constraints, check constraints, or both; or the value is X'0000000000', indicating that any row can violate referential constraints.	S
TRACKMOD	CHAR(1) NOT NULL WITH DEFAULT	Whether to track the page modifications in the space map pages: **N** No **blank** Yes	G
EPOCH	INTEGER NOT NULL WITH DEFAULT	A number that increments whenever a utility operation that changes the location of rows in a table occurs.	G
SECQTYI	INTEGER NOT NULL WITH DEFAULT	Secondary space allocation in units of 4KB storage. For user-managed data sets, the value is the secondary space allocation in units of 4KB blocks.	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	Number of rows in the table space or partition, or if the table space is a LOB table space, the number of LOBs in the table space. The value is -1 if statistics have not been gathered.	G

Column name	Data type	Description	Use
IPREFIX	CHAR(1) NOT NULL WITH DEFAULT 'I'	The first character of the instance qualifier for the data set name for the table space or partition. 'I' or 'J' are the only valid characters for this field. The default is 'I'.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the most recent ALTER TABLESPACE statement was executed for the table space or partition. If no ALTER TABLESPACE statement has been applied, the value is '0001-01-01.00.00.00.000000'.	G
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Kilobytes of DASD storage. The value is -1 if statistics have not been gathered. The value might be non-zero for an auxiliary table in the LOB table space. This is an updatable column.	G
DSNUM	INTEGER NOT NULL WITH DEFAULT -1	Number of data sets. The value is -1 if statistics have not been gathered. This is an updatable column.	G
EXTENTS	INTEGER NOT NULL WITH DEFAULT -1	Number of data set extents. The value is -1 if statistics have not been gathered. This is an updatable column. This value is only for the last DSNUM for the object.	G
LOGICAL_PART	SMALLINT NOT NULL WITH DEFAULT	The logical partition (logical ascending or descending order) for table spaces created with either table-controlled partitioning or index-controlled partitioning. The physical partition number is kept in column PART and is zero for partitioned table spaces created prior to Version 8 and for nonpartitioned table spaces.	G
LIMITKEY_ INTERNAL	VARCHAR(512) NOT NULL WITH DEFAULT FOR BIT DATA	The highest value of the limit key of the partition in an internal format. If the uses index-controlled partitioning instead of table-controlled partitioning or the table is not partitioned, the value is an empty string. If the table space was converted from index-controlled partitioning to table-controlled partitioning, the value is the highest possible value for an ascending key, or the lowest possible value for a descending key. If any column of the key has a field procedure, the internal format is the encoded form of the value.	G
OLDEST_VERSION	SMALLINT NOT NULL WITH DEFAULT	The version number of the oldest format of data in the table part and any image copies at the part level.	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the partition was created.	G
AVGROWLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of rows for the tables in the table space or part. If the table space or part is compressed, the value is the compressed row length. If the table space or part is not compressed, the value is the uncompressed row length. The value is -1 if statistics have not been gathered.	G
FORMAT	CHAR(1) NOT NULL WITH DEFAULT	Indicates the format of the rows in the table space or partition: **R** Indicates reordered row format **blank** Indicates basic row format or a LOB table space	G

Column name	Data type	Description	Use
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G
REORG_LR_TS	TIMESTAMP NOT NULL WITH DEFAULT	The time when the REORG or LOAD REPLACE utility last occurred. The default value is '0001-01-01.00.00.00.000000'.	G
HASHSPACE	BIGINT NOT NULL WITH DEFAULT	For partition-by-growth table spaces this is zero. For range-partitioned universal table spaces, this is the amount of space, in KB, specified at the partition level to override the space specification at the table level. If no override is provided it will be the same as the value of HASHSPACE in the SYSIBM.SYSTABLEPSACE catalog table.	G
HASHDATAPAGES	BIGINT NOT NULL WITH DEFAULT	For partition-by-growth table spaces, the value is zero. For range-partitioned universal table spaces, this is the number of hash data pages that correspond to the value of the HASHSPACE column for each partition. The value is 0 for table spaces which have been changed to use hash access but have not been reorganized.	G
RBA_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	Indicates the format of the RBA/LRSN. **B** Basic, 6-byte RBA/LRSN format. **E** Extended, 10-byte RBA/LRSN format. **U** Undefined. DEFINE NO was specified when creating the table space, and the table space is not an XML table space with XML versions. **blank** For migrated objects.	G
PCTFREE_UPD	SMALLINT NOT NULL WITH DEFAULT	The percentage of free space that is reserved for updates to variable length records, as defined when the object as created or altered.	G
PCTFREE_UPD_CALC	SMALLINT NOT NULL WITH DEFAULT	The percentage of free space that is reserved for updates to variable length records, calculated by DB2 or utilities.	G

SYSIBM.SYSTABLEPART_HIST table

The SYSIBM.SYSTABLEPART_HIST table contains rows from SYSTABLEPART.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Column name	Data type	Description	Use
PARTITION	SMALLINT NOT NULL	Partition number. 0 if table space is not partitioned.	G
TSNAME	VARCHAR(24) NOT NULL	Name of the table space.	G
DBNAME	VARCHAR(24) NOT NULL	Name of the database that contains the table space.	G
PQTY	INTEGER NOT NULL	For user-managed data sets, the value is the primary space allocation in units of 4 KB storage blocks or -1. For user-specified values of PRIQTY other than -1, the value is set to the primary space allocation only if RUNSTATS TABLESPACE with UPDATE(ALL) or UPDATE(SPACE) is executed; otherwise, the value is zero. PQTY is based on a value of PRIQTY in the appropriate CREATE or ALTER TABLESPACE statement. Unlike PQTY, however, PRIQTY asks for space in 1 KB units. A value of -1 indicates that either of the following cases is true: • PRIQTY was not specified for a CREATE TABLESPACE statement or for any subsequent ALTER TABLESPACE statements. • -1 was the most recently specified value for PRIQTY, either on the CREATE TABLESPACE statement or a subsequent ALTER TABLESPACE statement. If a storage group is not used, the value is 0.	G

Column name	Data type	Description	Use
SECQTYI	INTEGER NOT NULL	For user-managed data sets, the value is the secondary space allocation in units of 4 KB storage blocks or -1. For user-specified values of SECQTY other than -1, the value is set to the secondary space allocation only if RUNSTATS TABLESPACE with UPDATE(ALL) or UPDATE(SPACE) is executed; otherwise, the value is zero. SQTY is based on a value of SECQTY in the appropriate CREATE or ALTER TABLESPACE statement. Unlike SQTY, however, SECQTY asks for space in 1 KB units. A value of -1 indicates that either of the following cases is true: • SECQTY was not specified for a CREATE TABLESPACE statement or for any subsequent ALTER TABLESPACE statements. • -1 was the most recently specified value for SECQTY, either on the CREATE TABLESPACE statement or a subsequent ALTER TABLESPACE statement. If a storage group is not used, the value is 0.	G
FARINDREF	INTEGER NOT NULL WITH DEFAULT -1	Number of rows that have been relocated far from their original page. The value is -1 if statistics have not been gathered. Not applicable if the table space is a LOB table space.	S
NEARINDREF	INTEGER NOT NULL WITH DEFAULT -1	Number of rows that have been relocated near their original page. The value is -1 if statistics have not been gathered. Not applicable if the table space is a LOB table space.	S
PERCACTIVE	SMALLINT NOT NULL WITH DEFAULT -1	Percentage of space occupied by rows of data from active tables. The value is -1 if statistics have not been gathered. The value is -2 if the table space is a LOB table space.	S
PERCDROP	SMALLINT NOT NULL WITH DEFAULT -1	Percentage of space occupied by rows of dropped tables. The value is -1 if statistics have not been gathered. The value is 0 for segmented table spaces. Not applicable if the table is an auxiliary table.	S
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of kilobytes of DASD storage allocated to the table space partition. The value is -1 if statistics have not been gathered.	G

Column name	Data type	Description	Use
PAGESAVE	SMALLINT NOT NULL	Percentage of pages saved in the table space or partition as a result of defining the table space with COMPRESS YES. For example, a value of 25 indicates a savings of 25 percent, so that the pages required are only 75 percent of what would be required without data compression. The calculation includes overhead bytes for each row, the bytes required for dictionary, and the bytes required for the current FREEPAGE and PCTFREE specification for the table space or partition. This calculation is based on an average row length, and the result varies depending on the actual lengths of the rows. The value is 0 if there are no savings from using data compression, or if statistics have not been gathered. The value can be negative, if for example, data compression causes an increase in the number of pages in the data set.	S
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics. The default value is '0001-01-01.00.00.00.000000'.	G
CARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of rows in the table space or partition, or if the table space is a LOB table space, the number of LOBS in the table space. The value is '-1' if statistics have not been gathered.	S
EXTENTS	INTEGER NOT NULL WITH DEFAULT -1	Number of data set extents. The value is '-1' if statistics have not been gathered. This value is only for the last DSNUM for the object.	G
DSNUM	INTEGER NOT NULL WITH DEFAULT -1	Data set number within the table space. For partitioned table spaces, this value corresponds to the partition number for a single partition copy, or 0 for a copy of an entire partitioned table space or index space. The value is '-1' if statistics have not been gathered.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
AVGROWLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of rows for the tables in the table space or part. If the table space or part is compressed, the value is the compressed row length. If the table space or part is not compressed, the value is the uncompressed row length. The value is '-1' if statistics have not been gathered.	G

SYSIBM.SYSTABLES table

The SYSIBM.SYSTABLES table contains one row for each table, view, or alias.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the table, view, or alias.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the table, view, or alias.	G
TYPE	CHAR(1) NOT NULL	Type of object: **A** Alias **C** Clone table **G** Created global temporary table **H** History table **M** Materialized query table **P** Table that was implicitly created for XML columns **R** Archive table **T** Table **V** View **X** Auxiliary table	G
DBNAME	VARCHAR(24) NOT NULL	For a table, or a view of tables, the name of the database that contains the table space that is named in TSNAME. For a created temporary table, an alias, or a view of a view, the value is DSNDB06.	G
TSNAME	VARCHAR(24) NOT NULL	For a table, or a view of one table, the name of the table space that contains the table. For a view of more than one table, the name of a table space that contains one of the tables. For a created temporary table, a view of a view, or an alias, it is SYSTSTAB.	G
DBID	SMALLINT NOT NULL	Internal identifier of the database; 0 if the row describes a view, alias, or created temporary table. Non-zero if the view has an INSTEAD OF trigger defined.	S
OBID	SMALLINT NOT NULL	Internal identifier of the table; 0 if the row describes a view, an alias, or a created temporary table. Non-zero if the view has an INSTEAD OF trigger defined.	S
COLCOUNT	SMALLINT NOT NULL	Number of columns in the table or view. The value is 0 if the row describes an alias.	G
EDPROC	VARCHAR(24) NOT NULL	Name of the edit procedure; blank if the row describes a view or alias or a table without an edit procedure.	G
VALPROC	VARCHAR(24) NOT NULL	Name of the validation procedure; blank if the row describes a view or alias or a table without a validation procedure.	G
CLUSTERTYPE	CHAR(1) NOT NULL	Whether RESTRICT ON DROP applies: **blank** No **Y** Yes. You cannot drop the table or any table space or database that contains the table.	G
CLUSTERID	INTEGER NOT NULL	Not used	N

Column name	Data type	Description	Use
CARD	INTEGER NOT NULL	Not used	N
NPAGES	INTEGER NOT NULL	Total number of pages that include rows of the table. The value is -1 if statistics have not been gathered, or the row describes a view, an alias, a created temporary table, or an auxiliary table. This column can be updated.	S
PCTPAGES	SMALLINT NOT NULL	Percentage of active table space pages that contain rows of the table. A page is termed active if it is formatted for rows, regardless of whether it contains any. If the table space is segmented, the percentage is based on the number of active pages in the set of segments that are assigned to the table. The value is -1 if statistics have not been gathered, or the row describes a view, alias, created temporary table, or auxiliary table. This column can be updated.	S
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
REMARKS	VARCHAR(762) NOT NULL	A character string that is provided by the user with the COMMENT statement.	G
PARENTS	SMALLINT NOT NULL	Number of relationships in which the table is a dependent. The value is 0 if the row describes a view, an alias, a created temporary table, or a materialized query table.	G
CHILDREN	SMALLINT NOT NULL	Number of relationships in which the table is a parent. The value is 0 if the row describes a view, an alias, a created temporary table, or a materialized query table.	G
KEYCOLUMNS	SMALLINT NOT NULL	Number of columns in the primary key of the table. The value is 0 if the row describes a view, an alias, or a created temporary table.	G

Column name	Data type	Description	Use
RECLENGTH	SMALLINT NOT NULL	For user tables, the maximum length of any record in the table. Length is 8+*N*+*L*, where: • The number 8 accounts for the header (6 bytes) and the ID map entry (2 bytes). • *N* is 10 if the table has an edit procedure, or 0 otherwise. • *L* is the sum of the maximum column lengths. In determining the maximum length of a column, take into account whether the column allows nulls and the data type of the column. If the column can contain nulls and is not a LOB or ROWID column, add 1 byte for a null indicator. Use 4 bytes for the length of a LOB column and 19 bytes for the length of a ROWID column. If the column has a varying-length data type (for example, VARCHAR, CLOB, or BLOB), add 2 bytes for a length indicator. For more information about column lengths, see "Data types" on page 80. The value is 0 if the row describes a view, alias, or auxiliary table. For maximum row and record sizes, see Maximum record size.	G
STATUS	CHAR(1) NOT NULL	Indicates the status of the table definition: **I** The definition of the table is incomplete. The TABLESTATUS column indicates the reason why the table definition is incomplete. **R** An error occurred when an attempt was made to regenerate the internal representation of the view. **X** The table has a unique constraint (primary key or unique key) and the table definition is complete. **blank** The table has no unique constraint (primary key or unique key), the table is a catalog table, or the row describes a view or alias. The definition of the table, view, or alias is complete.	G
KEYOBID	SMALLINT NOT NULL	Internal DB2 identifier of the index that enforces uniqueness of the primary key of the table; 0 if not applicable.	S
LABEL	VARCHAR(90) NOT NULL	The label as given by a LABEL statement; otherwise, the value is an empty string.	G

Column name	Data type	Description	Use
CHECKFLAG	CHAR(1) NOT NULL WITH DEFAULT	**C** The table space that contains the table is in CHECK-pending status. One of the following conditions is true: • There are rows in the table that violate referential constraints, check constraints, or both • The table is a materialized query table that might contain inconsistent data **blank** Indicates one of the following conditions: • The table contains no rows that violate referential constraints, check constraints, or both • The table is a materialized query table that contains consistent data • The row describes a view, an alias, or a temporary table	G
CHECKRID	CHAR(4) NOT NULL WITH DEFAULT FOR BIT DATA	A value of 'FFFFFF00' in this column indicates that the edit procedure on this table is defined without row attribute sensitivity. Any other value indicates that the edit procedure is defined with row attribute sensitivity.	G
AUDITING	CHAR(1) NOT NULL WITH DEFAULT	Value of the audit option: **A** AUDIT ALL **C** AUDIT CHANGE **blank** AUDIT NONE, or the row describes a view, an alias, or a created temporary table.	G
CREATEDBY	VARCHAR(128) NOT NULL WITH DEFAULT	Primary authorization ID of the user who created the table, view, or alias.	G
LOCATION	VARCHAR(128) NOT NULL WITH DEFAULT	Location name of the object of an alias. The value is blank for a table, a view, an alias that was not defined with a three-part object name, or a materialized query table.	G
TBCREATOR	VARCHAR(128) NOT NULL WITH DEFAULT	• For an alias, the schema of the referenced table or view • For a base table that is involved in a clone relationship, the name of the creator of the clone table • For a clone table that is involved in a clone relationship, the name of the creator of the base table • For a view, the name of the underlying table. • Otherwise, TBCREATOR is blank	G
TBNAME	VARCHAR(128) NOT NULL WITH DEFAULT	• For an alias, the name for the referenced table or view • For a base table that is involved in a clone relationship, the name of the clone table • For a clone table that is involved in a clone relationship, the name of the base table • For a view, the name of the underlying table. • Otherwise, TBNAME is blank	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the CREATE statement was executed for the table, view, or alias	G

Column name	Data type	Description	Use
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	For a table, the time when the latest ALTER TABLE statement was applied. If no ALTER TABLE statement was applied, or if the row is for an alias, ALTEREDTS has the value of CREATEDTS. For a view, the time when the last ALTER VIEW REGENERATE statement was applied.	G
DATACAPTURE	CHAR(1) NOT NULL WITH DEFAULT	Records the value of the DATA CAPTURE option for a table: **blank** No **Y** Yes For a created temporary table, DATACAPTURE is always blank.	G
RBA1	CHAR(10) NOT NULL WITH DEFAULT FOR BIT DATA	The log RBA when the table was created. Otherwise, RBA1 is X'00000000000000000000', indicating that the log RBA is not known, or that the object is a view, an alias, or a created temporary table. In a data sharing environment, RBA1 is the LRSN (Log Record Sequence Number) value.	S
RBA2	CHAR(10) NOT NULL WITH DEFAULT FOR BIT DATA	The log RBA when the table was last altered. Otherwise, RBA2 is X'00000000000000000000' indicating that the log RBA is not known, or that the object is a view, an alias, or a created temporary table. RBA1 equals RBA2 if the table has not been altered. In a data sharing environment, RBA2 is the LRSN (Log Record Sequence Number) value.	S
PCTROWCOMP	SMALLINT NOT NULL WITH DEFAULT	Percentage of rows that are compressed within the total number of active rows in the table. This number includes any row in a table space that is defined with COMPRESS YES. The value is -1 if statistics have not been gathered, or the row describes a view, alias, created temporary table, or auxiliary table. This column can be updated.	S
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics. The default value is '0001-01-01.00.00.00.000000'. For a created temporary table, the value of STATSTIME is always the default value. This column can be updated.	G
CHECKS	SMALLINT NOT NULL WITH DEFAULT	Number of check constraints that are defined on the table. The value is 0 if either of the following conditions are true: • The row describes a view, an alias, a created temporary table, or a materialized query table. • No constraints are defined on the table.	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	Total number of rows in the table or total number of LOBs in an auxiliary table. The value is -1 if statistics have not been gathered or the row describes a view, alias, or created temporary table. This column can be updated.	S

Column name	Data type	Description	Use
CHECKRID5B	CHAR(5) NOT NULL WITH DEFAULT FOR BIT DATA	RID of the first row of the table space partition that can violate referential constraints, check constraints, or both. The value of X'0000000000' indicates that any row can violate referential constraints. The value is blank if any of the following conditions are true: • The table or partition is not in CHECK-pending status (CHECKFLAG is blank) • The table space is not partitioned • The table is a created temporary table	S
ENCODING_SCHEME	CHAR(1) NOT NULL WITH DEFAULT 'E'	Encoding scheme for tables, views, and local aliases: **E** EBCDIC **A** ASCII **M** Multiple CCSID set or multiple encoding schemes **U** UNICODE **blank** For remote aliases The value is 'E' for tables in non-work file databases. The value is blank for tables in work file databases that were created before Version 5 or in the default database, DSNDB04. This column is not applicable for tables that were created before DB2 for z/OS Version 5.	G
TABLESTATUS	VARCHAR(30) NOT NULL WITH DEFAULT	Indicates the reason for an incomplete table definition: **L** Definition is incomplete because an auxiliary table or auxiliary index has not been defined for a LOB column. **P** Definition is incomplete because the table lacks a primary index. **R** Definition is incomplete because the table lacks a required index on a row ID. **U** Definition is incomplete because the table lacks a required index on a unique key. **V** An error occurred when an attempt was made to regenerate the internal representation of the view. **blank** Definition is complete.	G
NPAGESF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of pages that are used by the table. The value is -1 if statistics have not been gathered or the table is an auxiliary table. This column can be updated.	G
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Kilobytes of DASD storage. The value is -1 if statistics have not been gathered. The value might be non-zero for an auxiliary table in the LOB table space. This column can be updated.	G
AVGROWLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of rows for the tables in the table space. If the table space is compressed, the value is the compressed row length. If the table space is not compressed, the value is the uncompressed row length. The value is -1 if statistics have not been gathered.	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. See Release dependency indicators for the values.	G

Column name	Data type	Description	Use
NUM_DEP_MQTS	SMALLINT NOT NULL WITH DEFAULT	Number of dependent materialized query tables. The value is zero if the row describes an alias or a created temporary table, or if no materialized query tables are defined on the table.	G
VERSION	SMALLINT NOT NULL WITH DEFAULT	The version of the data row format for this table. • A value of zero indicates that an alter operation that creates a new version has never occurred for this table. • A value of -1 indicates that the view has been regenerated because a column of the base table has been altered. • A value of 800 indicates that a successful CREATE VIEW or ALTER VIEW statement has occurred against this view in Version 8 or later. • A value of 900 indicates that a successful ALTER TABLE statement with a DROP COLUMN clause has occurred against this view.	G
PARTKEYCOLNUM	SMALLINT NOT NULL WITH DEFAULT	The number of columns in the partitioning key. This value is zero for tables that do not have partitioning or use index-controlled partitioning. The value is non-zero for tables that use table-controlled partitioning.	G
SPLIT_ROWS	CHAR(1) NOT NULL WITH DEFAULT	This column is blank except for volatile tables. For volatile table, this column contains 'Y' to indicate to DB2 to use index access on this table whenever possible.	G
SECURITY_LABEL	CHAR(1) NOT NULL	This column is only meaningful if the TYPE column is a T (for table) or M (for materialized query table). The value indicates whether the table has multilevel security: **Blank** The table does not have multilevel security. **R** The table has multilevel security with row granularity.	G
OWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the owner of the table, view, or alias. This column is blank for tables, views, or aliases that were created before DB2 for z/OSVersion 9.	G
APPEND	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the APPEND option is specified for the table. **Y** The APPEND option is specified. **N** The APPEND option is not specified.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: **blank** Authorization ID **L** Role	G
CONTROL	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether access to the table is enforced by using row or column access control: **blank** No access control enforcement **B** The table is enforced by using both row and column access control **C** The table is enforced by using column access control **R** The table is enforced by using row access control	G

Column name	Data type	Description	Use
VERSIONING _SCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	Indicates the schema name of the history table if the table is a system-period temporal table with versioning. Indicates the schema name of the system-period temporal table if the table is a history table. Otherwise, the value is blank.	G
VERSIONING _TABLE	VARCHAR(128) NOT NULL WITH DEFAULT	Indicates the table name of the history table if the table is a system-period temporal table with versioning. Indicates the table name of system-period temporal table if the table is a history table. Otherwise, the value is blank.	G
HASHKEYCOLUMNS	SMALLINT NOT NULL WITH DEFAULT	The number of columns in the hash key of the table. The value is 0 if the row describes a view, an alias, or a created temporary table.	G
ARCHIVING_ SCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	Contains a schema name as follows: • If the table is an archive-enabled table, this column contains the schema name of the archive table. • If the table is an archive table, this column contains the schema name of the archive-enabled table. • If the table is not an archive-enabled table or an archive table, the value is blank.	G
ARCHIVING _TABLE	VARCHAR(128) NOT NULL WITH DEFAULT	Contains a table name as follows: • If the table is an archive-enabled table, this column contains the table name of the archive table. • If the table is an archive table, this column contains the table name of the archive-enabled table. • If the table is not an archive-enabled table or an archive table, the value is blank.	G
STATS_FEEDBACK	CHAR (1) NOT NULL	When a query qualifies for statistics collection based on DSNZPARM STATFDBK_SCOPE, this column controls whether statistics recommendations for this table are placed in SYSIBM.SYSSTATFEEDBACK. You can update this flag to 'Y' or 'N' to enable or disable collection for the table.	G

SYSIBM.SYSTABLESPACE table

The SYSIBM.SYSTABLESPACE table contains one row for each table space.

Column name	Data type	Description	Use
NAME	VARCHAR(24) NOT NULL	Name of the table space.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the table space.	G
DBNAME	VARCHAR(24) NOT NULL	Name of the database that contains the table space.	G
DBID	SMALLINT NOT NULL	Internal identifier of the database which contains the table space.	S
OBID	SMALLINT NOT NULL	Internal identifier of the table space file descriptor.	S
PSID	SMALLINT NOT NULL	Internal identifier of the table space page set descriptor.	S
BPOOL	CHAR(8) NOT NULL	Name of the buffer pool used for the table space.	G
PARTITIONS	SMALLINT NOT NULL	Number of partitions of the table space; 0 if the table space is not partitioned.	G
LOCKRULE	CHAR(1) NOT NULL	Lock size of the table space: **A** Any **L** Large object (LOB) **P** Page **R** Row **S** Table space **T** Table **X** implicitly created XML table space	G
PGSIZE	SMALLINT NOT NULL	Size of pages in the table space in kilobytes.	G
ERASERULE	CHAR(1) NOT NULL	Whether the data sets are to be erased when dropped. The value is meaningless if the table space is partitioned. **N** No erase **Y** Erase	G
STATUS	CHAR(1) NOT NULL	Availability status of the table space: **A** Available **C** Definition is incomplete because the table space does not use table-controlled partitioning and a partitioning index has not been created. **P** Table space is in a check pending status. **S** Table space is in a check pending status with the scope less than the entire table space. **T** Definition is incomplete because no table has been created.	G

Column name	Data type	Description	Use
IMPLICIT	CHAR(1) NOT NULL	Whether the table space was created implicitly: **N** No **Y** Yes	G
NTABLES	SMALLINT NOT NULL	Number of tables defined in the table space.	G
NACTIVE	INTEGER NOT NULL	Number of active pages in the table space. A page is termed active if it is formatted for rows, even if it currently contains none. The value is 0 if statistics have not been gathered. This is an updatable column.	S
	VARCHAR(24) NOT NULL	Not used	N
CLOSERULE	CHAR(1) NOT NULL	Whether the data sets are candidates for closure when the limit on the number of open data sets is reached. **N** No **Y** Yes	G
SPACE	INTEGER NOT NULL	Number of kilobytes of DASD storage allocated to the table space, as determined by the last execution of the STOSPACE utility. The value is 0 if the table space is not related to a storage group, or if STOSPACE has not been run. If the table space is partitioned, the value is the total kilobytes of DASD storage allocated to all partitions that are storage group defined.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. If ALTER TABLESPACE changes the DSSIZE value to 128G or 256G, this column value is changed to O, which is the release dependency indicator for Version 10. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
	VARCHAR(54) NOT NULL	Internal use only	I
	VARCHAR(24) NOT NULL	Internal use only	I
SEGSIZE	SMALLINT NOT NULL WITH DEFAULT	Number of pages in each segment of a segmented table space. The value is 0 if the table space is not segmented.	G
CREATEDBY	VARCHAR(128) NOT NULL WITH DEFAULT	Primary authorization ID of the user who created the table space.	G
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics. The default value is '0001-01-01.00.00.00.000000'. This is an updatable column.	G

Column name	Data type	Description	Use
LOCKMAX	INTEGER	The maximum number of locks per user to acquire for the table or table space before escalating to the next locking level. **0** Lock escalation does not occur. *n* *n*, where *n* > 0, is the maximum number of locks (row, page, or LOB locks for the table or table space) an application process can acquire before lock escalation occurs. **-1** Represents LOCKMAX SYSTEM. The value of field LOCKS PER TABLE(SPACE) on installation panel DSNTIPJ determines lock escalation. If the value of the field is 0, lock escalation does not occur. If the value is *n*, where *n* > 0, lock escalation occurs as it does for LOCKMAX n.	G
TYPE	CHAR(1) NOT NULL WITH DEFAULT	The type of table space: **blank** The table space was created without the LOB or MEMBER CLUSTER options. If the DSSIZE column is zero, the table space is not greater than 64 gigabytes. **G** The table space was defined with the MAXPARTITIONS option (a partitioned-by-growth table space) with the underlying structure of a universal table space. **L** The table space can be greater than 64 gigabytes. **O** The table space was defined with the LOB option (the table space is a LOB table space). **P** Implicit table space created for XML columns. **R** Range-partitioned universal table space.	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the CREATE statement was executed for the table space. If the table space was created in a DB2 release prior to Version 5, the value is '0001-01-01.00.00.00.000000'.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the most recent ALTER TABLESPACE statement was executed for the table space. If no ALTER TABLESPACE statement has been applied, ALTEREDTS has the value of CREATEDTS. If the index was created in a DB2 release prior to Version 5, the value is '0001-01-01.00.00.00.000000'.	G
ENCODING_SCHEME	CHAR(1) NOT NULL WITH DEFAULT 'E'	Default encoding scheme for the table space: **E** EBCDIC **A** ASCII **U** UNICODE **blank** For table spaces in a work file database or a TEMP database (a database that was created AS TEMP, which is for declared temporary tables.) The value is 'E' for tables in non work file databases and blank for tables in work file databases created prior to Version 5 or the default database, DSNDB04.	G
SBCS_CCSID	INTEGER NOT NULL WITH DEFAULT	Default SBCS CCSID for the table space. For a table space in a work file database, a TEMP database, or a database created in a DB2 release prior to Version 5, the value is 0.	G
DBCS_CCSID	INTEGER NOT NULL WITH DEFAULT	Default DBCS CCSID for the table space. For a table space in a work file database, a TEMP database, or a database created in a DB2 release prior to Version 5, the value is 0.	G

Column name	Data type	Description	Use
MIXED_CCSID	INTEGER NOT NULL WITH DEFAULT	Default mixed CCSID for the table space. For a table space in a work file database, a TEMP database, or a database created in a DB2 release prior to Version 5, the value is 0.	G
MAXROWS	SMALLINT NOT NULL DEFAULT 255	The maximum number of rows that DB2 will place on a data page. The default value is 255. For a LOB table space, the value is 0 to indicate that the column is not applicable.	G
	CHAR(1) NOT NULL WITH DEFAULT	Not used	N
LOG	CHAR(1) NOT NULL WITH DEFAULT 'Y'	Whether the changes to a table space are to be logged. **N** This table space has the NOT LOGGED attribute. Undo and redo logging for the table space and all indexes for tables in the table space is suppressed. Logging is also suppressed for the auxiliary indexes for all auxiliary tables associated with tables in the table space. **Y** This table space has the LOGGED attribute. Normal logging is associated with modifications to this table space, all indexes for tables in this table space, and all auxiliary indexes for all auxiliary tables associated with tables in the table space. **X** This LOB or XML table space has the NOT LOGGED attribute. Undo and redo logging for the table space is suppressed. Also, the logging attribute for this LOB or XML table space is linked to the logging attribute of the associated base table space and might not be able to be altered independently. If the logging attribute of the base table space is altered to LOGGED, the logging attribute of the LOB or XML table space will also be altered to LOGGED.	G
NACTIVEF	FLOAT NOT NULL WITH DEFAULT -1	Number of active pages in the table space. A page is termed active if it is formatted for rows, even if it currently contains none. The value is -1 if statistics have not been gathered. This is an updatable column.	S
DSSIZE	INTEGER NOT NULL WITH DEFAULT	Maximum size of a data set in kilobytes. The value might be 0 if the table space was created prior to Version 10, but will contain the actual value after the table space is converted to a partitioned by growth table space.	G
OLDEST_VERSION	SMALLINT NOT NULL WITH DEFAULT	The version number of the oldest format of data in the table space and any image copies.	G
CURRENT_VERSION	SMALLINT NOT NULL WITH DEFAULT	The version number describing the newest format of data in the table space. A zero indicates that the table space has never had versioning. After the version number reaches the maximum value, the number wraps back to one.	G

Column name	Data type	Description	Use
AVGROWLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of rows for the tables in the table space or part. If the table space or part is compressed, the value is the compressed row length. If the table space or part is not compressed, the value is the uncompressed row length. The value is -1 if statistics have not been gathered.	G
SPACEF	FLOAT NOT NULL WITH DEFAULT	Kilobytes of DASD storage for the storage group. The value is -1 if statistics have not been gathered. This is an updatable column.	G
CREATORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: **blank** Authorization ID **L** Role	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G
INSTANCE	SMALLINT NOT NULL WITH DEFAULT	INSTANCE indicates the data set instance number of the current base object (table and index).	G
CLONE	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the table space contains any objects that are involved in a clone relationship: **Y** Table space contains objects that are involved in a clone relationship **N** Table space does not contain any objects that are involved in a clone relationship	G
MAXPARTITIONS	SMALLINT NOT NULL WITH DEFAULT	Identifies the maximum number of partitions to which the table space can grow. 0 if the table space is not a partition-by-growth table space.	G
MEMBER_CLUSTER	CHAR(1) NOT NULL WITH DEFAULT	Whether MEMBER CLUSTER is specified for the table space: **Y** MEMBER CLUSTER is specified for the table space **blank** MEMBER CLUSTER is not specified for the table space	G
ORGANIZATIONTYPE	CHAR(1) NOT NULL WITH DEFAULT	Type of table space organization: **blank** Not known. Blank is the default. **H** Hash organization	G
HASHSPACE	BIGINT NOT NULL WITH DEFAULT	The amount of space, in KB, that is to be allocated to the table space or partition as hash space. For partition-by-growth table spaces, the space applies to the whole table space. For range-partitioned universal table spaces, the space is applicable for each partition.	G

Column name	Data type	Description	Use
HASHDATAPAGES	BIGINT NOT NULL WITH DEFAULT	The total number of hash data pages to preallocate for hash space. For partition-by-growth table spaces, this includes all pages in the fixed part of the table space. For range-partitioned universal table spaces, this is the number of pages in the fixed hash space in each partition unless it is overridden by providing hash space at the partition level. This is calculated by DB2 from the value specified with the HASH SPACE option or when the REORG utility is run with automatic estimation of space. The calculated value is used in the hash algorithm. The value is 0 for non-hash table spaces. The value is also 0 for table spaces which have been changed to use hash access but have not been reorganized.	G

SYSIBM.SYSTABLESPACESTATS table

The SYSIBM.SYSTABLESPACESTATS table contains real time statistics for table spaces.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
UPDATESTATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	The timestamp that the row in the SYSTABLESPACESTATS table is inserted or updated.	G
NACTIVE	INTEGER	The number of active pages in the table space or partition.	G
NPAGES	INTEGER	The number of distinct pages with active rows in the partition or table space. This is an updatable column. This column can be used to calculate an estimate of the size of LOB data in a table space. To produce an estimate, use the following formula: *value of NPAGES * page size* = approximate size of LOB data	G
EXTENTS	SMALLINT	The number of extents in the table space. For multi-piece table spaces, this value is the number of extents for the last data set. For a data set that is striped across multiple volumes, the value is the number of logical extents. A null value indicates the number of extents is unknown.	G
LOADRLASTTIME	TIMESTAMP	The timestamp that the LOAD REPLACE utility was last run on the table space or partition. A null value indicates that the LOAD REPLACE utility has never been run on the table space or partition or that the timestamp is unknown.	G
REORGLASTTIME	TIMESTAMP	The timestamp the REORG utility was last run on the table space or partition, or when the REORG utility has not been run, the time when the table space or partition was created. A null value indicates that the timestamp is unknown.	G
REORGINSERTS	INTEGER	The number of records or LOBs that have been inserted into the table space or partition or loaded into the table space or partition using the LOAD utility specified without the REPLACE option since the last time the REORG or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of inserted records or LOBs is unknown.	G
REORGDELETES	INTEGER	The number of records or LOBs that have been deleted from the table space or partition since the last time the REORG or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of deleted records or LOBs is unknown.	G

Column name	Data type	Description	Use
REORGUPDATES	INTEGER	The number of rows that have been updated in the table space or partition since the last time the REORG or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of updated rows is unknown.	G
REORGUNCLUSTINS	INTEGER	The number of records that were inserted that are not well-clustered with respect to the clustering index since the last REORG or LOAD REPLACE , or since the object was created. A record is well-clustered if the record is inserted into a page that is within 16 pages of the ideal candidate page. The clustering index determines the ideal candidate page. A null value indicates that the number of not well clustered pages is unknown.	G
REORGDISORGLOB	INTEGER	The number of LOBs that were inserted that are not perfectly chunked since the last REORG or LOAD REPLACE, or since the object was created. A LOB is perfectly chunked if the allocated pages are in the minimum number of chunks. A null value indicates that the number of not perfectly chunked LOBs is unknown.	G
REORGMASSDELETE	INTEGER	The number of mass deletes from a segmented or LOB table space, or the number of dropped tables from a segmented table space since the last time the REORG or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of mass deletes is unknown.	G
REORGNEARINDREF	INTEGER	The number of overflow records that are created and relocated near the pointer record since the last time the REORG and LOAD REPLACE utilities were run, or since the object was created. For non-segmented table spaces, a page is near the present page if the two page numbers differ by 16 or less. For segmented table spaces, a page is near the present page if the two page numbers differ by SEGSIZE*2 or less. A null value indicates that the number of overflow records that are near the pointer record is unknown.	G
REORGFARINDREF	INTEGER	The number of overflow records that are created and relocated far from the pointer record since the last time the REORG and LOAD REPLACE utilities were run, or since the object was created. For non-segmented table spaces, a page is far from the present page if the two page numbers differ by more than 16. For segmented table spaces, a page is far from the present page if the two page numbers differ by at least (SEGSIZE*2)+1. A null value indicates that the number of overflow records that are near the pointer record is unknown.	G
STATSLASTTIME	TIMESTAMP	The timestamp of the last time that the RUNSTATS utility is run on the table space or partition.	G

Column name	Data type	Description	Use
STATSINSERTS	INTEGER	The number of records or LOBs that have been inserted into the table space or partition or loaded into the table space or partition using the LOAD utility specified without the REPLACE option since the last time that the RUNSTATS utility was run, or since the object was created. A null value indicates that the number of inserted records or LOBs is unknown.	G
STATSDELETES	INTEGER	The number of records or LOBs that have been deleted from the table space or partition since the last time that the RUNSTATS utility was run, or since the object was created. A null value indicates that the number of deleted records or LOBs is unknown.	G
STATSUPDATES	INTEGER	The number of rows that have been updated in the table space or partition since the last time that the RUNSTATS utility was run, or since the object was created. A null value indicates that the number of updated rows is unknown.	G
STATSMASSDELETE	INTEGER	The number of mass deletes from a segmented or LOB table space, or the number of tables that are dropped from a segmented table space, since the last time the RUNSTATS utility was run, or since the object was created. A null value indicates that the number of mass deletes is unknown.	G
COPYLASTTIME	TIMESTAMP	The timestamp of the last full or incremental image copy of the table space or partition, or since the object was created. A null value indicates that the COPY utility has never been run on the table space or partition. A null value can also indicate that the timestamp of the last image copy is unknown.	G
COPYUPDATED-PAGES	INTEGER	The number of distinct pages that have been updated since the last time that the COPY utility was run, or since the object was created. A null value indicates that the number of updated pages is unknown.	G
COPYCHANGES	INTEGER	The number of insert, update, and delete operations, or the number of records loaded, since the last time that the COPY utility was run, or since the object was created. A null value indicates that the number of insert, update, and delete operations or the number of records loaded is unknown.	G
COPYUPDATELRSN	CHAR(10) FOR BIT DATA	The LRSN or RBA of the first update that occurs after the last time the COPY utility was run, or since the object was created. A null value indicates that the LRSN or RBA is unknown.	G

Column name	Data type	Description	Use
COPYUPDATETIME	TIMESTAMP	The timestamp of the first update that occurs after the last time that the COPY utility was run, or since the object was created. A null value indicates that the timestamp is unknown. The value is 6 bytes of X'FF' if the RBA/LRSN exceeds the 6-byte limit.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
DBID	SMALLINT NOT NULL	The internal identifier of the database. This column is used to map a DBID to its statistics.	G
PSID	SMALLINT NOT NULL	The internal identifier of the table space page set descriptor. This column is used to map a PSID to its statistics.	G
PARTITION	SMALLINT NOT NULL	The data set number within the table space. This column is used to map a data set number in a table space to its statistics. For partitioned table spaces, this value corresponds to the partition number for a single partition. For non-partitioned table spaces, this value is 0.	G
INSTANCE	SMALLINT NOT NULL WITH DEFAULT 1	Indicates if the object is associated with data set instance 1 or 2. This is an updatable column.	G
SPACE	BIGINT	The amount of space, in KB, that is allocated to the table space or partition. For multi-piece, linear page sets, this value is the amount of space in all data sets. A null value indicates the amount of space is unknown.	G
TOTALROWS	BIGINT	The number of rows or LOBs that are in the table space or partition. For XML, this column contains the number of physical records in the table space or partition. Each XML document might have more than one physical record in a table space or partition.	G
DATASIZE	BIGINT	The total number of bytes that row data occupy. For LOB table spaces this column is always 0. This is an updatable column.	G
UNCOMPRESSED-DATASIZE	BIGINT	This column is not used. The value is always set to 0.	G
DBNAME	VARCHAR(24) NOT NULL	The name of the database. This column is used to map a database to its statistics.	G
NAME	VARCHAR(24) NOT NULL	The name of the table space. This column is used to map a table space to its statistics.	G

Column name	Data type	Description	Use
REORGSCAN-ACCESS	BIGINT	The number of times data is accessed for SELECT, FETCH, searched UPDATE, or searched DELETE since the last CREATE, LOAD REPLACE or REORG, or since the object was created.A null value indicates that the number of times data is accessed is unknown.	G
REORGHASH-ACCESS	BIGINT	The number of times data is accessed using hash access for SELECT, FETCH, searched UPDATE, searched DELETE, or used to enforce referential integrity constraints since the last CREATE, LOAD REPLACE or REORG, or since the object was created. A null value indicates that the number of times data is accessed is unknown.	G
HASHLASTUSED	TIMESTAMP	The date when hash access was last used for SELECT, FETCH, searched UPDATE, searched DELETE, or used to enforce referential integrity constraints.	G
REORGCLUSTERSENS	BIGINT	The number of times data has been read by SQL statements that are sensitive to the clustering sequence of the data since the last REORG or LOAD REPLACE, or since the object was created.	G
DRIVETYPE	CHAR(3) NOT NULL WITH DEFAULT	The drive type on which the table space or table space partition data set is defined. **HDD** Hard Disk Drive **SSD** Solid State Drive For multi-volume data sets, the drive type is set to SSD if any volume is SSD. For multi-piece linear page sets, the drive type of the first data set is used. This is an updatable column.	G
LPFACILITY	CHAR(1)	Whether the disk control unit has the high performance list prefetch facility. **N** No **Y** Yes A NULL value indicates that it is unknown whether the disk control unit has the high performance list prefetch facility. This is an updatable column.	G
	BIGINT	Reserved for future IBM use.	R
UPDATESIZE	BIGINT	The net number of bytes that were added or removed by UPDATE operations since the object was created, or since the last REORG or LOAD REPLACE operation.	G
LASTDATACHANGE	TIMESTAMP	The last time that this row was updated because data was modified in the table space or partition. The timestamp reflects the time at which the real-time statistics table was updated, and not the time at which the data in the table space or partition was modified. Physical data changes such as reorganization of data are not reflected in this column.	G

In data sharing environments, the values in SYSIBM.SYSTABLESPACESTATS can be negative for short periods of time for certain situations.

Related concepts:

How DB2 maintains in-memory statistics in data sharing (DB2 Data Sharing Planning and Administration)

SYSIBM.SYSTABLES_HIST table

The SYSIBM.SYSTABLES_HIST table contains rows from SYSTABLES.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the table, view, or alias.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the table, view, or alias.	G
DBNAME	VARCHAR(24) NOT NULL	For a table, or a view of tables, the name of the database that contains the table space named in TSNAME. For a temporary table, an alias, or a view of a view, the value is DSNDB06.	G
TSNAME	VARCHAR(24) NOT NULL	For a table, or a view of one table, the name of the table space that contains the table. For a view of more than one table, the name of a table space that contains one of the tables. For a temporary table, a view of a view, or an alias, it is SYSTSTAB.	G
COLCOUNT	SMALLINT NOT NULL	Number of columns in the table or view. The value is 0 if the row describes an alias.	G
PCTPAGES	SMALLINT NOT NULL WITH DEFAULT -1	Percentage of active table space pages that contain rows of the table. A page is termed active if it is formatted for rows, regardless of whether it contains any. If the table space is segmented, the percentage is based on the number of active pages in the set of segments assigned to the table. The value is -1 if statistics have not been gathered, or the row describes a view, alias, temporary table, or auxiliary table.	S
PCTROWCOMP	SMALLINT NOT NULL WITH DEFAULT -1	Percentage of rows compressed within the total number of active rows in the table. This includes any row in a table space that is defined with COMPRESS YES. The value is -1 if statistics have not been gathered, or the row describes a view, alias, temporary table, or auxiliary table.	G
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics. The default value is '0001-01-01.00.00.00.000000'. For a temporary table, the value of STATSTIME is always the default value.	G
CARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	Total number of rows in the table or total number of LOBs in an auxiliary table. The value is -1 if statistics have not been gathered or the row describes a view, alias, or temporary table.	S
NPAGESF	FLOAT(8) NOT NULL WITH DEFAULT -1	Total number of pages on which rows of the partition appear. The value is -1 if statistics have not been gathered.	S

Column name	Data type	Description	Use
AVGROWLEN	INTEGER NOT NULL WITH DEFAULT -1	Average row length of the table specified in the table space. The value is -1 if statistics have not been gathered.	G
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Kilobytes of DASD storage. The value is -1 if statistics have not been gathered. This is an updatable column.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSTABLES_PROFILES table

The SYSIBM.SYSTABLES_PROFILES table contains one row for each profile that is associated with a table in SYSIBM.SYSTABLES.

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	The schema (qualifier) for the table.	G
TBNAME	VARCHAR(128) NOT NULL	The table name.	G
PROFILE_TYPE	VARCHAR(32) NOT NULL	The type of profile. Allowed values are 'RUNSTATS'.	G
	VARCHAR(32)	Internal use only.	I
PROFILE_TEXT	CLOB(1M)	The text of the profile.	G
ROWID	ROWID NOT NULL GENERATED ALWAYS	The ROWID value for the LOB column of this table.	G
PROFILE_UPDATE	TIMESTAMP NOT NULL	The last time the profile was updated, or the timestamp for when the profile was inserted into the table.	G
	TIMESTAMP	Internal use only.	I

SYSIBM.SYSTABLES_PROFILE_TEXT table

The SYSIBM.SYSTABLES_PROFILE_TEXT table is an auxiliary table for the PROFILE_TEXT column of the SYSIBM.SYSTABLES_PROFILES table and is required to hold LOB data.

Column name	Data type	Description	Use
PROFILE_TEXT	CLOB(2M) NOT NULL WITH DEFAULT	The complete text for the profile that the row represents.	G

SYSIBM.SYSTABSTATS table

The SYSIBM.SYSTABSTATS table contains one row for each partition of a partitioned table space.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
CARD	INTEGER NOT NULL	Total number of rows in the partition.	S
NPAGES	INTEGER NOT NULL	Total number of pages on which rows of the partition appear.	S
PCTPAGES	SMALLINT NOT NULL	Percentage of total active pages in the partition that contain rows of the table.	S
NACTIVE	INTEGER NOT NULL	Number of active pages in the partition.	S
PCTROWCOMP	SMALLINT NOT NULL	Percentage of rows compressed within the total number of active rows in the partition. This includes any row in a table space that is defined with COMPRESS YES.	S
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
DBNAME	VARCHAR(24) NOT NULL	Database that contains the table space named in TSNAME.	G
TSNAME	VARCHAR(24) NOT NULL	Table space that contains the table.	G
PARTITION	SMALLINT NOT NULL	Partition number of the table space that contains the table.	G
OWNER	VARCHAR(128) NOT NULL	The schema of the table.	G
NAME	VARCHAR(128) NOT NULL	Name of the table.	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	Total number of rows in the partition.	S

SYSIBM.SYSTABSTATS_HIST table

The SYSIBM.SYSTABSTATS_HIST table contains rows from SYSTABSTATS.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Column name	Data type	Description	Use
NPAGES	INTEGER NOT NULL	Total number of pages on which rows of the partition appear.	S
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics.	G
DBNAME	VARCHAR(24) NOT NULL	Database that contains the table space named in TSNAME.	G
TSNAME	VARCHAR(24) NOT NULL	Table space that contains the table.	G
PARTITION	SMALLINT NOT NULL	Partition number of the table space that contains the table.	G
OWNER	VARCHAR(128) NOT NULL	The schema of the table.	G
NAME	VARCHAR(128) NOT NULL	Name of the table.	G
CARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	Total number of rows in the partition. The value is -1 if statistics have not been gathered.	S
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSTRIGGERS table

The SYSIBM.SYSTRIGGERS table contains one row for each trigger.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the trigger and trigger package.	G
SCHEMA	VARCHAR(128) NOT NULL	Schema of the trigger. This implicit or explicit qualifier for the trigger name is also used for the collection ID of the trigger package.	G
	SMALLINT NOT NULL	Not used.	N
DBID	SMALLINT NOT NULL	Internal identifier of the database for the trigger.	G
OBID	SMALLINT NOT NULL	Internal identifier of the trigger.	G
OWNER	VARCHAR(128) NOT NULL	Owner of the trigger.	G
CREATEDBY	VARCHAR(128) NOT NULL	Primary authorization ID of the user who created the trigger.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table or view.	G
TBOWNER	VARCHAR(128) NOT NULL	Qualifier of the name of the table or view to which this trigger applies.	G
TRIGTIME	CHAR(1) NOT NULL	Time when triggered actions are applied to the base table, relative to the event that activated the trigger: **A** Trigger is applied after the event. **B** Trigger is applied before the event. **I** Trigger is applied instead of the event	G
TRIGEVENT	CHAR(1) NOT NULL	Operation that activates the trigger: **I** Insert **D** Delete **U** Update	G
GRANULARITY	CHAR(1) NOT NULL	Trigger is executed once per: **S** Statement **R** Row	G
CREATEDTS	TIMESTAMP NOT NULL	Time when the CREATE statement was executed for this trigger. The time value is used in resolving functions, distinct types, and stored procedures. It is also used to order the execution of multiple triggers.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G

Column name	Data type	Description	Use
	VARCHAR(6000) NOT NULL	Not used.	N
REMARKS	VARCHAR(762) NOT NULL	A character string provided by the user with the COMMENT statement.	G
TRIGNAME	VARCHAR(128) NOT NULL	Unused	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: **blank** Authorization ID **L** Role	G
ENVID	INTEGER NOT NULL WITH DEFAULT	Internal environment identifier.	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G
	CHAR(1) NOT NULL WITH DEFAULT	Reserved for IBM use.	I
	CHAR(1) NOT NULL WITH DEFAULT	Reserved for IBM use.	I
	INTEGER NOT NULL	Reserved for IBM use.	I
	VARCHAR(96) NOT NULL	Reserved for IBM use.	I
SECURE	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates if the trigger is secured: **N** The trigger is not secured **Y** The trigger is secured	G
ALTEREDTS	TIMESTAMP NOT NULL	Time when the last ALTER statement was executed for this trigger.	G
ROWID	ROWID NULL GENERATED ALWAYS	ROWID column, created for the lob columns in this table.	G
STATEMENT	CLOB(2M) NOT NULL WITH DEFAULT	The text of the entire CREATE TRIGGER statement that was used to create the object.	G

SYSIBM.SYSTRIGGERS_STMT table

The SYSIBM.SYSTRIGGERS_STMT table is an auxiliary table for the STATEMENT column of the SYSIBM.SYSTRIGGERS table and is required to hold LOB data.

Column name	Data type	Description	Use
STATEMENT	CLOB(2M) NOT NULL WITH DEFAULT	The text of the entire CREATE TRIGGER statement that was used to create the object.	G

SYSIBM.SYSUSERAUTH table

The SYSIBM.SYSUSERAUTH table records the system privileges that are held by users.

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privileges.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID of the user that holds the privilege. Could also be PUBLIC for a grant to PUBLIC.	G
	CHAR(12) NOT NULL	Internal use only	I
	CHAR(6) NOT NULL	Not used	N
	CHAR(8) NOT NULL	Not used	N
	CHAR(1) NOT NULL	Not used	N
AUTHHOWGOT	CHAR(1) NOT NULL WITH DEFAULT	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. **blank** Not applicable **C** DBCTRL **D** DBADM **E** SECADM **G** ACCESSCTRL **K** SQLADM **L** SYSCTRL **M** DBMAINT **O** SYSOPR **S** SYSADM	G
	CHAR(1) NOT NULL	Not used	N
BINDADDAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the BIND subcommand with the ADD option: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
BSDSAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can issue the RECOVER BSDS command: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G

Column name	Data type	Description	Use
CREATEDBAAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can create databases and automatically receive DBADM authority over the new databases: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
CREATEDBCAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can execute the CREATE DATABASE statement to create new databases and automatically receive DBCTRL authority over the new databases: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
CREATESGAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can execute the CREATE STOGROUP statement to create new storage groups: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
DISPLAYAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the DISPLAY commands: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
RECOVERAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the RECOVER INDOUBT command: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
STOPALLAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the STOP command: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
STOSPACEAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the STOSPACE utility: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
SYSADMAUTH	CHAR(1) NOT NULL	Whether the GRANTEE has system administration authority: **blank** Privilege is not held **G** Privilege was granted with the GRANT option **Y** Privilege was granted without the GRANT option GRANTEE has the privilege with the GRANT option for a value of either Y or G.	G
SYSOPRAUTH	CHAR(1) NOT NULL	Whether the GRANTEE has system operator authority: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
TRACEAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can issue the START TRACE and STOP TRACE commands: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
MON1AUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can obtain IFC serviceability data: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
MON2AUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can obtain IFC data: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
CREATEALIASAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can execute the CREATE ALIAS statement: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege held without the GRANT option	G
SYSCTRLAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has SYSCTRL authority: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option GRANTEE has the privilege with the GRANT option for a value of either Y or G.	G
BINDAGENTAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has BINDAGENT privilege: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
ARCHIVEAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE is privileged to use the ARCHIVE LOG command: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
	CHAR(1) NOT NULL WITH DEFAULT	Not used	N
	CHAR(1) NOT NULL WITH DEFAULT	Not used	N
GRANTEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the GRANT statement was executed. The value is '1985-04-01.00.00.00.000000' for the one installation row.	G
CREATETMTAB-AUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has CREATETMTABAUTH privilege: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G

Column name	Data type	Description	Use
GRANTEETYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantee: **blank** Authorization ID **L** Role	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: **blank** Authorization ID **L** Role	G
DEBUGSESSION-AUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has DEBUGSESSION privilege: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
EXPLAINAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can explain and prepare statements: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
SQLADMAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has SQLADM authority: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
SDBADMAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has system DBADM authority: **blank** Privilege is not held **Y** Privilege is held without the GRANT option	G
DATAACCESSAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has DATAACCESS authority: **blank** Privilege is not held **Y** Privilege is held without the GRANT option	G
ACCESSCTRLAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has ACCESSCTRL authority: **blank** Privilege is not held **Y** Privilege is held without the GRANT option	G
CREATESECURE-AUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can create secured objects (triggers and user-defined functions): **blank** Privilege is not held **Y** Privilege is held without the GRANT option	G

SYSIBM.SYSVARIABLES table

The SYSIBM.SYSVARIABLES table contains one row for each global variable that is created.

Column name	Data type	Description	Use
VARID	BIGINT NOT NULL GENERATED ALWAYS AS IDENTITY	The identifier of the global variable.	G
SCHEMA	VARCHAR(128) NOT NULL	The schema name of the global variable.	G
NAME	VARCHAR(128) NOT NULL	The unqualified name of the global variable.	G
OWNER	VARCHAR(128) NOT NULL	The authorization ID of the owner of the global variable.	G
OWNERTYPE	CHAR(1) NOT NULL	The type of owner of the global variable: **L** The owner is a role **blank** The owner is an authorization ID	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. See Release dependency indicators for all other values.	G
CREATEDTS	TIMESTAMP NOT NULL	Time at which the global variable was created.	G
TYPESCHEMA	VARCHAR(128) NOT NULL	The schema name of the data type. For built-in data types, this value is SYSIBM.	G
TYPENAME	VARCHAR(128) NOT NULL	The unqualified name of the data type.	G
DATATYPEID	INTEGER NOT NULL	For a built-in data type, the internal ID of the built-in type. For a distinct type, the internal ID of the distinct type.	S
SOURCETYPEID	INTEGER NOT NULL	For a built-in data type, 0. For a distinct type, the internal ID of the built-in data type on which the distinct type is based.	S
LENGTH	INTEGER NOT NULL	The maximum length of the global variable.	G
SCALE	SMALLINT NOT NULL	The scale of the global variable.	G
CCSID	INTEGER NOT NULL	The CCSID of the global variable.	G

Column name	Data type	Description	Use
DEFAULT	CHAR(3) NOT NULL	The default value of the global variable. This column can contain one of the following values: **N** The global variable does not have a default value. **S** The default value is the value of the SQL authorization ID of the process at the time that a default value is used. **1** The default value is a string constant. **2** The default value is a floating-point constant. **3** The default value is a decimal constant. **4** The default value is an integer constant. **5** The default value is a hexadecimal character string. **6** The default value is a UX string. **7** The global variable has a graphic data type and has a default value that is a character string constant. **8** The global variable has a character data type and has a default value that is a character string constant. **9** The default value is a DECFLOAT constant If this column contains one of the following values, the default value of the global variable is the value of the indicated special register at the time that a default value is used: **AES** CURRENT APPLICATION ENCODING SCHEME **ACT** CURRENT CLIENT_ACCTNG **APN** CURRENT CLIENT_APPLNAME **CID** CURRENT CLIENT_USERID **WSN** CURRENT CLIENT_WRKSTNNAME **DAT** CURRENT DATE **DBG** CURRENT DEBUG MODE **DEC** CURRENT DECFLOAT ROUNDING MODE **DEG** CURRENT DEGREE **EXP** CURRENT EXPLAIN MODE **LCT** CURRENT LOCALE LC_CTYPE **MTT** CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION **MEM** CURRENT MEMBER **HNT** CURRENT OPTIMIZATION HINT **CPP** CURRENT PACKAGE PATH **CPS** CURRENT PACKAGESET **PTH** CURRENT PATH **PRC** CURRENT PRECISION **RFA** CURRENT REFRESH AGE **RVS** CURRENT ROUTINE VERSION **RUL** CURRENT RULES **SCH** CURRENT SCHEMA **SVR** CURRENT SERVER **TIM** CURRENT TIME **TST** CURRENT TIMESTAMP **STZ** SESSION TIME ZONE **U** SESSION_USER	G

Column name	Data type	Description	Use
ROWID	ROWID NOT NULL GENERATED ALWAYS	The ROWID value for the lob columns in this table.	G
DEFAULTTEXT	CLOB(2M) NOT NULL WITH DEFAULT	The text of the default value of the global variable.	G
	BLOB(2M) NOT NULL	Reserved for IBM use.	I
ENVID	INTEGER NOT NULL	Internal environment identifier.	G
REMARKS	VARCHAR(762) NOT NULL	A character string about this global variable that is provided by using the COMMENT statement.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G

SYSIBM.SYSVARIABLEAUTH table

The SYSIBM.SYSVARIABLEAUTH table contains one row for each privilege of each authorization ID that has privileges on a global variable.

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	The grantor of the privilege.	G
GRANTORTYPE	CHAR(1) NOT NULL	The type of grantor: **blank** Grantor is an authorization ID **L** Grantor is a role	G
GRANTEE	VARCHAR(128) NOT NULL	The holder of the privilege.	G
GRANTEETYPE	CHAR(1) NOT NULL	The type of grantee: **blank** Grantee is an authorization ID **L** Grantee is a role **P** Grantee is a package. The grantee is a package if COLLID is a value other than blank.	G
SCHEMA	VARCHAR(128) NOT NULL	The schema name of the global variable.	G
NAME	VARCHAR(128) NOT NULL	The unqualified name of the global variable.	G
COLLID	VARCHAR(128) NOT NULL	If the grantee is a package, this value is the COLLID of the package.	G
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	If the grantee is a package, this value is the consistency token of the DBRM from which the package is derived. Otherwise, this value is blank.	G
READAUTH	CHAR(1) NOT NULL	The privilege to read the global variable: **blank** The READ privilege is not held **G** The READ privilege is held with the GRANT option **Y** The READ privilege is held without the GRANT option	G
WRITEAUTH	CHAR(1) NOT NULL	The privilege to write to the global variable: **blank** The WRITE privilege is not held **G** The WRITE privilege is held with the GRANT option **Y** The WRITE privilege is held without the GRANT option	G

Column name	Data type	Description	Use
AUTHHOWGOT	CHAR(1) NOT NULL	The authorization level of the user who granted the privileges: **blank** Not applicable **E** SECADM **G** ACCESSCTRL **S** SYSADM **T** DATAACCESS This authorization level is not necessarily the highest authority level of the grantor.	G
GRANTEDTS	TIMESTAMP NOT NULL	The time when the GRANT statement was executed.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSVARIABLES_DESC table

The SYSIBM.SYSVARIABLES_DESC table is an auxiliary table for the SYSIBM.SYSVARIABLES table.

Column name	Data type	Description	Use
	BLOB(2M)	IBM-internal use only.	I

SYSIBM.SYSVARIABLES_TEXT table

The SYSIBM.SYSVARIABLES_TEXT table is an auxiliary table for the DEFAULTTEXT column of the SYSIBM.SYSVARIABLES table.

Column name	Data type	Description	Use
DEFAULTTEXT	CLOB(2M)	The text of the default value of the global variable.	G

SYSIBM.SYSVIEWDEP table

The SYSIBM.SYSVIEWDEP table records the dependencies of views on tables, functions, and other views.

Column name	Data type	Description	Use
BNAME	VARCHAR(128) NOT NULL	Name of the object on which the view is dependent. If the object type is a function (BTYPE='F'), the name is the specific name of the function.	G
BCREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of BNAME.	G
BTYPE	CHAR(1) NOT NULL	Type of object: **F** Function **G** Created global temporary table **M** Materialized query table **T** Table **V** View **W** SYSTEM_TIME period **Z** BUSINESS_TIME period	G
DNAME	VARCHAR(128) NOT NULL	Name of the view.	G
DCREATOR	VARCHAR(128) NOT NULL	The schema of the view.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
BSCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	Schema of BNAME.	G
DTYPE	CHAR(1) NOT NULL	Type of table: **F** SQL function **M** Materialized query table **V** View	G
DOWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the owner of the view, blank for views that were created in a DB2 release prior to Version 9.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: **blank** Authorization ID **L** Role	G

SYSIBM.SYSVIEWS table

The SYSIBM.SYSVIEWS table contains one or more rows for each view, materialized query table, or user-defined SQL function.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the object.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the object.	G
	SMALLINT NOT NULL	Not used	N
CHECK	CHAR(1) NOT NULL	Whether the WITH CHECK OPTION clause was specified in the CREATE VIEW statement: **N** No **C** Yes with the *cascaded* semantic **Y** Yes with the *local* semantic The value is N if the view has no WHERE clause, or the object is not a view.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
	VARCHAR(1500) NOT NULL	Not used	N
PATHSCHEMAS	VARCHAR(2048) NOT NULL WITH DEFAULT	SQL path at the time the object was defined. The path is used to resolve unqualified data type and function names used in the object definition.	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G
TYPE	CHAR(1) NOT NULL	Type of table: **F** SQL function **M** Materialized query table **V** View	G
REFRESH	CHAR(1) NOT NULL WITH DEFAULT	Refresh mode: **D** A materialized query table with a deferred refresh mode **blank** Not a materialized query table	G
ENABLE	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether query optimization is enabled: **Y** Enabled **N** Disabled **blank** Not a materialized query table	G
MAINTENANCE	CHAR(1) NOT NULL WITH DEFAULT	Maintenance mode: **S** For a REFRESH = 'D', a materialized query table that is maintained by the system. **U** For a REFRESH = 'D', a materialized query table that is maintained by the user. **blank** Not a materialized query table.	G

Column name	Data type	Description	Use
REFRESH_TIME	TIMESTAMP NOT NULL WITH DEFAULT	For REFRESH = 'D' and MAINTENANCE = 'S', the timestamp of the REFRESH TABLE statement that last refreshed the data. Otherwise, this is the default timestamp ('0001-01-01.00.00.00.000000').	G
ISOLATION	CHAR(1) NOT NULL WITH DEFAULT	Isolation level when the materialized query table is created or altered from a base table: **R** RR (repeatable read) **S** CS (cursor stability) **T** RS (read stability) **U** UR (uncommitted read) **blank** Not a materialized query table	G
SIGNATURE	VARCHAR(1024) NOT NULL WITH DEFAULT FOR BIT DATA	Contains an internal description. Used for materialized query tables.	G
APP_ENCODING_ CCSID	INTEGER NOT NULL WITH DEFAULT	CCSID of the current application encoding scheme at the time the object was created. For objects created prior to Version 8 of DB2, the value is 0.	G
OWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the owner of the view, blank for views that were created in a DB2 release prior to Version 9.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: **blank** Authorization ID **L** Role	G
ENVID	INTEGER NOT NULL WITH DEFAULT	Internal environment identifier.	G
ROWID	ROWID NULL GENERATED ALWAYS	ROWID column, created for the lob columns in this table	G
STATEMENT	CLOB(2M) NOT NULL WITH DEFAULT	The text of the entire CREATE VIEW statement that was used to create the object.	G
	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only.	I

SYSIBM.SYSVIEWS_STMT table

The SYSIBM.SYSVIEWS_STMT table is an auxiliary table for the STATEMENT column of the SYSIBM.SYSVIEWS table and is required to hold LOB data.

Column name	Data type	Description	Use
STATEMENT	CLOB(2M) NOT NULL WITH DEFAULT	The text of the statement that was used to create the object.	G

SYSIBM.SYSVIEWS_TREE table

The SYSIBM.SYSVIEWS_TREE table is an auxiliary table for the PARSETREE column of the SYSIBM.SYSVIEWS table and is required to hold LOB data.

Column name	Data type	Description	Use
	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only.	I

SYSIBM.SYSVOLUMES table

The SYSIBM.SYSVOLUMES table contains one row for each volume of each storage group.

Column name	Data type	Description	Use
SGNAME	VARCHAR(128) NOT NULL	Name of the storage group.	G
SGCREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the storage group.	G
VOLID	VARCHAR(18) NOT NULL	Serial number of the volume or * if SMS-managed.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G

SYSIBM.SYSXMLRELS table

The SYSIBM.SYSXMLRELS table contains one row for each XML table that is created for an XML column.

Column name	Data type	Description	Use
TBOWNER	VARCHAR(128) NOT NULL	Schema or qualifier of the base table.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the base table.	G
COLNAME	VARCHAR(128) NOT NULL	Name of the XML column in the base table.	G
XMLTBOWNER	VARCHAR(128) NOT NULL	Schema or qualifier of the XML table.	G
XMLTBNAME	VARCHAR(128) NOT NULL	Name of the XML table.	G
XMLRELOBID	INTEGER NOT NULL	Internal identifier of the relationship between the base table and the XML table.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
CREATEDTS	TIMESTAMP NOT NULL	Time when the XML table was created.	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. See Release dependency indicators for the values.	G

SYSIBM.SYSXMLSTRINGS table

Each row of the SYSIBM.SYSXMLSTRINGS table contains a single string and its unique ID that are used to condense XML data. The string can be an element name, attribute name, name space prefix, or a namespace URI.

Column name	Data type	Description	Use
STRINGID	INTEGER NOT NULL GENERATED ALWAYS AS IDENTITY	Unique ID for the string.	G
STRING	VARCHAR(1000) NOT NULL	The string data.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.USERNAMES table

Each row in the SYSIBM.USERNAMES table is used to carry out one outbound ID translation or inbound ID translation and "come from" checking.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
TYPE	CHAR(1) NOT NULL	How the row is to be used: **I** For inbound translation and "come from" checking. **O** For outbound translation. **S** For outbound system AUTHID to establish a trusted connection.	G
AUTHID	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID to be translated. Applies to any authorization ID if blank.	G
LINKNAME	VARCHAR(24) NOT NULL	Identifies the VTAM or TCP/IP network locations associated with this row. A blank value in this column indicates this name translation rule applies to any TCP/IP or SNA partner. If a non-blank LINKNAME is specified, one or both of the following statements must be true: • A row exists in SYSIBM.LUNAMES whose LUNAME matches the value specified in the SYSIBM.USERNAMES LINKNAME column. This row specifies the VTAM site associated with this name translation rule. • A row exists in SYSIBM.IPNAMES whose LINKNAME matches the value specified in the SYSIBM.USERNAMES LINKNAME column. This row specifies the TCP/IP host associated with this name translation rule. Inbound name translation and "come from" checking are not performed for TCP/IP clients.	G
NEWAUTHID	VARCHAR(128) NOT NULL WITH DEFAULT	Translated value of AUTHID. Blank specifies no translation.NEWAUTHID can be stored as encrypted data by calling the DSNLEUSR stored procedure. To send the encrypted value of AUTHID across a network, one of the encryption security options in the SYSIBM.IPNAMES table should be specified.	G
PASSWORD	VARCHAR(255) NOT NULL WITH DEFAULT	Password to accompany an outbound request, if passwords are not encrypted by RACF. If passwords are encrypted, or the row is for inbound requests, the column is not used.PASSWORD can be stored as encrypted data by calling the DSNLEUSR stored procedure. To send the encrypted value of PASSWORD across a network, one of the encryption security options in the SYSIBM.IPNAMES table should be specified.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSIBM.SYSXMLTYPMOD table

The SYSIBM.SYSXMLTYPMOD table contains rows about the XML type modifiers of XML columns. Rows in this table can be inserted, updated and deleted.

Column name	Data type	Description	Use
XML_TYPEMOD _ID	INTEGER NOT NULL GENERATED ALWAYS AS IDENTITY	An id generated for the XML type modifier, it is an identity column and primary key.	G
TYPE_ ANNOTATION	CHAR(1) NOT NULL	Indicate whether there is type annotation. **Y** WITH type annotation **N** with no type annotation.	G
CREATEDTS	TIMESTAMP NOT NULL	The timestamp when this type modifier is created.	G
ALTEREDTS	TIMESTAMP NOT NULL	The timestamp when this type modifier is altered	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. See Release dependency indicators for the values.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
CREATEDBY	VARCHAR(128) NOT NULL	Primary authorization ID of the user who created the database.	G

SYSIBM.SYSXMLTYPMSCHEMA table

The SYSIBM.SYSXMLTYPMSCHEMA table contains the XML schema information for an XML type modifier. It contains one row per XML schema for an XML type modifier.

Column name	Data type	Description	Use
XML_TYPEMOD _ID	INTEGER NOT NULL	The id for the XML type modifier.	G
XSROBJECTID	INTEGER NOT NULL	The id for an XML schema registered in XSR.	G
ELEMENT_ NAMESPACE	INTEGER NOT NULL	String id for the namespace name of the root element node. By default, it is the TARGETNAMESPACE of the XML schema. It would be 0 if it is NO NAMESPACE.	G
ELEMENT_ NAME	INTEGER NOT NULL	String id for the local name of the root element node. It would be 0 if it is not specified.	G
CREATEDTS	TIMESTAMP NOT NULL	The timestamp when this type modifier is created.	G
ALTEREDTS	TIMESTAMP NOT NULL	The timestamp when this type modifier is altered	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. See Release dependency indicators for the values.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G

DB2 directory tables

DB2 for z/OS maintains a set of tables (in database DSNDB01) called the DB2 directory.

About these topics

These topics describe the directory tables that allow SELECT operations by describing the columns of those tables.

Authorized users can query the directory; however, it is primarily intended for use by DB2 and is therefore subject to change.

Users must have one of the following privileges to execute SELECT statements on the directory tables:
- Installation SYSADM
- SYSADM
- SYSCTRL
- ACCESSCTRL
- DATAACCESS
- SECADM
- SQLADM
- System DBADM
- DBADM on DSNDB01
- The SELECT privilege on a specific table

All directory tables are qualified by SYSIBM. Do not use this qualifier for user-defined tables.

The directory tables are updated by DB2 during normal operations in response to certain SQL statements, commands, and utilities.

Programming interface information

Not all directory table columns are part of the general-use programming interface. Whether a column is part of this interface is indicated in a column labeled "Use" in the table that describes the column. The values that "Use" can assume are as follows:

Value	Meaning
S	Column is part of the product-sensitive interface
I	Column is for internal use only

For columns for which "Use" is I, the name of the column and its description do not appear in the explanation of the column.

Directory table spaces and indexes

DB2 directory tables are contained in certain table spaces and have indexes.

The following table lists the table space and indexes for each directory table and lists the index fields for each index. The indexes are in ascending order.

The directory table space, tables, and indexes are primarily intended for use by DB2 and are therefore subject to change.

Table 177. Table spaces and indexes for the directory tables

TABLE SPACE DSNDB01. ...	TABLE SYSIBM. ...	INDEX SYSIBM. ...	INDEX FIELDS
DBD01	DBDR	DSNDB01X	DBID.SECTION
SYSDBDXA	SYSDBD_DATA	DSNDB1XA	DBD_DATA
SCT02	SCTR	DSNSCT02	SCTNAME.SCTSEC. SPTSEQ
SPT01	SPTR	DSNSPT01	SPTPID.SPTSEC. SPTSEQ
		DSNSPT02	version.SPTID. SPTSEC.SPTSEQ
SYSSPUXA	SYSSPTSEC_DATA	DSNSPDXA	SPTSEC_DATA
SYSSPUXB	SYSSPTSEC_EXPL	DSNSPEXA	SPTSEC_EXPL
SYSLGRNX	SYSLGRNX	DSNLLX01	LGRDBID.LGRPSID. LGRPART.LGRMEMB. LGRSLRSN
		DSNLLX02	LGRDBID.LGRPSID. LGRSLRSN
SYSUTILX	SYSUTIL	DSNLUX01	USUUID
	SYSUTILX	DSNLUX02	UTILID.SEQNO

SYSIBM.DBDR table

The DBDR table stores one row for each DBD section.

Column name	Data type	Description	Use
	INTEGER	Not used	S
DBID	SMALLINT	DBID of the database	S
SECTION	SMALLINT	DBD section number	S
DBD_ROWID	ROWID	ID that is used to support the DBD_DATA column	S
DBD_DATA	BLOB(2G)	DBD data for the section	I

SYSIBM.SYSDBD_DATA table

The SYSIBM.SYSDBD_DATA table is an auxiliary table for the SYSIBM.DBDR table.

Column name	Data type	Description	Use
DBD_DATA	BLOB(2G)	Contents of the DBD section.	I

SYSIBM.SCTR table

The SYSIBM.SCTR table stores Skeleton Cursor Tables (SKCT) information.

Column name	Data type	Description	Use
SCTLL	CHAR (4) FOR BIT DATA	The length of the record.	S
SCTNAME	CHAR (14) FOR BIT DATA	The plan name, section number, and sequence number.	S
SCTDAT	VARCHAR(4028)	SKCT data.	I

SYSIBM.SPTR table

The SYSIBM.SPTR table stores Skeleton Package Table (SKPT) information

Column name	Data type	Description	Use
SPTLL	INTEGER		S
SPTLOCID	VARCHAR(128)		S
SPTCOLID	VARCHAR(128)		S
SPTNAME	VARCHAR(128)		S
SPTCONID	CHAR(8) FOR BIT DATA		S
SPTRESV	CHAR(2) FOR BIT DATA		S
SPTSEC	CHAR(4) FOR BIT DATA		S
SPTSEQ	CHAR(2) FOR BIT DATA		S
SPTBODY	VARCHAR(1)		S
SPTVER	VARCHAR(64)		S
SPT_ROWID	ROWID		S
SPT_DATA	BLOB(2G)		I
SPT_EXPLAIN	BLOB(2G)		I

SYSIBM.SYSSPTSEC_DATA table

The SYSIBM.SYSSPTSEC_DATA table is an auxiliary table that contains package data for the SYSIBM.SPTR table.

Column name	Data type	Description	Use
SPT_DATA	BLOB(2G)	Contents of the SKPT section	I

SYSIBM.SYSSPTSEC_EXPL table

The SYSIBM.SYSSPTSEC_EXPL table is an auxiliary table that contains static package explain data for the SYSIBM.SPTR table.

Column name	Data type	Description	Use
SPT_EXPLAIN	BLOB(2G)	Contents of the SKPT section explain block	I

SYSIBM.SYSLGRNX table

The SYSLGRNX table stores recovery log ranges that record the time an index space defined with COPY YES or a table space was open for updates. This provides an efficient way for DB2 to access the appropriate log records for recovery, rather than having to scan every record in the recovery log for a particular table.

Column name	Data type	Description	Use
LGRDBID	CHAR(2) FOR BIT DATA	DBID of the modified object	S
LGRPSID	CHAR(2) FOR BIT DATA	OBID of the modified object	S
LGRUCDT	CHAR(6)	Modification date in the form *mmddyy*	S
LGRUCTM	CHAR(8)	Modification time in the form *hhmmssth*	S
LGRSRBA[1]	CHAR(10) FOR BIT DATA	Starting RBA	S
LGRSPBA[1]	CHAR(10) FOR BIT DATA	Stopping RBA	S
LGRPART	SMALLINT	Partition number in the table space or index space	S
LGRSLRSN[1]	CHAR(10) FOR BIT DATA	Starting LRSN of update log records for data sharing. Otherwise, the system clock value that corresponds to the first update log record.	S
LGRELRSN[1]	CHAR(10) FOR BIT DATA	Ending LRSN of update log records for data sharing. Otherwise, the system clock value that corresponds to the last update log record.	S
LGRMEMB	CHAR(2)	Data sharing member ID of the modifying DB2 subsystem. X'0000' for a non-data-sharing environment.	S

Note:

1. A SELECT from SYSIBM.SYSLGRNX displays this column in either 6-byte or 10-byte format. Before CATENFM of SYSLGRNX the data and the display are in 6-byte format. After CATENFM of SYSLGRNX the data and the display are in 10-byte format.

SYSIBM.SYSUTIL table

The SYSUTIL table stores status information about DB2 utilities that are active or stopped. Each record is uniquely identified by the utility identifier. Each row of the table contains the information for one utility execution step. When the utility completes, the corresponding entries in the SYSUTIL table are deleted.

Name	Data type	Description	Use
USUUID	CHAR(16)	UTILID value that was passed in a JOB statement parameter	S
USUJOBNM	CHAR(8)	Job name from the JOB statement	S
USUAUID	CHAR(8)	Authorization ID of the invoker	S
USURDATE	CHAR(4) FOR BIT DATA	Date of the utility	S
USUREL	CHAR(3)	Utility release level at restart time	S
USUIRQD	CHAR(1)	IBM required field	S
USULSIZE	CHAR(4) FOR BIT DATA	List size	S
USULCUR	CHAR(4) FOR BIT DATA	The object that is currently being processed or was last processed	S
USUUTNAM	CHAR(8)	Name of the currently executing utility	S
USUPHASE	CHAR(8)	Current phase of the currently executing utility	S
USUDSNU	CHAR(2) FOR BIT DATA	Data set or piece number	S
USUDSNU2	CHAR(2) FOR BIT DATA	Ending number of the partition range	S
USUSTATU	CHAR(1)	Status of the currently executing utility	S
USUTREQ	CHAR(1)	Termination requested (Y or N)	S
USUFORCE	CHAR(1)	Element of USO forced (Y or N)	S
USURLOK	CHAR(1)	Reload was successful (Y or N)	S
USUCMPOK	CHAR(1)	Compatibility check passed (Y or N)	S
USURSFLG	BIT(8)	Utility restriction flags	S
USURTFLG	BIT(8)	Term settings	S
USURSFLG2	BIT(8)	Utility flags	S
USUPOS	CHAR(4) FOR BIT DATA	Relative USM position in the SYSIN DD statement	S
USUDONE	CHAR(8) FOR BIT DATA	Number of objects processed	S
USUCKSUM	CHAR(4) FOR BIT DATA	USU checksum	S
USUDBOB	CHAR(2) FOR BIT DATA	DBID for the table space	S
USUPSID	CHAR(2) FOR BIT DATA	PSID for the table space or index space	S
USUPSDD	CHAR(2) FOR BIT DATA	Secondary PSID for RECOVER INDEX data page set	S
USUCATMGFRM	CHAR(1) FOR BIT DATA	Saved catalog level for the release from which migration is done, from the DBD01 header page	S

Name	Data type	Description	Use
USUOFLAG	CHAR(1) FOR BIT DATA	Flags for object properties	S
USUDBNAM	CHAR(8)	Database name	S
USUSPNAM	CHAR(8)	Table space or index space name	S
USUMEMBR	CHAR(8)	Member name	S
USUOCATR	CHAR(1) FOR BIT DATA	Saved catalog release level, from the DBD01 header page	S
USUOCATV	CHAR(1) FOR BIT DATA	Saved catalog version level, from the DBD01 header page	S
USUOCATCV	CHAR(1) FOR BIT DATA	Saved migration mode, from the DBD01 header page	S
USUOCATH	CHAR(1) FOR BIT DATA	Saved highest version of the catalog	S
USUUDA	CHAR(150) FOR BIT DATA	Utility-dependent data	S
USURTIME	CHAR(4) FOR BIT DATA	Latest utility start time	S
USURLSN	CHAR(6) FOR BIT DATA	Latest utility start LRSN	S
USURDATO	CHAR(4) FOR BIT DATA	Original utility start date	S
USURTIMO	CHAR(4) FOR BIT DATA	Original utility start time	S
USURLSNO	CHAR(4) FOR BIT DATA	Original utility start LRSN	S
USUR5	CHAR(10) FOR BIT DATA	Reserved	I
USURCNTR	CHAR(31) FOR BIT DATA	Generic counter or value holder	S
USURLSNX	CHAR(10) FOR BIT DATA	Latest utility start LRSN value	S
USURLSOX	CHAR(10) FOR BIT DATA	Original utility start LRSN value	S
USUR6	CHAR(72) FOR BIT DATA	Reserved	I
USUUSTRN	CHAR(27000) FOR BIT DATA	Utility-dependent restart information	S

SYSIBM.SYSUTILX table

The SYSUTILX table is a dependent of the SYSUTIL table. A record is created in the SYSUTILX table when the amount of information in the parent record exceeds the record size of SYSUTIL. The rows in SYSUTILX are uniquely identified by the utility identifier and sequence number.

Column name	Data type	Description	Use
UTILID	CHAR(16)	The utility ID that identifies the parent record in SYSIBM.SYSUTIL	S
SEQNO	SMALLINT	The sequence number of this row	S
	CHAR(12)	Reserved	I
CHECKPOINT	VARCHAR(32000)	The overflow checkpoint/restart information	S

Performance information for SQL application programming

Efficient applications are an important first step to good system and application performance. As you code applications that access data in DB2, consider performance objectives in your application design.

The following topics can help you understand how application programmers can consider performance as they write applications that access data in DB2 for z/OS.

Concurrency and programming

The goal is to program and prepare applications in a way that:

- Protects the integrity of the data that is being read or updated from being changed by other applications.
- Minimizes the length of time that other access to the data is prevented.

For more information about DB2 concurrency and recommendations for improving concurrency in your application programs, see the following topics:

- Concurrency recommendations for application designers (Introduction to DB2 for z/OS)
- Concurrency and locks (DB2 Performance)
- Improving concurrency (DB2 Performance)
- Improving concurrency in data sharing environments (DB2 Data Sharing Planning and Administration)

Writing efficient queries

The predicates, subqueries, and other structures in SQL statements affect the access paths that DB2 uses to access the data.

For information about how to write SQL statements that access data efficiently, see the following topics:

- Ways to improve query performance (Introduction to DB2 for z/OS)
- Writing efficient SQL queries (DB2 Performance)

Analyzing access paths

By analyzing the access path that DB2 uses to access the data for an SQL statement, you can discover potential problems. You can use this information to modify your statement to perform better.

For information about how you can use EXPLAIN tables, and SQL optimization tools, to analyze the access paths for your SQL statements, see the following topics:

- Investigating access path problems (DB2 Performance)
- Using EXPLAIN to understand the access path (Introduction to DB2 for z/OS)
- Investigating SQL performance by using EXPLAIN (DB2 Performance)
- Interpreting data access by using EXPLAIN (DB2 Performance)
- EXPLAIN tables (DB2 Performance)
- "EXPLAIN" on page 1642
- Tuning SQL with Optim Query Tuner, Part 1: Understanding access paths
- Generating visual representations of access plans

Distributed data access performance

The goal is to reduce the amount of network traffic that is required to access the distributed data, and to manage the use of system resources such as distributed database access threads and connections.

For information about improving the performance of applications that access distributed data, see the following topics:

- Ways to reduce network traffic (Introduction to DB2 for z/OS)
- Managing DB2 threads (DB2 Performance)
- Improving performance for applications that access distributed data (DB2 Performance)
- Improving performance for SQL statements in distributed applications (DB2 Performance)

Stored procedures performance

For information about stored procedures and DB2 performance, see the following topics:

- Implementing DB2 stored procedures (DB2 Administration Guide)
- Improving the performance of stored procedures and user-defined functions (DB2 Performance)

Related concepts:

DB2 XML schema repository tables

The DB2 for z/OS XML schema repository (XSR) is a set of DB2 tables where you can store XML schemas.

DB2 creates the XSR tables during installation or migration. After you add XML schemas to the DB2 XSR, you can use them to validate XML documents before you store them in XML columns.

An XML schema consists of a set of XML schema documents. To add an XML schema to the DB2 XSR, you register XML schema documents to DB2. The XML schema documents must be in the Unicode encoding scheme.

Programming interface information

Not all XSR table columns are part of the general-use programming interface. Whether a column is part of this interface is indicated in a column labeled "Use" in the row that describes the table column. The meaning of the values for the "Use" column is indicated in the following table.

Table 178. Meaning of values in the "Use" column if table descriptions

Value	Meaning
G	Column is part of the general-use programming interface
S	Column is part of the product-sensitive interface
I	Column is for IBM use only
N	Column is not used

For columns for which "Use" is N or I, the name of the column and its description do not appear in the explanation of the column.

XML schema repository (XSR) table spaces and indexes

DB2 XSR tables are contained in certain table spaces and have indexes.

The following tables list the table space and indexes for each XRS table and lists the index fields for each index. The indexes are in ascending order, except where noted.

Table 179. Table spaces and indexes for the DSNXSR database tables

Table space DSNXSR. ...	Table SYSIBM. ...	Index SYSIBM. ...	Index fields
SYSXSR	XSROBJECTS	XSROBJ01	XSROBJECTID
		XSROBJ02	XSROBJECTSCHEMA.XSROBJECTNAME
		XSROBJ03	TARGETNAMESPACE.SCHEMALOCATION
		XSROBJ04	SCHEMALOCATION
	XSROBJECT-COMPONENTS	XSRCOMP01	XSRCOMPONENTID
		XSRCOMP02	TARGETNAMESPACE.SCHEMALOCATION
	XSROBJECT-HIERARCHIES	XSRHIER01	XSROBJECTID.TARGETNAMESPACE. SCHEMALOCATION
		XSRHIER02	XSROBJECTID.TARGETNAMESPACE
SYSXSRA1	XSROBJECTGRAMMAR	XSRXOG01	GRAMMAR
SYSXSRA2	XSROBJECTPROPERTY	XSRXOP01	PROPERTIES
SYSXSRA3	XSRCOMPONENT	XSRXCC01	COMPONENT
SYSXSRA4	XSRPROPERTY	XSRXCP01	PROPERTIES

Note: Index field is in descending order

SYSIBM.XSRCOMPONENT table

The SYSIBM.XSRCOMPONENT table is an auxiliary table for the BLOB column COMPONENT in SYSIBM.SYSXSROBJECTCOMPONENTS. It is in LOB table space SYSXSRA3.

Column name	Data type	Description	Use
COMPONENT	BLOB(30M)	Contents of the XML schema document	G

SYSIBM.XSROBJECTS table

The SYSIBM.XSROBJECTS table contains one row for each registered XML schema.

Rows in this table can only be changed using static SQL statements issued by the DB2-supplied XSR stored procedures.

Column name	Data type	Description	Use
XSROBJECTID	INTEGER NOT NULL	Internal identifier of the XML schema. XSROBJECTID is generated as an identity column.	G
XSROBJECTSCHEMA	VARCHAR(128) NOT NULL	Qualifier of the XML schema name. This is always set to 'SYSXSR'.	G
XSROBJECTNAME	VARCHAR(128) NOT NULL	Name of the XML schema.	G
TARGETNAMESPACE	INTEGER	The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the target namespace URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS	G
SCHEMALOCATION	INTEGER	The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the schema location URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS	G
ROWID	ROWID NOT NULL GENERATED ALWAYS	The ID that is used to support BLOB data type values.	G
GRAMMAR	BLOB(250M)	The internal binary representation of the XML schema.	G
PROPERTIES	BLOB(5M)	Additional property information of the entire XML schema.	G
CREATEDBY	VARCHAR(128) NOT NULL	Authorization ID under which the XML schema was created.	G
CREATEDTS	TIMESTAMP NOT NULL	The time that the DB2-supplied stored procedure XSR_REGISTER was executed for the XML schema.	G
STATUS	CHAR(1) NOT NULL WITH DEFAULT	Registration status of the XML schema: **C** Complete **I** Incomplete **T** Temporary	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. See Release dependency indicators for the values.	G
	CHAR(1)	Not used.	N
	VARCHAR(128)	Not used.	N

Column name	Data type	Description	Use
REMARKS	VARCHAR(762)	Character string that contains comments about this XML schema.	G

SYSIBM.XSROBJECTCOMPONENTS table

The SYSIBM.XSROBJECTCOMPONENTS table contains one row for each component (document) in an XML schema.

Rows in this table can only be changed using static SQL statements issued by the DB2-supplied XSR stored procedures.

Column name	Data type	Description	Use
XSRCOMPONENTID	INTEGER NOT NULL	Internal identifier of the XML schema document. XSRCOMPONENTID is generated as an identity column.	G
TARGETNAMESPACE	INTEGER	The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the target namespace URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS.	G
SCHEMALOCATION	INTEGER	The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the schema location URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS.	G
ROWID	ROWID NOT NULL GENERATED ALWAYS	The ID that is used to support BLOB data type values.	G
COMPONENT	BLOB(30M) NOT NULL	Contents of the XML schema document.	G
PROPERTIES	BLOB(5M)	If available, additional property information of the XML schema document	G
CREATEDTS	TIMESTAMP NOT NULL	The time that the XML schema document was registered.	G
STATUS	CHAR(1) NOT NULL WITH DEFAULT	Registration status of the XML schema: **C** Complete **I** Incomplete	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. See Release dependency indicators for the values.	G

SYSIBM.XSROBJECTGRAMMAR table

SYSIBM.XSROBJECTGRAMMAR is an auxiliary table for the BLOB column GRAMMAR in SYSIBM.SYSXSROBJECTS. It is in LOB table space SYSXSRA1.

Column name	Data type	Description	Use
GRAMMAR	BLOB(250M)	Internal binary representation of the XML schema	G

SYSIBM.XSROBJECTHIERARCHIES table

The SYSIBM.XSROBJECTHIERARCHIES table contains one row for each component (document) in an XML schema to record the XML schema document hierarchy relationship.

Rows in this table can only be changed using static SQL statements issued by the DB2-supplied XSR stored procedures.

Column name	Data type	Description	Use
XSROBJECTID	INTEGER	Internal identifier of the XML schema.	G
XSRCOMPONENTID	INTEGER	Internal identifier of the XML schema document.	G
HTYPE	CHAR(1)	Hierarchy type: **D** Document **P** Primary document	G
TARGETNAMESPACE	INTEGER	The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the target namespace URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS.	G
SCHEMALOCATION	INTEGER	The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the schema location URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS.	G
RELCREATED	CHAR(1) NOT NULL	The release of DB2 that is used to create the object. See Release dependency indicators for the values.	G

SYSIBM.XSROBJECTPROPERTY table

SYSIBM.XSROBJECTPROPERTY is an auxiliary table for the BLOB column PROPERTIES in SYSIBM.SYSXSROBJECTS. It is in LOB table space SYSXSRA2.

Column name	Data type	Description	Use
PROPERTIES	BLOB(5M)	Contents of the additional property information of the entire XML schema.	G

SYSIBM.XSRPROPERTY table

The SYSIBM.XSRPROPERTY table is an auxiliary table for the BLOB column COMPONENT in SYSIBM.SYSXSROBJECTCOMPONENTS. It is in LOB table space SYSXSRA3.

Column name	Data type	Description	Use
COMPONENT	BLOB(5M)	Contents of the additional property information of the XML schema document.	G

EXPLAIN tables

EXPLAIN tables contain information about SQL statements and functions that run on DB2 for z/OS.

You can create and maintain a set of EXPLAIN tables to capture and analyze information about the performance of SQL statements and functions that run on DB2 for z/OS. Each row in an EXPLAIN table describes some aspect of a step in the execution of a query or subquery in an explainable statement. The column values for the row identify, among other things, the query or subquery, the tables and other objects involved, the methods used to carry out each step, and cost information about those methods. DB2 creates EXPLAIN output and populates EXPLAIN tables in the following situations:

- When an EXPLAIN statement is executed.
- At BIND or REBIND with the EXPLAIN(YES) or (ONLY) bind options. Rows are added for every explainable statement in the plan or package being bound. For a plan, these do not include statements in the packages that can be used with the plan. For either a package or plan, they do not include explainable statements within EXPLAIN statements nor do they include explainable statements that refer to declared temporary tables, which are incrementally bound at run time.
- When an explainable dynamic statement is executed and the value of the CURRENT EXPLAIN MODE special register is set to YES or EXPLAIN.

Capturing EXPLAIN information (DB2 Performance)

Creating EXPLAIN tables (DB2 Performance)

PLAN_TABLE

The plan table, PLAN_TABLE, contains information about access paths that is collected from the results of EXPLAIN statements.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM
One instance of each EXPLAIN table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use these tables. These tables are created when you run job DSNTIJSG when you install or migrate DB2.

userID You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

Optional PLAN_TABLE formats

A PLAN_TABLE instance can have a format with fewer columns than those shown in the sample CREATE TABLE statement. However instances of PLAN_TABLE must have one of the following formats:

Version 11 format
All columns shown in the sample CREATE TABLE statement, up to and including the EXPANSION_REASON column (COLCOUNT=66).

Version 10 format
All columns shown in the sample CREATE TABLE statement, up to and including the MERGN column (COLCOUNT=64).

Version 9 format
All columns shown in the sample CREATE TABLE statement, to and including the PARENT_PLANNO column (COLCOUNT=59).

Version 8 format
All columns shown in the sample CREATE TABLE statement, up to and including the STMTTOKEN column (COLCOUNT=58).

Important: If the EXPLAIN tables have any format older than the Version 8 format, or are encoded in EBCDIC, DB2 returns an error for any operation that inserts rows in the EXPLAIN tables.

Column descriptions

Your subsystem or data sharing group can contain more than one of these tables, including a table with the qualifier SYSIBM, a table with the qualifier DB2OSCA, and additional tables that are qualified by user IDs.

The following table shows the descriptions of the columns in PLAN_TABLE.

Table 180. Descriptions of columns in PLAN_TABLE

Column name	Data Type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.

Table 180. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PLANNO	SMALLINT NOT NULL	The number of the step in which the query that is indicated in QBLOCKNO was processed. This column indicates the order in which the steps were executed.
METHOD	SMALLINT NOT NULL	A number that indicates the join method that is used for the step: **0** The table in this step is the first table that is accessed, a continuation of a previous table that was accessed, or a table that is not used. **1** A nested loop join is used. For each row of the current composite table, matching rows of a new table are found and joined. **2** A merge scan join is used. The current composite table and the new table are scanned in the order of the join columns, and matching rows are joined. **3** Sorts are needed by ORDER BY, GROUP BY, SELECT DISTINCT, UNION, INTERSECT, EXCEPT, a quantified predicate, or an IN predicate. This step does not access a new table. **4** A hybrid join was used. The current composite table is scanned in the order of the join-column rows of the new table. The new table is accessed using list prefetch.
CREATOR	VARCHAR(128) NOT NULL	The creator of the new table that is accessed in this step, blank if METHOD is 3.

Table 180. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
TNAME	VARCHAR(128) NOT NULL	The name of one of the following objects: • Table • Materialized query table • Created or declared temporary table • Materialized view • materialized table expression The value is blank if METHOD is 3. The column can also contain the name of a table in the form DSNWFQB(*qblockno*). DSNWFQB(*qblockno*) is used to represent the intermediate result of a UNION ALL, INTERSECT ALL, EXCEPT ALL, or an outer join that is materialized. If a view is merged, the name of the view does not appear. DSN_DIM_TBLX(*qblockno*) is used to the represent the work file of a star join dimension table.
TABNO	SMALLINT NOT NULL	Values are for IBM use only.
ACCESSTYPE[1]	CHAR(2) NOT NULL	The method of accessing the new table.[4]
MATCHCOLS	SMALLINT NOT NULL	For ACCESSTYPE I, IN, I1, N, NR, MX, or DX, the number of index keys that are used in an index scan; otherwise, 0.
ACCESSCREATOR	VARCHAR(128) NOT NULL	For ACCESSTYPE I, I1, N, NR, MX, or DX, the creator of the index; otherwise, blank.
ACCESSNAME	VARCHAR(128) NOT NULL	For ACCESSTYPE I, I1, H, MH, N, NR, MX, or DX, the name of the index; for ACCESSTYPE P, DSNPJW(*mixopseqno*) is the starting pair-wise join leg in MIXOPSEQ; otherwise, blank.
INDEXONLY	CHAR(1) NOT NULL	Indication of whether access to an index alone is enough to perform the step, or Indication of whether data too must be accessed. **Y** Yes **N** No
SORTN_UNIQ	CHAR(1) NOT NULL	Indication of whether the new table is sorted to remove duplicate rows. **Y** Yes **N** No
SORTN_JOIN	CHAR(1) NOT NULL	Indication of whether the new table is sorted for join method 2 or 4. **Y** Yes **N** No
SORTN_ORDERBY	CHAR(1) NOT NULL	Indication of whether the new table is sorted for ORDER BY. **Y** Yes **N** No
SORTN_GROUPBY	CHAR(1) NOT NULL	Indication of whether the new table is sorted for GROUP BY. **Y** Yes **N** No

Table 180. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
SORTC_UNIQ	CHAR(1) NOT NULL	Indication of whether the composite table is sorted to remove duplicate rows. **Y** Yes **N** No
SORTC_JOIN	CHAR(1) NOT NULL	Indication of whether the composite table is sorted for join method 1, 2 or 4. **Y** Yes **N** No
SORTC_ORDERBY	CHAR(1) NOT NULL	Indication of whether the composite table is sorted for an ORDER BY clause or a quantified predicate. **Y** Yes **N** No
SORTC_GROUPBY	CHAR(1) NOT NULL	Indication of whether the composite table is sorted for a GROUP BY clause. **Y** Yes **N** No
TSLOCKMOD	CHAR(3) NOT NULL	An indication of the mode of lock that is acquired on either the new table, or its table space or table space partitions. If the isolation can be determined at bind time, the values are: **IS** Intent share lock **IX** Intent exclusive lock **S** Share lock **U** Update lock **X** Exclusive lock **SIX** Share with intent exclusive lock **N** UR isolation; no lock If the isolation level cannot be determined at bind time, the lock mode is determined by the isolation level at run time is shown by the following values. **NS** For UR isolation, no lock; for CS, RS, or RR, an S lock. **NIS** For UR isolation, no lock; for CS, RS, or RR, an IS lock. **NSS** For UR isolation, no lock; for CS or RS, an IS lock; for RR, an S lock. **SS** For UR, CS, or RS isolation, an IS lock; for RR, an S lock. The data in this column is right justified. For example, IX appears as a blank, followed by I, followed by X. If the column contains a blank, then no lock is acquired. If the access method in the ACCESSTYPE column is DX, DI, or DU, no latches are acquired on the XML index page and no lock is acquired on the new base table data page or row, nor on the XML table and the corresponding table spaces. The value of TSLOCKMODE is a blank in this case.

Table 180. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
TIMESTAMP	CHAR(16) NOT NULL	This column is deprecated. Use EXPLAIN_TIME instead.
REMARKS	VARCHAR(762) NOT NULL	A field into which you can insert any character string of 762 or fewer characters. DB2 inserts a value into this column in certain situations. [6, 7]
PREFETCH	CHAR(1) NOT NULL WITH DEFAULT	Indication of whether data pages are to be read in advance by prefetch: **D** Optimizer expects dynamic prefetch **S** Pure sequential prefetch **L** Prefetch through a page list **U** List prefetch with an unsorted RID list **blank** Unknown or no prefetch
COLUMN_FN_EVAL	CHAR(1) NOT NULL WITH DEFAULT	When an SQL aggregate function is evaluated: **R** While the data is being read from the table or index **S** While performing a sort to satisfy a GROUP BY clause **blank** After data retrieval and after any sorts
MIXOPSEQ	SMALLINT NOT NULL WITH DEFAULT	The sequence number of a step in a multiple index operation. **1, 2, ...** *n* For the steps of the multiple index procedure (ACCESSTYPE is MX, MI, MU, DX, DI, or DU), the sequence number of the OR predicate in the SQL statement. (ACCESSTYPE is 'NR'). **0** For any other rows.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.

Table 180. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
ACCESS_DEGREE	SMALLINT	The number of parallel tasks or operations that are activated by a query. This value is determined at bind time; the actual number of parallel operations that are used at execution time could be different. This column contains 0 if a host variable is used. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.
ACCESS_PGROUP_ID[2]	SMALLINT	The identifier of the parallel group for accessing the new table. A parallel group is a set of consecutive operations, executed in parallel, that have the same number of parallel tasks. This value is determined at bind time; it could change at execution time.This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.
JOIN_DEGREE	SMALLINT	The number of parallel operations or tasks that are used in joining the composite table with the new table. This value is determined at bind time and can be 0 if a host variable is used. The actual number of parallel operations or tasks used at execution time could be different. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.

Table 180. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
JOIN_PGROUP_ID[2]	SMALLINT	The identifier of the parallel group for joining the composite table with the new table. This value is determined at bind time; it could change at execution time. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.
SORTC_PGROUP_ID[3]	SMALLINT	The parallel group identifier for the parallel sort of the composite table. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.
SORTN_PGROUP_ID[3]	SMALLINT	The parallel group identifier for the parallel sort of the new table. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.
PARALLELISM_ MODE[2]	CHAR(1)	The kind of parallelism, if any, that is used at bind time: **C** Query CP parallelism. **I** Query I/O parallelism. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns, if the method that it refers to does not apply, or if the plan or package was bound prior to Version 10.
MERGE_ JOIN_ COLS	SMALLINT	The number of columns that are joined during a merge scan join (Method=2). This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.
CORRELATION_ NAME	VARCHAR(128)	The correlation name of a table or view that is specified in the statement. If no correlation name exists, then the column is null. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.
PAGE_RANGE	CHAR(1) NOT NULL WITH DEFAULT	Indication of whether the table qualifies for page range screening, so that plans scan only the partitions that are needed. **Y** Yes **blank** No

Table 180. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
JOIN_TYPE	CHAR(1) NOT NULL WITH DEFAULT	The type of join: **F** FULL OUTER JOIN **L** LEFT OUTER JOIN **P** Pair-wise join **S** Star join **blank** INNER JOIN or no join RIGHT OUTER JOIN converts to a LEFT OUTER JOIN when you use it, so that JOIN_TYPE contains L.
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.
IBM_ SERVICE_ DATA	VARCHAR(254) FOR BIT DATA	This column contains values that are for IBM use only.
WHEN_OPTIMIZE	CHAR(1) NOT NULL WITH DEFAULT	When the access path was determined: **blank** At bind time, using a default filter factor for any host variables, parameter markers, or special registers. **B** At bind time, using a default filter factor for any host variables, parameter markers, or special registers; however, the statement is re-optimized at run time using input variable values for input host variables, parameter markers, or special registers. The bind option REOPT(ALWAYS), REOPT(AUTO), or REOPT(ONCE) must be specified for reoptimization to occur. **R** At run time, using input variables for any host variables, parameter markers, or special registers. The bind option REOPT(ALWAYS), REOPT(AUTO), or REOPT(ONCE) must be specified for this to occur.
QBLOCK_TYPE[1]	CHAR(6) NOT NULL WITH DEFAULT	For each query block, an indication of the type of SQL operation that is performed. For the outermost query, this column identifies the statement type.5 on page 2486
BIND_TIME	TIMESTAMP NOT NULL WITH DEFAULT	This column is deprecated. Use EXPLAIN_TIME instead.
OPTHINT	VARCHAR(128) NOT NULL WITH DEFAULT	A string that you use to identify this row as an optimization hint for DB2. DB2 uses this row as input when choosing an access path.

Table 180. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
HINT_USED	VARCHAR(128) NOT NULL WITH DEFAULT	One of the following values: **'APREUSE'** When an access path was successfully reused because the APREUSE option was specified at bind or rebind. '*opthint-value*' When PLAN_TABLE access path hints are used. *opthint-value* is the value of the OPTHINT column for the hint that was used. **'SYSQUERYPLAN** *query-id*' When statement-level access path hints are used. *query-id* is the value of the QUERYID column in the SYSQUERYPLAN catalog table for the hint. **'SYSQUERYSEL** *query-id*' When a predicate selectivity override is used. *query-id* is the value of the QUERYID column of the SYSQUERYSEL catalog table row for the hint. **'EXPLAIN PACKAGE: COPY** *copy-id*' When the row is the result of an EXPLAIN PACKAGE statement. *copy-id* is one of the following values: **0** The current copy. **1** The previous copy. **2** The original copy.
PRIMARY_ ACCESSTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether direct row access is attempted first: **D** DB2 tries to use direct row access with a rowid column. If DB2 cannot use direct row access with a rowid column at run time, it uses the access path that is described in the ACCESSTYPE column of PLAN_TABLE. **P** DB2 used data partitioned secondary index and a part-level operation to access the data. **T** The base table or result file is materialized into a work file, and the work file is accessed via sparse index access. If a base table is involved, then ACCESSTYPE indicates how the base table is accessed. **blank** DB2 does not try to use direct row access by using a rowid column or sparse index access for a work file. The value of the ACCESSTYPE column of PLAN_TABLE provides information on the method of accessing the table.

Table 180. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
PARENT_QBLOCKNO	SMALLINT NOT NULL WITH DEFAULT	A number that indicates the QBLOCKNO of the parent query block.
TABLE_TYPE	CHAR(1)	The type of new table: **B** Buffers for SELECT from INSERT, SELECT from UPDATE, SELECT from MERGE, or SELECT from DELETE statement. **C** Common table expression **F** Table function **I** The new table is generated from an IN-LIST predicate. If the IN-LIST predicate is selected as the matching predicate, it will be accessed as an in-memory table. **M** Materialized query table **Q** Temporary intermediate result table (not materialized). For the name of a view or nested table expression, a value of Q indicates that the materialization was virtual and not actual. Materialization can be virtual when the view or nested table expression definition contains a UNION ALL that is not distributed. **R** Recursive common table expression **S** Subquery (correlated or non-correlated) **T** Table **W** Work file The value of the column is null if the query uses GROUP BY, ORDER BY, or DISTINCT, which requires an implicit sort.
TABLE_ENCODE	CHAR(1) NOT NULL WITH DEFAULT	The encoding scheme of the table. The possible values are: **A** ASCII **E** EBCDIC **U** Unicode **M** The table contains multiple CCSID sets
TABLE_SCCSID	SMALLINT NOT NULL WITH DEFAULT	The SBCS CCSID value of the table. If column TABLE_ENCODE is M, the value is 0.
TABLE_MCCSID	SMALLINT NOT NULL WITH DEFAULT	The mixed CCSID value of the table. If the value of the TABLE_ENCODE column is M, the value is 0. If MIXED=NO in the application defaults module, the value is -2.
TABLE_DCCSID	SMALLINT NOT NULL WITH DEFAULT	The DBCS CCSID value of the table. If the value of the TABLE_ENCODE column is M, the value is 0. If MIXED=NO in the application defaults module, the value is -2.

Table 180. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
ROUTINE_ID	INTEGER NOT NULL WITH DEFAULT	The values in this column are for IBM use only.
CTEREF	SMALLINT NOT NULL WITH DEFAULT	If the referenced table is a common table expression, the value is the top-level query block number.
STMTTOKEN	VARCHAR(240)	User-specified statement token.
PARENT_PLANNO	SMALLINT NOT NULL	Corresponds to the plan number in the parent query block where a correlated subquery is invoked. Or, for non-correlated subqueries, corresponds to the plan number in the parent query block that represents the work file for the subquery.
BIND_EXPLAIN_ONLY	CHAR(1) NOT NULL WITH DEFAULT	Identifies whether the row was inserted because a command specified the EXPLAIN(ONLY) option.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.
EXPLAIN_TIME	TIMESTAMP NOT NULL WITH DEFAULT	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
MERGC	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the composite table is consolidated before the join. **Y** Yes **N** No

Table 180. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description	
MERGN	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the new table is consolidated before the join, or whether access that used a data partitioned secondary index (DPSI) involved a merge operation.	
		Y	Yes, the new table is consolidated before the join.
		N	No, the new table is not consolidated before the join
		D	Access through a DPSI involved a merge operation.
		U	Access through a DPSI that did not involve a merge operation.
SCAN_DIRECTION	CHAR(1)	For index access, the direction of the index scan:	
		F	Forward
		R	Reverse
		blank	Index scan is not used

Table 180. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **A** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

Notes:

1. For PLAN_TABLE rows in which ACCESSTYPE='A' and QBLOCK_TYPE='SELECT', the values of all other columns except QUERYNO, APPLNAME, and PROGNAME are the default values for those columns.
2. In rows that are used for optimization hints, NULL values in the following columns indicate a hint for no parallelism:

- PARALLELISM_MODE
- ACCESS_PGROUP_ID
- JOIN_PGROUP_ID

3. In rows that are used for optimization hints, NULL values in the following columns indicate a hint for no parallel sort:
   - SORTN_PGROUP_ID
   - SORTC_PGROUP_ID
4. The ACCESSTYPE column contains the following values:

   A The query is sent to an accelerator server.

   DI By an intersection of multiple DOCID lists to return the final DOCID list

   DU By a union of multiple DOCID lists to return the final DOCID list

   DX By an XML index scan on the index that is named in ACCESSNAME to return a DOCID list

   E By direct row access using a row change timestamp column.

   H By hash access. IF an overflow condition occurs, the hash overflow index that is identified by ACCESSCREATOR and ACCESSNAME is used.

   HN By hash access using an IN predicate, or an IN predicate that DB2 generates. If a hash overflow condition occurs, the hash overflow index that is identified in ACCESSCREATOR and ACCESSNAME is used.

   I By an index (identified in ACCESSCREATOR and ACCESSNAME)

   IN By an index scan when the matching predicate contains an IN predicate and the IN-list is accessed through an in-memory table.

   I1 By a one-fetch index scan

   M By a multiple index scan. A row that contains this value might be followed by a row that contains one of the following values:
   - DI
   - DU
   - MH
   - MI
   - MU
   - MX

   MH By the hash overflow index named in ACCESSNAME. A row that contains this value always follows a row that contains M.

   MI By an intersection of multiple indexes. A row that contains this value always follows a row that contains M.

   MU By a union of multiple indexes. A row that contains this value always follows a row that contains M.

   MX By an index scan on the index named in ACCESSNAME. When the access method MX follows the access method DX, DI, or DU, the table is accessed by the DOCID index by using the DOCID list that is returned by DX, DI, or DU. A row that contains this value always follows a row that contains M.

   N One of the following types:
   - By an index scan when the matching predicate contains the IN keyword
   - By an index scan when DB2 rewrites a query using the IN keyword

   O By a work file scan, as a result of a subquery.

   NR Range list access.

   P By a dynamic pair-wise index scan

   R By a table space scan

   RW By a work file scan of the result of a materialized user-defined table function

   V By buffers for an INSERT statement within a SELECT

blank Not applicable to the current row

5. The QBLOCK_TYPE column contains the following values:

SELECT
SELECT

INSERT
INSERT

UPDATE
UPDATE

MERGE
MERGE

DELETE
DELETE

SELUPD
SELECT with FOR UPDATE OF

DELCUR
DELETE WHERE CURRENT OF CURSOR

UPDCUR
UPDATE WHERE CURRENT OF CURSOR

CORSUB
Correlated subselect or fullselect

TRUNCA
TRUNCATE

NCOSUB
Noncorrelated subselect or fullselect

TABLEX
Table expression

TRIGGR
WHEN clause on CREATE TRIGGER

UNION
UNION

UNIONA
UNION ALL

INTERS
INTERSECT

INTERA
INTERSECT ALL

EXCEPT
EXCEPT

EXCEPTA
EXCEPT ALL

PRUNED
DB2 does not generate an access path for the query because the query is guaranteed to qualify zero rows, such as the case of an always-false WHERE clause. For example:`WHERE 0=1`

6. DB2 inserts a value into the REMARKS column at bind or rebind when the EXPLAIN(ONLY) option is specified and reuse or comparison fails for an access path. The value might include the following information:
   - A reason code that corresponds to the reason codes in SQLCODE +395 when reuse fails
   - The name of the unmatched PLAN_TABLE column for which comparison failed
   - A string that identifies that unmatched rows where found
7. DB2 inserts a value into the REMARKS column when selectivity overrides cannot be used for a statement . The value contains a reason code that indicates why the selectivity override was not used. The value might also contain additional diagnostic information.

   The reason code values correspond to SQLCODE +395 reason codes:

   '1'-'41' Indicate that an optimization hint that was generated as part of the extended optimization process cannot be applied. Use only a single selectivity instance.

   '42' Indicates that the structure of the selectivity override is not valid. Generate the selectivity override again.

   '43' The selectivity override cannot be applied because of an unexpected error. If the problem persists, you might need to contact IBM Software Support.

   '44'-'99'
   Indicate that an optimization hint that was generated as part of the extended optimization process cannot be applied. Use only a single selectivity instance.

The PLAN_TABLE_HINT_IX index

The PLAN_TABLE_HINT_IX index improves prepare performance when access path hints are used. This index is required for statement-level access paths and optimization parameters. The PLAN_TABLE_HINT_IX index is optional, although strongly recommended, for PLAN_TABLE access path hints.

The statement that creates the PLAN_TABLE_HINT_IX index is included as part of the DSNTESC member of the SDSNSAMP library. PSPI

EXPLAIN table changes in Version 11 (DB2 for z/OS What's New?)

DSN_COLDIST_TABLE

The column distribution table contains non-uniform column group statistics that are obtained dynamically by DB2 from non-index leaf pages.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM
One instance of each EXPLAIN table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use these tables. These tables are created when you run job DSNTIJSG when you install or migrate DB2.

userID You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

Column descriptions

PSPI

The following table shows the descriptions of the columns in the DSN_COLDIST_TABLE table.

Table 181. Descriptions of columns in DSN_COLDIST_TABLE

Column name	Data Type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.
APPLNAME	VARCHAR(128) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.

Table 181. Descriptions of columns in DSN_COLDIST_TABLE (continued)

Column name	Data Type	Description
COLLID	VARCHAR(128) NOT NULL	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
GROUP_MEMBER	VARCHAR(128) NOT NULL	The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.
VERSION	VARCHAR(122) NOT NULL	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.

Table 181. Descriptions of columns in DSN_COLDIST_TABLE (continued)

Column name	Data Type	Description
SCHEMA	VARCHAR(128) NOT NULL	The schema of the table that contains the column.
TBNAME	VARCHAR(128) NOT NULL	The name of the table that contains the column.
NAME	VARCHAR(128) NOT NULL	Name of the column. If the value of NUMCOLUMNS is greater than 1, this name identifies the first column name of the set of columns associated with the statistics.
COLVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	Contains the data of a frequently occurring value in the column. Statistics are not collected for an index on a ROWID column. If the value has a non-character data type, the data might not be printable. This column might contain values that depend on the value of the type column: **TYPE='T'** One of the following values: • 'E3C2C1C3C1D9C4C6' for TBACARDF • 'E3C2C1D5C1C3E3C6' for TBANPAGF • 'E3C2C1D5D7C1C7C6' for TBANACTF **TYPE='L'** 'C3C1E3C6D3C4C3C6' for CATFLDCF **TYPE='P'** One of the following values: • 'D7C3C1D7D5D9E6C6' for PCAPNRWF • 'D7C3C1D7D5D7C7C6' for PCAPNPGF
TYPE	CHAR(1) NOT NULL	The type of statistics: **C** Cardinality **F** Frequent value **H** Histogram **T** Real-time table cardinality **L** Real-time column cardinality (unique index only) **P** real-time partition cardinality

Table 181. Descriptions of columns in DSN_COLDIST_TABLE (continued)

Column name	Data Type	Description
CARDF	FLOAT NOT NULL	For TYPE='C', the number of distinct values for the column group. For TYPE='H', the number of distinct values for the column group in a quantile indicated by the value of the QUANTILENO column. For TYPE='T', a value related to real-time statistics table values that are determined by the COLVALUE column. For TYPE= 'L', a value related to a real-time statistics column value that is determined by the COLVALUE column. The QUANTILENO column contains the column number. The NAME column contains the column name. For TYPE='P' a value related to real-time statistics partition value that is determined by the COLVALUE column. The QUANTILENO column contains the partition number.
COLGROUPCOLNO	VARCHAR(254) NOT NULL FOR BIT DATA	The identity of the set of columns associated with the statistics. If the statistics are only associated with a single column, the field contains a zero length. Otherwise, the field is an array of SMALLINT column numbers with a dimension equal to the value in the NUMCOLUMNS column. This is an updatable column.
NUMCOLUMNS	SMALLINT NOT NULL	Identifies the number of columns associated with the statistics.
FREQUENCYF	FLOAT NOT NULL	The percentage of rows in the table with the value that is specified in the COLVALUE column when the number is multiplied by 100. For example, a value of '1' indicates 100%. A value of '.153' indicates 15.3%.
QUANTILENO	SMALLINT NOT NULL	The ordinary sequence number of a quantile in the whole consecutive value range, from low to high. This column is not updatable. For TYPE= 'L', this column contains the column number. For TYPE='P', the column contains the partition number.
LOWVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	For TYPE='H', this is the lower bound for the quantile indicated by the value of the QUANTILENO column. Not used if the value of the TYPE column is not 'H'. This column is not updatable.
HIGHVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	For TYPE='H', this is the higher bound for the quantile indicated by the value of the QUANTILENO column. This column is not used if the value of the TYPE column is not 'H'. This column is not updatable.

Table 181. Descriptions of columns in DSN_COLDIST_TABLE (continued)

Column name	Data Type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **A** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

PSPI

Related concepts:

Dynamic collection of index filtering estimates (DB2 Performance)

DSN_DETCOST_TABLE

The detailed cost table, DSN_DETCOST_TABLE, contains information about detailed cost estimation of the mini-plans in a query.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM
: One instance of each EXPLAIN table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use these tables. These tables are created when you run job DSNTIJSG when you install or migrate DB2.

userID
: You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

Column descriptions

The following table describes the columns of DSN_DETCOST_TABLE.

Table 182. DSN_DETCOST_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PLANNO	SMALLINT NOT NULL	The plan number, a number used to identify each mini-plan with a query block.
OPENIO	FLOAT(4) NOT NULL	The Do-at-open IO cost for non-correlated subquery.
OPENCPU	FLOAT(4) NOT NULL	The Do-at-open CPU cost for non-correlated subquery.
OPENCOST	FLOAT(4) NOT NULL	The Do-at-open total cost for non-correlated subquery.
DMIO	FLOAT(4) NOT NULL	IBM internal use only.

Table 182. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
DMCPU	FLOAT(4) NOT NULL	IBM internal use only.
DMTOT	FLOAT(4) NOT NULL	IBM internal use only.
SUBQIO	FLOAT(4) NOT NULL	IBM internal use only.
SUBQCOST	FLOAT(4) NOT NULL	IBM internal use only.
BASEIO	FLOAT(4) NOT NULL	IBM internal use only.
BASECPU	FLOAT(4) NOT NULL	IBM internal use only.
BASETOT	FLOAT(4) NOT NULL	IBM internal use only.
ONECOMPROWS	FLOAT(4) NOT NULL	The number of rows qualified after applying local predicates.
IMLEAF	FLOAT(4) NOT NULL	The number of index leaf pages scanned by Data Manager.
IMIO	FLOAT(4) NOT NULL	IBM internal use only.
IMPREFH	CHAR(2) NOT NULL	IBM internal use only.
IMMPRED	INTEGER NOT NULL	IBM internal use only.
IMFF	FLOAT(4) NOT NULL	The filter factor of matching predicates only.
IMSRPRED	INTEGER NOT NULL	IBM internal use only.
IMFFADJ	FLOAT(4) NOT NULL	The filter factor of matching and screening predicates.
IMSCANCST	FLOAT(4) NOT NULL	IBM internal use only.
IMROWCST	FLOAT(4) NOT NULL	IBM internal use only.
IMPAGECST	FLOAT(4) NOT NULL	IBM internal use only.
IMRIDSORT	FLOAT(4) NOT NULL	IBM internal use only.
IMMERGCST	FLOAT(4) NOT NULL	IBM internal use only.
IMCPU	FLOAT(4) NOT NULL	IBM internal use only.
IMTOT	FLOAT(4) NOT NULL	IBM internal use only.
IMSEQNO	SMALLINT NOT NULL	IBM internal use only.

Table 182. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
DMPEREFH	FLOAT(4) NOT NULL	IBM internal use only.
DMCLUDIO	FLOAT(4) NOT NULL	IBM internal use only.
DMPREDS	INTEGER NOT NULL	IBM internal use only.
DMSROWS	FLOAT(4) NOT NULL	IBM internal use only.
DMSCANCST	FLOAT(4) NOT NULL	IBM internal use only.
DMCOLS	FLOAT(4) NOT NULL	The number of data manager columns.
DMROWS	FLOAT(4) NOT NULL	The number of data manager rows returned (after all stage 1 predicates are applied).
RDSROWCST	FLOAT(4) NOT NULL	IBM internal use only.
DMPAGECST	FLOAT(4) NOT NULL	IBM internal use only.
DMDATAIO	FLOAT(4) NOT NULL	IBM internal use only.
DMDATAIO	FLOAT(4) NOT NULL	IBM internal use only.
DMDATACPU	FLOAT(4) NOT NULL	IBM internal use only.
DMDATACPU	FLOAT(4) NOT NULL	IBM internal use only.
RDSROW	FLOAT(4) NOT NULL	The number of RDS rows returned (after all stage 1 and stage 2 predicates are applied).
SNCOLS	SMALLINT NOT NULL	The number of columns as sort input for new table.
SNROWS	FLOAT(4) NOT NULL	The number of rows as sort input for new table.
SNRECSZ	INTEGER NOT NULL	The record size for new table.
SNPAGES	FLOAT(4) NOT NULL	The page size for new table.
SNRUNS	FLOAT(4) NOT NULL	The number of runs generated for sort of new table.
SNMERGES	FLOAT(4) NOT NULL	The number of merges needed during sort.
SNIOCOST	FLOAT(4) NOT NULL	IBM internal use only.
SNCPUCOST	FLOAT(4) NOT NULL	IBM internal use only.
SNCOST	FLOAT(4) NOT NULL	IBM internal use only.

Table 182. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
SNCSCANIO	FLOAT(4) NOT NULL	IBM internal use only.
SNSCANCPU	FLOAT(4) NOT NULL	IBM internal use only.
SNCCOLS	FLOAT(4) NOT NULL	The number of columns as sort input for Composite table.
SCROWS	FLOAT(4) NOT NULL	The number of rows as sort input for Composite Table.
SCRECSZ	FLOAT(4) NOT NULL	The record size for Composite table.
SCPAGES	FLOAT(4) NOT NULL	The page size for Composite table.
SCRUNS	FLOAT(4) NOT NULL	The number of runs generated during sort of composite.
SCMERGES	FLOAT(4) NOT NULL	The number of merges needed during sort of composite.
SCIOCOST	FLOAT(4) NOT NULL	IBM internal use only.
SCCPUCOST	FLOAT(4) NOT NULL	IBM internal use only.
SCCOST	FLOAT(4) NOT NULL	IBM internal use only.
SCSCANIO	FLOAT(4) NOT NULL	IBM internal use only.
SCSCANCPU	FLOAT(4) NOT NULL	IBM internal use only.
SCSCANCOST	FLOAT(4) NOT NULL	IBM internal use only.
COMPCARD	FLOAT(4) NOT NULL	The total composite cardinality.
COMPIOCOST	FLOAT(4) NOT NULL	IBM internal use only.
COMPCPUCOST	FLOAT(4) NOT NULL	IBM internal use only.
COMPCOST	FLOAT(4) NOT NULL	The total cost.
JOINCOLS	SMALLINT NOT NULL	IBM internal use only.

Table 182. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
COSTBLK	INTEGER NOT NULL	IBM internal use only.
COSTSTOR	INTEGER NOT NULL	IBM internal use only.
MPBLK	INTEGER NOT NULL	IBM internal use only.
MPSTOR	INTEGER NOT NULL	IBM internal use only.
COMPOSITES	INTEGER NOT NULL	IBM internal use only.
CLIPPED	INTEGER NOT NULL	IBM internal use only.
TABREF	VARCHAR(64) NOT NULL FOR BIT DATA	IBM internal use only.
MAX_COMPOSITES	INTEGER NOT NULL	IBM internal use only.
MAX_STOR	INTEGER NOT NULL	IBM internal use only.
MAX_CPU	INTEGER NOT NULL	IBM internal use only.
MAX_ELAP	INTEGER NOT NULL	IBM internal use only.
TBL_JOINED_THRESH	INTEGER NOT NULL	IBM internal use only.
STOR_USED	INTEGER NOT NULL	IBM internal use only.
CPU_USED	INTEGER NOT NULL	IBM internal use only.
ELAPSED	INTEGER NOT NULL	IBM internal use only.
MIN_CARD_KEEP	FLOAT(4) NOT NULL	IBM internal use only.
MAX_CARD_KEEP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_COST_KEEP	FLOAT(4) NOT NULL	IBM internal use only.

Table 182. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
MAX_COST_KEEP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_VALUE_KEEP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_VALUE_CARD_KEEP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_VALUE_COST_KEEP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_CARD_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MAX_CARD_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_COST_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MAX_COST_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_VALUE_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_VALUE_CARD_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_VALUE_COST_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MAX_VALUE_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MAX_VALUE_CARD_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MAX_VALUE_COST_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.
PSEQIOCOST	FLOAT(4) NOT NULL	IBM internal use only.
PSEQIOCOST	FLOAT(4) NOT NULL	IBM internal use only.
PSEQCPUCOST	FLOAT(4) NOT NULL	IBM internal use only.
PSEQCOST	FLOAT(4) NOT NULL	IBM internal use only.
PADJIOCOST	FLOAT(4) NOT NULL	IBM internal use only.
PADJCPUCOST	FLOAT(4) NOT NULL	IBM internal use only.
PADJCOST	FLOAT(4) NOT NULL	IBM internal use only.

Table 182. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
UNCERTAINTY	FLOAT(4) NOT NULL WITH DEFAULT	Describes the uncertainty factor of inner table index access. It is aggregated from uncertainty of inner table probing predicates. A larger value indicates a higher uncertainty. 0 indicates no uncertainty or uncertainty not considered.
UNCERTAINTY_1T	FLOAT(4) NOT NULL WITH DEFAULT	Describes the uncertainty factor of ONECOMPROWS column of the table. It is aggregated from all local predicates on the table. A larger value indicates a higher uncertainty. 0 indicates no uncertainty or uncertainty not considered.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.
COLLID	VARCHAR(128) NOT NULL	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
VERSION	VARCHAR(128) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
IMNP	FLOAT(4) NOT NULL WITH DEFAULT	IBM internal use only.
DMNP	FLOAT(4) NOT NULL WITH DEFAULT	IBM internal use only.
IMJC	FLOAT(4) NOT NULL WITH DEFAULT	IBM internal use only.
IMFC	FLOAT(4) NOT NULL WITH DEFAULT	IBM internal use only.
IMJBC	FLOAT(4) NOT NULL WITH DEFAULT	IBM internal use only.

Table 182. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
IMJFC	FLOAT(4) NOT NULL WITH DEFAULT	IBM internal use only.
CRED	INTEGER NOT NULL WITH DEFAULT	IBM internal use only.
IXSCAN_SKIP_DUPS	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether duplicate index key values are skipped during an index scan. **'Y'** Duplicate key values are skipped. **'N'** Duplicate key values are not skipped.
IXSCAN_SKIP_SCREEN	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether key ranges that are disqualified by index screening predicates are skipped during an index scan. **'Y'** Disqualified key ranges are skipped. **'N'** Key ranges are not skipped.
EARLY_OUT	CHAR(1) NOT NULL WITH DEFAULT ' '	Whether fetching from the table stops after the first qualified row. **'Y'** Internal fetching stops after the first qualified row **'N'** Internal fetching continues after the first qualified row. **blank** The EXPLAIN information was captured in a previous release, or the EXPLAIN information was captured for a package that was bound in a previous release.

Table 182. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **A** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

DSN_FILTER_TABLE

The filter table, DSN_FILTER_TABLE, contains information about how predicates are used during query processing.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM
: One instance of each EXPLAIN table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use these tables. These tables are created when you run job DSNTIJSG when you install or migrate DB2.

userID
: You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

Column descriptions

The following table describes the columns of DSN_FILTER_TABLE.

Table 183. DSN_FILTER_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
PLANNO	SMALLINT	The plan number, a number used to identify each miniplan with a query block.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.

Table 183. DSN_FILTER_TABLE description (continued)

Column name	Data type	Description
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
ORDERNO	INTEGER NOT NULL	The sequence number of evaluation. Indicates the order in which the predicate is applied within each stage
PREDNO	INTEGER NOT NULL	The predicate number, a number used to identify a predicate within a query.
STAGE	CHAR(9) NOT NULL	The processing stage in which the predicate is evaluated: **MATCHING** During the index matching stage. **SCREENING** During the index screening stage. **PAGERANGE** DB2 used page range screening to limit the number of partitions that were accessed to evaluate the predicate in a join context. **STAGE1** During stage 1 processing, after data page access. **STAGE2** During stage 2 processing on the returned data rows.
ORDERCLASS	INTEGER NOT NULL	IBM internal use only.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
MIXOPSEQNO	SMALLINT NOT NULL	IBM internal use only.
REEVAL	CHAR(1) NOT NULL	IBM internal use only.

Table 183. DSN_FILTER_TABLE description (continued)

Column name	Data type	Description
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PUSHDOWN	CHAR(1) NOT NULL WITH DEFAULT	Whether the predicate is pushed down the Index Manager or Data Manager subcomponents for evaluation: **'I'** The Index Manager subcomponent evaluates the predicate. **'D'** The Data Manager subcomponent evaluates the predicate. **blank** The predicate is not pushed down for evaluation.

Table 183. DSN_FILTER_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **A** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

Column descriptions

PSPI

The following table describes the columns of DSN_FUNCTION_TABLE.

Table 184. Descriptions of columns in DSN_FUNCTION_TABLE

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL WITH DEFAULT	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.
QBLOCKNO	INTEGER NOT NULL WITH DEFAULT	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
APPLNAME	VARCHAR(24) NOT NULL WITH DEFAULT	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PROGNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.

Table 184. Descriptions of columns in DSN_FUNCTION_TABLE (continued)

Column name	Data type	Description
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.
EXPLAIN_TIME	TIMESTAMP NOT NULL WITH DEFAULT	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
SCHEMA_NAME	VARCHAR(128) NOT NULL WITH DEFAULT	The schema name of the function invoked in the explained statement.
FUNCTION_NAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the function invoked in the explained statement.
SPEC_FUNC_NAME	VARCHAR(128) NOT NULL WITH DEFAULT	The specific name of the function invoked in the explained statement.
FUNCTION_TYPE	CHAR(2) NOT NULL WITH DEFAULT	The type of function invoked in the explained statement. Possible values are: **CU** Column function **SU** Scalar function **TU** Table function
VIEW_CREATOR	VARCHAR(128) NOT NULL WITH DEFAULT	If the function specified in the FUNCTION_NAME column is referenced in a view definition, the creator of the view. Otherwise, blank.
VIEW_NAME	VARCHAR(128) NOT NULL WITH DEFAULT	If the function specified in the FUNCTION_NAME column is referenced in a view definition, the name of the view. Otherwise, blank.
PATH	VARCHAR(2048) NOT NULL WITH DEFAULT	The value of the SQL path that was used to resolve the schema name of the function.
FUNCTION_TEXT	VARCHAR(1500) NOT NULL WITH DEFAULT	The text of the function reference (the function name and parameters). If the function reference is over 100 bytes, this column contains the first 100 bytes. For functions specified in infix notation, FUNCTION_TEXT contains only the function name. For example, for a function named /, which overloads the SQL divide operator, if the function reference is A/B, FUNCTION_TEXT contains only /.
FUNC_VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	For a version of a non-inline SQL scalar function, this column contains the version identifier. For all other cases, this column contains a zero length string. A version of a non-inline SQL scalar function is defined in the SYSIBM.SYSROUTINES table with ORIGIN='Q', FUNCTION_TYPE='S', INLINE='N', and VERSION column containing the version identifier.

Table 184. Descriptions of columns in DSN_FUNCTION_TABLE (continued)

Column name	Data type	Description
SECURE	CHAR(1) NOT NULL WITH DEFAULT	Whether the user-defined function is secure.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **A** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

Related tasks:

Checking how DB2 resolves functions by using DSN_FUNCTION_TABLE (DB2 Application programming and SQL)

DSN_KEYTGTDIST_TABLE

The key-target distribution table contains non-uniform index expression statistic that are obtained dynamically by the DB2 optimizer.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM
One instance of each EXPLAIN table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use these tables. These tables are created when you run job DSNTIJSG when you install or migrate DB2.

userID You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

COLUMN descriptions

The following table shows the descriptions of the columns in the DSN_KEYTGTDIST_TABLE table.

Table 185. Descriptions of columns in DSN_KEYTGTDIST_TABLE

Column name	Data Type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.
APPLNAME	VARCHAR(128) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.

Table 185. Descriptions of columns in DSN_KEYTGTDIST_TABLE (continued)

Column name	Data Type	Description
COLLID	VARCHAR(128) NOT NULL	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
GROUP_MEMBER	VARCHAR(128) NOT NULL	The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.
VERSION	VARCHAR(122) NOT NULL	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.

Table 185. Descriptions of columns in DSN_KEYTGTDIST_TABLE (continued)

Column name	Data Type	Description
IXSCHEMA	VARCHAR(128) NOT NULL	The qualifier of the index.
IXNAME	VARCHAR(128) NOT NULL	The name of the index.
KEYSEQ	VARCHAR(128) NOT NULL	The numeric position of the key-target in the index.
KEYVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	Contains the data of a frequently occurring value. Statistics are not collected for an index on a ROWID column. If the value has a non-character data type, the data might not be printable. When the value of the TYPE column contains 'I', this column contains one of the following values: • 'C9C4E7C6E4D3D2C6' for IDXFULKF • 'C9C4E7D3C5C1C6C6' for IDXLEAFF • 'C9C4E7D5D3E5D3C6' for IDXNLVLF
TYPE	CHAR(1) NOT NULL	The type of statistics: **C** Cardinality **F** Frequent value **H** Histogram **I** Real-time index statistics
CARDF	FLOAT NOT NULL	For TYPE='C', the number of distinct values for the column group. For TYPE='H', the number of distinct values for the column group in a quantile indicated by the value of the QUANTILENO column. For TYPE='I', a value related to real-time index statistics values determined by the KEYVALUE column.
KEYGROUPKEYNO	VARCHAR(254) NOT NULL FOR BIT DATA	Contains a value that identifies the set of keys that are associated with the statistics. If the statistics are associated with more than a single key, it contains an array of SMALLINT key numbers with a dimension that is equal to the value in NUMKEYS. If the statistics are only associated with a single key, it contains 0.
NUMKEYS	SMALLINT NOT NULL	The number of keys that are associated with the statistics.
FREQUENCYF	FLOAT NOT NULL	The percentage of rows in the table with the value that is specified in the COLVALUE column when the number is multiplied by 100. For example, a value of '1' indicates 100%. A value of '.153' indicates 15.3%.
QUANTILENO	SMALLINT NOT NULL	The ordinary sequence number of a quantile in the whole consecutive value range, from low to high. This column is not updatable
LOWVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	For TYPE='H', this is the lower bound for the quantile indicated by the value of the QUANTILENO column. Not used if the value of the TYPE column is not 'H'. This column is not updatable.

Table 185. Descriptions of columns in DSN_KEYTGTDIST_TABLE (continued)

Column name	Data Type	Description
HIGHVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	For TYPE='H', this is the higher bound for the quantile indicated by the value of the QUANTILENO column. This column is not used if the value of the TYPE column is not 'H'. This column is not updatable.
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **A** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

DSN_PGRANGE_TABLE

The page range table, DSN_PGRANGE_TABLE, contains information about qualified partitions for all page range scans in a query.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM
One instance of each EXPLAIN table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use these tables. These tables are created when you run job DSNTIJSG when you install or migrate DB2.

userID You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

Column descriptions

The following table describes the columns of DSN_PGRANGE_TABLE.

Table 186. DSN_PGRANGE_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
TABNO	SMALLINT NOT NULL	The table number, a number which uniquely identifies the corresponding table reference within a query.
RANGE	SMALLINT NOT NULL	The sequence number of the current page range.
FIRSTPART	SMALLINT NOT NULL	The starting partition in the current page range.
LASTPART	SMALLINT NOT NULL	The ending partition in the current page range.
NUMPARTS	SMALLINT NOT NULL	The number of partitions in the current page range.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.

Table 186. DSN_PGRANGE_TABLE description (continued)

Column name	Data type	Description
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.
APPLNAME	VARCHAR(24) NOT NULL WITH DEFAULT	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PROGNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.

Table 186. DSN_PGRANGE_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **A** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

Column descriptions

The following table describes the columns of DSN_PGROUP_TABLE

Table 187. DSN_PGROUP_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
PLANNAME	VARCHAR(24) NOT NULL	The application plan name.
COLLID	VARCHAR(128) NOT NULL	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.

Table 187. DSN_PGROUP_TABLE description (continued)

Column name	Data type	Description
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
VERSION	VARCHAR(122) NOT NULL	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
GROUPID	SMALLINT NOT NULL	The parallel group identifier within the current query block.
FIRSTPLAN	SMALLINT NOT NULL	The plan number of the first contributing mini-plan associated within this parallel group.
LASTPLAN	SMALLINT NOT NULL	The plan number of the last mini-plan associated within this parallel group.
CPUCOST	REAL NOT NULL	The estimated total CPU cost of this parallel group in milliseconds.
IOCOST	REAL NOT NULL	The estimated total I/O cost of this parallel group in milliseconds.
BESTTIME	REAL NOT NULL	The estimated elapsed time for each parallel task for this parallel group.
DEGREE	SMALLINT NOT NULL	The degree of parallelism for this parallel group determined at bind time. Max parallelism degree if the Table space is large is 255, otherwise 64.
MODE	CHAR(1) NOT NULL	The parallel mode: **'I'** I/O parallelism **'C'** CPU parallelism **'N'** No parallelism
REASON	SMALLINT NOT NULL	The reason code for downgrading parallelism mode.
LOCALCPU	SMALLINT NOT NULL	The number of CPUs currently online when preparing the query.
TOTALCPU	SMALLINT NOT NULL	The total number of CPUs in Sysplex. LOCALCPU and TOTALCPU are different only for the DB2 coordinator in a Sysplex.
FIRSTBASE	SMALLINT	The table number of the table that partitioning is performed on.
LARGETS	CHAR(1)	'Y' if the TableSpace is large in this group.

Table 187. DSN_PGROUP_TABLE description (continued)

Column name	Data type	Description
PARTKIND	CHAR(1)	The partitioning type: **'L'** Logical partitioning **'P'** Physical partitioning
GROUPTYPE	CHAR(3)	Determines what operations this parallel group contains: table Access, Join, or Sort 'A' 'AJ' 'AJS'
ORDER	CHAR(1)	The ordering requirement of this parallel group : **'N'** No order. Results need no ordering. **'T'** Natural Order. Ordering is required but results already ordered if accessed via index. **'K'** Key Order. Ordering achieved by sort. Results ordered by sort key. This value applies only to parallel sort.
STYLE	CHAR(4)	The Input/Output format style of this parallel group. Blank for IO Parallelism. For other modes: **'RIRO'** Records IN, Records OUT **'WIRO'** Work file IN, Records OUT **'WIWO'** Work file IN, Work file OUT
RANGEKIND	CHAR(1)	The range type: **'K'** Key range **'L'** IN-list elements partitioning **'P'** Page range **'R'** Record range partitioning
NKEYCOLS	SMALLINT	The number of interesting key columns, that is, the number of columns that will participate in the key operation for this parallel group.
LOWBOUND	VARCHAR(40) FOR BIT DATA	The low bound of parallel group.
HIGHBOUND	VARCHAR(40) FOR BIT DATA	The high bound of parallel group.
LOWKEY	VARCHAR(40) FOR BIT DATA	The low key of range if partitioned by key range.
HIGHKEY	VARCHAR(40) FOR BIT DATA	The high key of range if partitioned by key range.
FIRSTPAGE	CHAR(4) FOR BIT DATA	The first page in range if partitioned by page range.
LASTPAGE	CHAR(4) FOR BIT DATA	The last page in range if partitioned by page range.

Table 187. DSN_PGROUP_TABLE description (continued)

Column name	Data type	Description
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.
HOST_REASON	SMALLINT	IBM internal use only.
PARA_TYPE	CHAR(4)	IBM internal use only.
PART_INNER	CHAR(1)	IBM internal use only.
GRNU_KEYRNG	CHAR(1)	IBM internal use only.
OPEN_KEYRNG	CHAR(1)	IBM internal use only.
APPLNAME	VARCHAR(24) NOT NULL WITH DEFAULT	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.
STRAW_MODEL	CHAR(1) NOT NULL WITH DEFAULT	IBM internal use only.

Table 187. DSN_PGROUP_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **A** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

PSPI

DSN_PREDICAT_TABLE

The predicate table, DSN_PREDICAT_TABLE, contains information about all of the predicates in a query. It is also used as input when you issue a BIND QUERY command to override predicate selectivities for matching SQL statements.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM
One instance of each EXPLAIN table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use these tables. These tables are created when you run job DSNTIJSG when you install or migrate DB2.

userID You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

Column descriptions

The following table describes the columns of the DSN_PREDICAT_TABLE

Table 188. DSN_PREDICAT_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PREDNO	INTEGER NOT NULL	The predicate number, a number used to identify a predicate within a query.

Table 188. DSN_PREDICAT_TABLE description (continued)

Column name	Data type	Description
TYPE	CHAR(8) NOT NULL	A string used to indicate the type or the operation of the predicate. The possible values are: • 'AND' • 'BETWEEN' • 'EQUAL' • 'EXISTS • 'COMPOUND' • 'HAVING' • 'IN' • 'LIKE' • 'NOT LIKE' • 'NOTEXIST' • 'OTHERS' • 'OR' • 'RANGE' • 'SUBQUERY' • 'XEXISTS' • 'NXEXISTS'
LEFT_HAND_SIDE	VARCHAR(128) NOT NULL	Describes the left side of the predicate. If the left side of the predicate is a table column, this value indicates the name of that column. Other possible values are: • 'VALUE' • 'COLEXP' • 'NONCOLEXP' • 'CORSUB' • 'NONCORSUB' • 'SUBQUERY' • 'EXPRESSION' • Blanks
LEFT_HAND_PNO	INTEGER NOT NULL	If the predicate is a compound predicate (AND/OR), then this column indicates the first child predicate. However, this column is not reliable when the predicate tree consolidation happens. Use PARENT_PNO instead to reconstruct the predicate tree.
LHS_TABNO	SMALLINT NOT NULL	If the left side of the predicate is a table column or a column expression in an expression-based index, then this column indicates a number which uniquely identifies the corresponding table reference within a query.
LHS_QBNO	SMALLINT NOT NULL	If the left side of the predicate is a table column or a column expression in expression-based index, then this column indicates a number which uniquely identifies the corresponding query block within a query.

Table 188. DSN_PREDICAT_TABLE description (continued)

Column name	Data type	Description
RIGHT_HAND_SIDE	VARCHAR(128) NOT NULL	Describes the right side of the predicate. If the right side of the predicate is a table column, this value column indicates the column name. Other possible values are: • 'VALUE' • 'COLEXP' • 'NONCOLEXP' • 'CORSUB' • 'NONCORSUB' • 'SUBQUERY' • 'EXPRESSION' • Blanks
RIGHT_HAND_PNO	INTEGER NOT NULL	If the predicate is a compound predicate (AND/OR), then this column indicates the second child predicate. However, this column is not reliable when the predicate tree consolidation happens. Use PARENT_PNO instead to reconstruct the predicate tree.
RHS_TABNO	CHAR(1) NOT NULL	If the right side of the predicate is a table column or a column expression in an index on expression, then this column indicates a number which uniquely identifies the corresponding table reference within a query.
RHS_QBNO	CHAR(1) NOT NULL	If the right side of the predicate is a subquery or a column expression in an expression-based index, then this column indicates a number which uniquely identifies the corresponding query block within a query.
FILTER_FACTOR	FLOAT NOT NULL	The estimated filter factor.
BOOLEAN_TERM	CHAR(1) NOT NULL	Whether this predicate can be used to determine the truth value of the whole WHERE clause.
SEARCHARG	CHAR(1) NOT NULL	Whether this predicate can be processed by data manager (DM). If it is not, then the relational data service (RDS) needs to be used to take care of it, which is more costly.
JOIN	CHAR(1) NOT NULL	Whether the predicate can be used as a simple join predicate between two tables.
AFTER_JOIN	CHAR(1) NOT NULL	Indicates the predicate evaluation phase: **'A'** After join **'D'** During join **blank** Not applicable

Table 188. DSN_PREDICAT_TABLE description (continued)

Column name	Data type	Description
ADDED_PRED	CHAR(1) NOT NULL	Whether the predicate is generated by DB2, and the reason why the predicate is added: **blank** DB2 did not add the predicate. **'B'** For bubble up. **'C'** For correlation. **'J'** For join. **'K'** For LIKE for expression-based index. **'L'** For localization. **'P'** For push down. **'R'** For page range. **'S'** For simplification. **'T'** For transitive closure.
REDUNDANT_PRED	CHAR(1) NOT NULL	Whether it is a redundant predicate, which means evaluation of other predicates in the query already determines the result that the predicate provides.
DIRECT_ACCESS	CHAR(1) NOT NULL	Whether the predicate is direct access, which means one can navigate directly to the row through ROWID.
KEYFIELD	CHAR(1) NOT NULL	Whether the predicate includes the index key column of the involved table for all applicable indexes considered by DB2.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
CATEGORY	SMALLINT NOT NULL	IBM internal use only.
CATEGORY_B	SMALLINT NOT NULL	IBM internal use only.
TEXT	VARCHAR(2000) NOT NULL	The text of the transformed predicate text. If the text of the predicate contains more than 2000 characters, it is truncated.
PRED_ENCODE	CHAR(1) NOT NULL WITH DEFAULT	IBM internal use only.
PRED_CCSID	SMALLINT NOT NULL WITH DEFAULT	IBM internal use only.
PRED_MCCSID	SMALLINT NOT NULL WITH DEFAULT	IBM internal use only.

Table 188. DSN_PREDICAT_TABLE description (continued)

Column name	Data type	Description
MARKER	CHAR(1) NOT NULL WITH DEFAULT	Whether this predicate includes host variables, parameter markers, or special registers.
PARENT_PNO	INTEGER NOT NULL	The parent predicate number. If this predicate is a root predicate within a query block, then this column is 0.
NEGATION	CHAR(1) NOT NULL	Whether this predicate is negated via NOT.
LITERALS	VARCHAR(128) NOT NULL	This column indicates the literal value or literal values separated by colon symbols.
CLAUSE	CHAR(8) NOT NULL	The clause where the predicate exists: **'HAVING '** The HAVING clause **'ON '** The ON clause **'WHERE '** The WHERE clause **SELECT** The SELECT clause
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.
ORIGIN	CHAR(1) NOT NULL WITH DEFAULT	Indicates the origin of the predicate. **Blank** Generated by DB2 **C** Column mask **R** Row permission **U** Specified by the user
UNCERTAINTY	FLOAT(4) NOT NULL WITH DEFAULT	Describes the uncertainty factor of a predicate's estimated filter factor. A bigger value indicates a higher degree of uncertainty. Value zero indicates no uncertainty or uncertainty not considered.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.

Table 188. DSN_PREDICAT_TABLE description (continued)

Column name	Data type	Description
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **A** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

Related reference:

Tables for influencing access path selection (DB2 Performance)

BIND QUERY (DSN) (DB2 Commands)

DSN_PREDICATE_SELECTIVITY table

The predicate selectivity table contains information about the selectivity of predicates that are used for access path selection. It is used as an input table for the BIND QUERY command when selectivity overrides are specified.

PSPI

When selectivity overrides are not specified, or specified selectivity overrides cannot not be used by DB2, the DSN_PREDICATE_SELECTIVITY table contains one row for each predicate in DSN_PREDICAT_TABLE that is used for access path selection. These rows contain ASSUMPTION='NORMAL' values. DSN_PREDICATE_SELECTIVITY does not contain rows from DSN_PREDICAT_TABLE for predicates that are not used for access path selection.

When selectivity overrides are specified and used by DB2, this table also contains one row for each selectivity override that was used. These rows contain ASSUMPTION='OVERRIDE' values.

Additionally, if the sum of the weights for all specified selectivity override instances is less than one, this table contains one row for each predicate in DSN_PREDICAT_TABLE that is used for access path selection. These rows contain ASSUMPTION='NORMAL' values and WEIGHT values equal to one minus the sum of the specified override weight values.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM
One instance of each EXPLAIN table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use these tables. These tables are created when you run job DSNTIJSG when you install or migrate DB2.

userID You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

Column descriptions

Your subsystem or data sharing group can contain more than one of these tables, including a table with the qualifier SYSIBM, a table with the qualifier DB2OSCA, and additional tables that are qualified by user IDs.

The following table shows the descriptions of the columns in the DSN_PREDICATE_SELECTIVITY table.

Table 189. Descriptions of columns in the DSN_PREDICATE_SELECTIVITY table

Column name	Data Type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.

Table 189. Descriptions of columns in the DSN_PREDICATE_SELECTIVITY table (continued)

Column name	Data Type	Description
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.
COLLID	VARCHAR(128) NOT NULL	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
VERSION	VARCHAR(122) NOT NULL	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PREDNO	INTEGER NOT NULL	The predicate number, a number used to identify a specific predicate within a query.
INSTANCE	SMALLINT NOT NULL	The selectivity instance. Used to group related selectivities.
SELECTIVITY	FLOAT NOT NULL	The selectivity estimate.

Table 189. Descriptions of columns in the DSN_PREDICATE_SELECTIVITY table (continued)

Column name	Data Type	Description
WEIGHT	FLOAT(4) NOT NULL	The percentage of executions that have the specified selectivity. For example, a value of 0.25 means that 25% of the time when query is executed it has this selectivity.
ASSUMPTION	VARCHAR(128) NOT NULL	Indicates how the selectivity was estimated, or is used. One of the following values: **'NORMAL'** Selectivity is estimated by using the normal selectivity assumptions. **'OVERRIDE'** Selectivity is based on an override.
INSERT_TIME	TIMESTAMP NOT NULL GENERATED ALWAYS FOR EACH ROW ON UPDATE AS ROW CHANGE TIMESTAMP	The time when the row was inserted or updated.
EXPLAIN_TIME	TIMESTAMP	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
REMARKS	VARCHAR(762)	IBM internal use only.

Table 189. Descriptions of columns in the DSN_PREDICATE_SELECTIVITY table (continued)

Column name	Data Type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **A** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

userID You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

Column descriptions

The following table describes the columns of DSN_PTASK_TABLE.

Table 190. DSN_PTASK_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
PGDNO	SMALLINT NOT NULL	The parallel group identifier within the current query block. This value corresponds to the value of the GROUPID column in DSN_PGROUP_TABLE table rows.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
LPTNO	SMALLINT NOT NULL	The parallel task number.
KEYCOLID	SMALLINT	The key column ID (KEY range only).
DPSI	CHAR(1) NOT NULL	Indicates if a data partition secondary index (DPSI) is used.
LPTLOKEY	VARCHAR(40) FOR BIT DATA	The low key value for this key column for this parallel task (KEY range only).
LPTHIKEY	VARCHAR(40) FOR BIT DATA	The high key value for this key column for this parallel task (KEY range only).

Table 190. DSN_PTASK_TABLE description (continued)

Column name	Data type	Description
LPTLOPAG	CHAR(4) FOR BIT DATA	The low page information if partitioned by page range.
LPTLHIPAG	CHAR(4) FOR BIT DATA	The high page information if partitioned by page range.
LPTLOPG[1]	CHAR(4) FOR BIT DATA	The lower bound page number for this parallel task (Page range or DPSI enabled only).
LPTHIPG[1]	CHAR(4) FOR BIT DATA	The upper bound page number for this parallel task (Page range or DPSI enabled only).
LPTLOPT[1]	SMALLINT	The lower bound partition number for this parallel task (Page range or DPSI enabled only).
LPTHIPT[1]	SMALLINT	The upper bound partition number for this parallel task (Page range or DPSI enabled only).
KEYCOLDT	SMALLINT	The data type for this key column (KEY range only).
KEYCOLPREC	SMALLINT	The precision/length for this key column (KEY range only).
KEYCOLSCAL	SMALLINT	The scale for this key column (KEY range with Decimal datatype only).
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL WITH DEFAULT WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.

Table 190. DSN_PTASK_TABLE description (continued)

Column name	Data type	Description
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.

Table 190. DSN_PTASK_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **A** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

Notes:

1. The name of these columns originally contained the # symbol as the last character in the names. However, the names that contain these characters are obsolete and are no longer supported.

PSPI

DSN_QUERYINFO_TABLE

The query information table, DSN_QUERYINFO_TABLE, contains information about the eligibility of query blocks for automatic query rewrite, information about the materialized query tables that are considered for eligible query blocks, reasons why ineligible query blocks are not eligible, and information about acceleration of query blocks.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

userID You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind, or rebind, a plan or package with the EXPLAIN(YES) option. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

Column descriptions

Table 191. Descriptions of columns in DSN_QUERYINFO_TABLE

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
QINAME1	VARCHAR(128) NOT NULL WITH DEFAULT	When TYPE='A': • When REASON_CODE=0, this value is the name of the accelerator server to which the query is sent. • When REASON_CODE<>0, the query was not sent to an accelerator server. The REASON_CODE value indicates why the query was not sent to the accelerator server.
QINAME2	VARCHAR(128) NOT NULL WITH DEFAULT	When TYPE='A' and REASON_CODE=0, this value is the name of the location name of the accelerator server to which the query is sent.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.

Table 191. Descriptions of columns in DSN_QUERYINFO_TABLE (continued)

Column name	Data type	Description
VERSION	VARCHAR(122) NOT NULL	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
COLLID	VARCHAR(128) NOT NULL	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.
SEQNO	INTEGER NOT NULL WITH DEFAULT	The sequence number for this row if QI_DATA exceeds the size of its column.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
TYPE	CHAR(8) NOT NULL WITH DEFAULT	The type of the output for this row: **A** This row is for a query that DB2 attempts to run on an accelerator server. The value in column REASON_CODE indicates the outcome.

Table 191. Descriptions of columns in DSN_QUERYINFO_TABLE (continued)

Column name	Data type	Description
QI_DATA	CLOB(2M) NOT NULL WITH DEFAULT	When TYPE='A': • For REASON_CODE values other than 0, this value is the description of the REASON_CODE value. • For a REASON_CODE value of 0, this value is the query text, after it is converted for processing by the accelerator.
SERVICE_INFO	BLOB(2M) NOT NULL WITH DEFAULT	IBM internal use only.
QB_INFO_ROWID	ROWID NOT NULL GENERATED ALWAYS	IBM internal use only.
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **A** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

Notes:

1. The REASON_CODE column has the following values:

   0 The query block qualifies for routing to an accelerator server. The values of QINAME1 and QINAME2 identify the accelerator server.

For example, for version 1 of the IBM DB2 Analytics Accelerator for z/OS, the associated data mart name is recorded in the QINAME2 column, with the following naming convention: *data-mart-name@accelerator-name@digits*.

1 No active accelerator server was found when EXPLAIN was executed.

2

Special register CURRENT QUERY ACCELERATION is set to NONE.

3 DB2 classified the query as a short-running query, or DB2 determined that sending the query to an accelerator server provided no performance advantage.

4 The query is not read-only.

6 The cursor is defined as a scrollable cursor or rowset cursor.

7 The query references objects with multiple encoding schemes.

8 The FROM clause of the query specifies a data change table reference.

9 The query contains a table expression with one or more correlated references to other tables in the same FROM clause.

10 The query contains a reference to a recursive common table expression.

11 The query contains an unsupported expression. The text of the expression is in QI_DATA.

12 The query references a table that meets one of the following conditions:

- The table is not defined in the accelerator server.
- The table is defined in the accelerator server, but is not enabled for processing by an accelerator.

13 The accelerator server that contains the tables that are referenced by the query is not started.

14 A column that is referenced in the query was altered by DB2 after the data was loaded in the accelerator server.

15 The query uses functionality that is available only in DB2 for z/OS Version 10 new-function mode or later, and the functionality is not supported by the accelerator server.

17 The query is an INSERT statement, but the DB2 subsystem parameter DSN6SPRM.QUERY_ACCEL_OPTIONS does not specify option 2 to enable its acceleration.

19 The accelerator server is not at the correct level and does not support a function in the SQL statement. The QI_DATA column contains the function text or expression text that is using the unsupported function for the accelerator server.

900-999

For IBM internal use only.

DSN_QUERY_TABLE

The query table, DSN_QUERY_TABLE, contains information about a SQL statement, and displays the statement before and after query transformation.

PSPI

Unlike other EXPLAIN tables, rows in DSN_QUERY_TABLE are not populated for static SQL statements at BIND or REBIND with the EXPLAIN(YES) option.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM
One instance of each EXPLAIN table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use these tables. These tables are created when you run job DSNTIJSG when you install or migrate DB2.

userID You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

Column descriptions

The following table describes the columns of DSN_QUERY_TABLE.

Table 192. DSN_QUERY_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.
TYPE	CHAR(8) NOT NULL	The type of the data in the NODE_DATA column.
QUERY STAGE	CHAR(8) NOT NULL WITH DEFAULT	The stage during query transformation when this row is populated.
SEQNO	NOT NULL	The sequence number for this row if NODE_DATA exceeds the size of its column.
NODE_DATA	CLOB(2M)	The XML data containing the SQL statement and its query block, table, and column information.
EXPLAIN_TIME	TIMESTAMP	The EXPLAIN timestamp.
QUERY_ROWID	ROWID NOT NULL GENERATED ALWAYS	The ROWID of the statement.
GROUP MEMBER	VARCHAR(24) NOT NULL	The member name of the DB2 subsystem that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.
HASHKEY	INTEGER NOT NULL	The hash value of the contents in NODE_DATA
HAS_PRED	CHAR(1) NOT NULL	When NODE_DATA contains an SQL statement, this column indicates if the statement contains a parameter marker literal, non-parameter marker literal, or no predicates.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.

Table 192. DSN_QUERY_TABLE description (continued)

Column name	Data type	Description
APPLNAME	VARCHAR(24) NOT NULL WITH DEFAULT	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PROGNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.

Table 192. DSN_QUERY_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **A** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

PSPI

DSN_SORTKEY_TABLE

The sort key table, DSN_SORTKEY_TABLE, contains information about sort keys for all of the sorts required by a query.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM
One instance of each EXPLAIN table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use these tables. These tables are created when you run job DSNTIJSG when you install or migrate DB2.

userID You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

Column descriptions

The following table describes the columns of DSN_SORTKEY_TABLE.

Table 193. DSN_SORTKEY_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
PLANNO	SMALLINT NOT NULL	The plan number, a number used to identify each miniplan with a query block.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.

Table 193. DSN_SORTKEY_TABLE description (continued)

Column name	Data type	Description
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
SORTNO	SMALLINT NOT NULL	The sequence number of the sort
ORDERNO	SMALLINT NOT NULL	The sequence number of the sort key
EXPTYPE	CHAR(3) NOT NULL	The type of the sort key. The possible values are: • 'COL' • 'EXP' • 'QRY'
TEXT	VARCHAR(128) NOT NULL	The sort key text, can be a column name, an expression, or a scalar subquery, or 'Record ID'.
TABNO	SMALLINT NOT NULL	The table number, a number which uniquely identifies the corresponding table reference within a query.
COLNO	SMALLINT NOT NULL	The column number, a number which uniquely identifies the corresponding column within a query. Only applicable when the sort key is a column.
DATATYPE	CHAR(18)	The data type of sort key. The possible values are • 'HEXADECIMAL' • 'CHARACTER' • 'PACKED FIELD ' • 'FIXED(31)' • 'FIXED(15)' • 'DATE' • 'TIME' • 'VARCHAR' • 'PACKED FLD' • 'FLOAT' • 'TIMESTAMP' • 'UNKNOWN DATA TYPE'
LENGTH	INTEGER NOT NULL	The length of sort key.
CCSID	INTEGER NOT NULL	IBM internal use only.

Table 193. DSN_SORTKEY_TABLE description (continued)

Column name	Data type	Description
ORDERCLASS	INTEGER NOT NULL	IBM internal use only.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.

Table 193. DSN_SORTKEY_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **A** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

PSPI

DSN_SORT_TABLE

The sort table, DSN_SORT_TABLE, contains information about the sort operations required by a query.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM
One instance of each EXPLAIN table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use these tables. These tables are created when you run job DSNTIJSG when you install or migrate DB2.

userID You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

Column descriptions

The following table describes the columns of DSN_SORT_TABLE.

Table 194. DSN_SORT_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
PLANNO	SMALLINT NOT NULL	The plan number, a number used to identify each miniplan with a query block.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.

Table 194. DSN_SORT_TABLE description (continued)

Column name	Data type	Description
COLLID	VARCHAR(128) NOT NULL	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
SORTC	CHAR(5) NOT NULL WITH DEFAULT	Indicates the reasons for sort of the composite table. The reasons are shown as a series of bytes: • Byte 1 is 'G' if the reason is GROUP BY, or otherwise blank. • The second byte is 'J' if the reason is JOIN, or otherwise blank. • Byte is 'O' if the reason is ORDER BY, or otherwise blank. • The fourth by is 'U' if the reason is uniqueness, or otherwise blank.
SORTN	CHAR(5) NOT NULL WITH DEFAULT	Indicates the reasons for sort of the new table. The reasons are shown as a series of bytes: • The first byte is 'G' if the reason is GROUP BY, or otherwise blank. • The second byte is 'J' if the reason is JOIN, or otherwise blank. • The third byte is 'O' if the reason is ORDER BY, or otherwise blank. • The fourth by is 'U' if the reason is uniqueness, or otherwise blank.
SORTNO	SMALLINT NOT NULL	The sequence number of the sort.
KEYSIZE	SMALLINT NOT NULL	The sum of the lengths of the sort keys.
ORDERCLASS	INTEGER NOT NULL	IBM internal use only.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.

Table 194. DSN_SORT_TABLE description (continued)

Column name	Data type	Description
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **A** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

PSPI

DSN_STATEMENT_CACHE_TABLE

The statement cache table, DSN_STATEMENT_CACHE_TABLE, contains information about the SQL statements in the statement cache, information captured as the results of an EXPLAIN STATEMENT CACHE ALL statement.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM
One instance of each EXPLAIN table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use these tables. These tables are created when you run job DSNTIJSG when you install or migrate DB2.

userID You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

Column descriptions

The following table shows the descriptions of the columns in DSN_STATEMENT_CACHE_TABLE.

Table 195. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE

Column name	Data Type	Description
STMT_ID	INTEGER NOT NULL	The statement ID; this value is the EDM unique token for the statement.
STMT_TOKEN	VARCHAR(240)	The statement token; you provide this value as an identification string.

Table 195. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
COLLID	VARCHAR(128) NOT NULL	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register.
PROGRAM_NAME	VARCHAR(128) NOT NULL	The name of the package that performed the initial PREPARE for the statement.
INV_DROPALT	CHAR(1) NOT NULL	This column indicates if the statement has been invalidated by a DROP or ALTER statement.3 on page 2572
INV_REVOKE	CHAR(1) NOT NULL	This column indicates if the statement has been invalidated by a REVOKE statement.3 on page 2572
INV_LRU	CHAR(1) NOT NULL	This column indicates if the statement has been removed from the cache by LRU.3 on page 2572
INV_RUNSTATS	CHAR(1) NOT NULL	This column indicates if the statement has been invalidated by RUNSTATS.3 on page 2572
CACHED_TS	TIMESTAMP NOT NULL	The timestamp when the statement was stored in the dynamic statement cache.3 on page 2572
USERS	INTEGER NOT NULL	The number of current users of the statement. This number indicates the users that have prepared or run the statement during their current unit of work. 1 on page 2572,3 on page 2572
COPIES	INTEGER NOT NULL	The number of copies of the statement that are owned by all threads in the system. 1 on page 2572,3 on page 2572
LINES	INTEGER NOT NULL	The precompiler line number from the initial PREPARE of the statement. 1 on page 2572
PRIMAUTH	VARCHAR(128) NOT NULL	The primary authorization ID that did the initial PREPARE of the statement.
CURSQLID	VARCHAR(128) NOT NULL	The CURRENT SQLID that did the initial PREPARE of the statement.
BIND_QUALIFIER	VARCHAR(128) NOT NULL	The BIND qualifier. For unqualified table names, this is the object qualifier.
BIND_ISO	CHAR(2) NOT NULL	The value of the ISOLATION BIND option that is in effect for this statement. The value will be one of the following values: **'UR'** Uncommitted read **'CS'** Cursor stability **'RS'** Read stability **'RR'** Repeatable read
BIND_CDATA	CHAR(1) NOT NULL	The value of the CURRENTDATA BIND option that is in effect for this statement. The value will be one of the following values: **'Y'** CURRENTDATA(YES) **'N'** CURRENTDATA(NO)

Table 195. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
BIND_DYNRL	CHAR(1) NOT NULL	The value of the DYNAMICRULES BIND option that is in effect for this statement. The value will be one of the following values: **'B'** DYNAMICRULE(BIND) **'R'** DYNAMICRULES(RUN)
BIND_DEGRE	CHAR(1) NOT NULL	The value of the CURRENT DEGREE special register that is in effect for this statement. The value will be one of the following values: **'A'** CURRENT DEGREE = ANY **'1'** CURRENT DEGREE = 1
BIND_SQLRL	CHAR(1) NOT NULL	The value of the CURRENT RULES special register that is in effect for this statement. The value will be one of the following values: **'D'** CURRENT RULES = DB2 **'S'** CURRENT RULES = SQL
BIND_CHOLD	CHAR(1) NOT NULL	The value of the WITH HOLD attribute of the PREPARE for this statement. The value will be one of the following values: **'Y'** Initial PREPARE specified WITH HOLD **'N'** Initial PREPARE specified WITHOUT HOLD
STAT_TS	TIMESTAMP NOT NULL	Timestamp of the statistics. This is the timestamp when IFCID 318 is started. 2 on page 2572
STAT_EXEC	INTEGER NOT NULL	This column is deprecated. Use STAT_EXECB instead.
STAT_GPAG	INTEGER NOT NULL	This column is deprecated. Use STAT_GPAGB instead. 1 on page 2572
STAT_SYNR	INTEGER NOT NULL	This column is deprecated. Use STAT_SYNRB instead. 1 on page 2572
STAT_WRIT	INTEGER NOT NULL	This column is deprecated. Use STAT_WRITB instead. 1 on page 2572
STAT_EROW	INTEGER NOT NULL	This column is deprecated. Use STAT_EROWB instead. 1 on page 2572
STAT_PROW	INTEGER NOT NULL	This column is deprecated. Use STAT_PROWB instead. 1 on page 2572
STAT_SORT	INTEGER NOT NULL	This column is deprecated. Use STAT_SORTB instead. 1 on page 2572
STAT_INDX	INTEGER NOT NULL	This column is deprecated. Use STAT_SORTB instead.
STAT_RSCN	INTEGER NOT NULL	This column is deprecated. Use STAT_SORTB instead.
STAT_PGRP	INTEGER NOT NULL	This column is deprecated. Use STAT_SORTB instead.
STAT_ELAP	FLOAT NOT NULL	The accumulated elapsed time that is used for the statement. 2 on page 2572
STAT_CPU	FLOAT NOT NULL	The accumulated CPU time that is used for the statement. 2 on page 2572
STAT_SUS_SYNIO	FLOAT NOT NULL	The accumulated wait time for synchronous I/O operations for the statement. 2 on page 2572
STAT_SUS_LOCK	FLOAT NOT NULL	The accumulated wait time for lock requests for the statement. 2 on page 2572
STAT_SUS_SWIT	FLOAT NOT NULL	The accumulated wait time for synchronous execution unit switch for the statement. 2 on page 2572
STAT_SUS_GLCK	FLOAT NOT NULL	The accumulated wait time for global locks for this statement. 2 on page 2572

Table 195. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
STAT_SUS_OTHR	FLOAT NOT NULL	The accumulated wait time for read activity that is done by another thread. 2 on page 2572
STAT_SUS_OTHW	FLOAT NOT NULL	The accumulated wait time for write activity done by another thread. 2 on page 2572
STAT_RIDLIMT	INTEGER NOT NULL	This column is deprecated. Use STAT_SORTB instead.
STAT_RIDSTOR	INTEGER NOT NULL	This column is deprecated. Use STAT_SORTB instead.
EXPLAIN_TS	TIMESTAMP NOT NULL	The timestamp for when the statement cache table is populated.
SCHEMA	VARCHAR(128) NOT NULL	The value of the CURRENT SCHEMA special register.
STMT_TEXT	CLOB(2M) NOT NULL	The statement that is being explained.
STMT_ROWID	ROWID NOT NULL GENERATED ALWAYS	The ROWID of the statement.
BIND_RO_TYPE	CHAR(1) NOT NULL WITH DEFAULT	The current specification of the REOPT option for the statement3 on page 2572: **'N'** REOPT(NONE) or its equivalent **'1'** REOPT(ONCE) or its equivalent **'A'** REOPT(AUTO) or its equivalent **'O'** The current plan is deemed optimal and there is no need for REOPT(AUTO)
BIND_RA_TOT	INTEGER NOT NULL WITH DEFAULT	The total number of REBIND commands that have been issued for the dynamic statement because of the REOPT(AUTO) option.1 on page 2572,3 on page 2572
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.
STAT_EXECB	BIGINT NOT NULL WITH DEFAULT	The number of times this statement has been run. For a statement with a cursor, this is the number of OPENs.2 on page 2572
STAT_GPAGB	BIGINT NOT NULL WITH DEFAULT	The number of getpage operations that are performed for the statement. 2 on page 2572
STAT_SYNRB	BIGINT NOT NULL WITH DEFAULT	The number of synchronous buffer reads that are performed for the statement. 2 on page 2572
STAT_WRITB	BIGINT NOT NULL WITH DEFAULT	The number of buffer write operations that are performed for the statement. 2 on page 2572
STAT_EROWB	BIGINT NOT NULL WITH DEFAULT	The number of rows that are examined for the statement. 2 on page 2572
STAT_PROWB	BIGINT NOT NULL WITH DEFAULT	The number of rows that are processed for the statement. 2 on page 2572
STAT_SORTB	BIGINT NOT NULL WITH DEFAULT	The number of sorts that are performed for the statement.2 on page 2572
STAT_INDXB	BIGINT NOT NULL WITH DEFAULT	The number of index scans that are performed for the statement.2 on page 2572
STAT_RSCNB	BIGINT NOT NULL WITH DEFAULT	The number of table space scans that are performed for the statement.2 on page 2572
STAT_PGRPB	BIGINT NOT NULL WITH DEFAULT	The number of parallel groups that are created for the statement.2 on page 2572

Table 195. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
STAT_RIDLIMTB	BIGINT NOT NULL WITH DEFAULT	The number of times a RID list was not used because the number of RIDs would have exceeded DB2 limits.2 on page 2572
STAT_RIDSTORB	BIGINT NOT NULL WITH DEFAULT	.The number of times a RID list was not used because there is not enough storage available to hold the list of RIDs.2 on page 2572
LITERAL_REPL	CHAR(1) NOT NULL WITH DEFAULT	Identifies cached statements where the literal values are replaced by the '&' symbol:3 on page 2572 **'R'** The statement is prepared with CONCENTRATE STATEMENTS WITH LITERALS behavior and the literal constants in the statement have been replaced with '&' . **'D'** This statement is a duplicate statement instance with different literal reusability criteria. **blank** Literal values are not replaced.
STAT_SUS_LATCH	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for latch requests for the statement.
STAT_SUS_PLATCH	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for page latch requests for the statement.
STAT_SUS_DRAIN	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for drain lock requests for the statement.
STAT_SUS_CLAIM	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for claim count requests for the statement.
STAT_SUS_LOG	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for log writer requests for the statement.

Table 195. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **A** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

Notes:

1. If the specified value exceeds 2147483647, the column contains the value 2147483647.
2. Statistics are cumulative, across executions of the same statement, and across threads, if the value of COLLID is DSNDYNAMICSQLCACHE. If the value of COLLID is DSNEXPLAINMODEYES, the values are for a single run of the statement only. If the value of COLLID is DSNEXPLAINMODE EXPLAIN, the values of all statistics columns are 0.
3. The column is not applicable when the value of the COLLID column is 'DSNEXPLAINMODEYES' or 'DSNEXPLAINMODEEXPLAIN'

PSPI

DSN_STATEMNT_TABLE

The statement table, DSN_STATEMNT_TABLE, contains information about the estimated cost of specified SQL statements.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM
One instance of each EXPLAIN table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use these tables. These tables are created when you run job DSNTIJSG when you install or migrate DB2.

userID You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

Column descriptions

The following table describes the content of each column in STATEMNT_TABLE.

Table 196. Descriptions of columns in DSN_STATEMNT_TABLE

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL WITH DEFAULT	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.
APPLNAME	VARCHAR(24) NOT NULL WITH DEFAULT	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PROGNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.

Table 196. Descriptions of columns in DSN_STATEMNT_TABLE (continued)

Column name	Data type	Description
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.
EXPLAIN_TIME	TIMESTAMP NOT NULL WITH DEFAULT	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
STMT_TYPE	CHAR(6) NOT NULL WITH DEFAULT	The type of statement being explained. Possible values are: **SELECT** SELECT **INSERT** INSERT **UPDATE** UPDATE **MERGE** MERGE **DELETE** DELETE **TRUNCA** TRUNCATE **SELUPD** SELECT with FOR UPDATE OF **DELCUR** DELETE WHERE CURRENT OF CURSOR **UPDCUR** UPDATE WHERE CURRENT OF CURSOR
COST_CATEGORY	CHAR(1) NOT NULL WITH DEFAULT	Indicates if DB2 was forced to use default values when making its estimates. Possible values: **A** Indicates that DB2 had enough information to make a cost estimate without using default values. **B** Indicates that some condition exists for which DB2 was forced to use default values. See the values in REASON to determine why DB2 was unable to put this estimate in cost category A.
PROCMS	INTEGER NOT NULL WITH DEFAULT	The estimated processor cost, in milliseconds, for the SQL statement. The estimate is rounded up to the next integer value. The maximum value for this cost is 2147483647 milliseconds, which is equivalent to approximately 24.8 days. If the estimated value exceeds this maximum, the maximum value is reported. If an accelerator is used, the difference is reflected in this value.

Table 196. Descriptions of columns in DSN_STATEMNT_TABLE (continued)

Column name	Data type	Description
PROCSU	INTEGER NOT NULL WITH DEFAULT	The estimated processor cost, in service units, for the SQL statement. The estimate is rounded up to the next integer value. The maximum value for this cost is 2147483647 service units. If the estimated value exceeds this maximum, the maximum value is reported. If an accelerator is used, this value represents the estimated cost including any impact of acceleration.
REASON	VARCHAR(254) WITH DEFAULT	A string that indicates the reasons for putting an estimate into cost category B. **HAVING CLAUSE** A subselect in the SQL statement contains a HAVING clause. **HOST VARIABLES** The statement uses host variables, parameter markers, or special registers. **MATERIALIZATION** Statistics are missing because the statement uses materialized views or nested table expresses. **PROFILEID** *value* When profile monitoring is used for the statement, the value of the PROFILEID column in SYSIBM.DSN_PROFILE_TABLE. **REFERENTIAL CONSTRAINTS** Referential constraints of the type CASCADE or SET NULL exist on the target table of a DELETE statement. **TABLE CARDINALITY** The cardinality statistics are missing for one or more of the tables that are used in the statement. **TRIGGERS** Triggers are defined on the target table of an insert, update, or delete operation. **UDF** The statement uses user-defined functions.
STMT_ENCODE	CHAR(1) WITH DEFAULT	Encoding scheme of the statement. If the statement represents a single CCSID set, the possible values are: **A** ASCII **E** EBCDIC **U** Unicode If the statement has multiple CCSID sets, the value is M.
TOTAL_COST	FLOAT NOT NULL WITH DEFAULT	The overall estimated cost of the statement. If an accelerator is used the benefit is reflected in this value. This cost should be used only for reference purposes.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.

Table 196. Descriptions of columns in DSN_STATEMNT_TABLE (continued)

Column name	Data type	Description
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **A** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

PSPI

DSN_STAT_FEEDBACK

The DSN_STAT_FEEDBACK table contains recommendations for capturing missing or conflicting statistics that are defined during EXPLAIN. Collecting these statistics by the RUNSTATS utility might improve the performance of the query.

PSPI The values in this table are updated only at EXPLAIN time, and are not modified by the RUNSTATS utility.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM
One instance of each EXPLAIN table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use these tables. These tables are created when you run job DSNTIJSG when you install or migrate DB2.

userID You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

Column descriptions

The following table contains descriptions of the columns in the DSN_STAT_FEEDBACK table.

Table 197. Descriptions of columns in the DSN_STAT_FEEDBACK table

Column name	Data Type	Descriptions
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.

Table 197. Descriptions of columns in the DSN_STAT_FEEDBACK table (continued)

Column name	Data Type	Descriptions
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
SECTNOI	INTEGER NOT NULL WITH DEFAULT WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
TBCREATOR	VARCHAR(128) NOT NULL	The creator of the table.
TBNAME	VARCHAR(128) NOT NULL	The name of the table.
IXCREATOR	VARCHAR(128) NOT NULL	The creator of the index.
IXNAME	VARCHAR(128) NOT NULL	The name of the index.
COLNAME	VARCHAR(128) NOT NULL	The name of the column.
NUMCOLUMNS	SMALLINT NOT NULL	The number of columns in the column group.
COLGROUPCOLNO	VARCHAR(254) NOT NULL FOR BIT DATA	A hex representation that identifies the set of columns associated with the statistics. If the statistics are only associated with a single column, the field contains a zero length. Otherwise, the field is an array of SMALLINT column numbers with a dimension equal to the value in NUMCOLUMNS.
TYPE	CHAR(1) NOT NULL	The type of statistic to collect: **'C'** Cardinality. **'F'** Frequency. **'H'** Histogram. **'I'** Index. **'T'** Table.

Table 197. Descriptions of columns in the DSN_STAT_FEEDBACK table (continued)

Column name	Data Type	Descriptions
DBNAME	VARCHAR(24) NOT NULL	The name of the database.
TSNAME	VARCHAR(24) NOT NULL	The name of the table space.
REASON	CHAR(8) NOT NULL	The reason that the statistic was recommend: **'BASIC'** A basic statistic value for a column table or index is missing. No statistics were collected for the identified object. **'KEYCARD'** The cardinalities of index key columns are missing. **'LOWCARD'** The cardinality of the column is a low value, which indicates that data might be skewed. **'NULLABLE'** Distribution statistics are not available for a nullable column, which indicates that data might be skewed. **'DEFAULT'** A predicate references a value that is probably a default value, which indicates that data might be skewed. **'RANGEPRD'** Histogram statistics are not available for a range predicate. **'PARALLEL'** Parallelism could be improved by uniform partitioning of key ranges. **'CONFLICT'** Another statistic contains a value that conflicts with the value of this statistic. Such conflicts usually occur because statistics were collected for related objects at different times. **'COMPFFIX'** Multi-column cardinality statistics are needed for an index compound filter factor.
REMARKS	VARCHAR(254) NOT NULL	Free form text for extensibility.

"SYSIBM.SYSSTATFEEDBACK table" on page 2370

DSN_STRUCT_TABLE

The structure table, DSN_STRUCT_TABLE, contains information about all of the query blocks in a query.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM
One instance of each EXPLAIN table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use these tables. These tables are created when you run job DSNTIJSG when you install or migrate DB2.

userID You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

Column descriptions

The following table describes the columns of DSN_STRUCT_TABLE

Table 198. DSN_STRUCT_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PARENT	SMALLINT NOT NULL	The parent query block number of the current query block in the structure of SQL text; this is the same as the PARENT_QBLOCKNO in PLAN_TABLE.
TIMES	FLOAT NOT NULL	The estimated number of rows returned by Data Manager; also the estimated number of times this query block is executed.
ROWCOUNT	INTEGER NOT NULL	The estimated number of rows returned by RDS (Query Cardinality).
ATOPEN	CHAR(1) NOT NULL	Whether the query block is moved up for do-at-open processing; 'Y' if done-at-open; 'N': otherwise.

Table 198. DSN_STRUCT_TABLE description (continued)

Column name	Data type	Description
CONTEXT	CHAR(10) NOT NULL	This column indicates what the context of the current query block is. The possible values are: • 'TOP LEVEL' • 'UNION' • 'UNION ALL' • 'PREDICATE' • 'TABLE EXP' • 'UNKNOWN'
ORDERNO	SMALLINT NOT NULL	Not currently used.
DOATOPEN_PARENT	SMALLINT NOT NULL	The parent query block number of the current query block; Do-at-open parent if the query block is done-at-open, this may be different from the PARENT_QBLOCKNO in PLAN_TABLE.
QBLOCK_TYPE	CHAR(6) NOT NULL WITH DEFAULT	This column indicates the type of the current query block. The possible values are • 'SELECT' • 'INSERT' • 'UPDATE' • 'DELETE' • 'SELUPD' • 'DELCUR' • ''UPDCUR' • 'CORSUB' • 'NCOSUB' • 'TABLEX' • 'TRIGGR' • 'UNION' • 'UNIONA' • 'CTE' It is equivalent to QBLOCK_TYPE column in PLAN_TABLE, except for CTE.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
QUERY_STAGE	CHAR(8) NOT NULL	IBM internal use only.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.

Table 198. DSN_STRUCT_TABLE description (continued)

Column name	Data type	Description
ORIGIN	CHAR(1) NOT NULL WITH DEFAULT	Indicates the origin of the query block: **Blank** Generated by DB2 **C** Column mask **R** Row permission **U** Specified by the user
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.

Table 198. DSN_STRUCT_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **A** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

PSPI

DSN_VIEWREF_TABLE

The view reference table, DSN_VIEWREF_TABLE, contains information about all of the views and materialized query tables that are used to process a query.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the DB2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

SYSIBM
One instance of each EXPLAIN table can be created with the SYSIBM qualifier. DB2 and SQL optimization tools might use these tables. These tables are created when you run job DSNTIJSG when you install or migrate DB2.

userID You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the SDSNSAMP library.

Column descriptions

The following table describes the columns of DSN_VIEWREF_TABLE.

Table 199. DSN_VIEWREF_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL WITH DEFAULT	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** DB2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, if the QUERYNO clause is specified, then its value is used by DB2. Otherwise DB2 assigns a number based on the line number of the SQL statement in the non-inline SQL function, native SQL procedure.
APPLNAME	VARCHAR(24) NOT NULL WITH DEFAULT	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
PROGNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.

Table 199. DSN_VIEWREF_TABLE description (continued)

Column name	Data type	Description
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.
CREATOR	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the owner of the object.
NAME	VARCHAR(128)	Name of the object.
TYPE	CHAR(1) NOT NULL WITH DEFAULT	The type of the object: **'V'** View **'R'** MQT that has been used to replace the base table for rewrite **'M'** MQT
MQTUSE	SMALLINT WITH DEFAULT	IBM internal use only.
EXPLAIN_TIME	TIMESTAMP NOT NULL WITH DEFAULT	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in Version 9 or earlier.

Table 199. DSN_VIEWREF_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies to only statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. DB2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **A** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

PSPI

Tables that are used by accelerators

To interact with accelerator servers, DB2 requires two tables that record characteristics of those accelerator servers: SYSACCELERATORS and SYSACCELERATEDTABLES.

The following table lists the table space and indexes for these two tables, and lists the index fields for each index. The indexes are in ascending order, except where noted.

Table 200. Table spaces and indexes for the tables that are used for accelerators

TABLE SPACE DSNACCEL. ...	TABLE SYSACCEL. ...	INDEX SYSACCEL. ...	INDEX FIELDS
SYSACCEL	SYSACCELERATORS	DSNACC01	ACCELERATORNAME
	SYSACCELERATEDTABLES	DSNACT01	CREATOR.NAME.ACCELERATORNAME

SYSACCEL.SYSACCELERATORS table

The SYSACCEL.SYSACCELERATORS table contains rows that describe the characteristics of each accelerator server.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
ACCELERATORNAME	VARCHAR(128) NOT NULL	A unique name for the accelerator server. This is the name by which the accelerator server is known to the local DB2 accelerated query tables.	G
LOCATION	VARCHAR(128)	Identifies the location name that is associated with the accelerator server.	G

SYSACCEL.SYSACCELERATEDTABLES table

The SYSACCEL.SYSACCELERATEDTABLES table contains rows that describe the characteristics of each table that is marked for acceleration.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	The name of the table.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the table.	G
ACCELERATORNAME	VARCHAR(128) NOT NULL	A unique name for the accelerator server. This is the name by which the accelerator server is known to the local DB2 accelerated query tables.	G
REMOTENAME	VARCHAR(128) NOT NULL	The name of the base alias object.	G
REMOTECREATOR	VARCHAR(128) NOT NULL	The owner of the base alias object.	G
ENABLE	CHAR(1) NOT NULL	Indicates whether the remote table is enabled or disabled for query acceleration: **Y** Enabled **N** Disabled	G
CREATEDBY	VARCHAR(128) NOT NULL	The primary authorization ID of the user who created the table.	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	The time when the CREATE statement was executed for the table.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	The time when the table was last altered.	G
REFRESH_TIME	TIMESTAMP NOT NULL WITH DEFAULT	The timestamp when the data was last refreshed. If the data was not refreshed, this column contains the default timestamp ('0001-01-01.00.00.00.000000').	G
SUPPORTLEVEL	SMALLINT NOT NULL	Internal use only.	I
ARCHIVE	CHAR(1)	The archive status of the table in the accelerator database: **A** The table is archived in the accelerator server that is specified by the ACCELERATORNAME value. The accelerator server contains active and archived data. **C** The table is archived in other accelerator servers. The accelerator server that is specified by the ACCELERATORNAME value contains only active data. **blank** The table is not archived in an accelerator server.	G

Tables that are used for program authorization

For program authorization, a table is provided to record the authorization for a program to execute a plan.

Table spaces and indexes for program authorization

Tables that are used for program authorization are contained in certain table spaces and have indexes.

The following table lists the table space and index for the table that is used for program authorization, and lists the index fields for the index. The index is in ascending order.

Table 201. Table spaces and indexes for the tables that are used for program authorization

TABLE SPACE DSNMDCDB. ...	TABLE SYSIBM. ...	INDEX SYSIBM. ...	INDEX FIELDS
DSNMDCTS	DSNPROGAUTH	DSNPROGAUTH_IDX1	PROGNAME.PLANNAME

SYSIBM.DSNPROGAUTH table

The SYSIBM.DSNPROGAUTH table enables program authorization with or without program data integrity checking.

Column name	Data type	Description	Use
PROGNAME	VARCHAR(24) NOT NULL	Name of the application program that can run the plan.	G
PLANNAME	VARCHAR(24) NOT NULL	Name of the application plan for the application program.	G
PROGMDCVAL	CHAR(16) NOT NULL FOR BIT DATA WITH DEFAULT X'0000000000000000- 00000000000000000'	Reserved.	G
PROGMDCPAD	CHAR(1) NOT NULL WITH DEFAULT	Reserved.	G
CREATOR	VARCHAR(128) NOT NULL WITH DEFAULT CURRENT SQLID	The authorization ID under which the row was inserted or most recently updated.	G
ENABLED	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether program authorization is enabled: **Y** Program authorization is enabled. **N** Program authorization is disabled.	
CREATETS	TIMESTAMP NOT NULL WITH DEFAULT	The time at which the row was inserted or most recently updated.	G
REMARKS	VARCHAR(762)	A user-specified character string.	G

Using the catalog in database design

Retrieving information from the catalog by using SQL statements, can be helpful in designing your relational database.

GUPI

DB2 SQL Reference lists all the DB2 catalog tables and the information stored in them.

The information in the catalog is vital to normal DB2 operation. You can *retrieve* catalog information, but *changing* it can have serious consequences. Therefore you cannot execute insert or delete operations that affect the catalog, and only a limited number of columns exist that you can update. Exceptions to these restrictions are the SYSIBM.SYSSTRINGS, SYSIBM.SYSCOLDIST, and SYSIBM.SYSCOLDISTSTATS catalog tables, into which you can insert rows and proceed to update and delete rows.

To retrieve information from the catalog, you need at least the SELECT privilege on the appropriate catalog tables.

Note: Some catalog queries can result in long table space scans.

GUPI

Retrieving catalog information about DB2 storage groups

The SYSIBM.SYSSTOGROUP and SYSIBM.SYSVOLUMES tables contain information about DB2 storage groups and the volumes in those storage groups.

Procedure

GUPI

To obtain information about DB2 storage groups and the volumes in those storage groups:

Query the SYSIBM.SYSSTOGROUP and SYSIBM.SYSVOLUMES tables. The following query shows what volumes are in a DB2 storage group, how much space is used, and when that space was last calculated.

```
SELECT SGNAME,VOLID,SPACE,SPCDATE
  FROM SYSIBM.SYSVOLUMES,SYSIBM.SYSSTOGROUP
  WHERE SGNAME=NAME
  ORDER BY SGNAME;
```

GUPI

Related reference:

"SYSIBM.SYSSTOGROUP table" on page 2377

"SYSIBM.SYSVOLUMES table" on page 2441

Retrieving catalog information about a table

The SYSIBM.SYSTABLES table contains information about every table, view, and alias in your DB2 system.

About this task

GUPI The SYSIBM.SYSTABLES table contains a row for every table, view, and alias in your DB2 system. Each row tells you whether the object is a table, a view, or an alias, its name, who created it, what database it belongs to, what table space it belongs to, and other information. The SYSTABLES table also has a REMARKS column in which you can store your own information about the table in question.

Procedure

To retrieve catalog information about a table:

Query the SYSIBM.SYSTABLES table. The following example query displays all the information for the project activity sample table:

```
SELECT *
  FROM SYSIBM.SYSTABLES
  WHERE NAME = 'PROJACT'
  AND CREATOR = 'DSN8B10';
```

GUPI

Related concepts:

"Adding and retrieving comments" on page 2606

Related reference:

"SYSIBM.SYSTABLES table" on page 2396

Retrieving catalog information about partition order

The LOGICAL_PART column in the SYSIBM.SYSTABLEPART table contains information for key order or logical partition order.

Procedure

GUPI

To retrieve catalog information about partition order:

Query the SYSIBM.SYSTABLEPART table. The following statement displays information on partition order in ascending limit value order:

```
SELECT LIMITKEY, PARTITION
  FROM SYSIBM.SYSTABLEPART
  ORDER BY LOGICAL_PART;
```

GUPI

Related reference:

"SYSIBM.SYSTABLEPART table" on page 2387

Retrieving catalog information about aliases

Query SYSIBM.SYSTABLES to obtain information about aliases.

About this task

GUPI

You can use the SYSIBM.SYSTABLES table to find information about aliases by referencing the following three columns:

- LOCATION contains your subsystem's location name for the remote system, if the object on which the alias is defined resides at a remote subsystem.
- TBCREATOR contains the schema table or view.
- TBNAME contains the name of the table or the view.

You can also find information about aliases by using the following user-defined functions:

- TABLE_NAME returns the name of a table, view, or undefined object found after resolving aliases for a user-specified object.
- TABLE_SCHEMA returns the schema name of a table, view, or undefined object found after resolving aliases for a user-specified object.
- TABLE_LOCATION returns the location name of a table, view, or undefined object found after resolving aliases for a user-specified object.

The NAME and CREATOR columns of the SYSTABLES table contain the name and schema of the alias, and three other columns contain the following information for aliases:

- TYPE is A.

- DBNAME is DSNDB06.
- TSNAME is SYSTSTAB.

If similar tables at different locations have names with the same second and third parts, you can retrieve the aliases for them with a query like this one:

```
SELECT LOCATION, CREATOR, NAME
  FROM SYSIBM.SYSTABLES
    WHERE TBCREATOR='DSN8B10' AND TBNAME='EMP'
      AND TYPE='A';
```

GUPI

Related reference:

"SYSIBM.SYSTABLES table" on page 2396

"TABLE_NAME" on page 2631

"TABLE_SCHEMA" on page 2633

"TABLE_LOCATION" on page 2629

Retrieving catalog information about columns

The SYSIBM.SYSCOLUMNS table has one row for each column of every table and view.

Procedure

GUPI

To obtain information about the columns of a table or view:

Query the SYSIBM.SYSCOLUMNS table.
The following statement retrieves information about columns in the sample department table:

```
SELECT NAME, TBNAME, COLTYPE, LENGTH, NULLS, DEFAULT
  FROM SYSIBM.SYSCOLUMNS
  WHERE TBNAME='DEPT'
  AND TBCREATOR = 'DSN8B10';
```

The result is shown below; for each column, the following information about each column is given:

- The column name
- The name of the table that contains it
- Its data type
- Its length attribute. For LOB columns, the LENGTH column shows the length of the pointer to the LOB.
- Whether it allows nulls
- Whether it allows default values

```
NAME      TBNAME  COLTYPE         LENGTH  NULLS  DEFAULT
DEPTNO    DEPT    CHAR               3    N       N
DEPTNAME  DEPT    VARCHAR           36    N       N
MGRNO     DEPT    CHAR               6    Y       N
ADMRDEPT  DEPT    CHAR               3    N       N
```

GUPI

Related tasks:

"Retrieving catalog information about LOBs" on page 2604

Related reference:

"SYSIBM.SYSCOLUMNS table" on page 2155

Retrieving catalog information about indexes

The SYSIBM.SYSINDEXES table contains a row for every index, including indexes on catalog tables.

Procedure

GUPI

To obtain information about indexes:

Query the SYSIBM.SYSINDEXES table. For example, to retrieve a row about an index named XEMPL2:

```
SELECT *
  FROM SYSIBM.SYSINDEXES
  WHERE NAME = 'XEMPL2'
  AND CREATOR = 'DSN8B10';
```

A table can have more than one index. To display information about all the indexes of a table:

```
SELECT *
  FROM SYSIBM.SYSINDEXES
  WHERE TBNAME = 'EMP'
  AND TBCREATOR = 'DSN8B10';
```

GUPI

Related reference:

"SYSIBM.SYSINDEXES table" on page 2211

Retrieving catalog information about views

For every view you create, DB2 stores descriptive information in several catalog tables. Query these catalog tables to obtain information about views in your database.

About this task

GUPI

The following actions occur in the catalog after the execution of CREATE VIEW:

- A row is inserted into the SYSIBM.SYSTABLES table.
- A row is inserted into the SYSIBM.SYSTABAUTH table to record the owner's privileges on the view.
- For each column of the view, a row is inserted into the SYSIBM.SYSCOLUMNS table.
- One or more rows are inserted into the SYSIBM.SYSVIEWS table to record the text of the CREATE VIEW statement.
- For each table or view on which the view is dependent, a row is inserted into the SYSIBM.SYSVIEWDEP table to record the dependency.

GUPI

Procedure

To obtain information about views:

Query one or more catalog tables.

Related reference:

"CREATE VIEW" on page 1527
"SYSIBM.SYSTABLES table" on page 2396
"SYSIBM.SYSTABAUTH table" on page 2383
"SYSIBM.SYSCOLUMNS table" on page 2155
"SYSIBM.SYSVIEWS table" on page 2437
"SYSIBM.SYSVIEWDEP table" on page 2436

Retrieving catalog information about authorizations

The SYSIBM.SYSTABAUTH table contains information about who can access your data.

Procedure

To obtain information about who can access your data:

GUPI Query the SYSIBM.SYSTABAUTH table. The following query retrieves the names of all users who have been granted access to the DSN8B10.DEPT table.

```
SELECT GRANTEE
  FROM SYSIBM.SYSTABAUTH
  WHERE TTNAME = 'DEPT'
    AND GRANTEETYPE <> 'P'
    AND TCREATOR = 'DSN8B10';
```

GRANTEE is the name of the column that contains authorization IDs for users of tables. The TTNAME and TCREATOR columns specify the DSN8B10.DEPT table. The clause GRANTEETYPE <> 'P' ensures that you retrieve the names only of users (not application plans or packages) that have authority to access the table.

GUPI

Retrieving catalog information about primary keys

The SYSIBM.SYSCOLUMNS table identifies columns of a primary key in column KEYSEQ; a nonzero value indicates the place of a column in the primary key.

Procedure

GUPI

To obtain catalog information about primary keys:

Query the SYSIBM.SYSCOLUMNS table. To retrieve the creator, database, and names of the columns in the primary key of the sample project activity table using SQL statements, execute:

```
SELECT TBCREATOR, TBNAME, NAME, KEYSEQ
  FROM SYSIBM.SYSCOLUMNS
  WHERE TBCREATOR = 'DSN8B10'
  AND TBNAME = 'PROJACT'
  AND KEYSEQ > 0
    ORDER BY KEYSEQ;
```

The SYSIBM.SYSINDEXES table identifies the primary index of a table by the value P in column UNIQUERULE. To find the name, creator, database, and index space of the primary index on the project activity table, execute:

```
SELECT TBCREATOR, TBNAME, NAME, CREATOR, DBNAME, INDEXSPACE
  FROM SYSIBM.SYSINDEXES
  WHERE TBCREATOR = 'DSN8B10'
  AND TBNAME = 'PROJACT'
  AND UNIQUERULE = 'P';
```

GUPI

Retrieving catalog information about foreign keys

The SYSIBM.SYSRELS and SYSIBM.SYSFOREIGNKEYS tables contain information about referential constraints and the columns of the foreign key that defines the constraint.

About this task

GUPI

The SYSIBM.SYSRELS table contains information about referential constraints, and each constraint is uniquely identified by the schema and name of the dependent table and the constraint name (RELNAME). The SYSIBM.SYSFOREIGNKEYS table contains information about the columns of the foreign key that defines the constraint.

Procedure

To obtain information about referential constraints and the columns of the foreign key that defines the constraint:

Query the SYSIBM.SYSRELS table or the SYSIBM.SYSFOREIGNKEYS table. To retrieve the constraint name, column names, and parent table names for every relationship in which the project table is a dependent, execute:

```
SELECT A.CREATOR, A.TBNAME, A.RELNAME, B.COLNAME, B.COLSEQ,
       A.REFTBCREATOR, A.REFTBNAME
  FROM SYSIBM.SYSRELS A, SYSIBM.SYSFOREIGNKEYS B
  WHERE A.CREATOR = 'DSN8B10'
  AND B.CREATOR = 'DSN8B10'
  AND A.TBNAME = 'PROJ'
  AND B.TBNAME = 'PROJ'
  AND A.RELNAME = B.RELNAME
    ORDER BY A.RELNAME, B.COLSEQ;
```

To find information about the foreign keys of tables to which the project table is a parent:

```
SELECT A.RELNAME, A.CREATOR, A.TBNAME, B.COLNAME, B.COLNO
  FROM SYSIBM.SYSRELS A, SYSIBM.SYSFOREIGNKEYS B
  WHERE A.REFTBCREATOR = 'DSN8B10'
  AND A.REFTBNAME = 'PROJ'
  AND A.RELNAME = B.RELNAME
    ORDER BY A.RELNAME, B.COLNO;
```

GUPI

Retrieving catalog information about check pending

The SYSIBM.SYSTABLESPACE table contains information about table spaces that are in check-pending status.

About this task

GUPI

The SYSIBM.SYSTABLESPACE table indicates that a table space is in check-pending status by a value in column STATUS: P if the entire table space has that status, S if the status has a scope of less than the entire space.

Procedure

To obtain information about table spaces that are in check-pending status:

Query the SYSIBM.SYSTABLESPACE table. To list all table spaces whose use is restricted for *any* reason, issue this command:

```
-DISPLAY DATABASE (*) SPACENAM(*) RESTRICT
```

To retrieve the names of table spaces in check-pending status only, with the names of the tables they contain, execute:

```
SELECT A.DBNAME, A.NAME, B.CREATOR, B.NAME
  FROM SYSIBM.SYSTABLESPACE A, SYSIBM.SYSTABLES B
  WHERE A.DBNAME = B.DBNAME
  AND A.NAME = B.TSNAME
  AND (A.STATUS = 'P' OR A.STATUS = 'S')
    ORDER BY 1, 2, 3, 4;
```

GUPI

Related reference:

"SYSIBM.SYSTABLESPACE table" on page 2404

Retrieving catalog information about check constraints

The SYSIBM.SYSCHECKS and SYSIBM.SYSCHECKDEP tables contain information about check constraints.

About this task

GUPI

Information about check constraints is stored in the DB2 catalog in:

- SYSIBM.SYSCHECKS, which contains one row for each check constraint defined on a table
- SYSIBM.SYSCHECKDEP, which contains one row for each reference to a column in a check constraint

Procedure

To retrieve catalog information about check constraints:

Query the SYSIBM.SYSCHECKS and SYSIBM.SYSCHECKDEP tables. The following query shows all check constraints on all tables named SIMPDEPT and SIMPEMPL in order by column name within table schema. It shows the name, authorization ID of the creator, and text for each constraint. A constraint that uses more than one column name appears more than once in the result.

```
CREATE TABLE SIMPDEPT
  (DEPTNO   CHAR(3) NOT NULL,
   DEPTNAME VARCHAR(12) CONSTRAINT CC1 CHECK (DEPTNAME IS NOT NULL),
   MGRNO    CHAR(6),
   MGRNAME  CHAR(6));
```

```
SELECT A.TBOWNER, A.TBNAME, B.COLNAME,
A.CHECKNAME, A.CREATOR, A.CHECKCONDITION
FROM SYSIBM.SYSCHECKS A, SYSIBM.SYSCHECKDEP B
WHERE A.TBOWNER = B.TBOWNER
  AND A.TBNAME = B.TBNAME
  AND B.TBNAME = 'SIMPDEPT'
  AND A.CHECKNAME = B.CHECKNAME
  ORDER BY TBOWNER, TBNAME, COLNAME;
```

GUPI

"SYSIBM.SYSCHECKS table" on page 2143

"SYSIBM.SYSCHECKDEP table" on page 2142

Retrieving catalog information about LOBs

The SYSIBM.SYSAUXRELS table contains information about the relationship between a base table and an auxiliary table.

Procedure

GUPI

To retrieve catalog information about LOBs:

Query the SYSIBM.SYSAUXRELS table. For example, this query returns information about the name of the LOB columns for the employee table and its associated auxiliary table schema and name:

```
SELECT COLNAME, PARTITION, AUXTBOWNER, AUXTBNAME
   FROM SYSIBM.SYSAUXRELS
   WHERE TBNAME = 'EMP' AND TBOWNER = 'DSN8B10';
```

Information about the length of a LOB is in the LENGTH2 column of the SYSCOLUMNS table. You can query information about the length of the column as it is returned to an application with the following query:

```
SELECT NAME, TBNAME, COLTYPE, LENGTH2, NULLS, DEFAULT
  FROM SYSIBM.SYSCOLUMNS
  WHERE TBNAME='DEPT'
  AND TBCREATOR = 'DSN8B10';
```

GUPI

Related reference:

"SYSIBM.SYSAUXRELS table" on page 2141

"SYSIBM.SYSCOLUMNS table" on page 2155

Retrieving catalog information about user-defined functions and stored procedures

The SYSIBM.SYSROUTINES table contains information about routines.

Procedure

To retrieve information about user-defined functions and stored procedures:

GUPI Query the SYSIBM.SYSROUTINES table to obtain information about user-defined functions and stored procedures. You can use this example to find packages with stored procedures that were created prior to Version 6 and then migrated to the SYSIBM.SYSROUTINES table:

```
SELECT SCHEMA, NAME FROM SYSIBM.SYSROUTINES
   WHERE ROUTINETYPE = 'P';
```

You can use this query to retrieve information about user-defined functions:

```
SELECT SCHEME, NAME, FUNCTION_TYPE, PARM_COUNT FROM SYSIBM.SYSROUTINES
   WHERE ROUTINETYPE='F';
```

GUPI

Related tasks:

Preparing a client program that calls a remote stored procedure (DB2 Application programming and SQL)

Related reference:

"SYSIBM.SYSROUTINES table" on page 2346

Retrieving catalog information about triggers

The SYSIBM.SYSTRIGGERS table contains information about triggers.

Procedure

To retrieve catalog information about triggers:

GUPI Query the SYSIBM.SYSTRIGGERS table to obtain information about the triggers defined in your databases. You can issue this query to find all the triggers defined on a particular table, their characteristics, and to determine the order they are activated in:

```
SELECT DISTINCT SCHEMA, NAME, TRIGTIME, TRIGEVENT, GRANULARITY, CREADEDTS
   FROM SYSIBM.SYSTRIGGERS
   WHERE TBNAME = 'EMP' AND TBOWNER = 'DSN8B10';
```

Issue this query to retrieve the text of a particular trigger:

```
SELECT STATEMENT, CREATEDTS
   FROM SYSIBM.SYSTRIGGERS
   WHERE SCHEMA = schema_name
      AND NAME = trigger_name
   ORDER BY CREATEDTS;
```

Issue this query to determine triggers that must be rebound because they are invalidated after objects are dropped or altered:

```
SELECT COLLID, NAME
   FROM SYSIBM.SYSPACKAGE
   WHERE TYPE = 'T'
      AND (VALID = 'N' OR OPERATIVE = 'N');
```

GUPI

Related reference:

"SYSIBM.SYSTRIGGERS table" on page 2422

Retrieving catalog information about sequences

The SYSIBM.SYSSEQUENCES and SYSIBM.SYSSEQUENCEAUTH tables contain information about sequences.

Procedure

GUPI

To obtain information about sequences:

Query the SYSIBM.SYSSEQUENCES or SYSIBM.SYSSEQUENCEAUTH table. To retrieve the attributes of a sequence, issue this query:

```
SELECT *
  FROM SYSIBM.SYSSEQUENCES
  WHERE NAME = 'MYSEQ' AND SCHEMA = 'USER1B';
```

Issue this query to determine the privileges that user USER1B has on sequences:

```
SELECT GRANTOR, NAME, DATEGRANTED, ALTERAUTH, USEAUTH
  FROM SYSIBM.SEQUENCEAUTH
  WHERE GRANTEE = 'USER1B';
```

GUPI

Related reference:

"SYSIBM.SYSSEQUENCES table" on page 2366

"SYSIBM.SYSSEQUENCEAUTH table" on page 2364

Adding and retrieving comments

After you create an object, you can provide explanatory information about it for future reference. For example, you can provide information about the purpose of the object, who uses it, and anything unusual about it.

GUPI

You can create comments about tables, views, indexes, aliases, packages, plans, distinct types, triggers, stored procedures, and user-defined functions. You can store a comment about the table or the view as a whole, and you can also include a comment for *each column*. A comment must not exceed 762 bytes.

A comment is especially useful if your names do not clearly indicate the contents of columns or tables. In that case, use a comment to describe the specific contents of the column or table.

Below are two examples of COMMENT:

```
COMMENT ON TABLE DSN8B10.EMP IS
  'Employee table. Each row in this table represents one
   employee of the company.';
COMMENT ON COLUMN DSN8B10.PROJ.PRSTDATE IS
  'Estimated project start date. The format is DATE.';
```

After you execute a COMMENT statement, your comments are stored in the REMARKS column of SYSIBM.SYSTABLES or SYSIBM.SYSCOLUMNS. (Any comment that is already present in the row is replaced by the new one.) The next two examples retrieve the comments that are added by the previous COMMENT statements.

```
SELECT REMARKS
  FROM SYSIBM.SYSTABLES
  WHERE NAME = 'EMP'
  AND CREATOR = 'DSN8B10';
SELECT REMARKS
  FROM SYSIBM.SYSCOLUMNS
  WHERE NAME = 'PRSTDATE' AND TBNAME = 'PROJ'
  AND TBCREATOR = 'DSN8B10';
```

GUPI

Verifying the accuracy of the database definition

You can use the catalog to verify the accuracy of your database definition.

Procedure

GUPI To verify that you have created the objects in your database and check that no errors are in your CREATE statements:

Query the catalog tables to verify that your tables are in the correct table space, your table spaces are in the correct storage group, and so on. GUPI

Related reference:

"DB2 catalog tables" on page 2102

Sample user-defined functions

Some sample user-defined functions are provided with DB2. You can use the functions in your applications just as you would use other user-defined functions, or as examples to help you define your own user-defined functions..

- To use these functions in your applications: Use the functions only if installation job DSNTEJ2U, which prepares the functions for use, has been run. Because the external programs that implement the logic of the sample functions are written

in C and C++, the installation job requires that your site has IBM C/C++ for OS/390®. For information on installation job DSNTEJ2U, see *DB2 Installation Guide*.

- If you want to use these functions as examples to help you define and implement your own user-defined functions: Data set *prefix*.SDSNSAMP contains the code for the sample functions.

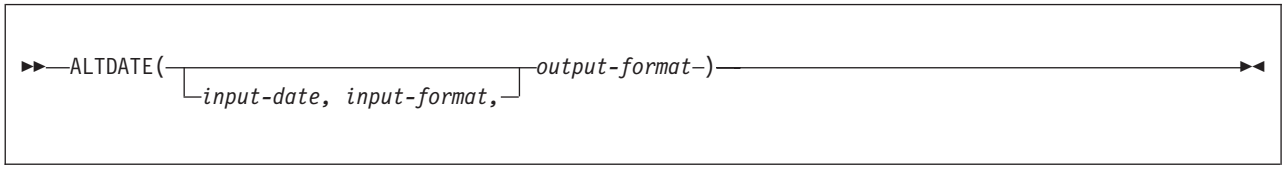
The following table lists the sample user-defined functions. The detailed descriptions of the functions include their external program names and specific names. The functions are in schema DSN8. The functions are defined to treat character or graphic string parameters, both input and output, as EBCDIC-encoded data.

Table 202. DB2 sample user-defined functions

Function Name	Description
ALTDATE	Returns the current date or a user-specified date in a user-specified format
ALTTIME	Returns the current time or a user-specified time in a user-specified format
CURRENCY	Returns a floating-point number as a currency value
DAYNAME	Returns the name of the day of the week on which a date in ISO format falls
MONTHNAME	Returns the name of the month in which a date in ISO format falls
TABLE_LOCATION	Returns the location name of a table or view after resolving any aliases
TABLE_NAME	Returns the unqualified name of a table or view after resolving any aliases
TABLE_SCHEMA	Returns the schema name of a table or view after resolving any aliases
WEATHER	Shows how to use a user-defined table function to make non-relational data available for SQL manipulation

ALTDATE

The ALTDATE function returns the current date in the specified format or converts a user-specified date from one format to another.



The schema is DSN8.

The ALTDATE function returns the current date in one of the following formats or converts a user-specified date from one format to another:

```
D MONTH YY    D MONTH YYYY    DD MONTH YY    DD MONTH YYYY
D.M.YY        D.M.YYYY        DD.MM.YY       DD.MM.YYYY
D-M-YY        D-M-YYYY        DD-MM-YY       DD-MM-YYYY
D/M/YY        D/M/YYYY        DD/MM/YY       DD/MM/YYYY
M/D/YY        M/D/YYYY        MM/DD/YY       MM/DD/YYYY
YY/M/D        YYYY/M/D        YY/MM/DD       YYYY/MM/DD
YY.M.D        YYYY.M.D        YY.MM.DD       YYYY.MM.DD
              YYYY-M-D                       YYYY-MM-DD
              YYYY-D-XX                      YYYY-DD-XX
              YYYY-XX-D                      YYYY-XX-DD
where:
D:     Suppress leading zero if the day is less than 10
DD:    Retain leading zero if the day is less than 10
M:     Suppress leading zero if the month is less than 10
MM:    Retain leading zero if the month is less than 10
MONTH: Use English-language name of month
XX:    Use a capital Roman numeral for month
YY:    Use a year format without century
YYYY:  Use a year format with century
```

The ALTDATE function demonstrates how you can create an overloaded function—a function name for which there are multiple function instances. Each instance supports a different parameter list enabling you to group related but distinct functions in a single user-defined function. The ALTDATE function has two forms.

Form 1: ALTDATE(*output-format***)**

This form of the function converts the current date into the specified format.

output-format

A character string that matches one of the 34 date formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 13 bytes.

The result of the function is VARCHAR(17).

Form 2: ALTDATE(*input-date, input-format, output-format***)**

This form of the function converts a date (*input-date*) in one user-specified format (*input-format*) into another format (*output-format*).

input-date

The argument must be a date or a character string representation of a date

in the format specified by *input-format*. The character string must have a data type of VARCHAR and an actual length that is not greater than 17 bytes.

input-format
A character string that matches one of the 34 date formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 13 bytes.

output-format
A character string that matches one of the 34 date formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 13 bytes.

The result of the function is VARCHAR(17).

The following table shows the external and specific names for the two forms of the function, which are based on the input to the function.

Table 203. External program and specific names for ALTDATE

Conversion type	Input arguments	External name	Specific name
Current date	*output-format* (VARCHAR)	DSN8DUAD	DSN8.DSN8DUADV
User-specified date	*input-date* (VARCHAR) *input-format* (VARCHAR) *output-format* (VARCHAR)	DSN8DUCD	DSN8.DSN8DUCDVVV
	input-date (DATE) *input-format* (VARCHAR) *output-format* (VARCHAR)	DSN8DUCD	DSN8.DSN8DUCDDVV

Example 1: Convert the current date into format 'DD MONTH YY', a format that will include any leading zero for the month, the name of the month in English, and the year without the two digits for the century.

```
VALUES DSN8.ALTDATE( 'DD MONTH YY' );
```

Example 2: Convert the current date into format 'D.M.YYYY', a format that will suppress any leading zero for the day or month and include the year with the century.

```
VALUES DSN8.ALTDATE( 'D.M.YYYY' );
```

Example 3: Convert the current date into format 'YYYY-XX-DD', a format that will include the century, the month of the year as a roman numeral, and the day of the month with any leading zero.

```
VALUES DSN8.ALTDATE( 'YYYY-XX-DD' );
```

Example 4: Convert a date in the format of 'DD MONTH YYYY' to a date in the format of 'YYYY/MM/DD'.

```
VALUES DSN8.ALTDATE( '11 November 1918',
                     'DD MONTH YYYY',
                     'YYYY/MM/DD' );
```

The result of the above example is '1918/11/18'.

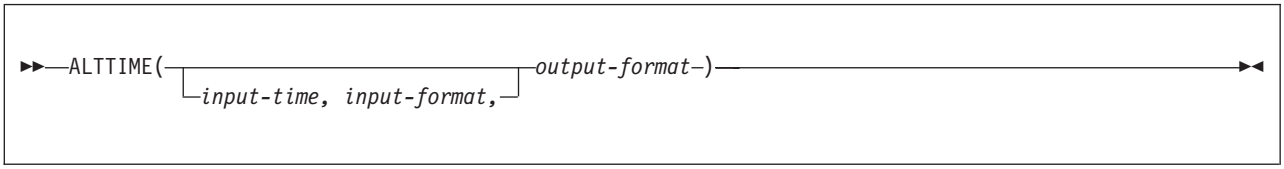
Example 5: Convert the date that employee 000130 was hired, a date in ISO format, into the format of 'D.M.YY'.

```
SELECT  FIRSTNME || ' '
     ||  LASTNAME || ' was hired on '
     ||  DSN8.ALTDATE( HIREDATE,
                       'YYYY-MM-DD',
                       'D.M.YY' )
  FROM  EMP
 WHERE  EMPNO  = '000130';
```

Assuming that the HIREDATE is '1971-07-28', the above example returns: 'DELORES QUINTANA was hired on 28.7.71'.

ALTTIME

The ALTTIME function returns the current time in the specified format or converts a user-specified time from one format to another.



The schema is DSN8.

The ALTTIME function returns the current time in one of the following formats or converts a user-specified time from one of the formats to another:

```
H:MM AM/PM           HH:MM AM/PM
HH:MM:SS AM/PM       HH:MM:SS
H.MM                 HH.MM
H.MM.SS              HH.MM.SS
where:
H:      Suppress leading zero if the hour is less than 10
HH:     Retain leading zero if the hour is less than 10
M:      Suppress leading zero if the minute is less than 10
MM:     Retain leading zero if the minute is less than 10
AM/PM:  Return time in 12-hour clock format, else 24-hour
```

The ALTTIME function demonstrates how you can create an overloaded function—a function name for which there are multiple function instances. Each instance supports a different parameter list enabling you to group related but distinct functions in a single user-defined function. The ALTTIME function has two forms.

Form 1: ALTTIME(*output-format***)**
This form of the function converts the current time into the specified format.

output-format
A character string that matches one of the 8 time formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 14 bytes.

The result of the function is VARCHAR(11).

Form 2: ALTTIME(*input-time, input-format, output-format***)**
This form of the function converts a time (*input-date*) in one user-specified format (*input-format*) into another format (*output-format*).

input-time
The argument must be a time or a character string representation of a time in the format specified by *input-format*. A character string argument must have a data type of VARCHAR and an actual length that is not greater than 11 bytes.

input-format
A character string that matches one of the 8 time formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 14 bytes.

output-format
A character string that matches one of the 8 time formats that are shown

above. The character string must have a data type of VARCHAR and an actual length that is not greater than 14 bytes.

The result of the function is VARCHAR(11).

The following table shows the external program and specific names for the two forms of the function, which are based on the input to the function.

Table 204. External and specific names for ALTTIME

Conversion type	Input arguments	External name	Specific name
Current time	*output-format* (VARCHAR)	DSN8DUAT	DSN8.DSN8DUATV
User-specified time	*input-time* (VARCHAR) *input-format* (VARCHAR) *output-format* (VARCHAR)	DSN8DUCT	DSN8.DSN8DUCTVVV
	input-time (TIME) *input-format* (VARCHAR) *output-format* (VARCHAR)	DSN8DUCT	DSN8.DSN8DUCTTVV

Example 1: Convert the current time into a 12-hour clock format without seconds, 'H.MM AM/PM'.

```
VALUES DSN8.ALTTIME( 'H:MM AM/PM' );
```

Example 2: Convert the current time into a 24-hour clock format without seconds, 'HH.MM'.

```
VALUES DSN8.ALTTIME( 'HH.MM' );
```

Example 3: Convert the current time into a 24-hour clock format with seconds, 'HH.MM.SS'.

```
VALUES DSN8.ALTTIME( 'HH.MM.SS' );
```

Example 4: Convert '00:00:00', a time in 24-hour clock format with seconds, to a time in 12-hour clock format without seconds.

```
VALUES DSN8.ALTTIME( '00:00:00','HH:MM:SS','HH:MM AM/PM' );
```

The function returns '12:00 AM'.

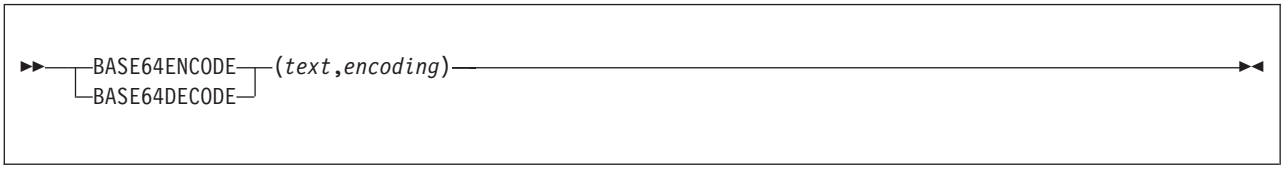
Example 5: Convert '00:00:00', a time in 24-hour clock format with seconds, to a time in 12-hour clock format without seconds and without any leading zero on the hour.

```
VALUES DSN8.ALTTIME( '06.42.37','HH.MM.SS','H:MM AM/PM' );
```

The function returns '6:42 AM'.

BASE64ENCODE and BASE64DECODE

The BASE64ENCODE and BASE64DECODE helper REST functions complete Base64 encoding or decoding of the provided text or data.



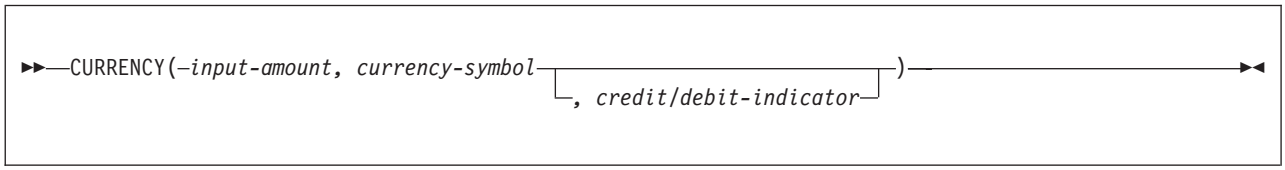
The schema is DB2XML.

text
Specifies the text to encode or decode. For BASE64ENCODE, this argument is provided as a VARCHAR(2732) value and the function returns a Base64-encoded string. For BASE64DECODE, this argument is provided as a Base64-encoded VARCHAR(4096) value and the function returns the data as binary.

encoding
Specifies the character set that is to be used. It can be set to NULL where UTF-8 is used as the default.

CURRENCY

The CURRENCY function returns a value that is formatted as an amount with a user-specified currency symbol and, if specified, one of three symbols that indicate debit or credit.



The schema is DSN8.

input-amount
An expression that specifies the value to be formatted. The expression must be a floating-point value.

currency-symbol
A character string that specifies the currency symbol. The string must have a data type of VARCHAR and an actual length that is not greater than 2 bytes.

credit/debit-indicator
A character string that specifies the symbol that is included with the result to indicate whether the value is negative or positive. The string must have a data type of VARCHAR and an actual length that is not greater than 5 bytes. If *credit/debit-indicator* is not specified or is the value null, the result is formatted without an indicator symbol. You can specify the following symbols:

CR/DB
Bank style. Negative input values are appended with 'DB'; positive input values are appended with 'CR'.

+/- *Arithmetic style.* Negative input values are prefixed with a minus sign '-'; positive values are formatted without symbols.

(/) *Accounting style.* Negative input values are enclosed in parentheses '( )'; positive values are formatted without symbols.

The result of the function is VARCHAR(19).

The CURRENCY function uses the C language functions strfmon to facilitate formatting of money amounts and setlocale to initialize strfmon for local conventions. If setlocale fails, the CURRENCY function returns an error.

The following table shows the external program and specific names for CURRENCY. The specific names differ depending on the input to the function.

Table 205. External program and specific names for CURRENCY

Input arguments	External name	Specific name
input-amount *currency-symbol*	DSN8DUCY	DSN8.DSN8DUCYFV
input-amount *currency-symbol* *credit/debit-indicator*	DSN8DUCY	DSN8.DSN8DUCYFVV

Example 1: Express® '-1234.56' as an amount in US dollars, using the bank style debit/credit indicator to indicate whether the value is negative or positive.

```
VALUES DSN8.CURRENCY( -1234.56,'$','CR/DB' );
```

The result of the function is '$1,234.56 DB'.

Example 2: Express '-1234.56' as an amount in Deutsche marks, using the accounting style debit/credit indicator to indicate whether the value is negative or positive.

```
VALUES DSN8.CURRENCY( -1234.56,'DM','(/)' );
```

The result of the function is '(DM 1,234.56)'.

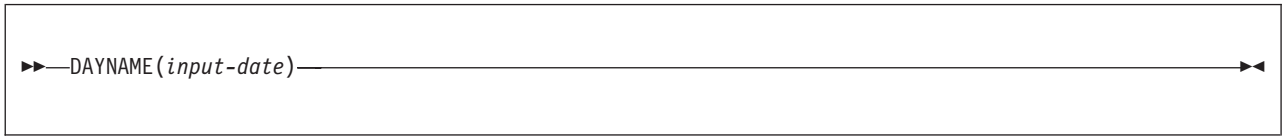
Example 3: Express '-1234.56' as an amount in Canadian dollars, using the accounting style debit/credit indicator to indicate whether the value is negative or positive.

```
VALUES DSN8.CURRENCY( -1234.56,'CD','+/-' );
```

The result of the function is '-CD 1,234.56'.

DAYNAME

The DAYNAME function returns the name of the weekday on which a given date falls. The name is returned in English.



The schema is DSN8.

input-date
A valid date or valid character string representation of a date. A character string representation The string must have a data type of VARCHAR and an actual length that is not greater than 10 bytes. The date must be in ISO format.

The result of the function is VARCHAR(9).

The DAYNAME function uses the IBM C++ classIDate.

The following table shows the external and specific names for DAYNAME. The specific names differ depending on the data type of the input argument.

Table 206. External and specific names for DAYNAME

Input arguments	External name	Specific name
input-date (VARCHAR)	DSN8EUDN	DSN8.DSN8EUDNV
input-date (DATE)	DSN8EUDN	DSN8.DSN8EUDND

Example 1: For the current date, find the day of the week.

```
VALUES DSN8.DAYNAME( CURRENT DATE );
```

Example 2: Find the day of the week on which leap year falls in the year 2008.

```
VALUES DSN8.DAYNAME( '2008-02-29' );
```

The result of the function is 'Friday'.

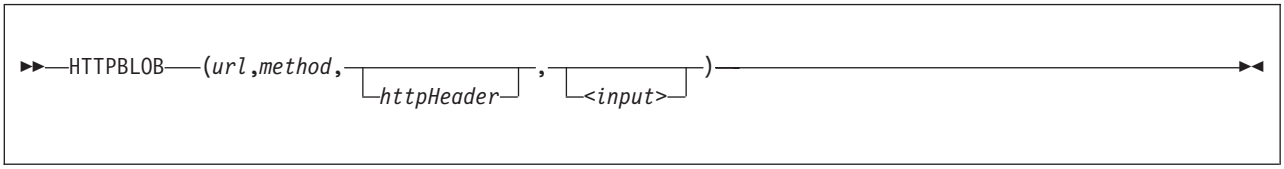
Example 3: Find the day of the week on which Delores Quintana, employee number 000130, was hired.

```
SELECT  FIRSTNME || ' '
    ||  LASTNAME || ' was hired on '
    ||  DSN8.DAYNAME( HIREDATE ) || ', '
    ||  CHAR( HIREDATE )
  FROM  EMP
 WHERE  EMPNO  = '000130';
```

The result of the function is 'DELORES QUINTANA was hired on Wednesday, 1971-07-28'.

HTTPBLOB

The HTTPBLOB REST function completes an HTTP request with the specified HTTP verb. Response messages from the server are returned as BLOB data.



The schema is DB2XML.

url
Specifies the URL at which to complete the request. This argument is defined as a VARCHAR(2048) value.

method
Specifies the HTTP verb to use. Valid values are GET, POST, PUT, and DELETE.

httpHeader
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAtributeValue">
        <header name="name" value="value" />
</httpHeader>
```

headerAttribute
Specify any of the following optional attributes:

connectionTimeout
Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout
Specifies an integer value for the read timeout threshold in milliseconds.

followRedirects
Specifies whether redirects should be followed. This is a boolean value.

useCaches
Specifies whether caches should be used. This is a boolean value.

headerAttributeValue
Specifies a value for the *headerAttribute*. Separate *headerAttribute* and *headerAttributeValue* combinations with single spaces.

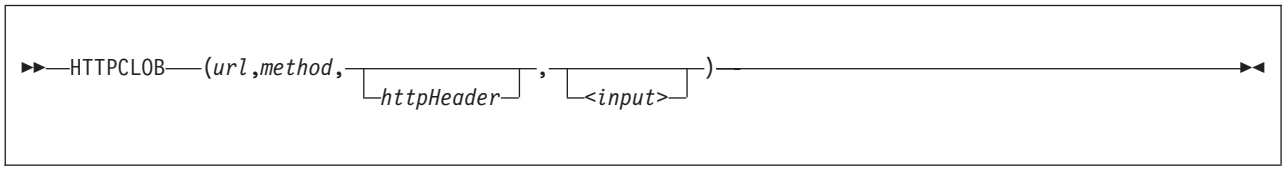
name
The header name.

value
The header value.

<*input***>**
Specifies the data to update at the specified URL. This argument is defined as BLOB(5M).

HTTPCLOB

The HTTPCLOB REST function completes an HTTP request with the specified HTTP verb. Response messages from the server are returned as CLOB data. The character set is converted into the database code page if necessary.



The schema is DB2XML.

url
Specifies the URL at which to complete the request. This argument is defined as a VARCHAR(2048) value.

method
Specifies the HTTP verb to use. Valid values are GET, POST, PUT, and DELETE.

httpHeader
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAtributeValue">
        <header name="name" value="value" />
</httpHeader>
```

headerAttribute
Specify any of the following optional attributes:

connectionTimeout
Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout
Specifies an integer value for the read timeout threshold in milliseconds.

followRedirects
Specifies whether redirects should be followed. This is a boolean value.

useCaches
Specifies whether caches should be used. This is a boolean value.

headerAttributeValue
Specifies a value for the *headerAttribute*. Separate *headerAttribute* and *headerAttributeValue* combinations with single spaces.

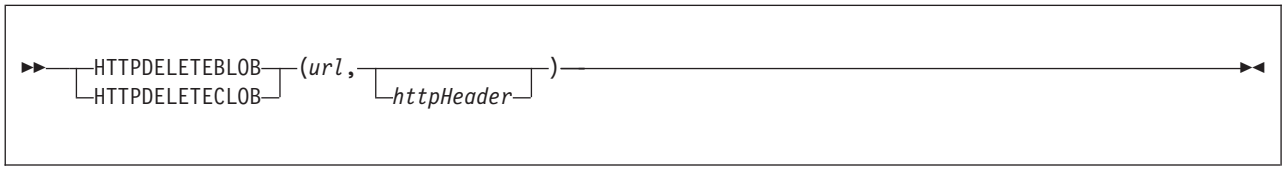
name
The header name.

value
The header value.

| *<input>*
| Specifies the data to update at the specified URL. This argument is defined as
| CLOB(5M).

HTTPDELETEBLOB and HTTPDELETECLOB

The HTTPDELETEBLOB and HTTPDELETECLOB REST functions delete a binary or text-based resource from the specified URL through an HTTP DELETE request. HTTPDELETEBLOB returns messages as BLOB data. HTTPDELETECLOB returns messages as CLOB data. The character set is converted into the database code page if necessary.



The schema is DB2XML.

url
Specifies the URL of the resource being accessed. This parameter is defined as a VARCHAR(2048) value.

httpHeader
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAtributeValue">
        <header name="name" value="value" />
</httpHeader>
```

headerAttribute
Specify any of the following optional attributes:

connectionTimeout
Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout
Specifies an integer value for the read timeout threshold in milliseconds.

followRedirects
Specifies whether redirects should be followed. This is a boolean value.

useCaches
Specifies whether caches should be used. This is a boolean value.

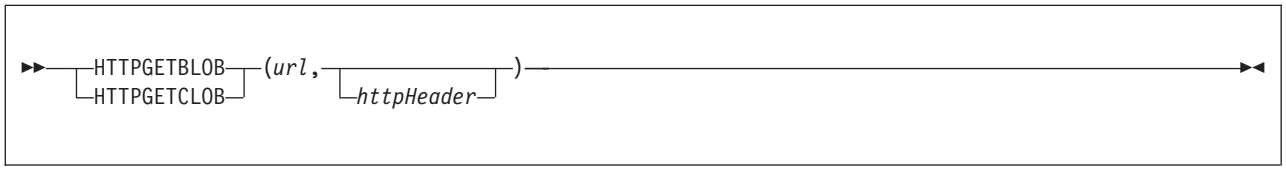
headerAttributeValue
Specifies a value for the *headerAttribute*. Separate *headerAttribute* and *headerAttributeValue* combinations with single spaces.

name
The header name.

value
The header value.

HTTPGETBLOB and HTTPGETCLOB

The HTTPGETBLOB and HTTPGETCLOB REST functions retrieve a binary or text-based resource from the specified URL through an HTTP GET request. HTTPGETBLOB returns the resource as BLOB(5M) data. HTTPGETCLOB returns the resource as CLOB(5M) data. The character set is converted into the database code page if necessary.



The schema is DB2XML.

url
Specifies the URL of the resource being accessed. This argument is defined as a VARCHAR(2048) value.

httpHeader
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAtributeValue">
        <header name="name" value="value" />
</httpHeader>
```

headerAttribute
Specify any of the following optional attributes:

connectionTimeout
Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout
Specifies an integer value for the read timeout threshold in milliseconds.

followRedirects
Specifies whether redirects should be followed. This is a boolean value.

useCaches
Specifies whether caches should be used. This is a boolean value.

headerAttributeValue
Specifies a value for the *headerAttribute*. Separate *headerAttribute* and *headerAttributeValue* combinations with single spaces.

name
The header name.

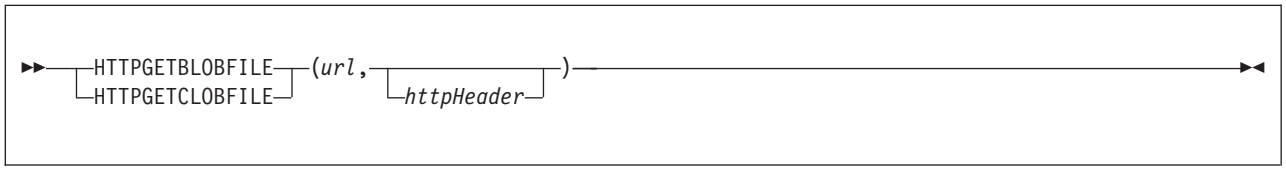
value
The header value.

The following SQL statement retrieves country information from the GeoNames database:

```
SELECT DB2XML.HTTPGETCLOB(
  CAST ('http://ws.geonames.org/countryInfo?lang=' ||
          DB2XML.URLENCODE('en','') ||
        '&country=' ||
          DB2XML.URLENCODE('us','') ||
        '&type=XML' AS VARCHAR(255)),
  CAST(NULL AS CLOB(1K)))
FROM SYSIBM.SYSDUMMY1;
```

HTTPGETBLOBFILE and HTTPGETCLOBFILE

The HTTPGETBLOBFILE and HTTPGETCLOBFILE REST functions retrieve a binary or text-based resource from the specified URL through an HTTP GET request. The resource is stored in a temporary file, and the path of the temporary file is returned as VARCHAR data. The character set is converted into the database code page if necessary.



The schema is DB2XML.

url
Specifies the URL of the resource that is being accessed. This argument is defined as a VARCHAR(2048) value.

httpHeader
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAtributeValue">
        <header name="name" value="value" />
</httpHeader>
```

headerAttribute
Specify any of the following optional attributes:

connectionTimeout
Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout
Specifies an integer value for the read timeout threshold in milliseconds.

followRedirects
Specifies whether redirects should be followed. This is a boolean value.

useCaches
Specifies whether caches should be used. This is a boolean value.

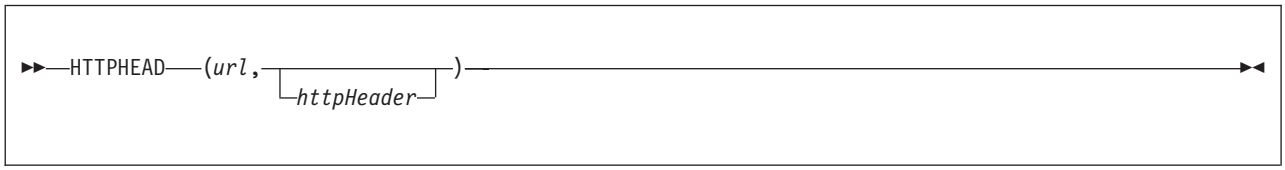
headerAttributeValue
Specifies a value for the *headerAttribute*. Separate *headerAttribute* and *headerAttributeValue* combinations with single spaces.

name
The header name.

value
The header value.

HTTPHEAD

The HTTPHEAD REST function verifies the HTTP header for the specified resource through an HTTP HEAD request. The HTTP header is returned as CLOB or XML data.



The schema is DB2XML.

url
Specifies the URL of the resource. This argument is defined as a VARCHAR(2048) value.

httpHeader
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAtributeValue">
        <header name="name" value="value" />
</httpHeader>
```

headerAttribute
Specify any of the following optional attributes:

connectionTimeout
Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout
Specifies an integer value for the read timeout threshold in milliseconds.

followRedirects
Specifies whether redirects should be followed. This is a boolean value.

useCaches
Specifies whether caches should be used. This is a boolean value.

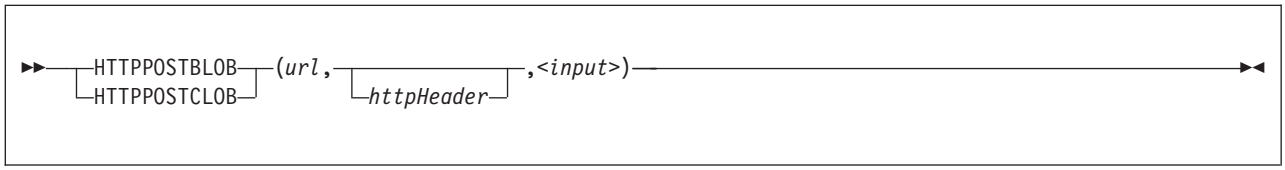
headerAttributeValue
Specifies a value for the *headerAttribute*. Separate *headerAttribute* and *headerAttributeValue* combinations with single spaces.

name
The header name.

value
The header value.

HTTPPOSTBLOB and HTTPPOSTCLOB

The HTTPPOSTBLOB and HTTPPOSTCLOB REST functions update a binary or text-based resource under the specified URL through an HTTP POST request. Response messages from the server are returned as BLOB for HTTPPOSTBLOB or as CLOB for HTTPPOSTCLOB. The character set is converted into the database code page if necessary.



The schema is DB2XML.

url
Specifies the URL at which to update the data. This argument is defined as a VARCHAR(2048) value.

httpHeader
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAtributeValue">
        <header name="name" value="value" />
</httpHeader>
```

headerAttribute
Specify any of the following optional attributes:

connectionTimeout
Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout
Specifies an integer value for the read timeout threshold in milliseconds.

followRedirects
Specifies whether redirects should be followed. This is a boolean value.

useCaches
Specifies whether caches should be used. This is a boolean value.

headerAttributeValue
Specifies a value for the *headerAttribute*. Separate *headerAttribute* and *headerAttributeValue* combinations with single spaces.

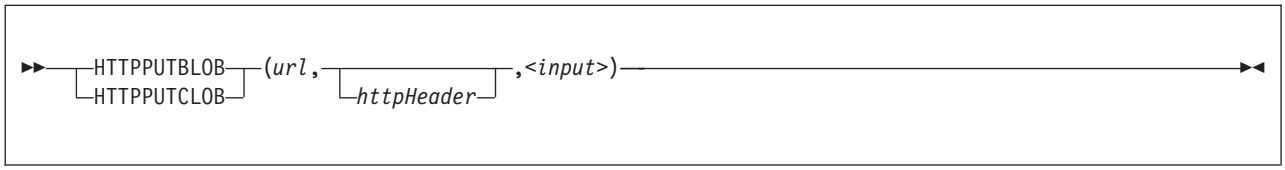
name
The header name.

value
The header value.

<*input***>**
Specifies the data to update at the specified URL. This argument is defined as BLOB(5M) for HTTPPOSTBLOB or CLOB(5M) for HTTPPOSTCLOB.

HTTPPUTBLOB and HTTPPUTCLOB

The HTTPPUTBLOB and HTTPPUTCLOB REST functions create or update a binary or text-based resource under the specified URL through an HTTP PUT request. Response messages from the server are returned as BLOB for HTTPPUTBLOB or as CLOB for HTTPPUTCLOB. The character set is converted into the database code page if necessary.



The schema is DB2XML.

url
Specifies the URL at which to create or update the data. This argument is defined as a VARCHAR(2048) value.

httpHeader
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAtributeValue">
        <header name="name" value="value" />
</httpHeader>
```

headerAttribute
Specify any of the following optional attributes:

connectionTimeout
Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout
Specifies an integer value for the read timeout threshold in milliseconds.

followRedirects
Specifies whether redirects should be followed. This is a boolean value.

useCaches
Specifies whether caches should be used. This is a boolean value.

headerAttributeValue
Specifies a value for the *headerAttribute*. Separate *headerAttribute* and *headerAttributeValue* combinations with single spaces.

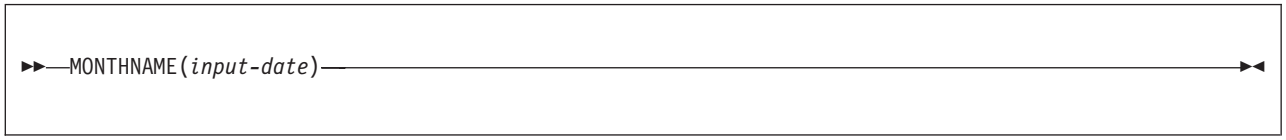
name
The header name.

value
The header value.

<*input***>**
Specifies the data to create or update at the specified URL. This argument is defined as BLOB(5M) for HTTPPUTBLOB or CLOB(5M) for HTTPPUTCLOB.

MONTHNAME

The MONTHNAME function returns the calendar name of the month in which a given date falls. The name is returned in English.



The schema is DSN8.

input-date
A valid date or valid character string representation of a date. A character string representation must have a data type of VARCHAR and an actual length that is no greater than 10 bytes. The date must be in ISO format.

The result of the function is VARCHAR(9).

The MONTHNAME function uses the IBM C++ class IDate.

The following table shows the external and specific names for MONTHNAME. The specific names differ depending on the data type of the input argument.

Table 207. External and specific names for MONTHNAME

Input arguments	External name	Specific name
input-date (VARCHAR)	DSN8EUMN	DSN8.DSN8EUMNV
input-date (DATE)	DSN8EUMN	DSN8.DSN8EUMND

Example 1: For the current date, find the name of the month.

```
VALUES DSN8.MONTHNAME( CURRENT DATE );
```

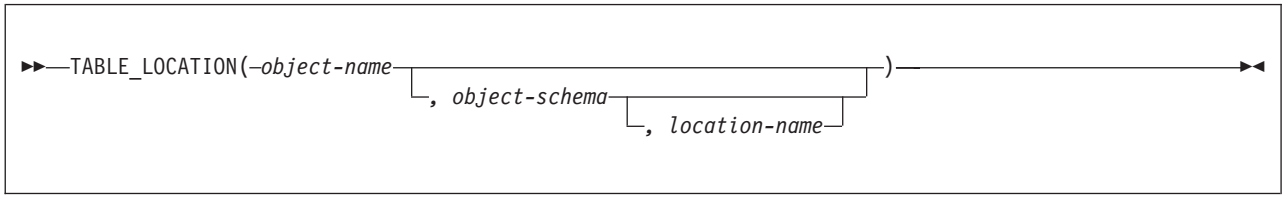
Example 2: Find the month of the year in which Delores Quintana, employee number 000130, was hired.

```
SELECT  FIRSTNME || ' '
    ||  LASTNAME || ' was hired in the month of '
    ||  DSN8.MONTHNAME( HIREDATE )
    ||  CHAR( HIREDATE )
  FROM  EMP
 WHERE  EMPNO  = '000130';
```

The result of the function is 'DELORES QUINTANA was hired in the month of July'.

TABLE_LOCATION

The TABLE_LOCATION function searches for an object and returns the location name of the object after any alias chains have been resolved.



The schema is DSN8.

The starting point of the resolution is the object that is specified by *object-name* and, if specified, *object-schema* and *location-name*. If the starting point does not refer to an alias, the location name of the starting point is returned. The resulting name can be of a table, view, or undefined object. The function returns a blank if there is no location name.

object-name
A character expression that specifies the unqualified name to be resolved. The unqualified name is usually of an existing alias. *object-name* must have a data type of VARCHAR and an actual length that is no greater than 18 bytes.

object-schema
A character expression that represents the schema that is used to qualify the value specified in *object-name* before resolution. *object-schema* must have a data type of VARCHAR and an actual length that is no greater than 8 bytes.

If *object-schema* is not specified or is null, the default schema is used for the qualifier.

location-name
A character expression that represents the location that is used to qualify the value specified in *object-name* before resolution. *location-name* must have a data type of VARCHAR and an actual length that is no greater than 16 bytes.

If *location-name* is not specified or is null, the location name is equivalent to "any".

The result of the function is VARCHAR(16). If *object-name* can be null, the result can be null; if *object-name* is null, the result is the null value.

The following table shows the external and specific names for TABLE_LOCATION. The specific names differ depending on the number of input arguments to the function.

Table 208. External and specific names for TABLE_LOCATION

Input arguments	External name	Specific name
object-name (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTILV
object-name (VARCHAR) *object-schema* (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTILVV

Table 208. External and specific names for TABLE_LOCATION (continued)

Input arguments	External name	Specific name
object-name (VARCHAR) *object-schema* (VARCHAR) *location-name* (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTILVVV

Example: Assume that:

- DSN8.ALIAS_RS_SYSTABLES is an alias of SYSIBM.SYSTABLES at location name 'REMOTE_SITE'.
- The CURRENT SQLID is DSN8.

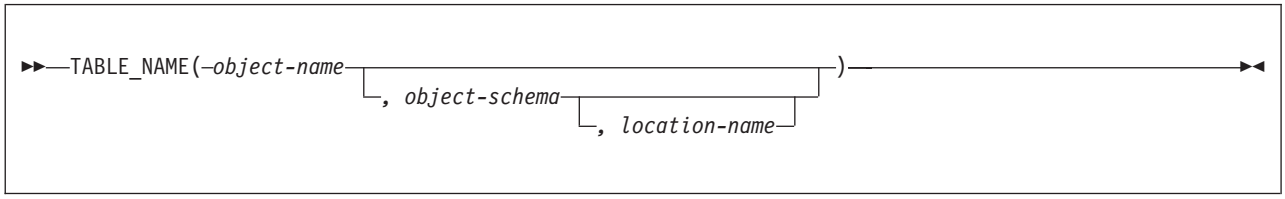
Use TABLE_LOCATION to find the location name where the base object for ALIAS_RS_SYSTABLES resides.

```
VALUES DSN8.TABLE_LOCATION( 'ALIAS_RS_SYSTABLES' );
```

The result of the function is 'REMOTE_SITE'.

TABLE_NAME

The TABLE_NAME function searches for an object and returns the unqualified name of the object after any alias chains have been resolved.



The schema is DSN8.

The starting point of the resolution is the object that is specified by *object-name* and, if specified, *object-schema* and *location name*. If the starting point does not refer to an alias, the unqualified name of the starting point is returned. The resulting name can be of a table, view, or undefined object.

object-name
A character expression that specifies the unqualified name to be resolved. The unqualified name is usually of an existing alias. *object-name* must have a data type of VARCHAR and an actual length that is no greater than 18 bytes.

object-schema
A character expression that represents the schema that is used to qualify the value specified in *object-name* before resolution. *object-schema* must have a data type of VARCHAR and an actual length that is no greater than 8 bytes.

If *object-schema* is not specified or is null, the default schema is used for the qualifier.

location-name
A character expression that represents the location that is used to qualify the value specified in *object-name* before resolution. *location-name* must have a data type of VARCHAR and an actual length than is no greater than 16 bytes.

If *location-name* is not specified or is null, the location name is equivalent to "any".

The result of the function is VARCHAR(128). If *object-name* can be null, the result can be null; if *object-name* is null, the result is the null value.

The following table shows the external and specific names for TABLE_NAME. The specific names differ depending on the number of input arguments to the function.

Table 209. External and specific names for TABLE_NAME

Input arguments	External name	Specific name
object-name (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTINV
object-name (VARCHAR) *object-schema* (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTINVV

Table 209. External and specific names for TABLE_NAME (continued)

Input arguments	External name	Specific name
object-name (VARCHAR) *object-schema* (VARCHAR) *location-name* (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTINVVV

Example: Assume that:

- DSN8.VIEW_OF_SYSTABLES is a view of SYSIBM.SYSTABLES.
- DSN8.ALIAS_OF_VIEW is an alias of DSN8.VIEW_OF_SYSTABLES.
- The CURRENT SQLID is DSN8.

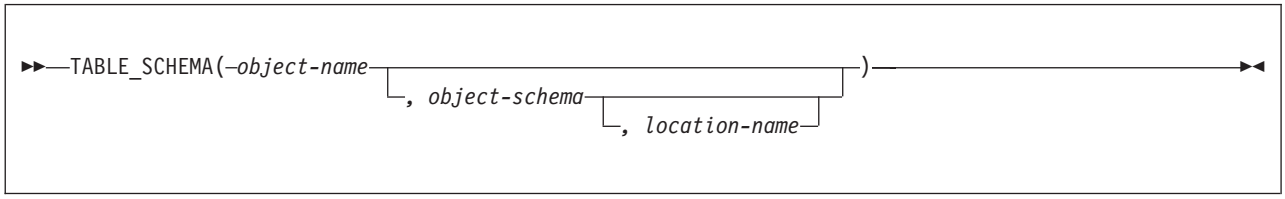
Use TABLE_NAME to find the name of the base object for ALIAS_OF_VIEW.

```
VALUES DSN8.TABLE_NAME( 'ALIAS_OF_VIEW' );
```

The result of the function is 'VIEW_OF_SYSTABLES'.

TABLE_SCHEMA

The TABLE_SCHEMA function searches for an object and returns the schema name of the object after any synonyms or alias chains have been resolved.



The schema is DSN8.

The starting point of the resolution is the object that is specified by *objectname* and *objectschema*. If the starting point does not refer to an alias or synonym, the schema name of the starting point is returned. The resulting schema name can be of a table, view, or undefined object.

object-name
A character expression that specifies the unqualified name to be resolved. The unqualified name is usually of an existing alias. *object-name* must have a data type of VARCHAR and an actual length that is no greater than 18 bytes.

object-schema
A character expression that represents the schema that is used to qualify the value specified in *object-name* before resolution. *object-schema* must have a data type of VARCHAR and an actual length that is no greater than 8 bytes.

If *object-schema* is not specified or is null, the default schema is used for the qualifier.

location-name
A character expression that represents the location that is used to qualify the value specified in *object-name* before resolution. *location-name* must have a data type of VARCHAR (and an actual length that is no greater than 16 bytes.

If *location-name* is not specified or is null, the location name is equivalent to "any".

The result of the function is VARCHAR(128). If *object-name* can be null, the result can be null; if *object-name* is null, the result is the null value.

The following table shows the external and specific names for TABLE_SCHEMA. The specific names differ depending on the number of input arguments.

Table 210. External and specific names for function TABLE_SCHEMA

Input arguments	External name	Specific name
object-name (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTISV
object-name (VARCHAR) *object-schema* (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTISVV

Table 210. External and specific names for function TABLE_SCHEMA (continued)

Input arguments	External name	Specific name
	DSN8DUTI	DSN8.DSN8DUTISVVV
object-name (VARCHAR) *object-schema* (VARCHAR) *location-name* (VARCHAR)		

Example: Assume that:

- DSN8.ALIAS_OF_SYSTABLES is an alias of SYSIBM.SYSTABLES.
- The CURRENT SQLID is DSN8.

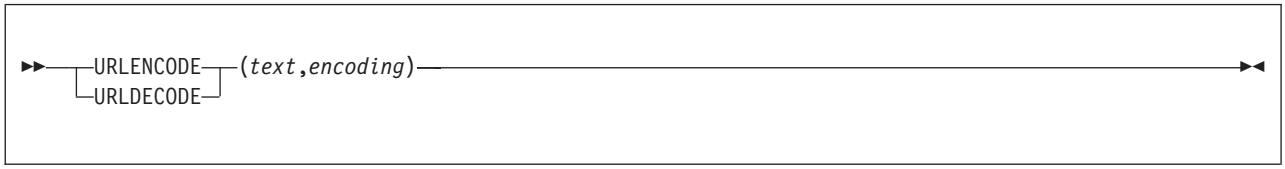
Find the name of the schema of the base table for ALIAS_OF_SYSTABLES.

```
VALUES DSN8.TABLE_SCHEMA( 'ALIAS_OF_SYSTABLES' );
```

The result of the function is 'SYSIBM'.

URLENCODE and URLDECODE

The URLENCODE and URLDECODE helper REST functions complete URL encoding or decoding of the provided text.



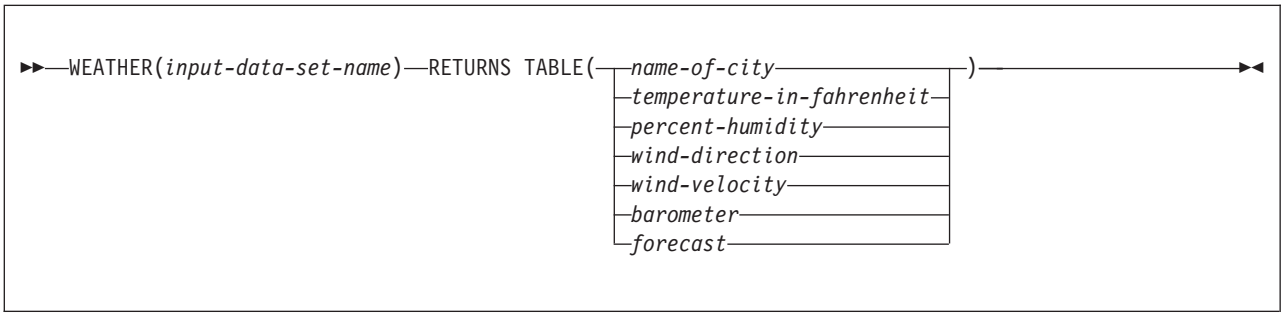
The schema is DB2XML.

text
Specifies the text to encode or decode. This argument is defined as a VARCHAR(2048) value.

encoding
Specifies the character set that is to be used. It can be set to NULL where UTF-8 is used as the default.

WEATHER

The WEATHER function returns information from a TSO data set as a DB2 table. The TSO data set contains sample weather statistics for various cities in the United States. The statistics are returned to the client with a row for each city and a column for each statistic. The WEATHER function is provided primarily to help you design and implement table functions.



The schema is DSN8.

Unlike the other sample user-defined functions, which are scalar functions, WEATHER is a table function. WEATHER shows how to use a table function to make non-relational data available to a client for manipulation by SQL.

input-data-set-name
The name of the TSO data set that contains sample weather statistics. The name is a character string with a data type of VARCHAR and an actual length that is not greater than 44 bytes.

The result of the function is a DB2 table with the following columns. Each column can be null.

name-of-city
VARCHAR(30)

temperature-in-fahrenheit
INTEGER

percent-humidity
INTEGER

wind-direction
VARCHAR(5)

wind-velocity
INTEGER

barometer
FLOAT

forecast
VARCHAR(25)

The external program name for the function is DSN8DUWF, and the specific name is DSN8.DSN8DUWF.

Example: Find the name of and the forecast for the cities that have a temperature less than 25 degrees.

```
SELECT CITY, FORECAST
  FROM TABLE(DSN8.WEATHER('prefix.SDSNIVPD(DSN8LWC)')) AS W
  WHERE TEMP_IN_F < 25
  ORDER BY CITY;
```

This example returns:

```
Bessemer, MI     Slight chance of snow
Cheyenne, WY     Continued cooling
Helena, MT       Heavy snow
Pierre, SD       Continued cold
```

Information resources for DB2 for z/OS and related products

Information about DB2 for z/OS and products that you might use in conjunction with DB2 for z/OS is available in online information centers or on library websites.

Obtaining DB2 for z/OS publications

The current DB2 for z/OS publications are available from the following website:

http://pic.dhe.ibm.com/infocenter/dzichelp/v2r2/topic/com.ibm.db2z11.doc/src/alltoc/db2z_lib.htm

Links to the information center version and the PDF version of each publication are provided.

DB2 for z/OS publications are also available for download from the IBM Publications Center (http://www.ibm.com/shop/publications/order).

In addition, books for DB2 for z/OS are available on a CD-ROM that is included with your product shipment:

- DB2 11 for z/OS Licensed Library Collection, LK5T-8882, in English. The CD-ROM contains the collection of books for DB2 11 for z/OS in PDF format. Periodically, IBM refreshes the books on subsequent editions of this CD-ROM.

Installable information center

You can download or order an installable version of the Information Management Software for z/OS Solutions Information Center, which includes information about DB2 for z/OS, QMF, IMS, and many DB2 and IMS Tools products. You can install this information center on a local system or on an intranet server. For more information, see http://pic.dhe.ibm.com/infocenter/dzichelp/v2r2/topic/com.ibm.dzic.doc/installabledzic.htm.

Programming interface information

This information is intended to help you to code SQL statements. This information primarily documents General-use Programming Interface and Associated Guidance Information provided by DB2 11 for z/OS. This information also documents Product-sensitive Programming Interface and Associated Guidance Information provided by DB2 11 for z/OS.

General-use Programming Interface and Associated Guidance Information

General-use Programming Interfaces allow the customer to write programs that obtain the services of DB2 11 for z/OS.

Product-sensitive Programming Interface and Associated Guidance Information

Product-sensitive Programming Interfaces allow the customer installation to perform tasks such as diagnosing, modifying, monitoring, repairing, tailoring, or tuning of this IBM software product. Use of such interfaces creates dependencies on the detailed design or implementation of the IBM software product. Product-sensitive Programming Interfaces should be used only for these specialized purposes. Because of their dependencies on detailed design and implementation, it is to be expected that programs written to such interfaces may need to be changed in order to run with new product releases or versions, or as a result of service.

Product-sensitive Programming Interface and Associated Guidance Information is identified where it occurs by the following markings:

PSPI Product-sensitive Programming Interface and Associated Guidance Information... PSPI

Trademarks

IBM, the IBM logo, and ibm.com® are trademarks or registered marks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the web at http://www.ibm.com/legal/copytrade.shtml.

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

Microsoft, Windows, Windows NT, and the Windows logo are trademarks of Microsoft Corporation in the United States, other countries, or both.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Java and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle and/or its affiliates.

Privacy policy considerations

IBM Software products, including software as a service solutions, (“Software Offerings”) may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering’s use of cookies is set forth below.

This Software Offering does not use cookies or other technologies to collect personally identifiable information.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM’s Privacy Policy at http://www.ibm.com/privacy and IBM’s Online Privacy Statement at http://www.ibm.com/privacy/details the section entitled “Cookies, Web Beacons and Other Technologies” and the “IBM Software Products and Software-as-a-Service Privacy Statement” at http://www.ibm.com/software/info/product-privacy.

Glossary

The glossary is available in the Information Management Software for z/OS Solutions Information Center.

See the Glossary topic for definitions of DB2 for z/OS terms.
